(We are glad to have Mr. Bryan's contribution to this discussion, even though we cannot agree with him. It is by presentation of both sides of a controversy that the truth is finally brought to light. Mr. Bryan says he cannot see what difference is made by the exclusion from the specifications of the dimensions of grate and heating surface when we specify the amount of water to be evaporated, the efficiency, the required dryness of steam and the required smoke performance. No doubt he is right if the question is judged from the standpoint of the ordinary customer who is not an engineer. What he wants is so much capacity and economy guaranteed by the seller; what does he know or care about heating and grate surface? But the case is different when it is presented to a consulting engineer. Suppose a client of Mr. Bryan's receives bids for 2,400 HP. from two boiler-makers, A and B. They offer boilers of identical construction in every respect, but A offers 10.27 sq. ft. of heating surface per HP. and asks the price of $25,000, while B offers only 6.94 sq. ft. with the price of $24,000. This is exactly the St. Louis case with a change in the prices. Would Mr. Bryan advise his client to accept the $24,000 bid because it is the lowest, and would he tell him "it is absolutely immaterial whether the bidder furnishes one or 50 sq. ft. of heating or grate surface to do a given amount of work;" and that if there were any preference it is "in favor of the man who did the work with the least amount of material?" We think not. He would be more apt to say "A's boiler is over 40% larger than B's. If B's boiler is 2,400 HP. A's is more. The $25,000 boiler is by far the cheapest, but it may be larger than you need. You had better call for new bids specifying the size of boiler, so that each bidder will bid on the same thing, and not on his idea of what that thing will accomplish."—Ed.)

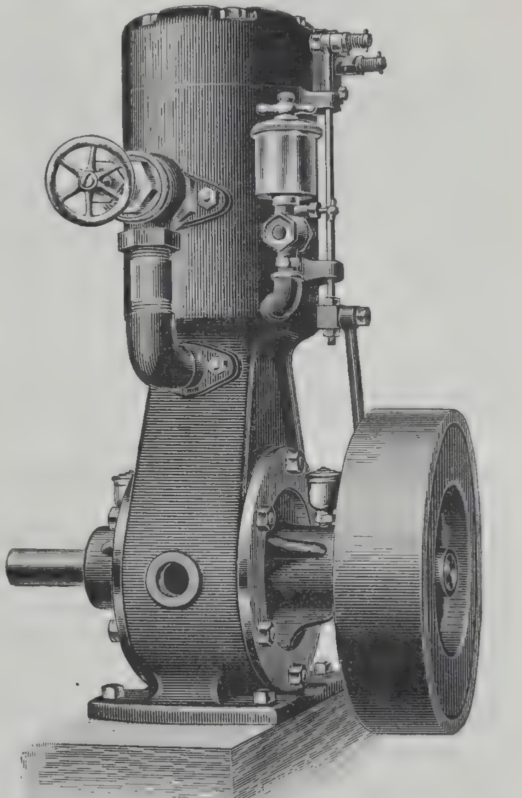
Notes and Queries.

A. W. C., Chicago, has a large body of magnetic iron ore in sand near the Chicago market, and wishes information concerning magnetic separation and briquetting the fine ore for blast furnace use.

THE SIMPLEX NAPHTHA LAUNCH ENGINE.

We illustrate in the accompanying engraving a naphtha engine recently put on the market by Chas. P. Willard & Co., of Chicago, Ill., and designed especially for launches and boats. In its general construction this engine does not differ from other vapor engines, but differs in its valve mechanism and other details, which are best explained in a brief description sent us by the designers.

The simplex naphtha engine differs from most other vapor engines on the market in not depending upon atmospheric evaporation for its supply of gas. It has attached to it a generator, which is heated by the exhaust from the cylinder, thus producing a uniform gas independent of atmospheric temperature or humidity, which, as is well known, strongly affects ordinary carburetters. Owing to the method of generating the gas, lower grades and less volatile oils may be used. The Simplex engine uses successfully naphtha as low as 60° specific gravity, and produces as good results as with the highly volatile forms. In starting, no fire is used to heat the generator, it being provided with an improved vaporizing arrangement, which furnishes the engine with the vapor used in starting up. After running a few minutes, the generator is sufficiently heated to produce a generated gas to take the place of the vaporized gas.



THE "SIMPLEX" NAPHTHA LAUNCH ENGINE.
Chas. P. Willard & Co., Chicago, Ill., Builders.

In the Simplex engine the gases are admitted to the cylinder through an ordinary throttle valve, and by means of this the speed can be varied at will, owing to the uniform quality of the gas and the ability to successfully fire a very small charge under low compression with the aid of an improved electric igniting device which is a combination circuit opener, closer, and sparker, and is so constructed as to permit the spark to be fired at any desirable point of the stroke. The electric circuit is held open about nine-tenths of the time when running, but this too can be adjusted as desired. The engine can be run in either direction, and in skillful hands the best method of reversing is by means of the electric switch. All that need be done is to cut out the electric switch and the engine immediately slows down, and when the piston is just reaching the point of highest compression, which can readily be seen when the engine is moving slowly, the switch is closed and the engine instantly starts in the opposite direction. This result is accomplished by the firing of the charge before the end of the stroke is reached, thus causing the crank to be propelled in the opposite direction to that in which it has been running, but in unskillful hands this method of reversing can not always be depended upon and the makers furnish a reversing device which is placed inside the boat and is operated by a lever.

Broadly speaking, the advantages claimed for this engine for boat use are: the absence of flame or fire in the boat and the necessity of carrying but a small amount of low grade naphtha. The engines are made in 2-HP., 4-HP. and 6-HP. sizes, and cost $275, $400 and $550, respectively. If high rotary speed is desired the engine can be speeded up to 500 revolutions per minute, but for general practice a speed of 300 revolutions is advised. Owing to pending patents the details of the valve mechanism and other parts cannot be made public at this time.

◆

AN OVERLOOKED STAND-PIPE INCIDENT AT ATLANTIC CITY, N. J.

While on a recent visit to Atlantic City a member of the editorial staff of this journal learned from Mr. W. C. Hawley, Assoc. M. Am. Soc. C. E., superintendent of the city water-works, that one of the stand-pipes connected with the works had a narrow escape from destruction a few years ago. This stand-pipe was built by the Atlantic City Water-Works Co., whose works, together with those built in 1889 by a rival company, were recently bought by the city. Mr. Geo. T. Prince, M. Am. Soc. C. E., now Chief Engineer of the Omaha Water Co., was in charge of the plant of the Atlantic City Water-Works Co. when the incident occurred. In response to a request from this journal, Mr. Prince has very kindly sent us the following account of the incident:

I believe it was on Sept. 12, 1889, that the occurrence took place, at a time when there was an exceptionally high tide, probably 3 ft. above the normal high water. This resulted in overflowing the basins of the water company, located about six miles from Atlantic City on the mainland, and, in consequence, the engineer was forced to stop his pumps, but was unable to advise the writer, who at that time was in charge of the works as superintendent, as the high winds had destroyed all telegraph and telephone communication between Atlantic City and the mainland. I, however, noted the fall in our water pressure indicated by the pressure gage in the office, and surmising the truth, hastened to shut off the stand-pipe and save as much of the water as possible. This was early in the afternoon. The wind was blowing a gale from the northeast, coming in violent gusts and causing the plates of the stand-pipe to be indented; this indentation seemed to take a spiral course around the pipe upward, going off at the top with a sharp report that could be heard several blocks distant.

The pipe is 25 ft. in diameter, 132 ft. high, and anchored, I think, with eight 1½-in. rods, which pass through and are secured below the heavy cut stone masonry and grillage upon which the pipe is founded. All of the rods upon the windward side were either broken or the brackets to which they were secured, allowing the pipe on that side to lift from its foundation. I did not think it safe to allow the men to approach near enough to the stand-pipe to close the valve located on its outlet pipe and but a few feet distant, but, instead, had them shut off a number of valves in the district. This lost us time and I judge there were probably 20 or 25 ft. of water remaining in the pipe after the valves were closed.

The wind continued to increase in velocity and was recorded, as I personally observed, by the instrument at the U. S. Signal Office at over 100 miles per hour. This force, however, came in gusts and would extend for a period of say five minutes, when for several minutes there would be a lull. In the middle of the night one of my men who had made an ineffectual attempt to leave Atlantic City to carry word to the engineer to start the pumps, regardless of brackish water, visited the stand-pipe and reported to me that it was lifting from its foundation fully 6 ins. On the following day I succeeded in getting the water pumped into the stand-pipe, and thus relieved the serious condition. The gale continued until the third day.

That the pipe, after being subjected to such a trying ordeal, did not show signs of leaking when afterwards filled, convinced me that it was of excellent material and well constructed. My recollection is that the top course is ¼-in. thick and the lower, ¾-in.; each course being 4 ft. high. It was constructed in 1882. Mr. Walter Wood, of the firm of R. D. Wood & Co., of Philadelphia, was at that time president of the Atlantic City Water-Works Co. My predecessor at Atlantic City was Mr. E. Graves, and under his direction the stand-pipe was constructed. Mr. Graves is at present Superintendent of the Camden Iron Works, of Camden, N. J.

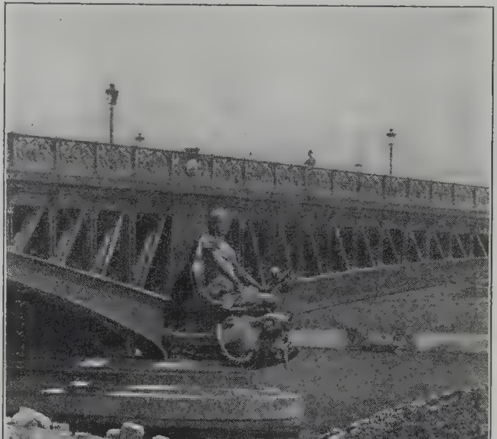

Fig. 6.—Mirabeau Bridge; Pier and Truss Decorations.

I never saw the specifications governing the construction of this stand-pipe, but understood from Mr. Graves that they were prepared by Mr. J. D. Cook, of Toledo, O., who acted as consulting engineer in the construction of the original plant, and were similar to those which he, Mr. Cook, had prepared for the stand-pipe at Sandusky, O.

It would be interesting to know whether the metal was rolled, after the old method, from piled iron, or the modern way of rolling from the ingot. An engineer of wide reputation who has had extended experience in the use of riveted wrought-iron pipe, covering a period of more than a quarter of a century, recently expressed himself to me as strongly in favor of the former and decidedly opposed to the latter method of rolling from the ingot, and is to-day insisting upon having his plates rolled from wrought iron wired in piles before reheating. He claims that any imperfection in any separate piece of iron in the pile does not extend through the entire thickness of rolled plate, but is confined to one layer, so to speak; whereas, in the case of the rolling from the ingot, any impurities in the steel are made to cover considerable area and extend through the plate, which objection, if well taken, is pertinent to the construction of standpipes.

Mr. E. Graves, now superintendent of the Camden Iron Works, has written us regarding the above incident, as follows:

Proof of Mr. George T. Prince's description of an incident in the history of the Atlantic City stand-pipe, together with your note of inquiry as to whether I could add anything of interest to same, is at hand. To this description there is but little more that I can say. As stated by Mr. Prince, the general specifications of this, as well as that of the first of the large stand-pipes, the one erected at Sandusky, O., in 1876, were prepared by Mr. J. D. Cook, and both erected under my personal supervision.

The plates in the Atlantic City structure are of steel, and were rolled by Park Bros., of Pittsburg. I have not before me data of the various thicknesses. Steel rivets were used, the stock for which was also made by Park Bros. The bottom of pipe is all ¼-in. thick, and is made up of a circular sheet with radial sheets joined to the first course of the shell by means of an angle. The holding-down bolts connect with lugs, which in turn are secured to the center of the first shell course at eight points in the circumference. When the tank was first completed it was found that the bottom did not lay flat on the foundation; that the pressing down of the buckles under the weight of water made leaks in the bottom calking. To obviate this difficulty a 6-in. diameter hole was cut in the center, and an ordinary half flange union secured to the plate by bolts. Into this flange was screwed a section of wrought-iron pipe some 3 or 4 ft. long, and liquid cement was poured in the top of this pipe until the bottom was raised and drawn tight by hydrostatic pressure—it assuming a spherical form with a rise in the center of perhaps 6 ins. After hardening of this cement the hole in the bottom was closed with a plug, and no further trouble was ever experienced through bottom joints leaking.

In a structure of this kind, having a semi-flexible bottom and a few feet of water in it, it can readily be seen that the weight of the water on the bottom holds back only to a small extent the first overturning motion; that as this motion increases, there is, on the windward side, a corresponding lifting of the bottom curb, carrying with it the ends of the bottom sheets. The further the ends of these sheets are lifted, the greater will be the suspended area and corresponding water load, resulting in an increasing resistance to overturning. This bottom being spherical, with an upward curve, allowed a greater swaying to top of tank than would have been the case had the curvature been downward, or had there been no slack in the bottom plates, and they had laid flat.

While this wind storm resulted in a severe test to the tank in question, that it sustained no material injury is hardly more surprising than that some tanks whose details have become familiar to the public through descriptions of their failure in Engineering News, stood long enough to be tested at all.

THE MIRABEAU CANTILEVER BRIDGE, IN PARIS.

This bridge, the first of the cantilever type erected in Paris, has recently been completed across the River Seine, but has not yet been formally opened to traffic. It connects the industrial quarter of Grenelle-Laval with the purely residential quarter of Auteuil on the right bank of the river, and the state and municipality equally shared the cost of erection, with a view of encouraging the present movement of population away from crowded centers and towards the new suburbs of modern construction.

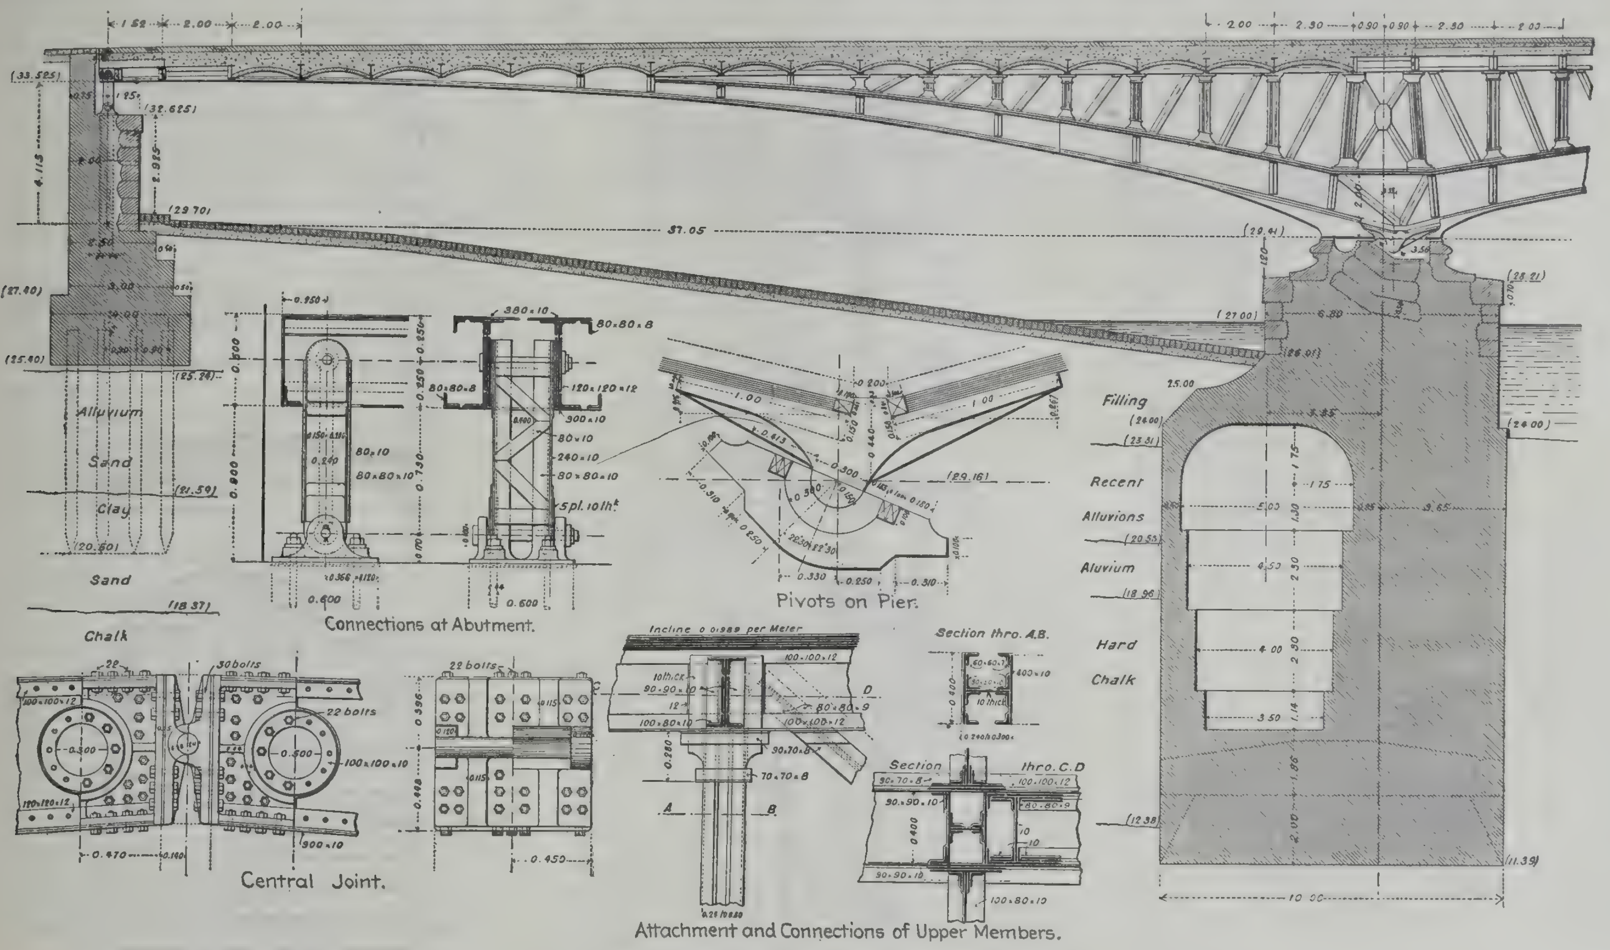

FIG. 2.—MIRABEAU BRIDGE; PIER AND HALF-CANTILEVER.

This bridge is made up of one center span of 328 ft. and two side spans of 118 ft. each, forming two cantilevers supported on pivots on two river piers and ending at two shore anchor-abutments. At the center of the river span the abutting arms are connected by a pin, or hinge. The width of the roadway is 39.36 ft., with two footways each 13.12 ft. wide. Each half of this bridge is made up of seven mild steel trussed arms, united laterally, as shown in Fig. 3, and spaced 9.84 ft. apart under the roadway, and 12.2 ft. apart under the footway. The height from the pier-pivot to the center of the bridge is 20 ft. 3 ins., and the under part of the frames takes the form of two semi-parabolas, with a horizontal axis. The depth of the frame is 17.54 ft. at the pier, decreasing to 2.75 ft. at the center and to 1.64 ft. at the shore ends. The framing of the two arms is continuous over the river piers, with the frame and arc made of box-girders. This is fixed on a steel pivot or balance, shown in Fig. 2, composed of two plates and a casting terminating in a half-cylinder, bolted to the arc of the frame. This half-cylinder rests upon a steel cushion imbedded in the granite pier. The central joint and the abutment connections are well shown in the cut, which is taken from "The Engineer," of London, along with a considerable part of this description.

The same journal thus describes the principle of equilibrium upon which the bridge was designed: Under the action of a symmetrical weight the two parts of the river span are subjected to a horizontal stress of only about 500 tons, as the weight of the shore spans compensate in great part for the weight of the river spans, and this condition makes possible the moderate depth given to the frames at the piers. Under the influence of loads this stress can be increased about four times above that produced by a permanent weight alone. The temperature also causes fluctuation in the pushing strains and brings into play the jointed anchorage. The pressure on the anchorage foundations, due to changes in temperature, varies from 71 lbs. to 206 lbs. per square inch, under the most unfavorable conditions.

The river-piers for this bridge are peculiar in construction, as shown in Fig. 2. These piers are 32.8 ft. wide and 91.8 ft. long from the river-bed downward, and rest upon a metallic caisson of the same horizontal dimensions, sunk by the use of compressed air to a hard-chalk stratum, lying about 54 ft. below the water. The sinking of these caissons, on the so-called Zschokke and Terrier system, is described as follows in "Le Genie Civil":

The top width of the pier is 22.2 ft.; but in order to increase the base area the pier was widened out by a curved offset, at about 10 ft. below the water level, and four wells were left within the base of the pier on the shore side, so as not to unnecessarily add to the quantity of masonry. The foundation material was sandy clay, soft clay and chalk, gradually increasing in hardness. The caissons are the same size as the piers, 91.8 ft. long and 32.8 ft. wide, the straight part of the sides being 68 ft. The working chamber is about 6½ ft. high and has four shafts. The two middle shafts, 2.8 ft. diameter, terminate in air locks of the Montagne system, and are used by the workmen. The two end shafts, 3.4 ft. diameter, are used for removing the material, and are fitted with the Zschokke and Terrier air locks (Fig. 4). The shafts are so placed with reference to the empty space in the pier that the masonry work can be nearly all completed before communication with the working chamber is shut off. The roof of the chamber is supported by lattice girders, as shown in Fig. 5. The working chamber is lighted by electricity. The first caisson was launched in August, 1893, and the masonry carried up to water level in two months; the working chamber was then filled with brick and rubble masonry between the girders, and all spaces filled with concrete. The second caisson was placed in November of the same year.

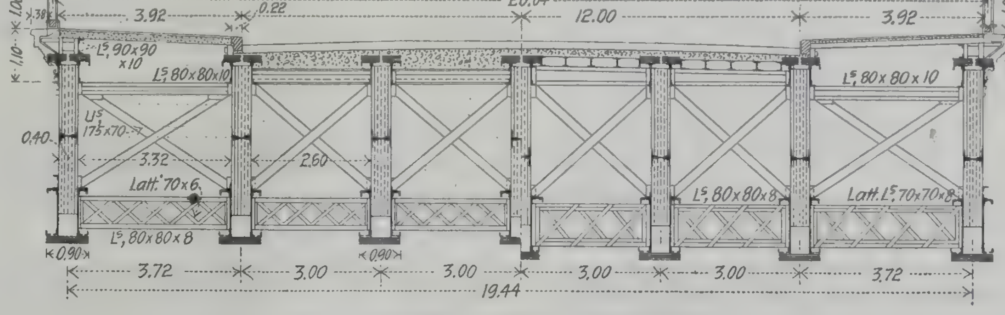

FIG. 3.—MIRABEAU BRIDGE; CROSS-SECTION.

The Montagne air locks for the workmen are operated in the usual way. The man enters the chamber on top of the shaft and closes the outer door; he then opens a valve admitting the compressed air, and when the pressure is equal to that in the shaft he can open the door in the floor of the chamber and descend by a ladder in the shaft. The Zschokke and Terrier air locks for the removal of the excavated material are much more rapid in operation, too rapid to be used by men, as the sudden changes in pressure would be dangerous. The bucket A, Fig. 4, rests on two trunnions on racks, B, attached to a frame, C, carrying at its lower part, D, a plate which closes the bottom of the chamber, E. This frame is suspended by a chain, one end of which is fixed to the top of the chamber, the chain passing under a pulley attached to the bucket frame, then over a small wheel in the top of the chamber, and then running down the shaft. This wheel has a pulley on the outer end of its axle (outside the chamber), which is driven by a friction wheel of a little compressed air engine, and thus raises or lowers the bight of the chain in which the bucket is suspended. The bucket being filled is raised by the chain; when it reaches the top of the shaft, the shaft is closed by the plate on the bottom of the bucket frame, fitting against a rubber-faced steel ring, and a valve is automatically opened to release the compressed air in the chamber. As soon as this is done the swinging door in the side of the chamber is opened and the bucket dumped. This door is then closed, and the friction wheel being thrown off the bucket runs down by its own weight.

The construction of the Mirabeau bridge was authorized in 1893, and the first caisson was sunk on August 8 of that year, and it was finished on Oct. 24. The second caisson foundation was completed between Nov. 10 and Dec. 30, 1893. On Sept. 1, 1894, the erection of the metal superstructure was commenced by means of a travelling crane with a reach of 85 ft. The bridge was erected upon false works, supported upon piles; commencing at the pier-pivot, parts of each adjoining arm were first constructed and then the river arm was completed, in accordance with the requirement that the first half of the bridge should be finished before the winter of 1894-95. This first half was finished in January, 1895, and the false works were removed and put up again under the other half by April 25, 1895. This second half was erected April 13 and August 24 in the same year. With the halves completed, the two river ends were brought into line and adjusted to the proper height and then the measurements were taken for the wedges to be placed on each arc between the center-hinge and the frames. When the wedges were prepared, the ends of the bridge were raised by jack-screws, the wedges put in and the ends allowed to fall into contact at the proper level. The roadway was then completed and on Dec. 5, 1895, the bridge was opened to pedestrians, having consumed about 18 months in construction. The superstructure weighs 2,744 metric tons, of which 2,077 tons are rolled steel, 385 tons rolled iron and 82 tons of forged steel; the remaining weight is in the ornamentation. The cost of this superstructure was about $247,000, and the total cost of the bridge was $413,400. The designer of the bridge was M. Resal and the work was carried on under M. Rabel, Chief Engineer of the "Ponts et Chaussees;" and M. Alby was the engineer in charge.

STATISTICS OF STRIKES AND LOCKOUTS.

Volume I. of the tenth annual report of the Commissioner of Labor for the year 1894, which has just been issued from the government printing office is a bulky book of 1,373 pages, of which all but the first 32 pages are devoted to tables of strikes and lockouts in the United States between Jan. 1, 1887, and June 30, 1894. The tables are arranged by states, years and industries, and the headings include occupation, locality, cause or object, ordered by labor organizations, establishments involved, closed or not closed, date of beginning and ending, duration in days, succeeded or not, wage loss, assistance to employees, and loss of employers. The introduction to the volume contains an analysis of the tables, with general summaries for the period embraced in this report and also for the period covered by the third annual report, viz., Jan. 1, 1881, to Dec. 31, 1886. From

Causes of Strikes in the United States for 13½ Years.

Items.	Jan. 1, 1881, to Dec. 31, 1886.		Jan. 1, '87, to June 30, 1894.	
	Estblshmts.	%	Estblshmts.	%
For increase of wages	9,439	42.32	12,041	25.69

these summaries we have abstracted the following figures:

Strikes and Lockouts in the United States From Jan. 1, 1887, to June 30, 1894; 6½ Years.

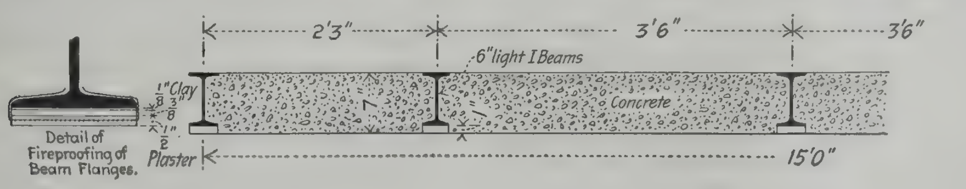
	Strikes.	Lockouts.
Total strikes and lockouts	5,909	244
Establishments	28,662	2,970
Employees thrown out employment	955,252	140,135
Wage loss of employees	$34,988,100	$12,108,463
Loss to employers	28,786,446	5,754,296
Assistance to employees[1]	4,590,177	671,818
From Jan. 1, 1881, to June 30, 1894; 13½ Years.		
Establishments	69,166	6,067
Average duration, days	25.4	47.0
Wage loss to employees	$163,807,657	$26,685,516
Assistance to employees[1]	10,914,406	2,524,298
Loss to employers	82,598,786	12,235,451
Establishments in which strikes or lockouts succeeded, %	44.49	40.33
Failed, %	44.23	47.75
Succeeded partly, %	11.25	9.58
Number thrown out of employment		Per cent.
in successful strikes	1,188,525	32.00
In strikes which failed	2,061,259	55.50
In partly successful strikes	462,777	12.46
In total strikes	3,714,231	.....

[1] By labor organizations.

The report contains two tables summarizing the leading causes of strikes for the two periods, Jan. 1, 1881, to Dec. 31, 1886, and Jan. 1, 1887, to Dec. 31, 1894. We have rearranged these two tables to make the one given below so as to place in contrast the figures for the two periods, and bring out a matter which does not seem to be discussed in the report, viz.: the apparent tendency to a change of the principal causes of strikes from those relating to differences of opinion between employers and employees concerning wages and hours of labor, to those relating to recognition of unions, employment of non-union men, "sympathetic strikes," etc. Of the several causes specified in the tables it appears that those relating simply to wages, hours, etc., comprised 85.38% of the total number of strikes (counted by establishments) in the first period, and only 55.32% in the second, while the specified causes of the second class, those relating to unions, sympathetic strikes, and the like, were only 4.90% in the first period and 24.40% in the second. The increased domination, or attempted domination of the unions, in recent years, of which these figures seem to give evidence is a subject well worthy of study by those interested in labor questions.

TESTS OF THE THOMSON AND THE McCABE FIRE-PROOF FLOORS.

Two additional tests in the series of fire and water tests of fireproof floor constructions, which is being conducted by the Building Department of New York city, were made during the past week at the testing grounds, 68th St. and Avenue A. Mr. Frank Rutherford was the expert of the Department in charge. The first test, made on Nov. 7, was of the floor designed by G. H. Thomson & Co., No. 51 East 44th St., New York. The test was made in a brick building similar to those used in the tests of the other floors which have been described in our columns in the past few weeks. The interior size of the building is 11 × 14 ft. and the walls are 1 ft. thick. The floor tested, which formed the roof of the building, was constructed of 6 in. light I-beams, 12 ft. long, spaced as in the accompanying sketch, the space between the beams being entirely filled, as shown by a concrete made of 1 part of Dyckerhoff Portland cement, 2½ parts clean sand and 6 parts ashes, and treated by a chemical preparation the nature of which has not been made public. The underside of the flanges of the beams was protected by two layers of hardened clay preparations of different constitution, the first ⅛-in. and the second ⅜-in. thick; and further by ½-in. of cement mortar, held in place by wire netting. The underside of the floor or ceiling was then plastered with a coat of about ½-in. of ordinary lime plaster. The most important difference between the construction of the Thomson floor and that of the other concrete filled floors before tested is in the disposition of the beams, which are only 6-in. I-beams, weighing 13 lbs. per ft., 12 ft. long between centers of supports and 3 ft. 6 ins. apart c. to c. In the other tests the beams were 10-in., 25 lbs. per ft., 15 ft. long between supports and spaced 4 ft. apart. The beams in the Thomson test were therefore subjected to a much greater fiber strain for a given load per sq. ft. of floor than those in the other tests. Before the test the central panel of the floor was loaded with 6,300 lbs. of pig iron, or 150 lbs. per sq. ft.



CONCRETE FIRE-PROOF FLOOR CONSTRUCTION.

Designed by G. H. Thomson, M. Am. Soc. C. E., New York City.

Isometric View.

CONCRETE AND PLASTER OF PARIS FIRE-PROOF CONSTRUCTION.

Patented by Peter McCabe, New York City.

The test was begun at 10 a. m. by lighting the fire of cordwood. The temperatures were taken by a Uehling & Steinbart recording pyrometer. By 10.45 a temperature of 1,775° F. was recorded, and at 10.57 2,200° F. The highest temperature was 2,250° F. at 1.45 p. m., and from 11 a. m. to 3 p. m. the temperature remained above 2,000°, except when the doors were opened for charging firewood. A double grate was used as in the earlier tests, so that the air supplying the upper grate might be heated by passing through the lower fire. At 3 p. m., after five hours of continuous firing, a strong stream of water supplied by a fire engine was directed against the underside of the ceiling, and when the interior of the building was sufficiently free from steam to be observed, it was found that the concrete filling between the beams was practically uninjured, the plaster coating, where the full force of the water struck it having been torn off. The maximum deflection of the floor observed during the test was only 1.82 in. at 2.57 p. m. After cooling this had reduced to 0.7 in. On Nov. 10 a load of 600 lbs. per sq. ft. was placed on the floor, and it developed only 0.37 in. deflection.

The next test was made on Monday, Nov. 9. It was made at the same place, and in a building of the same style as those used in the previous tests. The floor tested was designed and patented by Mr. Peter McCabe, of McCabe Bros., 33 West 64th St., New York city.

The floor is constructed as follows: The I-beams, 10-in. medium weight, 15 ft. long, running lengthwise of the building, are spaced 4 ft. apart c. to c. Upon their lower flanges is built a series of flat arches, made out of ribbed blocks of the shapes shown in the accompanying cuts. These are made of a composition of plaster of paris and ashes. After the arches of plaster blocks are laid the spaces between their upward projecting ribs are filled with dry ashes, the upper surface being rounded off to the arched form of the top of the rib. The whole space between this rounded surface and the level of the top of the upper flange of the 10-in. I-beam is then filled with a cement concrete, made of 1 part Portland cement, 2 parts sand and 4 parts ashes. The lower sides of the plaster blocks extend about 2½ ins. below the flanges of the I-beams, as shown. Light T-irons, inverted, are laid on the lower flanges of the I-beams for the purpose of supporting the arch blocks while they are being laid, and possibly of contributing to the strength of the floor.

The middle panel of the floor having been loaded with pig iron to the amount of 150 lbs. per sq. ft., the test was begun at 10 a. m., and continued five hours. By 11 a. m. the temperature had reached 1,500° F., by 11:20 it was 2,000°, and by 11:30, 2,250°. The highest temperature attained was 2,325°. Between 11:20 a. m. and 3 p. m., the temperature was kept above 2,000°, except for short intervals, while fresh wood was being charged. The maximum deflection during the test was only 0.33-in., which is much less than that found in any of the floors previously tested. Its small amount is no doubt due to the greater thickness of the construction, as compared with that of the other floors, and to the very complete protection of the lower side of the beam. On cooling very little change in the deflection was found. At 3 p. m., the floor was cooled by a stream from a fire engine, about 15 minutes being required. When the steam had cleared away it was found that small portions of the plaster blocks had fallen out in three places exposing the concrete arch above, and that a portion of the plaster blocks under the flange of the I-beams had also fallen off. It is probable that most if not all of this damage was done by the force of the fire stream. The concrete arch where it was exposed appeared to be entirely uninjured.

◆

TWO JAPANESE CRUISERS are to be built in the United States, one by the Cramp Ship & Engine Company, of Philadelphia, and the other by the Union Iron Works, of San Francisco. While the contracts have not yet been formally signed, the proposals of the American firms have been accepted. The new cruisers are to cost about $1,250,000 each, and the proposals call for a speed of 21 knots and 17,000 I. HP. Each cruiser will have about 5,700 tons displacement, with a length of 335 ft. on the water line, 51 ft. extreme beam, and 20 ft. mean draft. The main battery is to include four 8-in. and eight 5-in. rapid-fire guns, with a secondary battery of twelve 6 pdrs., six 1 pdr. and four Gatling guns. The Japanese government is said to be about closing contracts with the English shipbuilder, Armstrong, for two first-class battle ships and one armored cruiser; besides these, it is contracting for five 150-ton 24-knot torpedo boats and several torpedo boat destroyers, in England, five torpedo boats of the same class in France and five more from German firms.

◆

THE TIDAL SURVEY of the Gulf of St. Lawrence has been in progress for three years. The first season was occupied in examining the Belle Isle and Cabot Strait entrances and in fixing the general relation between the tides and currents of the gulf and the ocean. The second season was devoted to the St. Lawrence entrance between the Gaspe coast and Anticosti and the nature of the currents were traced across the southwestern side of the Gulf to Cape Breton. During the present year the northeastern arm of the Gulf, from Anticosti to Belle Isle, has been under examination. This arm of the Gulf has an area equal to that of the English Channel and through it passes all the Atlantic trade taking the Belle Isle route. Tide tables are now published covering the approach from Halifax to Quebec, the first tables which are based upon direct observations.

WHEELER-STERLING ARMOR-PIERCING PROJECTILES were tested at Indian Head, on Oct. 30, against a 12-in. Carnegie nickel-steel plate. The shell was 12 ins. in diameter, and represented a lot of 75. It was fired with a velocity of 1,800 ft. per second and though it pierced the plate it was badly shattered. The lot was rejected under the present regulation requiring the shell to not only penetrate the plate, but to pass through the trial without splitting or breaking up. The late trial is said to have brought about a change in this regulation, calling only for penetration without regard to the final condition of the shell.

◆

THE SUBMARINE TORPEDO BOAT, invented by Mr. John P. Holland, which is now being built at the Crescent Shipyards, Elizabethport, N. J., is expected to be launched about Jan. 15. It is a cigar-shaped vessel, 50 ft. long and 10 ft. diameter, constructed of double steel plating 7-16-in. thick forward, tapering to 5-16-in. aft. The motive power will be electricity and compressed gas, either of which may be used separately, or they may be coupled when the highest speed is desired. The only superstructure will be a telescopic conning tower, 3 ft. diameter and 1 ft. high. The displacement of the vessel will be 66 tons. Her armament will consist of a gun for throwing aerial torpedoes containing 200-lb. charges of high explosives, and her magazine will contain, in addition, six or seven "Whitehead" torpedoes. Her speed below the surface will be nine knots for twelve hours, or twelve knots for four hours, while being operated by electric current, and when awash she will develop eight knots under gas pressure. When launched, she will be fitted with a 50-HP. gas engine, but at a later date a 300-HP. motor will be used, which is expected to generate a speed of 16 knots. The cost of construction will be about $75,000. The larger boat of the same class, which is being built under contract with the U. S. Navy Department at the Columbian Iron Works, in Baltimore, and which was described in our issue of March 12, 1896, is expected to be completed in February.

◆

THE MISSISSIPPI JETTIES are in danger, says the New Orleans "Times-Democrat," from the existence of a crevasse, 3,000 ft. wide, leading from Pass a l'Outre to Garden Island Bay and to the Gulf. The South Pass, the one opened by the jetties, lies between the Pass a l'Outre and the South West Pass, and Mr. Eads laid mattresses across the mouths of both of the other passes to divert the water towards the center pass and to keep up the scour in that channel. But the mattress across the end of the Pass a l'Outre has been broken by floods and a deep channel formed at the mouth which leads a large volume of water into the northern arm of the delta. A crevasse has also been formed in the south bank, about 1½ miles below the head of the pass, and by making a shorter route for the water and decreasing the fall, it is estimated that about 52% of the volume of the river water now empties into the Gulf by this north channel and 25% goes through the crevasse. This output decreases the flow in the South Pass and it is said to be growing shoaler and narrower at an alarming rate. The crevasse occurred in 1891 and there is now a gap 1,200 ft. wide and 84 ft. deep between the end of the Pass a l'Outre mattress and the South Pass works. The executors of Mr. Eads, at their own expense, attempted twice to close this gap, but without success. Major B. M. Harrod, of the Mississippi River Commission, says that the crevasse at Pass a l'Outre, should be closed at once. But it must be done by the government, under a special Congressional appropriation, as there is nothing in the Eads contract compelling them to perform this work. Major Harrod favors the immediate improvement of the South West Pass, which is now deeper than the South Pass, when work was commenced upon it, for it has 12 to 14 ft. over the bar, as compared with 8 or 9 ft. in the original South Pass. The necessity for speedy action by the government is made more apparent by the fact that the Eads contract expires in July 1899, and something must be done, either to preserve the channel at the South Pass, or to secure a wider and deeper entrance at the South West Pass.

◆

THE UNITED STATES EXPORT ASSOCIATION, incorporated "to encourage the consumption of American products in other countries," has issued its fourth bulletin, designed for circulation in the English colonies. It sets forth the advantages possessed by American manufacturers in special lines and gives a long directory of American business houses. Mr. F. B. Thurber, the President of the Association, together with his assistants, are actively at work, and they already have the co-operation, as members, of a large number of leading houses in many lines of business. An information bureau has been organized by the Association which will answer free of charge any queries put to it, both from buyers and sellers of goods. The purpose of the Association is a most laudable one; and properly aided by those most interested, American producers, it should accomplish in this country what a similar persistent effort and organization has done for European producers. The offices of the Association are at 143 Chambers St., New York city, and application to that address will obtain fuller details as to the purposes and progress of the work.

THE BRUSSELS INTERNATIONAL EXPOSITION is to be held between May 24 and Oct. 31, 1897, under the auspices of the King of Belgium and the municipality of Brussels. The exhibits will include those usually seen at expositions of this character, and the Commissioners of the United States, Messrs. J. H. Gore and Thomas Wilson, call the special attention of American manufacturers to this opportunity for extending their trade by proper exhibits. Application for space must be made before Jan. 1, 1897, and the general rules for admission, classification, etc., may be obtained by addressing the Commissioners at Columbian University, Washington, D. C. An effort is also being made to obtain special freight rates for exhibits from the Red Star Line to Antwerp, and full particulars can be obtained by addressing this company at 6 Bowling Green, New York city.

◆

AN INTERNATIONAL EXHIBITION is to be held in Guatemala from March 15 to July 15, 1897. Information can be obtained from Mr. Joaquin Yeto, Consul-General of Guatemala, New York city.

◆

THE DECIMAL GAGE for measuring the thickness of sheet metal and the diameters of rods and wires which was adopted last year by the American Railway Master Mechanics' Association was also adopted by the Association of American Steel Manufacturers at its regular quarterly meeting in New York on Oct. 23. A committee of the Association presented a report in which they gave a number of reasons against the adoption of the U. S. Standard Sheet Metal Gage of 1893 and in favor of the decimal system of gaging, which report was formally indorsed by a resolution of the Association. An extended abstract of the report is given in "The Iron Age" of Oct. 29. In the decimal system of gaging, gage numbers are not used, as in the old systems, but the actual thickness in thousandths of an inch is used instead. For convenient shop measurements a notched gage is used, of sheet metal, 0.1 in. thick, and of elliptical shape, 4 × 2½ ins. Such a gage with 38 notches is furnished by the Pratt & Whitney Co., of Hartford, Conn., for $5. The gage has been adopted in the shops of all the principal railways of the United States and Canada.

◆

THE URBAN POPULATION OF THE UNITED STATES is discussed in "Scribner's" for October. It is stated that more than one-third of this total population now live in cities. In some states this percentage is much exceeded, as it is 70% in Massachusetts, 60% in New York, 54% in Connecticut, and 52% in New Jersey. In 1790 there were only six cities of more than 8,000 inhabitants; in 1890 there were 448 such cities. In 1840 there were only three cities with more than 100,000 inhabitants; in 1890 there were 28 cities of this population. In 1896 the 3,200,000 inhabitants estimated for the Greater New York almost equal the population of the 13 United States in 1789.

◆

THE CHEMICAL PROFESSION appears to be badly overcrowded in England, if we may trust an editorial in "The Engineer." We quote from it as follows:

> There are fifty chemists clamoring for every insignificant appointment in this country; and large numbers of German chemists are working here for salaries which would scarcely pay the tailor's bill of an Englishman. In few words, it does not pay in this country to make your son a chemist. If he has nothing but the income derived from the practice of his profession to rely upon, he will have to live a life of genteel poverty, cursing the hard fate which made him and his parents select a profession which pays no one properly at the beginning and leads to nothing at the end. No doubt a few chemists have made fortunes. In like manner a few large nuggets have been picked up in Australia, and a few large diamonds in South Africa. For the great mass of chemists in this country an income of about £150 a year represents the ultimate life return for a large outlay of time and money.

◆

PROJECTS FOR THE UTILIZATION OF COMPRESSED air in street cars and motor carriages are being "boomed" at a lively rate, but details of the apparatus used are carefully withheld from the public. Experiments are said to have been carried on for several months at the works of the American Wheelock Engine Co., in South Worcester, Mass., on a motor adapted for heavy wagons, cabs and private vehicles. At the same works experiments are being made on street car air motors for the Metropolitan Traction Co., of New York. A trial trip of a carriage motor was recently made in Worcester, at which a speed of 25 miles an hour is said to have been made. It is stated that if the experiments are successful, a stock company will be formed for the purpose of operating a system of air motor cabs in some of the large cities.

◆

THE MAKING OF GAS FROM ANTHRACITE COAL dust is being exploited in Scranton, Pa., by the "Anthracite Gas Producer Co.' Mr. J. Gardner Sanderson, the inventor of the gas producer read a paper before the Scranton Board of Trade on Oct. 19, describing the process in which he made the following statements:

> Now as to what we are able to do, with the millions of tons of waste coal scattered through the coal regions. After working over the piles and extracting all the marketable sizes, the earth will still be encumbered with millions of tons of unmarketable stuff. With this I am prepared to make a gas as valuable for fuel as the best prepared coal, and far more efficient in power-using gas engines than the best of coal with steam engines. Special devices were necessary in the use of culm. It could not be made in any of the producers before made. * * * * These provisions being worked out, we are able to produce gas with this material without more trouble or cost than with prepared coal, and this we have been doing for several months. By actual measurement we produce and store from 88,000 to 120,000 cu. ft. of gas with one ton of fine waste from the washing. With culm from the pile, after taking out all the sizes from buckwheat, we get about 140,000 cu. ft. per ton. Fifty cu. ft. of gas in a gas engine is a large allowance for one HP. per hour, hence one ton of culm will furnish 2,800 HP. per hour, or 230 HP. for ten hours, and there is no waste of fuel when the power is not in use. No boilers to care for, insure or explode, and but little expensive water required.

The figure 230 is probably a misprint for 280. It would be interesting to know what kind of gas it is that can obtained from anthracite culm in such large volume as 140,000 cu. ft. per ton, and the statement that 50 cu. ft. of gas per HP. per hour is a large allowance, might also be made more definite if the quality of the gas were stated. The number of pounds of coal to the ton is not stated, but if we assume 2,240 we obtain the following: 2,240 lbs. culm furnishes 2,800 HP. for one hour, which is equivalent to $2,240 \div 2,800 = 0.8$ lb. of culm per HP. per hour. This beats even what is claimed for the Bates Thermic engine, described in our issue of Oct. 22, and we beg to be excused from believing it without further proof than the statements of the inventor.

◆

THE BRIDGE OF ALEXANDER II., which will be built across the Seine, in Paris, as a part of the Exposition of 1900, is thus briefly described in "Le Genie Civil": It will have a single arched span of 110 m., or 360.8 ft., with a rise of 21.32 ft. and a width of 131.20 ft. The arch will be built of mild steel, and will be hinged at the center and at the two abutments. The Emperor and Empress of Russia laid the corner-stone during their recent visit to Paris.

◆

INSUFFICIENT FORCE OF INSPECTORS of the Building Department is becoming a common complaint in our large cities, especially since the erection of tall buildings of structural steel has become common. Mr. John B. Brady, Building Inspector of Washington, D. C., in his recent annual report requests that the number of his field inspectors be increased from two to seven. The constantly increasing amount of work of a miscellaneous chararacter that the department must look after makes the additional force necessary.

◆

DRIFTING SANDS are gradually encroaching upon Provincetown, on the extreme northerly point of Cape Cod, and the Massachusetts Harbor and Land Commissioners are now attempting to reclaim this area by grass planting. The State owns 3,000 acres of this land which is divided into two well-defined strips; one belt heavily wooded, and the other and larger one made up of shifting sand dunes lying next to the sea. This sand belt is continually moving southward and upon the timbered land. By planting beach grass and other hardy fibrous plants about 45 acres have been reclaimed since 1894 on an annual appropriation of about $3,500.

◆

A NEW TROUGH FLOOR CONSTRUCTION which is claimed to offer several advantages over the styles at present in use has recently been patented by Mr. M. F. X. Foley, 257 So. 4th St., Philadelphia. It is made up of standard steel shapes and requires only four rows of rivets per trough, all of which can be machine driven, as compared with eight rows of rivets in the troughs built up of plates and angles. The troughs can be made of any desired depth, and the cost of manufacture, it is claimed, can be made so moderate as to considerably increase the use of this type of floor.

◆

THE LOAD ALLOWED ON FLOORS of buildings used for the sale, storage and manufacture of merchandise, and of public livery, sale and boarding stables, according to the rules of the New York Building Department, is required to be stated on a placard publicly displayed on each floor. Efforts are being made by the Department to compel a rigid enforcement of this rule.

◆

THE CONSUMPTION OF COAL BY THE WARSHIPS of the United States Navy in the last fiscal year, according to the report of Commodore Chadwick, Chief of Naval Equipment, was 116,903 tons, costing $620,131. Of this amount 61,741 tons were purchased abroad. Only 45% of the total was used for steaming purposes, the remainder being used for auxiliaries, including electric lighting, ventilation, etc. A cargo of Pocahontas coal has been placed at Honolulu for the re-coaling of vessels at that point at a rate which allows it to compete successfully with coal from Canada or from Australia.

◆

A PLANT FOR THE MANUFACTURE OF FUEL GAS by the Burdett-Loomis process has been erected at Bridgeport, Conn., by the Citizens' Gas Co. It is said to be the largest city plant for making fuel gas in the world. At present it supplies fuel for 300 homes and for several factories, including those of the Yost Typewriting Co. and the Monumental Bronze Co. The price charged is 50 cts. per 1,000 cu. ft., with liberal discounts, according to the amount used, ranging from 20% for small bills to 50% for bills for 50,000 cu. ft. and upward per month.

THE WRIGHT IRRIGATION DISTRICT LAW of California was upheld as constitutional by the United States Supreme Court on Nov. 16. This act authorizes owners of irrigable lands to form irrigation districts, levy taxes, issue bonds and construct irrigation works. It has been subjected to repeated attacks in the courts of California, but has always been upheld there. About the middle of 1895 Judge Ross, of the U. S. Circuit Court for the Southern District of California, declared the law unconstitutional, in that it took away private property without due process of law. The U. S. Supreme Court now reverses this decision, Judge Peckham, in his opinion, not only stating that property taken under the act is appropriated to a public use, but that if it were otherwise, any general irrigation scheme would be impossible. Ex-President Benj. Harrison appeared for the irrigation districts in the suits. Comments on the decision will be found in our editorial columns.

◆

THE NEW ORLEANS DRAINAGE COMMISSION proposes to start work as soon as possible, in accordance with recommendations just submitted by Maj. B. M. Harrod, Vice-President Am. Soc. C. E. The work involved in these recommendations is largely the extension and improvement of canals, but also includes two pumping stations, each estimated to cost $150,000. The estimated cost of the canal work now proposed is $630,000. The commission has nearly $600,000 of cash in hand and from $200,000 to $300,000 more available within two years, while it may issue $500,000 of bonds, if necessary. The commission is constituted as follows: President, R. M. Malmsley; W. C. Flower, Mayor of New Orleans; A. Brittin, President, C. F. Claiborne and L. Cucullu, members city council; Otto Thomas, President, Paul Capdevielle and M. Abascal, members Levee Board; and J. C. Morris, member Board of Liquidation, City Debt. Maj. Harrod, as already stated, is Engineer, and Mr. A. F. Theard is Chief Draftsman of the commission. Mr. A. C. Bell is now City Engineer of New Orleans, having succeeded Mr. L. W. Brown, who carried on much of the investigation preliminary to the drainage work.

◆

BIDS FOR STREET CLEANING AND GARBAGE disposal at Philadelphia will be received until Nov. 25. The contract runs for only a year, and as large garbage disposal plants are now owned and operated by the present contractors it seems likely that there will be but little change in the contractors for this service.

◆

THE BROOKLYN GARBAGE contract has been awarded to the Brooklyn Sanitary Co., of which Mr. F. L. Cranford, of Brooklyn, is President. The contract is for the collection and disposal of ashes for five years, from Jan. 1, 1897, and the prices for the successive years, from first to fifth, are as follows: $113,000, $117,000, $120,000, $125,000, $130,000. The Arnold system of garbage utilization will be used for disposal, the same as is now in use for treating a large part of the garbage of Philadelphia, and will soon be used for all the garbage of New York.

◆

THE VALVE AND HYDRANT EXHIBITION under the auspices of the Department of Public Works, New York city, noted in preceding issues, is in progress as we go to press, and promises to be very satisfactory. There are a large number of exhibits, as will be seen by referring to the detailed list published in the columns of "Industrial Notes" in our supplement. A large number of different makes and styles of hydrants and valves have been connected to a testing stand and each is being tested to determine the amount of water passing per minute, the pressure at the inlet and outlet, and possibly other features. After this test is completed, the several valves and hydrants will be taken apart and put together again, the time taken in each operation being noted. Besides valves and hydrants, pipe tapping, cutting and calking machines, cutting-in-specials, lead melting pots, and other devices more or less closely related to the valve and hydrant service are being shown. The exhibit will be judged by the following officials of New York city: Geo. W. Birdsall, Chief Engineer Department Public Works; Horace Loomis, Engineer-in-Charge of Sewers; Edw. P. North, M. Am. Soc. C. E., Water Purveyor; Hugh Bonner, Chief Fire Department; and Alonso S. Gear. General Foreman Corporation Yards. The water used in the test is being measured by Venturi and Crown meters and the pressures observed by means of gages made by the Ashton Valve Co., of Boston, Mass. The chief novelties in the exhibit are the large pipe tapping machine, tapping and connecting a 36-in. with a 48-in. main under pressure, and a steam pipe calking machine, regarding which we hope to say more in a later issue.

◆

BONDS FOR THE PURCHASE OF THE DULUTH Water-Works have been voted by the city. The present plant is owned by the Duluth Gas & Water Co., which, it is reported, will be transferred to the city for about $1,500,000. The city has for some months past been constructing new intake works.

◆

THE OHIO RIVER IMPROVEMENT ASSOCIATION held its first annual convention at Pittsburg on Nov. 10. The object of this association is the securing of legislation and immediate work tending towards the improvement, with dams and locks, of the Monongahela, Allegheny and Ohio rivers. Speeches were made by many interested setting forth the great commercial advantages of such improvement, and a resolution indorsing the proposed ship canal was prepared for presentation to Congress. The officers elected for the coming year are: President, John L. Vance; Secretary, E. P. Wilson; Treasurer, J. D. Parker, and for vice-presidents and executive council, Messrs. John F. Dravo, C. B. Hart, John Ingle, W. W. Hite, W. P. Halliday and F. A. Laidley.

◆

THE IMPROVEMENT OF THE POTOMAC RIVER, at Washington, D. C., says Gen. Craighill, Chief of Engineers, U. S. A., has cost $2,088,047 since the beginning of work in August, 1882. There is now a 20-ft. navigation channel in front of the city and old channels have been widened; besides this, a tidal reservoir, 8 ft. deep and covering 111 acres, has been dredged, 32,645 ft. of sea wall and 5,775 ft. of training dike have been built and 621 acres of land has been reclaimed by filling from 7 to 12 ft. above low tide. Gen. Craighill again calls attention to and recommends the rebuilding of the Long Bridge across the Potomac River.

◆

THE HARLEM RIVER SHIP-CANAL PROJECT, proposing deep water connection with Long Island Sound, is to be again presented to Congress, with a bill asking for $2,500,000 for this work. This canal would be 3,400 ft. long, improving Bronx Kills, a shallow water course about 300 ft. wide connecting the Sound and Harlem River around the north end of Randall's Island. The proposers of this enterprise claim advantages for a Sound entrance for ocean steamers, and contend that the demand for another entrance to New York is already apparent in the crowding of the lower bay. The improvement would doubtless be advantageous to property on the Harlem, or rather Port Morris water front.

◆

THE NEW YORK STATE CANAL improvements will be undertaken as soon as the canals are closed for navigation, which will be about Dec. 1. The blasting and excavation work will be prosecuted during the winter, and much of the other work can be done after the re-opening of the canals in the spring. Contracts have already been let for work aggregating about $4,000,000. The present average depth of the Erie Canal is 7 ft. and this will be increased to 9 ft., while some of the locks will be lengthened. The immediate result of the improvements will be that boats of 16 ft. greater length, 2 ft. greater draft and 100 tons more freight capacity can be used.

◆

THE NORTH RIVER BRIDGE CO., at its annual meeting, re-elected Mr. Jordan L. Mott as President and Mr. Samuel Rea as Vice-President; Mr. Charles J. Canda was made Treasurer and Mr. Thomas B. Rea, Secretary. This is the bridge company chartered by Congress to bridge the Hudson River with a New York city landing at Twenty-third St., on plans made by Mr. G. Lindenthal, M. Am. Soc. C. E., as Chief Engineer.

◆

A BRIDGE OVER THE OHIO RIVER, at Marietta, O., is proposed, and surveys are being made under the direction of Mr. Felkel, C. E., of Pittsburg, Pa. The bridge approach is to commence near the Marietta union station and terminate on the heights at Williamstown, on the other side of the river. It is to be a railway and highway bridge, forming a connection for a proposed railway to the mineral fields of West Virginia. The cost of the structure is put at about $3,000,000, and the bridge and railway projects are said to be backed by Mr. William Jutte. of Pittsburg.

◆

THE MOST SERIOUS RAILWAY ACCIDENT of the week was the derailment of an express train on the Louisville & Nashville R. R., near Montgomery, Ala., Nov 13. Train wreckers had removed a rail and piled ties on the track. Three persons were seriously hurt.——A head collision between a southbound passenger train and a northbound freight train occurred Nov. 14 on the New York, New Haven & Hartford R. R., at Naugatuck, Conn. Two men were injured and several cars were burned.

◆

A DYNAMITE EXPLOSION occurred Nov. 14 in the office of E. D. Smith & Co., contractors for the extension of the wheel pit of the Niagara Falls Power Co., Niagara Falls, N. Y. Three men were killed and three or four injured.——A dynamite explosion occurred Nov. 10 at Germantown, Pa.; a laborer was preparing cartridges for use in blasting on the Magnolia Ave. sewer when the explosion took place. One man was killed.

◆

A FLOOR COLLAPSED in the Atlantic & Pacific Tea Co.'s store-room on Vesey St., New York city, Nov. 11. Boxes of tea had been piled on the floor, causing a portion, about 25 × 35 ft., to give way. Nobody was hurt.

◆

A BRIDGE AND SCHOONER collision occurred at the Craigie Bridge, Boston, Mass., Nov. 11. The schooner was just preparing to pass through the draw when a sudden squall caused it to drift against the bridge, crushing in the side of the roadway and tearing down the wires of the West End Electric Ry.

◆

A BROKEN SHAFT on the steamer "Anchoria," of the Anchor Line, was repaired at sea during the latest voyage from Glasgow to New York. The accident occurred about 130 miles east of Sandy Hook.

◆

LANDSLIDES AND WASHOUTS are reported from a number of railways in the Pacific northwest as the result of recent heavy storms and floods. Between Tacoma, Wash., and Portland, Ore., a heavy landslide has blocked the Northern Pacific R. R., while about 50 miles of the Cascades Division of the Great Northern Ry. have been washed out. The Canadian Pacific Ry. has several washouts on its line through British Columbia.

◆

AN ACCIDENT HAPPENED TO A PASSENGER ELEVATOR in the 22-story office building of the American Tract Society, Nassau and Spruce Sts., New York, on Nov. 14, by which one man had both knee caps fractured and ten others were badly shaken but not seriously injured. The car was descending and was about to stop at the tenth floor, when the operator found that his lever had no control over the car. It continued down the shaft at a speed considerably higher than the normal, but yet not high enough to throw into gear the automatic catches, and struck on the rubber buffer stops at the bottom of the shaft in the cellar, rebounding several feet. The cause of the accident was the breaking of one of four bolts in the cover of a check valve, located in the pipe running between the hydraulic pressure pump and the hydraulic cylinder, which allowed the gasket of the cover to blow out and the water to leak out of the cylinder through the opening thus made. A high pressure hydraulic elevator plant is in use in the building, the pressure being about 900 lbs. per sq. in.

◆

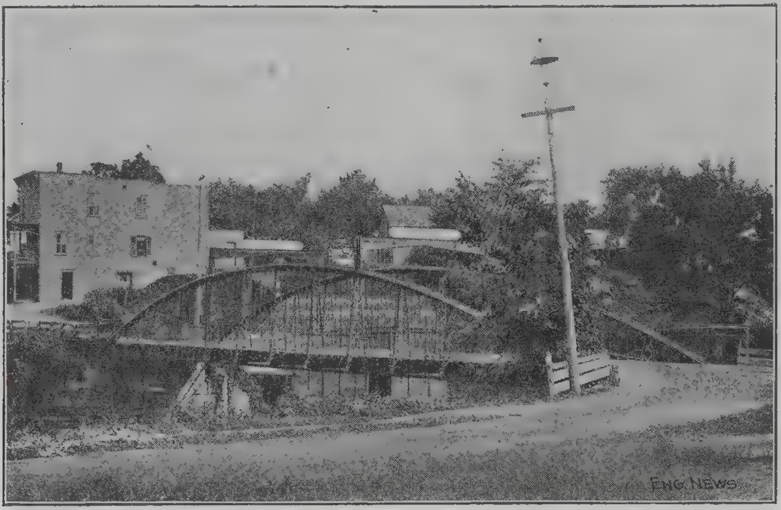
A REMARKABLE ELECTRIC WIRE ACCIDENT took place in Calais, France, on Nov. 6. While a huge boiler was being drawn through the streets by 16 horses the upper portion of it came in contact with overhead electric-light wires, breaking them. Some of the wires caught on the boiler and the framework of the truck, and in an instant all the horses were knocked down. Several of them were killed. The men engaged in transporting the boiler received violent shocks, some of them being probably fatally injured.

◆

THE BOSTON ELEVATED RAILWAY CONTROVERSY has come up again, through the desire of the Boston Elevated Ry. Co. to lease the West End Street Ry. Co. The charter of the former permits the use of either the Meigs or the New York systems of construction, but no definite route or plans have yet been adopted.

A BRIDGE TRUSS WITHOUT DIAGONAL MEMBERS.

We are indebted to Mr. G. Leland FitzGerald, M. Am. Soc. C. E., for a photograph of a somewhat remarkable highway bridge in Hoosick Falls, N. Y., which is here reproduced. It has a span of 117 ft., with a rise of 12 ft. at the centre, and the top and bottom chords are connected by vertical members only. As nearly as can be learned from the photographs forwarded the arch is made of Phoenix columns; but just how the connections are made is not plain. In view of the absence of all diagonal members in the truss, it is not remarkable that a conspicuous sign on one of the two transverse overhead "stiffeners" should give warning that a fine of $5 is imposed "for driving over this bridge faster than a walk." Mr. FitzGerald writes that the bridge responds, by vertical vibrations, "with impartial nimbleness to a heavy load or a few children." It was built in 1869 by the Continental Bridge Co., of Philadelphia, under the patent of Joseph G. Henszey, and is still in use. To the best of our knowledge it is the only bow-string truss actually erected without diagonals or their equivalents, and it is interesting as a reminder of the "queer things" in bridge construction, which were accepted by the generation just past.



A CURIOSITY IN BRIDGES AT HOOSICK FALLS, N. Y.

THE TRANS-SIBERIAN RAILWAY.*

(With inset.)

The Trans-Siberian railway unquestionably ranks as one of the most notable engineering works of this generation, both in magnitude and difficulty of execution. From time to time Engineering News has recorded the progress of this railway and given occasional technical details relating to its construction, but in view of the present advanced stage of the enterprise and the certainty, almost, that its completion is only the matter of a few years it seems desirable to consider the project in a somewhat more complete and comprehensive article. Owing to the easily understood difficulties of obtaining explicit information from a country of Russia's remoteness and character such a discussion must fail in presenting exact structural details, but enough is known to enable a fairly complete comprehension of the general type of constructions adopted, and of their magnitude and extent. In a future article it is hoped to present more detailed information.

Economic Questions.—To understand the economical significance of the Trans-Siberian railway, the possibilities of industrial development presented by the country it traverses must be understood, and there is considerable misconception upon this question. Because vast areas of Siberia are undeveloped and uninhabited, and because other vast areas have a climate of almost arctic severity, it is frequently assumed by people that Siberia as a country is a bleak, desolate region almost incapable of inhabitation and development. This is not true, as even a very cursory study of the climate, soil, mineral resources, and flora and fauna of the country will show. Space is not available to present the proofs of these statements here, but they are available in the greatest detail in various Russian Government publications and in other places. In a general way, however, a glance at the accompanying map will show that an enormous area of the country lies in mean geographical latitudes, and that within this area are included the meadow lands or steppes renowned for their fertility, and already competing with America in supplying wheat and other cereals to the European markets. Iron and coal, the two great factors of industrial development are found all over Siberia and in rich and often contiguous deposits. Mercury, lead, tin, copper, salt and other minerals also exist to varying extents, and where there are water routes are working with profit. The precious metals, gold and silver, are also found in a number of deposits much richer than the poorer deposits now worked in America. As yet none of these minerals have been worked in a thorough and extensive manner, owing to the small local demand and the lack of transportation facilities to outside markets.

Space to develop farther this presentation of facts will not be taken, but it will become evident, as the subject is more closely studied, that Siberia, over vast areas at least, is a country lacking development, and not a country incapable of development. The principal barrier to this development has been a want of transportation facilities, and realizing this the Russian Government has planned the Trans-Siberian railway, and, besides, is vigorously pushing other railway, waterway and colonization schemes. There is little doubt that questions of both national and international politics also enter very extensively into the Trans-Siberian railway scheme, or else the immediate expenditure of $270,200,000 in a project, which will not for a long time prove remunerative in the strict monetary sense of the word, would not have been undertaken so cheerfully. This, however, should not make us construe the Trans-Siberian railway solely as a military project, as is sometimes done. What should chiefly concern us is that this road serves to open up to the markets of the world vast natural advantages and resources which will ultimately compete with the advantages and resources of the North American countries in supplying European markets. The road means that Europe is to be connected to the Pacific and the far east, with Japan and China, by an uninterrupted line of railway communication. It opens a new route for the world's trade, as well as for Russian trade, across the country which has been aptly called the "Russian Canada."

Little more than a hint at the economic questions involved in the construction of the Trans-Siberian railway has been attempted here, for the purpose has been simply to invite attention to possibilities, which, so far as published evidence goes, Americans in general have not adequately considered. This being done we may turn to the more technical features of the enterprise.

Inception of the Enterprise.—As early as 1857, schemes were proposed by various persons for the development of railway lines in Siberia. One or two of these hinted at a Trans-Siberian line, but for the most part the proposed lines were comparatively short extensions of the railway system of European Russia into the western territories of Siberia. None of these projects were carried out in their entirety, but as the European system developed, its lines occupied portions of their proposed routes. It is not necessary to trace this development in detail, but by the end of 1890 the Russian railway system projected east in three lines whose extreme eastern terminations were Tiumen, Miass and Orenburg. By the same year the advisability of a Siberian extension of the European system had become more patent to government officials and the problem of construction had been placed in the hands of a special commission. After thoroughly canvassing the relative advantages of the above-named towns for a starting point it was finally decided to make the extension east from Miass. The eastern terminus was fixed at Vladivostok without question, as other point there was none in any way suitable for the purpose.

In consequence of this decision the construction of the road was determined upon on Feb. 21, 1891, and on March 17 this decision was affirmed by an imperial rescript. On May 12 this rescript was promulgated by the Grand Duke, the Czaravitch, now Czar Nicholas II., and on the same day His Imperial Highness formally began the great work of construction. In the same year surveys were commenced from both termini of the route, and by the end of the year the order of construction had been finally settled.

Route and Country Traversed.—The route finally adopted for the Trans-Siberian railway is shown on the accompanying map. From Cheliabinsk to the Obi River, the line, with few exceptions, runs through a fertile zone, where the climatic conditions are favorable to the cultivation of cereals, and encounters very few obstacles to easy construction. At the crossings of the rivers Tobol, Irtysh, Ishim and Obi there will be rather large and expensive bridges. The limiting grades do not exceed 1 in 740 and the minimum radius of curvature is 1,750 ft. To the River Obi from the starting point is 877 miles. After crossing the Obi the line as far as Achinsk, 364.7 miles, traverses a hilly country with maximum grades of 1 in 800 and curves of 1,750 ft. radius. Bridges of considerable size are required at the rivers Obi, Tom, Yaya, Yiya and Tchulim.

Further on, from Achinsk to Irkutsk, 788 miles, the character of the country completely changes and assumes a mountainous aspect. Besides several large rivers the line crosses numerous small tributaries near their summit levels and much heavy construction is required. The largest bridge, 3,150 ft. long, is across the Yenisei River, at milestone 1,356; but between milestones 1,279 and 1,312, before reaching this bridge, there are several grades of 1 in 150 and curves of 1,050 to 840 ft. radius. After crossing the Yenisei River the line begins its ascent to the summit level, winding through the valleys of the Berezovka and Sitik Rivers, which have steep and rocky sides, so that frequent cuttings, slope paving, and stream diversions are required. Within a distance of 44 miles here, there are 82 small bridges and culverts. Near milestone 1,500, the River Kan is crossed by a bridge 1,400 ft. long, which will have to be built on caisson foundations. From this structure to milestone 1,710 there is considerable heavy embankment work and two wooden viaducts 140 ft. high and 805 ft. and 875 ft. long, respectively, over ravines. Proceeding to the town of Uktouisk the line passes over a level tract of country with grades of 1 in 900 and curves of

---

*The information from which this article has been prepared has been collected from Russian Government publications, U. S. Consular Reports, the technical press and the proceedings of various engineering societies, and only in the case of the government publications does it bear the stamp of official authority, but a careful attempt has been made to eliminate all incongruities in the unofficial information, and as a description of the broad general features of the work it is believed to be substantially accurate.

LINE IN THE WORLD.

1,750 ft. radius and no heavy embankment, but with three bridges 1,050 ft., 700 ft. and 875 ft. long, respectively, crossing the rivers Uda, Iya and Oka. From the Oka River to Polovina another mountainous section is traversed, but thence to Irkutsk the grade is about 1 in 900 at a maximum, with only one bridge of any size. This is 875 ft. long and crosses the River Belaya.

From Irkutsk, along the shore of Lake Baikal, to Mysovsk the work is quite difficult, as the line passes through a frequently flooded valley and thence into the rocky gorge of the Irkut River, where numerous dikes and retaining walls and one tunnel, 224 ft. long, are required. Between milestones 2,093 and 2,095 there will be a tunnel 12,530 ft. long. Continuing beyond this tunnel the line runs through the narrow rocky gorge of the Ilcha River, where it must occupy part of the river bed, and be built on embankment held by retaining walls, and thence through a mountainous country to milestone 2,126. Along the whole mountainous section all the cuts will be in hard rocky ground and in some places the embankment must be of stone, as no soft soil is available. The greatest cuts are from 77 ft. to 105 ft. deep, and the deepest fills are about 118 ft. From milestone 2,126 along the shores of Lake Baikal the country loses its mountainous character, but as the line in many places is close to the lake shore a very considerable amount of protecting cribwork is demanded, and there are also numerous bridges and culverts crossing streams flowing into the lake. To protect the roadbed from water will be the greatest task along this whole shore line.

A few figures will aid in understanding the difficulties described in the preceding paragraph. From Irkutsk to Mysovsk is 107 miles, and the construction of this length of line will require 12,700,000 cu. yds. of embankment, 2,749,000 cu. yds. of excavation, and 315,000 cu. yds. of masonry. The section through which the line passes is completely desert except for a few small settlements along Lake Baikal; but the heavy fall of snow prevents the deep freezing of the soil which is encountered further along the line, as will soon be noted.

Beyond Mysovsk the line gradually leaves Lake Baikal and climbs the Yablonovoi Mts., where at milestone 2,610 it reaches its highest point, and it then descends to Sretensk on the River Shilka. The work on the whole is very difficult mountain construction, the line hugging the mountain declivities or passing along the frequently submerged river banks. The length of the Mysovsk-Sretensk section is 668 miles and on it there are 25,800,000 cu. yds. of excavation and embankment, nearly 3,800,000 cu. yds. of which is in rocky ground. The deepest cuts are about 116 ft., and the greatest fills about 75 ft. About 711,000 cu. yds. of retaining wall will be required to support the embankment at various points.

Added to all else is a climate of great severity, and either a desert or dense virgin forest country totally uninhabited over vast tracts. For example, in the Yablonovoi Mts., the temperature rises to 77° F. in day time and falls to 23° F. at night during June and July. At the town of Verkhneoudinsk in 1886 the temperature was above freezing for only three months; in 1887 it was above freezing for one month and at almost freezing for two months. From 1886 to 1888, inclusive, the highest temperature recorded was 98° F. and the lowest -52.6° F. As the atmosphere is dry and very little snow falls, the ground is frozen all the year round. According to investigations made in the valley of the Chita River, through which the road runs, the depth to which the soil freezes averages about 24½ ft. In summer the top soil is thawed to a depth of about 12⅔ ft. so that the remaining 11¾ ft. is eternally frozen. These are by no means the records of greatest severity.

From Sretensk to Khabarovka, 1,324 miles, the country penetrated is topographically about the same as that through which the Mysovsk-Sretensk line just described passes, being desert and dense forest. But from Khabarovka to Vladivostok, 482 miles, the country is more open, though quite a number of large bridges and other important constructive works will be required. In a few places the grades will be 1 in 150, but generally about 1 in 800.

The topography of the route and the character of the construction required throughout the whole distance from Cheliabinsk to Vladivostok, 4,708 miles, have now been described in their general features, and attention may be turned to the constructional features of the road.

Construction.—For purpose of construction the line is divided as follows:

No.	Section.	From and to.	Miles.
I.	Western Siberian..	Cheliabinsk to Obi River....	878
II.	Central Siberian...	Obi River to Irkutsk.......	1,162
III.	Baikal............	Irkutsk to Mysovsk	194
IV.	Transbaikal.......	Mysovsk to Sretensk	667
V.	Amoor............	Sretensk to Khabarovka....	1,325
VI.	North Ussurisk....	Khabarovka to Grafsk	230
VII.	South Ussurisk....	Grafsk to Vladivostok......	252
	Total		4,708

Note.—These divisions and distances are those given by a Russian Government report published in 1893. In several more recent, but unofficial statements, the lengths of some of the divisions are somewhat different, but as the total length of line is practically the same in all cases the older official statement is given here.

Work was begun on the West Siberian and South Ussurisk Sections in 1891. In 1893 work was begun on the Central Siberian Section. According to a recent statement, made by Prince Hilkoff, Imperial Minister of Transportation, 1,950 miles altogether have been completed, of which 1,550 miles are on the line east from Cheliabinsk, and 400 miles on the line north from Vladivostok. Between Lake Baikal and the Amoor River, about 600 miles, about half the grading is finished, and all the grading is finished between Lake Baikal and the end of the rail on the west side. It is intended to have the rails laid for the whole line (except the 1,400 miles down the Amoor, and the loop around Lake Baikal) in two years. The Amoor line may be completed in four years, but this is a little uncertain. For the loop around Lake Baikal a car ferry is to be substituted for the present, and when the ice is too thick for navigation rails laid on the ice will take the place of the ferry. For about half the year a steamboat line may be substituted for the Amoor line, and it is entirely possible that the railway will never be built if it is possible to build a favorable line across Manchuria. Recent surveys show that the substitution of the Manchuria line would shorten the total line about 665 miles, with a considerable reduction in engineering difficulties and some gain in traffic from a fairly well settled and quite productive country.

The Trans-Siberian railway, passing through an enormous expanse of country having widely differing topographical conditions, could not all be included under one type of construction. The basis adopted was always a good reliable construction, but one varied to suit the different conditions. In the level country sections the limiting grade was fixed at from 1 in 600 to 1 in 800, and the limiting radius of curvature at 1,750 ft.; but in the mountainous sections these limits were increased to grades of 1 in 150 to 1 in 174, and curves of 840 ft. radius. The width of roadbed is 16.45 ft. on embankment, and 15.4 ft. in cuts, with side slopes of 1 to 1.25. For the passage of water under the line and for crossing small streams, cast-iron pipes and stone culverts and wooden bridges are used, while the larger rivers are spanned by iron bridges with permanent masonry foundations. The track is on the Russian standard gage of 5 ft., or more accurately, 4 ft. 11¾ ins., and has 49-lb. rails on 0.875-ft. of ballast. The stations, section houses and other buildings are generally of wood, of simple construction, but in some places brick stations are built. The greatest distance between stations is about 40 miles. Water supply will be had only at stations. It should be noted that the foregoing applies to the first construction only, for as the country becomes more thickly populated and as the traffic increases additions and improvements are to be made as needed.

The illustrations here used are engraved from photographs forwarded to this journal from Irkutsk. They are especially interesting as showing the substantial character of the work done by the Russian engineers in this remote region, in high embankments, masonry, bridge construction and station buildings. The view at the stations looks familiar to the American railway builder, with the rails spiked down to wooden ties, the water tower, station platform and general arrangement.

Based upon this construction the estimated cost of the work is given in the accompanying table, a study of which will also give a very good understanding of the relative difficulties of construction on different sections. This table has been compiled from a Russian Government report published in 1893. Unofficial figures published more recently give slightly different amounts, arising partly from a different value given to the Russian rouble and partly it would seem from erroneous calculation. In order that the proportion of the cost which is entailed by large bridges and tunnels may be understood the following table of the costs of the more important of these structures has been compiled from the best available information:

Bridges.

All over 700-ft. span:		All over 700-ft. span:	
Irtysh River ...	$1,275,000	Oka River	$396,100
Obi River	2,100,000	Balaya River ...	405,900
Tom River	1,050,000	Calinga River (1).	2,175,000
Tchulim River..	544,200	Kirtcha River (1).	349,000
Yenisei River...	2,362,500	Amoor River (1)..	6,000,000
Kan River	749,200	Ussuri River (1)..	337,500
Birinsa River ..	758,700	Other bridges	2,250,000
Uda River	345,500		

Viaducts.

Two on Central Siberian Section 863,500

Tunnels.

Two, total length, 12,754 ft. 2,049,800

Thus far the work has been done partly by labor imported from European Russia and partly by local labor, the material being shipped in by the completed line partly, but generally by boats capable of traversing the various navigable rivers. The simplest means are used to do the work, hand labor, carts and wagons alone being used. As many as 150,000 laborers have been employed at one time during the summer months. The plan for shipping material proposed, and the plan thus far followed in a general way, is as follows: For the Khabarovka section, by sea to Vladivostok, and then by the completed line; for the Trans-Baikal section, partly by sea to Vladivostok, then by rail to Khabarovka, and then by the Amoor and Shilka Rivers to Sretensk and also partly by rail to Irkutsk, and then by the Angara River and Lake Baikal to Mysovsk; for the Baikal section

Table Showing Estimated Cost per Mile of Different Classes of Work on the Trans-Siberian Railway Compiled from the Official Estimate.

Classes of work.	Cost, per mile. I. Cheliabinsk-Obi Line.	II. Obi-Irkutsk Line.	III. Irkutsk-Mysovsk Line.	IV. Mysovsk-Sretensk Line.	V. Sretensk-Khabarovka Line.	VI. Khabarovka-Grafsk Line.	VII. Grafsk-Vladivostok Line.	Total Line.
Expropriation of land	$342	$200	$197	$581	$585	$256	$759	$421

Rolling stock and workmen included..........	7,124	7,132	6,698	6,510	6,566	6,465	4,170	6,673
Carriage of rails, fastenings, etc.	2,253	3,336	3,677	5,872	5,596	4,571	2,630	4,166
General, administrative and miscellaneous....	3,965	3,686	6,054	6,274	6,435	6,669	8,907	5,405
Total	$41,725	$49,232	$89,397	$61,816	$68,770	$63,081	$54,121	$57,614

Note.—In calculating this table from the Russian weights and measures, the verst was taken as 0.662 mile, and the rouble as 77.2 cts. This latter is the value of the gold rouble; the silver rouble while nominally of the same value as the gold, passes for only about 38 cts. in foreign exchange.

by rail to Irkutsk; and for the Amoor section, partly from the east by the same route as for the Trans-Baikal section and partly from the west by rail to Irkutsk, thence by water to Mysovsk, and thence by the Trans-Baikal line to Sretensk. It will be seen by studying the map that according to this plan the first work consists in completing the line east to Irkutsk and also west to Grafsk; the second is to construct the sections between the navigable rivers, and finally the third is to close the open sections. It is, of course, possible that as the work advances and the country is opened up changes may be made in this order, but such changes are more likely to appertain to the details than to the plan as a whole.

Auxiliary Works.—Auxiliary to the railway construction a large sum of money has been and will be expended in constructions designed to develop local traffic, in waterway improvements and in colonization enterprises. Branch railways are planned to connect the main line with nearby mineral districts and favorable water routes, and wharves and docks are being built. Large sums are also being expended in geological and mineralogical work intended to exploit the mineral resources available, and similar work is being done to develop the agricultural possibilities of the country. As indicating the expenditure to these ends it may be noted that when the appropriation was made for the Cheliabinsk-Irkutsk and Vladivostok-Grafsk sections it was provided that 14,000,000 roubles ($10,808,000) were to be used in auxiliary works of the kind mentioned, and it is announced officially that the probabilities are that similar amounts will be so set aside in further appropriations.

General Conclusions.—A study of the foregoing indicates that the Trans-Siberian railway is notable rather for its great length than for the structural difficulties encountered, although the latter comprise some heavy mountain work, and are augmented on certain parts of the line by the severe temperature and the desert nature of the country traversed. The type of construction adopted is substantial but rough and in a degree temporary, the American practice of bending all energies to open the line for traffic and leaving the better and more permanent work to follow, seeming to have been adopted. It has been stated in fact that the immediate model studied by those who planned the road was the Canadian Pacific Ry. The total estimated cost of the road is 350,210,000 roubles or $270,362,000, or about $57,615 per mile, calculating the Russian rouble at 77.2 cts.

The ascendency of Russia at the Chinese Court, resulting from the diplomatic outcome of the Chinese-Japanese war, may make a radical change in the Pacific terminus of the Trans-Siberian railway. Vladivostok was selected because no other port in the Japan Sea was available at the time; but it is closed by ice for a considerable part of the year and a more southerly port, open at all seasons, would be preferable when this great railway is once opened to traffic. Rumor has it that an agreement now exists between Russia and China, fixing upon Port Arthur, in the Gulf of Pichili, as a final terminus, with a necessary extension of the railway to this point through Chinese territory. Whether a new line would be located from Lake Baikal east and down through Manchuria, or whether the present line would be extended from Vladivostok to Port Arthur, it is, of course, impossible to say. But the comparatively small amount of work done on the Pacific end of the Siberian railway and the importance of bringing the line as far south as possible, might lead to an entirely new locating at this end, were Chinese territory once available for this purpose. The climatic features of construction on the Trans-Siberian line will be better realized when it is considered that the most southerly portion of the present location, excepting the Vladivostok end, lies north of 51° N. latitude. On our own continent, latitude 55° N., would strike the southern boundary of Alaska, and of Hudson Bay, pass nearly 100 miles north of Lake Winnipeg and through the middle of Labrador.

Since writing the above the "Centralblatt der Bauverwaltung" announces that the line from Cheliabinsk to the Obi River was opened to traffic on Oct. 27. At present only mixed freight and passenger trains are run, at an average speed of about 17.5 miles per hour. About the first of the coming year, however, it is proposed to run express trains at a speed of about 20 miles per hour, traversing the 1,800 miles between Moscow and Kolivan in about 4¼ days, or from St. Petersburg in 4¾ days. The present fare from St. Petersburg to Kolivan, on the mixed train, is 53 roubles, or $40.92 for first-class, and 32.60 and 20.40 roubles, or $25.17 and $15.75, for second and third-class fares, respectively.

THE APPLICATION OF SUCTION PIPES TO THE HANDLING OF GRAIN AT MILLWALL DOCKS, ENGLAND.

The foreign grain trade of the United Kingdom of Great Britain and Ireland has increased from an average of 1,022,067 tons per annum, in the ten years ending in 1850, to an average of 6,157,276 tons per annum for the ten years ending in 1890. In 1893 the total quantity of grain and flour imported was 8,165,796 tons, valued at $255,901,855.

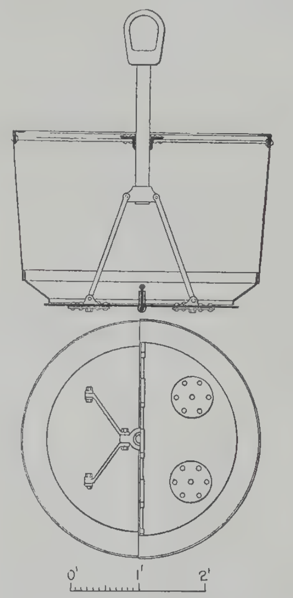

Fig. 1.—Grain Hoisting Bucket With Drop-Bottom.

The Millwall Docks, in London, opened in 1858, are much used by timber and grain-ladened vessels, and Mr. Frederic Eliot Duckham, M. Inst. C. E., has lately presented a paper to the Institution of Civil Engineers upon the "Grain Appliances at the Millwall Docks," from which the following abstract is made:

The first system adopted for the unloading of grain consisted in the erection of short stages, upon timber piling, parallel to the quay wall and sufficiently far from this wall to permit a vessel to lie between the stage and the quay. On both of these were stationed movable hydraulic cranes and hoppers, running on tracks of 7 ft. 6 ins gage. The grain was lifted from the hold of the vessel by grain-tubs and delivered to the hoppers on either side, as it was to be either stored on land or delivered to barges. The grain-tub used (Fig. 1) was remarkable for its extreme lightness compared with its capacity, as it weighed only 5 cwt., and carried 60 bushels, or nearly 3 cu. yds. The shell was of 3-16 in. steel, with a 1¾-in. angle iron rim inside the upper edge. The lower end was contracted for 6 ins., with the lower diameter 1 ft. less than the upper part of the shell. This bucket was suspended by a 3½-in. tube, passing through suitable guides and provided with an eye at the top, and it was connected by four rods with the two doors forming the tub-bottom. When the tub was suspended the weight kept the doors closed, and it was emptied by seating it upon the aperture in the top of the hopper having a diameter a few inches less than that of the tub-bottom.

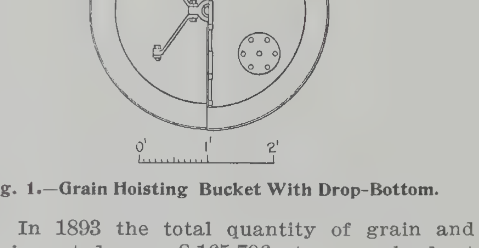

Fig. 2.—Suction Pipe for Moving Grain by Vacuum Process

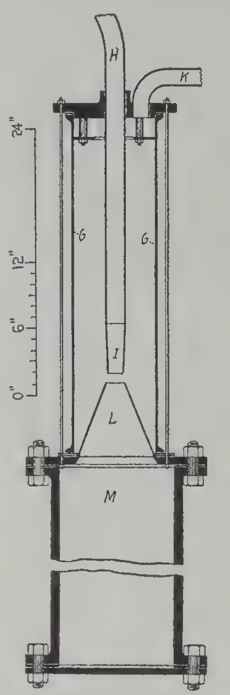

Fig. 3.—Device for Exhausting Air Without Removal of Dust.

These appliances, described in full by Mr. Duckham, were put in place in 1879 and worked successfully ever since; but time developed a number of disadvantages in this manner of handling grain. All of the grain had to be brought directly under the hatches to be shoveled into the tubs; hatches could not be kept open in wet weather without damage to the grain, long delays often occurred, and serious and sometimes fatal accidents occurred, as is apt to be the case wherever lifting gear is used. Mr. Duckham, in attempting to remedy these defects, conceived the idea of making use of air in discharging ships loaded with grain, and as the result of experiments he concluded that a suction process was better than the use of air under pressure. He ascertained by experiment the proper volume of air to be furnished to move a given quantity of grain when working with a certain vacuum and in Fig. 2 is shown the device finally adopted by him to regulate the proper working ratio of air to grain. The remainder of the description of the appliances used by Mr. Duckham we take from his own paper in the "Transactions" of the Institution, as follows:

> A flexible pipe, a, leading from the ship to the vacuum chamber, terminates in an inlet nozzle, b, surrounding which there is a sleeve, cc, of such diameter as to leave an annular passage between it and the nozzle of the same sectional area as that of the interior of the nozzle itself. By the screwed rods, d, the height of the sleeve above the mouth of the nozzle is altered according to the characteristics of various kinds of grain, the available degree of vacuum, etc. Regardless of the varying depth of immersion and other disturbing conditions, therefore, a regular supply of air is drawn down the sleeve. There can never be a greater body of grain to resist its progress towards the nozzle than that marked XX, which is carried on with the air while the surrounding grain continually flows down to refill the vacated space, to be in turn carried up by the nozzle. A wire grid or muzzle covers the mouth of the inlet-pipes when they are worked near the mats and similar divisions between different bulks of grain. The nozzle is made in various shapes, such as the bent form shown in Fig. 2, for use between decks and in similar confined spaces.
>
> The separation of the air from the grain was not difficult. In its imported condition, however, grain always contains a quantity of dust, husk and foreign matter, and during the early use of the machine, the exhaust air carried off some of the dust and lighter particles,

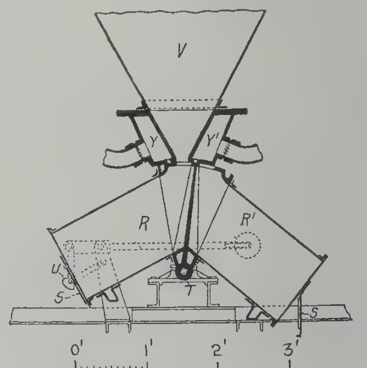

Fig. 4.—Air Lock for Discharging Grain.

with the result that, although the value of the grain was increased, its weight was diminished. Merchants who sold by weight upon a sample from the ship objected to the use of a machine which, though it improves the quality of the grain, deprived them of a small part of its weight. The improved condition of the grain had therefore to be sacrificed to the maintenance of the shipped weight, and so it became necessary to find some means of weighing and delivering the grain in the same condition as to dirt and dust as it arrived in the ship. Several methods were tried, including those employed in flour mills, etc., but with unsatisfactory results. In the course of the author's experiments a glass vessel was used, so that the action of the machine under various conditions might be seen. The arrangement is shown in Fig. 3, where GG is the glass vessel, H a flexible pipe leading from the dusty material experimented upon, and terminating in the adjustable nozzle I. A pipe, K, leading to the exhauster, L a funnel with its rim fitted air-tight in the closed chamber M. When in operation the partial vacuum of, say, 10 ins. mercury, drew grain-laden air in through the pipe H, at a speed of about 35 ft. per second, imparting to the solid particles such momentum that they were projected across the gap between the nozzle and the funnel into the comparatively still chamber M. But the air that had conveyed them was unable to penetrate or displace the somewhat denser air in the chamber M, so it is drawn off to the exhauster through the pipe K. No loss whatever could be discovered by the most careful weighing of a bushel of dusty barley before and after being passed through the apparatus. A loss of but ¼-oz. was found in 14 lbs. of fine, light dust. This apparatus on a larger scale was therefore added to the machine and a by-pass provided by which the dirt deposited in the closed chamber could be returned to and mixed with the grain in the vacuum-chamber. More recently, however, the disadvantage of this procedure has been recognized, and instructions are often received to keep impurities separate, and deliver the grain in its improved condition, which in some instances is represented by an increased value of several shillings per quarter.

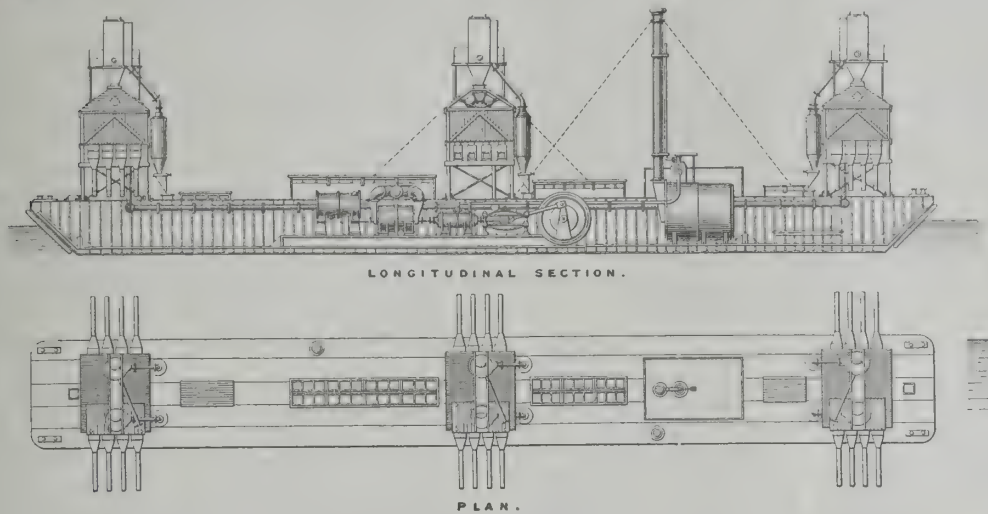

FIG. 5.—PLAN AND SECTION OF BARGE FOR MOVING GRAIN BETWEEN VESSELS AND STORAGE BINS BY VACUUM PROCESS.

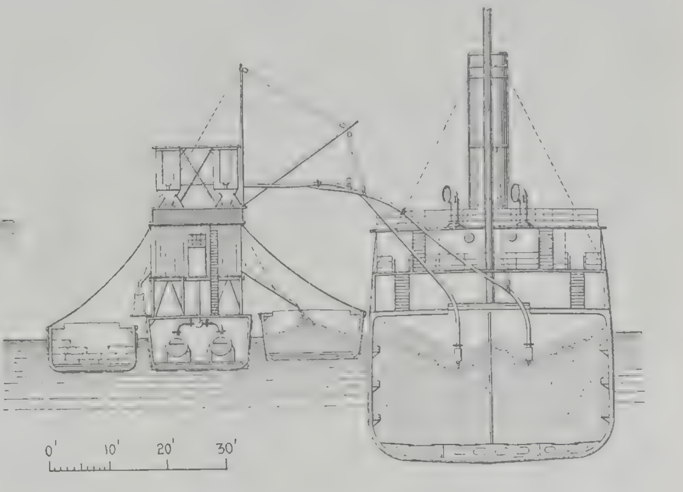

FIG. 6.—CROSS-SECTION SHOWING BARGE TRANSFERRING GRAIN FROM A SHIP'S HOLD TO BARGES ALONGSIDE.

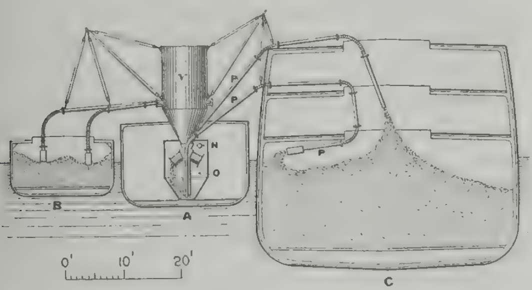

Fig. 7.—Section Showing Transfer of Grain From Barge to Ship's Hold.

The air-lock by which the grain discharges itself from the vacuum-chamber is shown in Fig. 4. It is a twin box, RR^1, mounted to rock on the trunnion T. Its upper side is machined to a segment of a circle with T as its center, and on this surface each box has its own oblong port for the admission of the grain. At the lower end of each box is an outlet closed at times by the flap-door S. To the lower end of the vacuum-chamber, V, is fixed a cast-iron outlet machined to make a practically air-tight joint with the segmental part of the rocking-box. The outlet from the vacuum-chamber has one oblong port corresponding with that in either box. With the box in the position shown in Fig. 4, the left-hand compartment, R, is under the same pressure as the vacuum-chamber, from which it would be receiving grain, while the outlet flap S would be kept closed by atmospheric pressure. When this compartment has received its full load it tips over and brings the right-hand compartment, R^1, into the loading position, the partial vacuum being broken and the grain discharging itself through the flap door. It was found that some detent mechanism was desirable to prevent the box rocking with so small a load as might lead to its sticking half way, and also that with the vacuum-chamber under vacuum and the box filled with air nder atmospheric conditions, the downward stream of grain through the port was retarded by the upward pressure of the expanding air which the box contained. To meet these difficulties the two auxiliary ports, YY^1, were added to the outlet and by means of a by-pass are kept under the same vacuum as the chamber V. Trigger-gear, U, was also fitted to each end of the rocking box to allow the loading-compartment to make a first stage of its movement unrestrained, and in doing so to bring the port of the compartment that has emptied itself into connection with the auxiliary port Y, its air being reduced to the same state as that in the vacuum-chamber. The loading continues until the weight in the box is sufficient to pull off its trigger; when the second stage of its movement is completed the flap-door opens and the other box is brought to its loading position and the operation repeated. The jockey-weights on the trigger steelyards are adjustable to approximately conform with any required weight of a box load of grain.

The machine as in use at Millwall Docks is shown in Figs. 5 and 6. To meet local requirements it is placed on a barge, the "Mark Lane," 170 ft. long by 18 ft. 6 ins. wide. A horizontal compound surface-condensing engine, with steam cylinders 15 ins and 28 ins. in diameter, with 4-ft. stroke, is used for exhausting. Each piston rod is continued through the back end of its cylinder and connected direct to two air-exhausting pumps 38 ins. in diameter. On the deck there are six sets of apparatus, each with its vacuum-chamber, its suction-hose for conveying the grain from the ship, and its rocking air-lock through which the grain discharges itself into an open hopper, and whence it is weighed and delivered either loose or in sacks. The capacity of such a machine is proportional to the power of the exhausters. The "Mark Lane" can transfer wheat from a ship to a barge at the rate of 90 tons per hour. The "Baltic," a similar machine now at work at the Royal Albert Dock, has steam cylinders 22 ins. and 40 ins. in diameter, and has lifted 180 tons per hour.

The amount of steam power employed to elevate a given quantity of grain is greater with this than with the ordinary elevating machinery, but the pneumatic process removes satisfactorily the objections already referred to, and possesses many advantages over the ordinary elevator. Its suction-pipes are taken to the grain wherever it may be, even in the bunkers and cupboards, and the trimming of grain on board ship is thus almost entirely obviated. By means of convenient suspended tackle, one attendant only can easily manage a suction-pipe lifting 30 tons or 40 tons per hour. As the conveying-pipe also occupies so small a part of the hatchway, other goods may be simultaneously unloaded by cranes or other tackle. During wet weather the hatchways are covered, room being left only for the pipe, the receiving-barge is protected by an awning, and the discharge proceeds uninterruptedly. No grain is spilt during the process, for it is conveyed within closed conduits from the ship's hold to the barge. The dangers attending the use of ordinary hoisting-gear are avoided, and the discharge of a cargo may be commenced within a few minutes of its arrival alongside the machine. The total cost of discharge, including labor, coals, wear and tear, and other charges, is considerably less by this than by any other existing method.

Machinery of this kind is as applicable to loading as to discharging cargoes. The loading may be effected either by raising the vacuum-chamber to a sufficient height to allow the grain to flow into the ship's hold by gravity, or it may be temporarily placed over the ship's hatch, or, preferably, in the case of ocean-going vessels, the arrangement shown by Fig. 7 may be adopted. In it the vacuum-chamber is placed as low as it conveniently can be on board the elevator-barge, and the oscillating air-lock is enclosed, and discharges its contents into the chamber O, to which air under pressure is admitted through the pipe N, and the grain is expelled through the pipe P into the ship's hold. A great advantage of this arrangement is that the grain is not simply dropped down the hatchway, but is carried by the pipe to any part of the ship, and there deposited quietly without trimming. Where it is required to weigh the grain during the operation of shipment, weighing machinery is inserted between the vacuum-chamber and the chamber O, and a second air-lock employed. There are other adaptations and combinations of the process for lifting and conveying any grain-like material afloat or on shore, and for transfer direct between ships and granaries. Steam-barges fitted with tanks to accommodate 800 tons or 1,000 tons of grain may empty themselves by air-pressure produced by their own propelling-engines. The limits of the capabilities of this process have not yet been reached, but wheat has been transmitted 800 ft., including a lift of 80 ft.

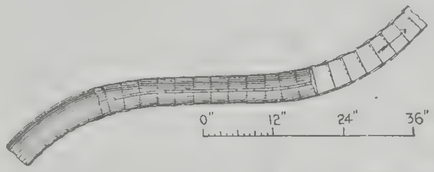

Fig. 8.—Flexible Steel Suction Pipe for Handling Grain.

The beneficial effects upon grain worked by the pneumatic process arise chiefly from the areating and brightening of the grain in passing through the pipes; but, in addition to this, the flow of exhaust air may be arranged, when required, to carry off much of the light husk and dust. This process has proved so successful that, over and above the ordinary operation of discharging cargoes, merchants often send their grain to the "Mark Lane" to be passed through it. The consequent increase in the value of the grain undergoing this process is considerable.

Great difficulty existed in obtaining flexible pipes to withstand the wear and tear of the grain passing so rapidly through them. Ordinary suction-hose with embedded steel-wire, lined with a composition of rubber, used as stencil masks in the sand-blast process, was the best obtainable, but was soon worn through. It was, however, found that satisfactory results could be obtained from rigid steel pipes. The author thereupon adopted the combination shown by Fig. 8, in which a number of truncated cones of plate steel are strung together by external tapes in such a way that the smaller end of one cone enters about ¼ in. into the larger end of the next. The steel rings resist wear by friction of the grain, and, being enveloped by ordinary rubber hose, are perfectly air-tight. The combination is so flexible that a 6-ft. length, 8 ins. diameter, may be bent through 90°. These have now been some time in use, and answer the purpose admirably.

THE GOLD MINES OF NORTH CAROLINA.

By Maxwell J. Gorman.[*]

The gold-bearing formations of North Carolina include nearly one-half its entire area. The productive portion of this area which has been worked, either commercially or experimentally, will not exceed 10,000 sq. miles; and while there are more than 350 localities which have been worked for gold, most of them prior to the war, and where work has not been resumed since, there are at present relatively few mines in operation.

---

[*] Special correspondent of Engineering News, Raleigh, N. C.

Just when gold mining was first undertaken in North Carolina is not definitely known, but there are traditions that the auriferous character of the section was known prior to the Revolution.

The Oliver Mine, in Cabarrus county, and the Parker Mine, in Cherokee county, are two of the mines in the state which it is reasonably certain were "worked" before that period, the latter being said to have been "operated" by the Cherokee Indians long prior to the advent of white settlers in that section of the country. The Brewer Mine, in Chesterfield county, S. C., is another "old-timer" which is known to have been worked in some manner before the first period of which we have authentic record.

In the year 1799, a 17-lb. gold nugget was found on the Reed plantation in Cabarrus county, where since that date hundreds of pounds of gold in nuggets have been taken from time to time, one nugget valued at $7,000 having been found and sold during the past summer. One of the nuggets found some years ago was assayed as containing $18,000 worth of gold.

Within 25 years after, or about 1823, gold mining on an extensive scale was being prosecuted at various points along the entire Appalachian slope, from Virginia to Alabama. The placers and similar deposits were first worked, then the gossan outcrops of the veins, where crude appliances and little skill were necessary to effect profitable results. These easily-worked stores were about exhausted, apparently, about the time that the California gold excitement struck the country, and nearly all the miners of this section emigrated to the Pacific coast.

The mining industry had not fully recovered from the retarding influences of that exodus when the Civil War broke out and put an end to it all for the time being and for many years afterwards. In fact, not until within the last year or two has there been real evidence of a resumption of gold mining in North Carolina on an extensive scale, although there have been spasmodic attempts; but now the indications all point to a genuine, healthy growth of the industry.

So far as we have record, the total value of the precious metals produced up to date, by the mines of North Carolina, amount to $11,817,990. Of this amount $11,754,369 was gold and $63,620 was silver. It is known, however, that this amount is not nearly the whole output of the gold mines of this state—it is more likely to represent less than one-half the true amount. It is known that great quantities of the products of the mines were for years exported directly by foreign companies having headquarters abroad. It would be more nearly correct, geologists here and others in a position to know tell me, to say that the gold mines of North Carolina have turned out at least $25,000,000 worth of the precious stuff, and the late Prof. W. C. Kerr, who for many years was the State Geologist, frequently stated, that in his opinion there was, ten years ago, at least $100,000,000 of gold in the rocks of western North Carolina capable of being profitably mined.

The North Carolina gold is particularly pure and beautiful in color, and there has always existed an active demand on the part of native and other jewelers for North Carolina gold in the manufacture of costly jewelry, in preference to that mined elsewhere.

There are so many gold "mines" in North Carolina that it is impossible here to do more than barely describe a few of the most important and promising.

The writer is under many obligations to the State Geologist, Prof. Joseph A. Holmes, for the use of valuable material secured from him and his office—the gold mining interests of the state having this year commanded a large portion of his time.

Brown Mountain Mine, Burke County.

This mine is located about 12 miles north of Morganton, N. C., on Caney Branch. The mine openings are merely prospects, and consist of two shafts 20 and 25 ft. deep and one small open cut. Shaft No. 2, according to an assay of a sample taken therefrom, shows $15.42 per ton—gold, $12.40; silver, $3.02. This sample was furnished to the State Geologist by the owner, Gen. R. F. Hoke, of Raleigh, President of the Charlotte & Atlanta R. R. Professor Holmes states that a sample taken from the ore dump at the mouth of this shaft by his staff of surveyors this year showed only a trace of gold and 1 oz. of silver. The bed of Caney Branch was washed for gold in former years up to a point opposite the present shaft No 1, and yielded well.

The Redding Mine, Randolph County.

This is one of the most prominent and promising mines in North Carolina. It is at this particular time attracting much attention on account of the operations going on there, and the valuable finds which have been made.

A friend of the writer, who visited this mine within a month, describes it as follows:

> The Redding Mine is about a mile from the railway station at Cedar Falls: It was owned for years by Peter Julian, and during his lifetime was extensively worked for surface gold. Mr. Julian's books show that these mines took out over $75,000 in gold with the crudest kind of hand-rockers. No attempt at shaft mining was made until recently, when Mr. J. W. Lindow bonded this property and placed Mr. Harry Doub, a practical miner, in charge, and he is now sinking three shafts. Two of these shafts have only been sunk 10 or 15 ft. deep. One shaft, however, has been sunk 25 ft., and as far as has been reached, the ore is exceedingly rich. The other two, while not quite so rich, still show ore that will pay handsomely. In mine No. 1 a vein of gold was found near the surface that will mill from $1,000 to $2,000 per ton. This ore grows richer as the shaft sinks deeper. A number of very pretty nuggets have been found in the Redding, one of which weighed 23 pennyweights, the others ranging from 1 to 10 pennyweights. Mr. Lindow is having the shaft sunk deep enough to thoroughly test the ore. If this test proves as satisfactory as it has so far, steps will be taken to mine it on a large scale. An eminent mineralogist has examined this property and will make his report soon.

Cabarrus and Mecklenburg County Mines.

These are two of the principal gold-bearing counties of North Carolina, and there are nearly one hundred mines in each county which have been profitably worked at some time. Few of them are in operation now, not exceeding a dozen. At the Goodman Mine, in No. 6 township, Cabarrus county, work has just been resumed on a small scale. The old Goodman Mine was purchased in July last by a syndicate, and on Aug. 12 the few men put to work at first "struck it rich." Within two days, so the writer is informed, several thousand dollars' worth of gold, in ore and nuggets, were taken out. The vein is said to be the richest ever struck in Cabarrus county.

The value of some of the "old mines" of this state is something deserving special attention. Most of them when they were worked before—or rather "scraped over" by the crude appliances of the early days of mining—were by no means exhausted when work on them was abandoned. With the improved machinery of to-day many of these old mines could be made to pay even better than they did when first opened.

The Reed Mine in Cabarrus county is located ten miles southeast of Concord (the county seat). The first nugget discovered at this mine was in 1799. It weighed 17 lbs.. Four years later another nugget was found, weighing 28 lbs, which is said to have been the largest ever found east of the Rocky Mountains. Regular work on this mine began about 1804 and was prosecuted for a period of about 40 years, during which time the mine yielded large quantities of gold—the proportion of large nuggets (which are still being found occasionally) not being equalled on this side of the continent, according to the State Geologist. The main shaft is 120 ft. deep. The mine was operated in a fitful way from 1881 to 1887, when regular work was discontinued. In 1895, some prospecting was done and the mine has been developed some since. The old shaft has been opened and retimbered, and several openings have been made for placer work. A shaft has been sunk near the western limit of the property which has opened up a large body of low-grade ore that assays at $7.50 per ton in free gold, and $11.55 per ton of gold and sulphurets. Preparations are being made for active mining on a larger scale, the property having changed hands recently.

The Rocky River Mine is situated ten miles southeast from Concord. The last work at this mine was done in the summer of 1895 by Mr. Wayne Darlington, M. E., who prospected the property for some Philadelphia capitalists. Assays of the ore from this mine show $6 to $68 of precious metals per ton.

The Gold Hill Group of Mines.

These are chiefly in Rowan county. The village of Gold Hill is about 15 miles southeast of Salisbury, where the large shops of the Southern Railway system have just been erected.

The group comprises several mines located in a belt of auriferous schists, about 1½ miles long and ⅔ of a mile wide. None of them are now in operation. There are ten or twelve well-defined veins in the district.

The Randolph vein, on the northwestern edge, has been worked for a distance of 1,500 ft. and to a depth of 750 feet. The ore chimneys or shoots are very marked and are three in number, and extend to the lowest depths to which the mine has been worked. In 1856 (when the depth of this mine was 410 ft.) the thickness of the ore body was stated by Emmons to be from 6 ins. to 4 ft., and in one part 7 ft.

The Hunnicutt (one of the veins alluded to above) has yielded $101,665, of which account has been kept. Another, the Troutman, has yielded over $400,000, and has been worked to a depth of over 100 ft. The McMakin was worked to 180 ft. with profitable results, two of the assays in 1894 and 1895 showing silver, per ton, $317.95 and $646.50. The whole of the Gold Hill mines produced over $2,000,000 up to 1856, according to Professor Emons, in a report made some years ago. Up to 1874 the Gold Hill mines had produced an aggregate of $3,000,000 worth of free gold, which has been extracted from the ores, and which represents but 20 to 33% of the assay value of the ores.

The mode of extraction, until 1881, when a 20-stamp mill was erected, was by Chilean mills and rockers entirely. The last regular operations carried on by the New Gold Hill Mining Co. was in 1893 by Mr. Richard Eames and associates, when ores from the Barnhardt vein were worked in a 10-stamp mill near the mine.

Since that time work has been irregularly conducted, mostly by "tributers," who mill the decomposed material from the old dumps of the Barnhardt mill.

Although the Gold Hill ores are sulphuretted, no treatment other than that of simple amalgamation has been attempted, so far, although chlorination has been advised.

State Geologist Holmes states that there are probably still good ore bodies in these mines, and that certainly a careful examination is warranted. Improvements in the metallurgical treatment are advised, viz.: concentration of the sulphurets, after battery amalgamation, and subsequent treatment by a chlorination, cyanide or smelting process.

Some of the other mines in Cabarrus county can only be named as follows: The Mauney, 1½ miles from Gold Hill, which has assayed ores at $2 to $6 per ton; the Rocky River (10 miles from Concord), whose ores have assayed at from $3.17 to $64.59 in gold and $1.04 to $3.66 in silver; the Buffalo, pyritic, $3.50 gold per ton; and the Allen Furr, eleven miles from Concord, the ores of which have assayed at $7.75 to $51.70 per ton.

The Sam Christian Mine.

This mine is in Montgomery county, 12 miles from Albemarle. It has been productive of remarkably fine and large gold nuggets. The gold is found in old "channels" in gravel of a thickness of from 1 to 3 ft., and deeply covered with soil. It is very rarely found in the shape of dust. The nuggets weigh from 5 to 1,000 pennyweights.

In 1888, during 88 washing days 40 nuggets were found weighing 4,200 dwts. The method of work pursued at this mine consists of a removal of the soil resting on the gravel, followed by a very careful washing of the gravel in sluices and rockers. Where the overlay was very slight it was removed by simple digging, and in some cases it was washed away by hydraulic giants. The "harvest" periods were uncertain. Sometimes a few days' work, and often only a few hours', would suffice to obtain very profitable rewards for months of almost unproductive labor. The above-mentioned 40 nuggets were obtained from 1,070 cu. ft. of gravel.

This mine was operated also in 1893, and water was supplied from a pumping station on the Yadkin River, about two miles distant, the water being conveyed in 20-in. iron pipes.

Other North Carolina Mines.

The Rudisil Mine is one mile south of Charlotte. It is owned by Carson & Miller, of Charlotte, and preparations began a month or so ago to resume work. It will soon again be in active operation. For many years this mine was operated with great success. The ore was carried in pockets in the slates and was the richest and most easily mined brown ore of the region at the surface and for a considerable depth. At a depth of about 200 ft. the free gold largely disappeared. The "middle shoal" or ore body to which this mine chiefly owed its fame, was 100 ft. long and in places 15 ft. thick, composed chiefly of compact iron pyrites. The ore was uniformly of high grade, entire shipments sometimes reaching $180 per ton.

At the St. Catherine Mine, near the eastern end of the Rudsil lode, preparations to resume work are also being made. Mr. Obdyke, of New York, is the owner, and the mine is in charge of Mr. G. W. Pitcher, of Charlotte. This mine has been worked to a depth of 460 ft., but a large ore body is still to be removed between the 370 ft. level and the bottom. Assays of brown ores from this mine show $27 to over $100 per ton in brown ore, $52 to $73 per ton in first-class ore and $33 to $36 in second-class ore. Concentrates yield $40 to $135 per ton.

In 1883 a 10-stamp mill was erected. The ores were first subjected to a preliminary cobbing, which separated out the massive pyrites and lean ore, the latter going to the stamp mill. The free gold was caught in the battery and on the plates in the customary mode of amalgamation, and the tailings led directly to Frue Vanners, where the product was concentrated. The cabbed pyrites and concentrates were shipped north and elsewhere for treatment. The last work at St. Catherine, of which the writer is aware, was in 1887. But, as intimated above, preparations are now being made for a resumption of operations, and on a large and permanent scale.

The work of drawing off the water from the St. Catherine began a month ago, and it will be put in shape for work as soon as practicable. The shaft is now 450 ft. deep.

The deep mines of Montgomery county have been very prominent in the mining history of the state. The most important group is situated in the extreme northwestern corner of the county, in the vicinity of the village of Eldorado.

The Russell Mine is about 3 miles north of Eldorado. It has been worked more extensively than any other, and has, therefore, allowed better opportunity for study.

It is stated that the average ore, embracing the entire material from this cut, milled $2.27 per ton. There were some streaks, from 4 to 5 ft. wide, which went much higher (as high as $9.95), and still others where portions of the ore were so rich that it was carried out in powder kegs. A set of 17 assays show gold all the way from $2 per ton to $332 per ton. A 40-stamp mill in good condition is located on the property. Preparations are now in progress for the erection of a cyanide plant for the treatment of the ores.

The Appalachian (or Coggins) Mine is situated in close proximity to Eldorado. It has large bodies of low-grade ore similar to those of the Russell, yet ores that are easily within the limits of profitable work.

The depth of the last workings was 160 ft. A 40-stamp mill stands on the property. Several assays of the ore show its variation to be similar to that of the Russell.

The Trediwick Mine is 7 miles southeast of Charlotte. It has been prospected to a depth of 80 ft., and for a length of 200 to 300 ft. The vein is 1 to 2 ft. wide, and carries a relatively large amount of copper minerals.

The Ray Mine is situated 9 miles southeast of Charlotte, and is owned by the Baltimore & North Carolina Mining Co. There are five veins with an aggregate length of about four miles. The south vein has been worked to a depth of about 60 ft., and the Phifer Grove vein to a depth of 40 ft. The mine material from both was free-milling brown ore. The Ray Mine, which is the best known of them all, is entered by six shafts, the deepest being 250 ft. The ore seam is 6 to 8 ins. thick and is filled with nearly compact sulphurets. Most of the ore down to the 120-ft. level has been stoped out. Assays show gold ranging $20 to $30 per ton. There are 360 acres in this property.

The Surface Hill Mine, in Cedar Creek township, has long been known for its large yield of nuggets. It is quite certain that several thousand pennyweights must have come from the space of a few square feet.

A considerable amount of brown ore of good appearance, carrying copper sulphurets, has been mined in the process of hunting for nuggets, but as an ore it is of little value, despite its fine appearance. Assays show but $2 to $3 per ton.

Some Minor Mines.

The Stephen Wilson Mine is nine miles west of Charlotte. The property comprises 340 acres, and it is stated that ten well-defined veins have been located. Of these only two have been worked, namely, No. 2 and No. 3. No. 2 vein was entered by an underlay shaft to a depth (on the incline) of 400 ft., and four levels run. The ores carry iron and copper pyrites. Some very rich ores have been mined, showing assays of $25 to $345 per ton.

The Todd Mine is situated five miles northwest of Charlotte. It has been penetrated to a depth of 80 ft. Some exploratory work was done at this mine in 1886, and a 10-stamp mill erected.

The Black Mine, ten miles east of Charlotte, has a small, but very rich vein of brown ore, of which assays show values from $50 to $236.

The Copper Knob (or Gap Creek) Mine is situated in the southern part of Ashe county. A shaft was sunk to a depth of 60 ft. with satisfactory results, and subsequently deepened (as reported) to 140 ft. At this stage the mine became the prey of a company of speculators. The concurrent testimony of many persons cognizant of the last work is that the resources of the mine continued good as far as the explorations extended. Assays show $10 to $123 per ton of precious metals.

In the region west of the Blue Ridge are several gold mining localities, some of which have attracted attention, and have been the site of more or less productive work.

South Carolina Gold Mines.

There are quite a number of valuable and profitably worked gold mines in South Carolina, but this article will deal with only two of them, located in the two counties of Chesterfield and Lancaster.

The largest and probably the best known of these mines is the Haille, located three miles from Kershaw. This mine has been in profitable operation for a number of years. It is now owned by a company of which Mr. G. H. Seeley, of New York, is president; Mr. A. T. Cross, of New York, is secretary and treasurer, and Mr. A. Thies, general manager.

The chlorination process is used and the mine is equipped with modern machinery, costing over $50,000. The Haile is the largest gold mine in operation east of the Rocky Mountains.

About 150 miners are regularly employed, all negroes except the foremen. The exact figures are not obtainable, but the report is that the monthly product of this mine is from $7,000 to $20,000, the annual product therefore being somewhere between $100,000 and $200,000. The labor employed is cheap—much cheaper than that employed in western mines—and the profits of the company therefore relatively much greater than those working western mining property.

The Brewer Mine, in Chesterfield county, is operated now by the De Soto Mining Co. The chief owners are the widow of the late Senator Hearst, of California, and Mr. E. Motz, the latter being the superintendent and general manager of the company. The president of the company is also a New Yorker, Mr. Irwin C. Stump, as is also the secretary and treasurer, Mr. H. B. Parsons. C. A. Clark, of San Francisco, is vice-president. The Brewer Mine is equipped with modern machinery, which at present has a capacity of 200 tons of ore per 24 hours. The ore averages $3 of gold per ton. It is the intention to enlarge the capacity of the plant to 2,000 tons per day. The supply of gold-producing ore is said to be almost inexhaustible. The ore body now being worked is 2,500 ft. wide and 1½ miles long. The open shaft is 500 ft. in diameter and 200 ft. deep, and the tunnel leading into the mine is 475 ft. long. This mine also uses the chlorination process.

VALVE BOX AND CAPSTONE USED ON THE WATER-WORKS OF SYRACUSE, N. Y.

The valve boxes and capstones for the same, used on the Syracuse water-works in 1895, are shown in detail by the accompanying illustrations. Two classes of valve boxes were used, different only in the size of their lower portions, as shown.

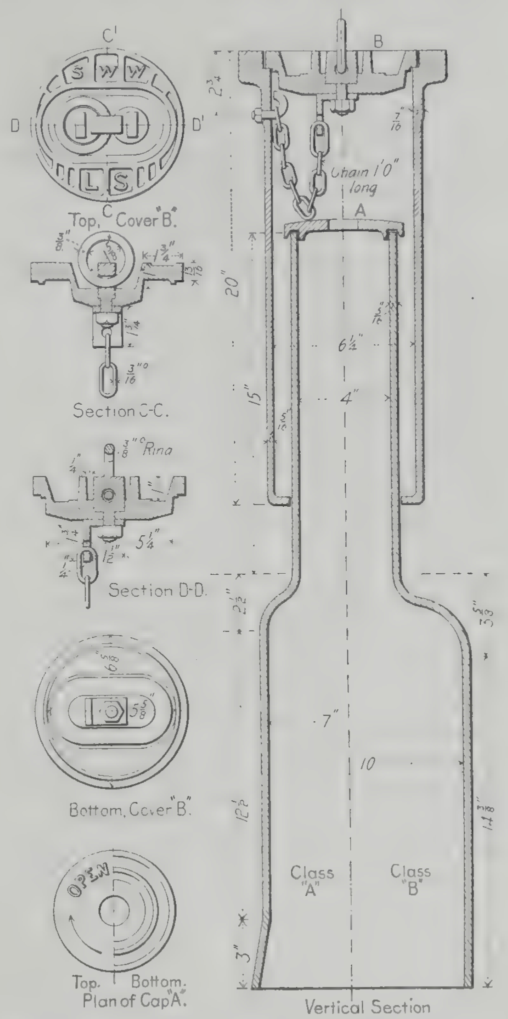

Fig. 1.—Details of Valve Boxes Used at Syracuse, N. Y.

The valve boxes were made by the Jackson & Woodin Mfg. Co., of Berwick, Pa., after the design furnished by the Syracuse Water Board, as shown herewith, and the contractor for the capstones was Mr. John Crabtree, of Syracuse. The caps are of limestone. We are indebted to Mr. W. R. Hill, M. Am. Soc. C. E., Chief Engineer of the Syracuse Water Board, for the information and illustrations given.

To all other countries in the Postal Union, add* $2.08 *per annum* (4 *cents per number*) *to above prices for postage. No club rates allowed. Mailing addresses may be changed at will by sending both old and new address. We shall be obliged if subscribers who fail to receive their papers promptly will notify us without delay. The number on the address label of each paper indicates when subscription expires, the last figure indicating the year and the one or two preceding figures the week of that year; for instance, the number* 326 *means that subscription is paid to the* 32d *week* (*that is the issue of Aug* 6) *of the year* 1896; *the change of these figures is the only receipt sent, unless by special request.*

ADVERTISING RATES: 20 *cents per line agate measure. Want notices, special rates, see page* 22. *Rates for standing advertisements sent on request. Changes to standing advertisements must be in hand on Monday afternoon; new advertisements, Tuesday afternoon; transient advertisements by Wednesday noon.*

Irrigation enterprise in the west will receive a new impulse in view of the decision of the U. S. Supreme Court, outlined in our news columns, upholding the constitutionality of the Wright Irrigation District Law. Although this was a California statute similar ones had been passed by a number of other states, and doubtless other Western commonwealths will be encouraged by this decision to take the same step. Briefly, these acts give land-owners corporate powers under which money may be raised, and irrigation works built at the general public expense, instead of requiring the land-owners to buy water from irrigation companies, or to form themselves into such private corporations. A large number of irrigation districts have been formed in California, millions of dollars of bonds issued, millions more voted, and many irrigation works of magnitude have been carried out under the Wright law. The districts have been harried from the start by litigation, but the California State courts have invariably, if we are correctly informed, upheld the Wright law. Nevertheless, the legal opposition has had a depressing effect on the district bonds, and the depression has doubtless been increased by bringing to bear all possible means to discredit the securities in question. In addition to this, the districts were largely experimental at the start, and probably the best engineering and legal advice were not secured at the inception of some of the districts. The importance of the best possible legal and engineering advice has been more fully realized of late, at least by some of the organizations, and accordingly many of the districts have employed the most eminent engineers and lawyers of California to report on their districts. These reports have been handsomely printed, and doubtless have aided greatly in establishing confidence in the several enterprises among financial men and others.

Outside of California, irrigation districts have not made so great progress, or certainly have not come nearly so prominently to public notice. The other states have followed where California led, and many have been slow about doing so, in some cases with good reason, it may be assumed. Recently, all, or nearly all, enterprise of this sort has been at a halt, awaiting the decision which has just been made. Now that the U. S. Supreme Court has so firmly sustained what the California courts vigorously and continuously upheld for many years, irrigation enterprise may be expected to take new life; bonds will be sold readily and much irrigation work may be expected. While the legal questions have been in suspense, the practical questions of operating the districts and their works have doubtless been satisfactorily answered, in very many cases, the economical development, distribution and application of water to crops has been advanced and the people of many new sections have come to appreciate the advantages, and often the necessity of providing an artificial water supply. At the same time, the small farm idea, for many products, has developed. Altogether the future of irrigation seems to be much brightened by the decision. Some of the irrigation companies may not be pleased by it, but many will find increased markets for their water in bulk, districts buying their whole supply from a company, as is already practiced, thus relieving the companies from many petty details and conflicts seemingly inherent to the distribution of water by corporations. At the same time, not all sections will adopt the district system, even if they might, and the general stimulus given to irrigation will, in such sections, be wholly to the benefit of the companies.

◆

We print on another page of this issue an interesting account of the present status of gold mining in North Carolina. There is no doubt that gold exists in the Appalachian range in various parts of the Carolinas, Alabama and Georgia, and it is possible that these states may yet figure largely as producers of precious metals. In a recent issue of the "New York Financier," a correspondent calls attention to the fact that the mines of the Rand district in South Africa, the most profitable in the world, produce low-grade ores almost entirely, yielding only $2.50 to $20 per ton, and require treating by the cyanide process, or chlorination, and continues:

> In Georgia and Alabama there are miles and miles of veins carrying free gold from $2 to $20 per ton within 40 ft. of the surface and as many more miles carrying the quartz that contain sulphurets and by assay show $10 to $75 per ton within 75 ft. of the surface.
>
> There are also large bodies of low grade ores in disintegrated or decomposed veins that are 10 to 40 ft. wide and show by assay $1 to $5 per ton within a few feet of the surface.

It may seem that if the above showing were correct, the future gold bonanzas of the world would be in the mountain regions of the Southern States; but the remarkable characteristic of the South African deposits is the uniformity with which the gold is distributed through great masses of gold-bearing rock. Does this condition also exist in the gold mines and gold prospects of the South? If it does, and if an extensive system of sampling and assaying can establish this for any given mine, its value as a gold producer is beyond question. We have never seen, however, authentic testimony that this is the case. On the contrary, our information is that the gold bearing veins in the Southern rocks are usually of small width, or if of large size carry paying ore in only a small part of their width. However, if large bodies of low-grade ore with average contents high enough to be profitable exist in the South in connection with any of the various prospects, the fact ought not to be difficult to establish.

We may remark in this connection that the gold deposits of the Southern States have been most thoroughly discussed in various papers read before the American Institute of Mining Engineers. We would advise any of our readers interested in the subject and desiring more information concerning it to consult the "Transactions" of this society.

◆

A remarkably fast train service now being regularly made on the Great Western Ry., of England, is recorded in another column. The train runs from London to Exeter, 194 miles, without a stop, in a schedule time of 3 hours 45 mins., or at an average speed of 51.7 miles per hour for the entire run. Water is taken at the track tanks. The line has generally easy grades and curves, broken, however, at Bath and Bristol by sharp curves which have to be passed at reduced speed, while there are some grades of 1.23 to 1.10%, each a mile long, and longer grades of 0.8 to 0.67%. The weight of train, consisting of six corridor cars mounted on trucks, is about 413,600 lbs. In our issue of Sept. 19, 1895, we discussed at some length the high-speed train records of English and American railways, and gave the details of the make-up and schedules of some of these trains. The most noted American train is undoubtedly the Empire State Express of the New York Central R. R., which, with a load of about 377,000 lbs. behind the tender, makes its daily run of 440 miles at the average speed of 50.76 miles per hour, or 52.17 miles per hour if stops are deducted. This train makes three stops, and the first division of its run, 143 miles, is passed in 165 minutes, or at the rate of 52.31 miles per hour. The railways running from London northward are those which have hitherto done the most showy running in competitive racing and in regular schedules, while the western and southern railways have for years had a bad reputation in this respect. The present remarkable service on the Great Western Ry., however, seems to indicate that that line is returning to the old aggressive position and high standing of its early days.

◆

An interesting damage suit was decided in the Supreme Court in Brooklyn on Oct. 28, in which the widow of a workman obtained a verdict for $6,000 against Levering & Garrigues, contractors for the new New York station of the New York and Brooklyn Bridge. The workman was a painter, and the scaffold upon which he was working fell to the ground. The scaffold was supported by two hooks from the eaves of the building, and one of the hooks broke. It was proved on the trial that the foreman of the painters asked the foreman of the structural work for some iron to make a hook, that the latter selected two tie rods, each about 5 ft. long, which had been used to tie the floor beams of the old structure; the painter's foreman gave a sketch to the blacksmith who made the hooks as directed. Neither of the foremen nor the blacksmith tested the iron, but the blacksmith said he knew the iron was good because it stood the work he put on it while bending it at a red heat into the form of the hook. The completed hook also was not tested in any manner whatever, but the scaffold was hung with it one evening and the men went to work on the scaffold next morning, and within five minutes afterwards it fell, killing one man and seriously injuring another. It was proved that when the tie rods were put into the old structure, 12 or 14 years ago, they were obtained from reputable manufacturers under rigid specifications and inspection, but the fractures of the iron showed it to be extremely bad, so bad indeed that no testimony was offered to show that it was good; but only that it was presumably good on account of its source and on account of the blacksmith's judgment upon it while he was working it. The whole case was a good illustration of how builders, foremen, blacksmiths, painters, and in fact almost everyone have the universal habit of "taking things for granted" in regard to the strength of materials and of structures. Because the iron had been used in a building it was taken for granted that it was good iron originally and that it had not deteriorated during its 12 years of service; it was taken for granted that the shape and dimensions of the hook were sufficient, although the shape was somewhat unusual; it was taken for granted that the blacksmith knew his business and would not burn the iron while working it; the blacksmith seems to have known nothing about making a cold bending test of the iron to determine whether it was good or not, but assumed that if it stood bending hot it could not fail to be good. The boss painter took the completed hook as being all right, as a matter of course, and made no attempt to test it, although he had ample opportunity, and the workmen, as workmen always do, took the judgment of their foreman that the scaffold was all right. If either of the two foremen or the blacksmith had any suspicion as to the quality of the iron, their doubts could have been resolved by a cold bending test which they could have made in five minutes; but not one of them seems to have had any suspicion whatever.

The lesson of the accident is, do not "take things for granted," but it will be heeded by but the few who happen to hear of such accidents. The great majority of foremen, blacksmiths and the public at large will continue to take things for granted as long as human nature is what it is.

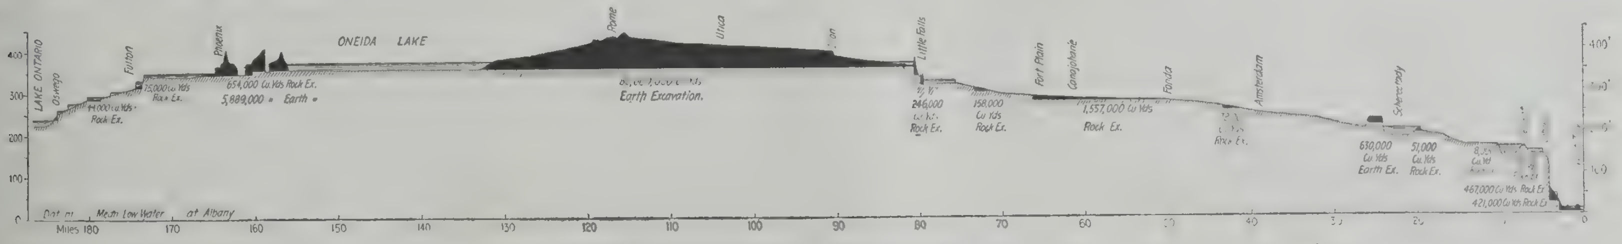
The incident is also an illustration of the risk which every large employer of labor runs of seeing a good slice or the whole of his profits from a piece of work absorbed by damage suits on account of accidents to employees. The law is clear that the employer of labor is charged with a responsibility for the safety of his workmen; and motives of self-interest as well as motives of humanity impel toward the most careful provisions for their safety. In addition to this it is the practise of most contractors and many manufacturers nowadays to carry insurance against losses of this class in some of the various casualty companies. Even the most painstaking vigilance cannot prevent occasional serious accidents, and it is as wise to make provision against exceptional losses of this sort as it is to make a similar provision against losses by fire.

We commend this incident also to the few engineers who still hold to iron as a safer metal than steel for structural purposes. A hook which breaks off short under a static load is certainly pretty poor metal and will well match all the stories that are told of unaccountable failures of steel from "crystallization," etc. Engineers are well agreed that structural steel of the present day is a safer material than the product now turned out from the puddling furnaces; but this occurrence illustrates the fact that more than a dozen years ago iron of very bad quality was also made and found its way into structures of such importance even as the Brooklyn Bridge terminal station.

Louis Baldwin Howell, M. E., died in Chicago, Ill., Nov. 12. He graduated from the Sibley School of Cornell University in the class of 1895, and during his senior year was the managing editor of the "Sibley Journal of Mechanical Engineering." A short time after his graduation he became a member of the staff of Engineering News, but was obliged to resign his position in December, 1895, on account of an affliction of the lungs. The remainder of the winter he spent at Eddy, New Mexico, but the climate there did not effect the cure that was hoped, and the last months of his life were spent at his home in Chicago.

Mr. Howell was a young man of remarkable abilities, and although a member of the staff of this journal for a few months only, he proved himself possessed of talents that justified hopes of the highest success in his profession. During his stay in New Mexico he prepared articles for this journal, of which one on "The Thompson-Ryan Dynamo" was published in our issue of March 12, and another describing the extensive works of the Pecos Irrigation & Improvement Co., at Eddy, was published Sept. 17.

By his attractive personal qualities and his excellent character he won the friendship and esteem of all those with whom he was associated, and the news of his untimely death brings to all his many friends the sense of a personal loss.

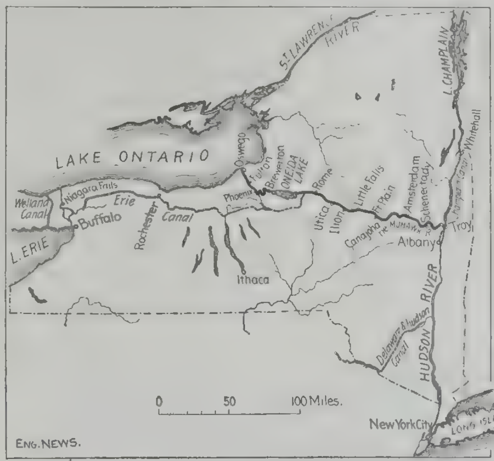


PROFILE OF PROPOSED OSWEGO SHIP CANAL.

A SURVEY OF A GREAT LAKES AND HUDSON RIVER SHIP CANAL.

The position of this journal on the proposal to construct a ship-canal from the Great Lakes to the Atlantic Ocean is well known to our readers. We believe that the current estimates of the great profits and public benefits of such an enterprise are absolutely unreliable because the information is nowhere available from which accurate estimates can be made, either of the cost of the work or of the traffic which would use it. Further, none of the various advocates of the enterprise have seemed to us to take a really broad and comprehensive view of all the conditions of the problem. The steady reduction in the cost of carrying bulk freight by rail, for example, seems to be persistently overlooked.

Nevertheless, we appreciate the fact that a great number of people, including many prominent members of the engineering profession, are enthusiastic over the possibilities, or probabilities, as they consider them, of "a deep waterway from the Great Lakes to the Atlantic;" and because the information available is so limited, it is as difficult to prove that their expectations cannot be realized as it is for them to show that they are well grounded. Vague guesses are not engineering estimates; and before the ship-canal enterprise will deserve to receive the support of either private or public capital on the one hand, or to be definitely laid on the shelf on the other, the actual facts concerning the enterprise ought to be ascertained and made public.



Map of the Canals of New York State, Showing Proposed Ship Canal on the Oswego Route.

The most important part of any such investigation, it appears to us, is the ascertaining of the traffic which a ship-canal over any of the various routes could secure. It ought to be first known with some accuracy what benefits will result from a proposed work before the actual planning and estimating of its cost should proceed very far. In this ship-canal scheme, however, there is a noticeable tendency on the part of its promoters to gloss over with glittering generalities this part of the investigation, and devote attention solely to the engineering questions respecting the most available route and the cost of the work.

Information in this field also, however, is exceedingly meager. No survey that is worthy of the name has ever been made of any of the proposed deep waterway routes, and the estimates of cost, therefore, have been more or less of the character of guesses. In the last annual report of the State Engineer of New York, however, we find a report by Mr. Albert J. Himes, Assoc. M. Am. Soc. C. E., Resident Engineer on the Eastern Division of the New York State Canals, of a "hasty reconnoisance" made by him for a 20-ft. deep waterway from Lake Ontario to the Hudson River. As no special fund was available for the work, it was done "in such odd moments as could be snatched from the routine work of the division." The data was obtained largely from papers in the Am. Soc. C. E. Transactions, the files of State Engineer reports, the maps of the Geological Survey, and other published matter, supplemented by cross-sections taken with the stadia. It is manifest that data secured in such hasty manner are hardly a safe reliance on which to base final opinions concerning an $80,000,000 enterprise. Nevertheless Mr. Himes' survey does offer something tangible in the place of the previous lack of knowledge, and we have, therefore, thought it worth while to present his principal facts and discuss his results in this place.

It is fair to say at the outset that Mr. Himes disclaims any great accuracy for his estimates, and states that they must be considered as preliminary, and as only valuable as a means of determining the advisability of making a complete instrumental survey, when the necessities of canal improvement require such a radical change in the present canal system as is here contemplated.

The proposed location is between Troy, on the River Hudson, and Oswego, on Lake Ontario, a distance of 182½ miles. The plan contemplates slack-water navigation of the Mohawk River by dams and locks to Rome, and the utilization of Oneida Lake and the Oswego River, on the general route suggested by the late State Engineer Elnathan Sweet, in his paper presented to the American Society of Civil Engineers in 1884. The estimates cover a canal 100 ft. wide on the bottom and 20 ft. deep, with locks 450 ft. by 60 ft. The proposed maximum lift of a common lock is 27 ft.; a lift seemingly warranted by the locks at Sault Ste. Marie and other points.

Concerning the important question of water supply to the summit-level, the estimates are based upon the emptying of each lock every 30 minutes, with evaporation and leakage duly considered. The required maximum amount, on this basis, would be 36,000 cu. ft. per minute; and of this the present 33,000 cu. ft. per minute on the summit-level of the Erie canal would be available for the new canal. As this is mostly stored water, it would be independent of the rainfall during the navigation season. To supplement the available supply, there is a drainage area above the proposed summit-level of 1,972 sq. miles, which Mr. Himes believes can be depended upon for a flow of 27,240 cu. ft. per minute, which, added to the present supply would be equivalent to 60,240 cu. ft. per minute. Oneida Lake would also be used as a storage reservoir to a 10-ft. depth; and as this lake has an area of 81 sq. miles, and allowing 1 ft. for evaporation, the remaining 9 ft. would furnish a flow of about 67,000 cu. ft. per minute continuously for seven months. Mr. Himes thus deems the sufficiency of a summit-level water supply as absolutely unquestionable.

In the matter of excavation the ultimate cost will depend largely upon the character of the material encountered, and in this connection Mr. Himes notes that by the conditions imposed he was compelled to depend upon surface indications alone. The most serious cutting is in the summit between Little Falls, on the Mohawk, and Oneida Lake, a distance of about 45 miles. The contents of this cut is estimated at 80,000,000 cu. yds. of earth at 25 cts. per cu. yd.; but Mr. Himes says that while this price on the Chicago drainage canal covered the handling of some very hard material, if the material actually found here were rock, the cost of its removal would be prohibitory. After discussing the dams required on the Mohawk and Oswego Rivers, the nature of the locks and the question of land damages, the following estimate is submitted for the total cost of an enlarged canal between Troy and Oswego:

86,519,000 cu. yds. earth excavation, at 25 cts.	$21,629,750
3,873,000 " " rock excavation, at $1.00	3,873,000
18 dams, average cost $376,278	6,773,000
518 vertical ft. locks at $40,000 per vertical ft.	20,720,000
65 bridges	1,750,000
Slope protection	5,188,757
Land damages	3,218,263
	$63,152,770
Engineering and contingencies, 30%	18,945,831
Total	$82,098,601

Mr. Himes sums up the merits of the proposed scheme as follows: By using slack-water navigation, there is deeper water at the lower end of each level, owing to the slope of the river bed, and out of 182½ miles of canal, 33.4 miles, or 18% of the whole, and including Oneida Lake, will have a depth of at least 25 ft., making navigation that much easier and safer. The width of the waterway is also greater than the typical canal sections for 73% of the entire distance, and the easier displacement of water will permit greater speed than in a narrow canal. New water powers of great value would be created; the removal of the present Erie canal from cities and towns would result in great gain in property values, and the land abandoned by the old canal would be worth much money to the State, though this is not used to offset land damages in the estimate. The engineering problems, while great, are capable of solution; and the chief difficulties in the way are the great cut through Rome, the control of the floods on the Mohawk and the operation of the proposed elevator locks. Mr. Himes deems his estimates rather above than below the actual cost of the work, and he believes that the result of his investigations are favorable to the route and warrant a more exhaustive study.

The most striking feature in the plan is the great summit-level cut, some 45 miles long, and averaging about 50 ft. in depth. Mr. Himes confesses that if this material were rock, its cost of excavation would be prohibitory. The possibility is suggested, however, that by using a higher summit-level and more locks it would be possible to greatly reduce this excavation. It is true that doubts then arise concerning the sufficiency of the water supply for the summit-level, but Mr. Himes points out that inclines or elevators might be designed for transferring boats to the summit-level which would use much less water than an ordinary canal lock.

But a more important question respecting the Oswego route than that of mere quantities and cost is the fact that a 20-ft. waterway over this route would only furnish a part of the proposed connection between the Atlantic seaboard and the Great Lakes. To the estimated cost of this link in the line would have to be added the deepening of the Hudson River for at least 30 miles, to secure a depth of 20 ft. of water, and also that of a 20-ft. canal between Lakes Ontario and Erie overcoming a difference in level of 326 ft. Mr. L. E. Cooley, at the late Deep Waterways Convention, estimated the cost of a new ship-canal, on the American side of the Niagara River, at $23,000,000. What the improvement of the Hudson River would cost for the 30 miles in question can not be definitely stated; but as a harbor has to be formed also at Oswego, the cost of which is not included in Mr. Hime's estimate, it is safe to say that the 20-ft. waterway from Lake Erie to deep water in the Hudson River by way of Oswego would cost not less than $125,000,000.

This is $75,000,000 less than the sum which has been commonly named as the cost of a 20-ft. channel over the present line of the Erie canal; but it is to be remembered that this is a pure guess, so that the comparison must be taken only for what it is worth.

We said at the outset that the economic advantage of the canal was a far more important question than the matter of its cost. Mr. Hime's report devotes one paragraph to this and we copy it verbatim as follows:

> In discussing the economy of building such a waterway, it would be well to consider the history of the Suez Canal. That canal cost in round numbers £20,000,000. To-day the profits of the canal have been so enormous that its stock is worth £80,000,000. But the traffic passing through the Detroit River to-day is not only greater than any traffic that ever passed through the Suez Canal, but greater than the traffic passing through any other single channel in the whole world. This traffic is mainly domestic and is carried on almost wholly between Chicago, Duluth and the upper lake ports on the one hand, and Cleveland, Buffalo and the lower lake ports on the other. Such being the present condition of traffic, what might we expect if the same waterway were extended to connect Albany, New York, Brooklyn, Jersey City and Philadelphia with Buffalo, Cleveland, Detroit, Milwaukee, Chicago and Duluth? We need not consider the possibility of trans-Atlantic shipments from Duluth, but only the extension of our domestic commerce.
>
> Turning now to the military aspect, it is idle to say that no war will ever come between this country and Canada, for the history of the world for all time is a succession of peace and war of varying duration. We hope it may not come; but if it does come, and the vast commerce and the wealth of the lake cities is unprotected, then may Heaven save us, our own hasty efforts cannot.

It appears to us that Mr. Himes is attempting a comparison between two things which are very dissimilar. The alternative to the use of the Suez canal is an ocean voyage around the continent of Africa. The alternative to the use of any Great Lakes and Hudson ship-canal would be the use of some other one of several different routes almost and perhaps quite as economical as the proposed ship-canal.

The railway lines to tide water are carrying freight cheaper every year. They have proved their ability to compete with the present Erie canal, and what is there to show that economies and improvements in railway engineering have come to an end? The Canadian waterway to the sea, by way of the St. Lawrence and Montreal, is being rapidly improved and is to be still further developed by the expenditure of large sums of money. Again, the class or type of vessel has yet to be devised which is adapted to a combined lake, canal and ocean service, if the voyage is to be made without breaking bulk. Barge transportation, in tows on the present waterways, is also in the development stage, and there is good reason to believe that it may prove more economical than transportation by vessels of deeper draft.

As for the "military" uses of a ship-canal across New York State, on which Mr. Himes lays such stress, it reminds us of a story of a peaceable and law-abiding wolf, who barricaded his den when he went to sleep for fear a lamb who lived next door would come in during the night and eat him up.

Seriously, in the highly improbable event of hostilities between Great Britain and the United States, land forces would occupy Canada and would permanently wreck the locks on the Canadian canals with a few well-placed charges of dynamite, long before any of the lighter craft of the British Navy, which alone could ascend the canals, could reach this side of the ocean.

It is fair to say, of course, that this aspect of the scheme was not properly within the scope of Mr. Himes' work. His task was to examine the feasibility and cost of a ship-canal on the Oswego route, and it appears that with the means at his disposal he accomplished wonders. His work should be given careful consideration in weighing the merits of different deep-waterway routes to the seaboard, when it is settled that such a waterway is "worth while."

◆

LETTERS TO THE EDITOR.

Thenard Movable Dam.

Sir: In Executive Document No. 78, House of Representatives, 42d Congress, 2d Session, will be seen about the fullest presentation of movable dams to be found in print. The Thenard system is there illustrated and described.

Yours truly, J. S. Walker.

Engineer Office, U. S. A., Nashville, Tenn., Nov. 9, 1896.

(We do not know whether this document is on sale; but enquiry made of Mr. F. A. Crandall, Superintendent of Documents, Washington, D. C., will settle that point.—Ed.)

Patents on Hydraulic Dredges.

Sir: In your issue of Oct. 29, I notice a letter from the New York Dredging Co., by H. S. Wood, concerning a dredge that company is building for the Mississippi River Commission, in which there occurs the following:

> One special feature of the design is that it is so far different from all usual arrangements of suction dredges with mechanical excavators, as to be entirely outside of the principles claimed by A. B. Bowers as his invention.

I thank Mr. Wood for this admission that "all usual arrangements of suction dredgers with mechanical excavators" are WITHIN "the principles claimed by A. B. Bowers as his invention," or in other words, within the claims of the Bowers Letters-Patent.

As I have twelve U. S. Letters-Patent containing in the aggregate 389 claims, it is perhaps not surprising that he should have failed to notice many of these as, for instance, among others bearing directly on the design referred to, the 14th claim of Letters-Patent No. 411,183, which is as follows:

> 14. In combination, a suction pipe and a rotary excavator secured to the mouth thereof, said excavator being provided with cutting edges or blades, and having its axis outide of and transverse to said pipe.

Until the courts have thus limited this and other claims, it is a bold assertion that the design of the dredge referred to "is outside of the principles claimed by A. B. Bowers, as his invention."

Conceding that he may have inadvertently overlooked the claim cited and many others, is it not strange, in view of his connection with the pending litigation, that he should also have overlooked the fact that Col. Von Schmidt, Williams and Bixler, the McNee Bros., the Golden State & Miners' Iron Works, and others, have been for several years under perpetual injunction not to use claim 25 of my Letters-Patent No. 318,859, which reads as follows:

> 25. A discharge pipe consisting of a series of sections flexibly joined together and supported by floats, in combination with a dredger having a rotary excavator.

Perhaps it may be of interest to note in this connection that in settlement of various suits against infringers of my patents I have acquired the entire right to the Angell, Lynch, Brown, Hobart (Atlas and Hercules), Letters-Patent; and to the Von Schmidt Letters-Patent also, except as to a one-half interest on the Pacific Coast and the right to, I think, four other states—eighteen Letters-Patent besides my own; and that the Bowers Pacific Dredging Co., of San Francisco, the Bowers Dredging Co., and the Bowers Gulf Dredging Co., of Chicago, the Bowers Hydraulic Dredging Co., of Camden, N. J., and myself, also, are protected by all 30 of the Letters-Patent owned by me with their 450-odd claims.

Respectfully yours,
A. B. Bowers.

Great Northern Hotel, Chicago, Nov. 13, 1896.

P. S.—Since writing the above, Judge Hanford has granted a preliminary injunction against the New York Dredging Co., restraining it from infringement of my patents in the suit of Bowers and the Bowers Dredging Co. vs. The New York Dredging Co., in the U. S. Circuit Court for the Western District of Washington. —A. B. B.

◆

Specifications for Water-Tube Boilers for the St. Louis Water-Works.

Sir: In answer to your editorial reply to my letter of the 7th inst., permit me to say that I adhere to my position "that—within reasonable limits, of course—it is absolutely immaterial whether the bidder furnishes 1 or 50 sq. ft. of heating or grate surface to do a given amount of work." It is assumed, of course, that proper precautions will be taken to insure that the contractor must comply with the requirements of the specifications as to efficiency, capacity, dryness of steam, and smokelessness.

You ask what my advice to a client would be in a case where two bidders, offering boilers "of identical construction," ask practically the same price, the one, however, giving nearly 50% more heating surface than the other.

In a public letting by a municipality, the decision must be in favor of the lowest bidder, who complies with the specifications, the additional heating surface not being entitled to consideration. In the case of a private corporation, however, my recommendation would unquestionably be in favor of the bidder furnishing the most heating surface, other considerations being equal.

Your question, however, does not cover the point at issue. As a matter of fact no two water-tube boilers in the market are "indentical in construction." Most of them differ widely, both in general design and in detail. It is no more proper, therefore, to compare them solely on the basis of heating surface, than it would be to make a similar comparison between the old type of cylindrical boiler and the modern return tubular. Differences in design and detail unquestionably affect the amount of work which can be done by a square foot of heating surface.

Without entering into this controversy further, it would seem to a disinterested outsider that in the matter of proportioning heating surface to capacity, the different boiler-makers—at least those of long standing and experience—should be credited with using ordinary good business judgment. It does not seem reasonable that one manufacturer could continue to sell his type of boiler year after year at a low rating of heating surface per horse-power without being sure of his ground; nor that another would continue to give a different type of boiler a greater allowance of heating surface unless he deemed it necessary to do so. The builders of boilers themselves should be, and I think usually are, very good judges of what can be done with their boilers. So many trials of capacity have been made, and they are so readily made now, that there can be no excuse for either ignorance or deception in this matter.

If your question were asked me on the basis of boilers not "identical in construction"—as would always be the case—I should study the differences, and endeavor to form a conclusion as to the value of a square foot of heating surface in each case. This would reduce the problem to one of relative ability to evaporate water, and on this I would base my recommendations.

Very respectfully,
William H. Bryan,
M. Am. Soc. M. E.

St. Louis, Mo., Nov. 14, 1896.

(Our question was intended to "cover the point at issue," for we understood that the two boilers referred to were of identical design, viz.: the Heine and the O'Brien, but that they differed in the amount of grate surface and heating surface offered by each as the equivalent of a horsepower. It would be unprofitable to continue the discussion further, for we see no probability that the differences of opinion between ourselves and Mr. Bryan can be reconciled. There are some new questions raised in Mr. Bryan's present letter, however, on which we may comment. That boiler makers of long standing and experience use "ordinary good business judgment" may be conceded. They sell boilers on the merits of their reputation, give good material and liberal proportions, and generally good satisfaction; and it is good "business judgment" to keep on selling boilers in just that way, with as little bother as possible concerning tests. But these same boiler makers are apt to be anything but good judges of what can be done with their boilers with different kinds of fuel and under different conditions, or of how to burn different kinds of fuel under their boilers to obtain the best results. Examples of the prevailing ignorance among boiler makers of what they can do with their boilers must have frequently come under Mr. Bryan's observation. In the case now under discussion, one maker offered 25% more grate surface and 48% more heating surface than the other; one or other of the bidders must have underrated or overrated the capacity of his boiler. In a former competition for supplying boilers to the St. Louis water-works the successful bidder failed to make good his guarantee, showing ignorance on his part as to what he could do with his boiler. If Mr. Bryan is able to form a conclusion as to the relative value of a square foot of heating surface in two different boilers by studying the differences of construction, we hope he will before long give the public his method of forming such a conclusion in the shape of a paper read before one of the engineering societies. We have no doubt such a paper would lead to a lively discussion, and bring out a variety of different opinions on the subject.—Ed.)

◆

THE APPLICATION OF PHOTOGRAPHY TO SURVEYING.

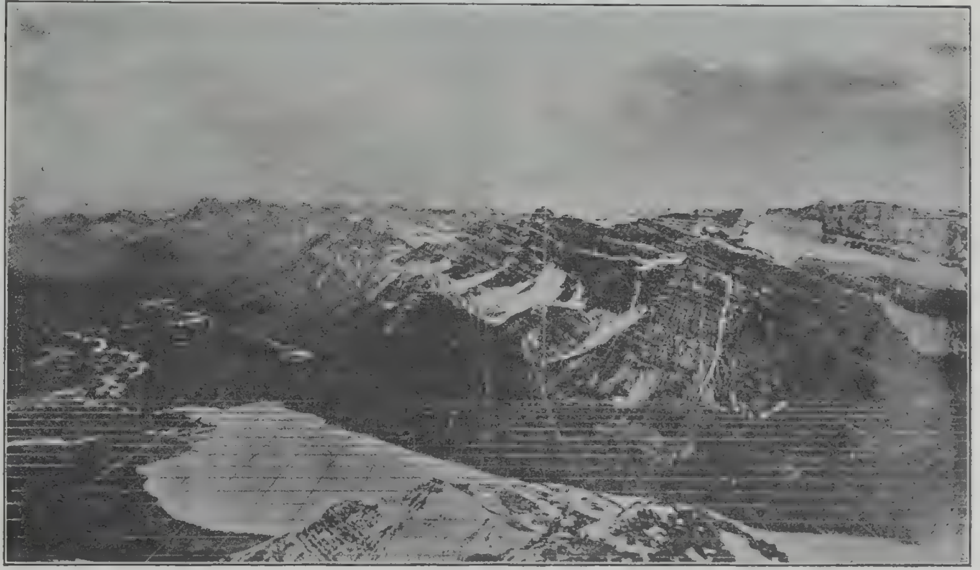
The first practical application of photography, on this continent, to the continuous survey of large areas, is due to the experiments and patient and intelligent work of Mr. E. Deville, Surveyor General of Canada. This method of obtaining topographical data was first suggested in 1850, by Col. Laussedat, of the French army; and later, German and Italian engineers continued his investigations and elaborated upon his methods. But the system seems to have been entirely abandoned in France, and in Germany it is mainly used for making plans of buildings; but the Italians have instituted the Ordnance Photographic Survey, and under the able engineer M. Porro, they have vastly developed the system and have done some remarkable work. In America, Lieut. Henry A. Reid, U. S. A., has published an excellent work upon "Photography Applied to Surveying," in which he gives the detailed history of the process and describes the instruments and methods employed. But the Canadians, alone on this continent, have made a practical application of the system upon any extensive scale.

Until a few years ago the land surveys of the Dominion Government were chiefly confined to the prairies of Manitoba and the Northwest Territories, where the operations were simple and topographical features were scarce. But when these surveys reached the Rocky Mountains the conditions changed; topography became well marked, and the old system of section lines became useless, if not impossible in application. Government administrations demanded a fairly accurate map and some means had to be devised for making this map rapidly and at a moderate cost. As the ordinary methods of topographical surveying were too slow and expensive, and as rapid surveys, based upon triangulation and sketches had been tried and proved ineffectual, photography was resorted to.

The principle of the method employed and a summary of work actually performed in the Dominion is given by Mr. John S. Dennis, of Ottawa, Canada, in a paper read before the Denver meeting of the American Society of Irrigation Engineers. From this paper we make the following abstract:

"The method used is based upon the fact that a photograph taken with a suitable lens is a true perspective, in which the focal length is the distance line. By drawing the horizon and principal lines all measurements usually taken on the ground can be obtained from the photograph. But there is this difference, that while the ordinary surveying instruments and methods restrict the surveyor to a few constructions, photography affords a great variety of processes by applying the inverse laws of perspective. Mr. Dennis does not enter into the detail of the methods used, and refers those interested to the work of Lieut. Reid; but he gives the results of the surveys thus made. Regular photographic surveys were commenced in 1888, in the main range of the Rocky Mountains, near the Canadian Pacific Ry., and 250 square miles were covered in that year. From that time from 375 to 500 sq. miles were thus surveyed each year until the aggregate area covered, at the end of 1892, was 2,025 sq. miles.

These surveys were all made by a party consisting of the topographer, one assistant, a packer and a laborer. It has now been established that 500 sq. miles is about the limit of area which a party, travelling rapidly, can cover in one season; though this area is, of course, affected by the general character of the ground; being largest in an open district with wide undulations. The topographer does not need more than a few minutes at each station, to observe angles and expose his plates. As showing the general advantages and the rapidity of the work, the season of 1892 is taken as follows: The start was made on June 29, the snow being too deep for work before that date, and the survey was stopped on Oct. 17, when the snow again became too deep for travelling. Of the 111 intervening days 48 were lost through smoke, rain and snow storms; in the 63 actual working days thus left, the equivalent of 500 sq. miles of territory was surveyed, an average of 8 sq. miles per working day.



PHOTOGRAPH USED IN THE CANADIAN TOPOGRAPHIC SURVEY, SHOWING METHOD OF PLOTTING.

The results of the survey are plotted on a scale of 1—20,000, and reduced for publication to 1—40,000. The published "Anthracite" sheet, with an area of 63 sq. miles, may be taken as an illustration of practice. This plot was made from 6 stations inside the sheet and 11 stations outside, and 1,075 points were fixed by intersections, or by constructions equivalent in accuracy, taken from 35 photographic views. This corresponds to 17 points per sq. mile; though more points could be fixed without difficulty as the limit is the time which can be devoted to plotting. The office rule is that the topographer must plot his season's work before going into the field again; though more detailed maps of any particular locality can be made at any time from the same photographs. The expenses of the season of 1892 were:

Packer, $2.00 per day; laborer, $1.50 per day...	$429.00
Transportation	578.50
Living expenses	394.71
Miscellaneous	76.98
Total	$1,479.19

To this add $1,500 per annum for the salary of the topographer and $730 for that of his assistant, and the total is $3,709.19, as the cost of surveying 500 sq. miles in one year. This is equivalent to $7.42 per sq. mile, or 1.15 cts. per acre. This extremely low cost is due to the fact that the party is very small, and very little time is consumed in taking angles and photographs, and no time is required in taking measurements on the ground. The time spent in the field is chiefly devoted to travelling from one point to another, and the actual work of deducing results from the data thus collected is done in the office by two men.

Mr. Dennis believes that this method could be successfully and economically applied to surveys made in connection with irrigation enterprises. On the Canadian maps the contour intervals are 100 ft.; but a detailed plan of the area covered by any one sheet could be made to a larger scale from the same photographs, and contours shown at any intervals required. The strongest point in its favor, however, would be the rapidity with which the work could be done; though economy in first cost of the survey is also often a vital consideration. It should be stated that the application of the method requires experience and a combination of the faculties which make an accomplished topographer. He has nothing before his eyes to show the progress of the work, or the gaps that may exist in it; so that he must ever be on the watch, and depend upon his judgment and experience for the data actually transmitted to the home office for record. Another peculiarity of photographic surveying, which applies directly to irrigation engineering, is that the same photographs can be used for a small scale general map, or a large scale detailed map, and a return to the ground for additional data is unnecessary.

The photograph here reproduced is one of several used by Mr. Dennis in his paper, and illustrates some of the intersections made for defining the boundaries of Bow Lake, and for obtaining other topographical data at that place.

◆

THE EXCLUSION OF TRUCKS from Fifth Ave., New York city, between 25th and 59th Sts., has been reported upon by the Street Committee of the Board of Aldermen, and favored only in a minority report. The majority reported that few people came before the committee desiring the restriction, while many protested against it. The minority denied that there was any purpose of turning the street over to a privileged class; and argued that the restriction would simply convert this avenue into a pleasure thoroughfare for the whole community. When this street is paved with asphalt, as proposed, some restriction will become a necessity to preserve the street from the almost exclusive use of heavy vehicles which will seek it because of easier traction. Other parallel avenues exist which could be used by heavy teams, and it seems that all interests should be united in thus preserving the only handsome approach to Central Park. Both reports have been laid over and ordered printed.

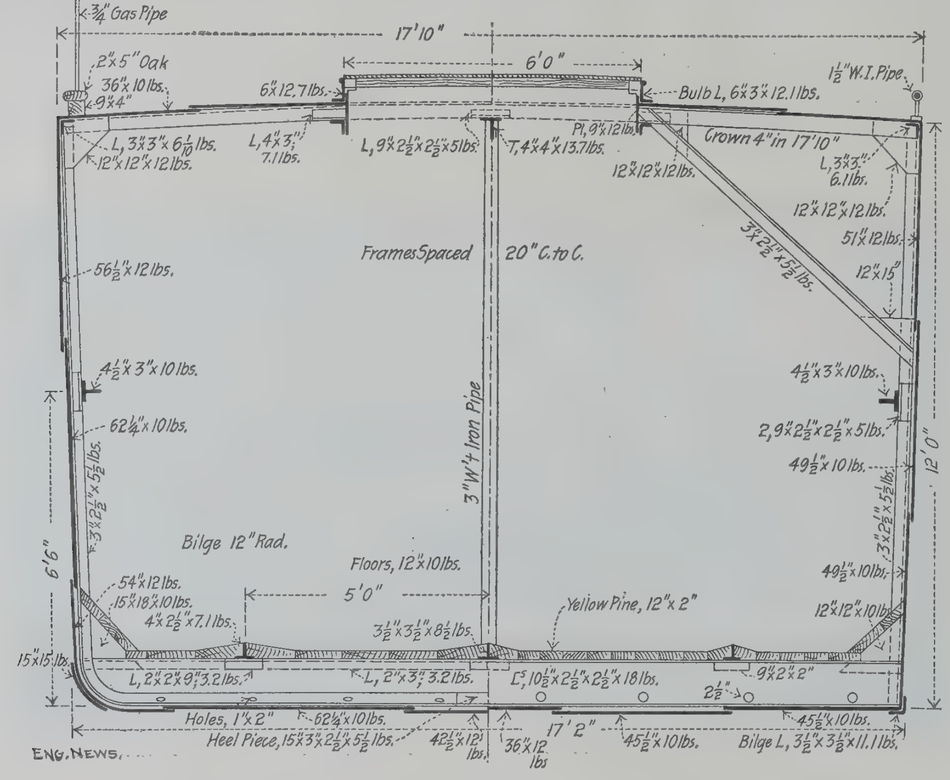
A MUNICIPAL ELECTRIC LIGHTING PLANT FOR Philadelphia is to be reported on by Mr. Jos. J. de Kinder, M. Am. Soc. M. E., Mr. M. Richards Muckle, Jr., and a third person to be selected by these two. The city owns a large gas plant.

STEEL CANAL BOATS.[*]

By Lewis Nixon, M. Soc. N. A. & M. E.

The appearance of the first fleet of steel canal boats on the Erie Canal was due to an investigation by the Cleveland Chamber of Commerce, which revealed the fact that the poor showing by the manufacturers of that city in the East was due to their inability to compete in Eastern markets on account of the heavy freight charges. It was found that the reason Buffalo had better freight rates was due to the competition of the Erie Canal from that city to New York. Mr. Charles E. Wheeler, the Secretary of the Chamber of Commerce, suggested the building of a fleet of steel boats to take freight through without transfer, from Cleveland to New York. Great prejudice was found along the canal against such a project, as it was claimed that the rocky bottom would seriously injure the steel vessels, and that no canal boat could weather the storms of Lake Erie. The first fleet, constructed in 1895, set at rest all doubts as to the fitness of steel boats for the service. This fleet consisted of a steamer and five consorts, all being 98 ft. long, 17 ft. 10 ins. wide, and 10 ft. deep. The steamer is driven by a fore and aft compound engine of 120 HP., and carries 125 tons of freight, while the consorts carry 230 tons each. The first trip was made in August, 1895, with a cargo of rails for the New York street railways. A rock was struck shortly after leaving Buffalo, by which the vessels were lifted from 6 ins. to a foot out of water; but it was found, after careful inspection in dock, that no injury whatever was done the vessels, the greatest dent being about ¼-in. deep. On the first return trip a cargo of sugar was carried, consigned to houses in Cleveland and other cities, one railway leaving Cleveland being given a solid train of 36 cars of sugar. During this trip a very severe storm was encountered on Lake Erie, and, although the vessels were tossed about like corks and were often lost sight of from the steamer in the hollow of the waves, less than $100 worth of damage resulted to the cargo of $75,000 worth of sugar; and this was caused by improper loading.



Half Section of Steamer. Half Section of Barge.

MIDSHIP SECTION OF STEEL CANAL BOAT, 100 FT. LONG.

In January, 1896, a further addition to this steel fleet was contracted for, consisting of three steamers and ten consorts. They were the same breadth and length as the first ones, but were made 2 ft. deeper with a view to utilizing the increased depth of 2 ft. of water in the canal. The steamers were given engines with cylinders 12 and 24 ins., by 16 ins. stroke, and Roberts tubular boilers. These engines develop about 275 HP. The consorts were built with square bilges, as shown on the midship sections. Open-hearth steel was used in the construction, of a tensile strength of 60,000 lbs., and an elongation in 8 ins. of 20%.

The consorts have frames 3 ins. by 2½ ins., of 5½ lbs. per ft., spaced 20 ins. apart. Forward, the frames, floors, and beams are canted, and alternate frames for 18 ft. on each side of the stern are built as web frames. A heavy breast hook is worked across the stem. The floors are made of channels 10½ ins. deep, weighing 18 lbs. per ft. Keelsons and longitudinals are formed by heavy "T" bars. The main hatch is 30 ft. long. This hatch is framed with a 6-in. bulb angle, forming a girder in connection with a 9-in. plate, and this girder is braced to the frames by 3½ × 2½-in. × 5½-lb. angle struts. Wooden hatch covers are fitted and a tarpaulin cover is secured over this by means of iron clamps, wedges and battens worked on the coaming.

The steamers are built with rounded bilges, but with about the same general construction as the barges.

The vessels are now run in fleets of one steamer and three consorts, carrying in all about 1,000 tons. Four fleets are to be kept constantly en route, with three consorts in New York loading for the return trip, thus keeping the steamers always on the go. A reduction of expense of about 40% is effected by the use of steam as compared with horse towing. The greatly increased fleet ordered after the first season's experience is an evidence of the commercial success of the venture. It is safe to say that this system of water transportation will reduce freight rates at least 25% over rail rates. A fleet makes about five miles an hour in Lake Erie, and from 3½ to 4 miles on the canal. The trip is made from Cleveland to New York in about ten days.

The importance of this growing fleet of steel canal boats arises not so much from the use of metal in their construction as from the attention which their success as freight carriers has directed towards the possibilities of the Erie Canal, and the results in the way of water transportation throughout the United States which are sure to follow.

While the debt which the interior of our country owes to the railways is beyond calculation, the cost of carrying products by rail over such distances eliminates all chances of profit at the farm. The expensive equipment and great first cost of railways means that the freight charges must be regulated by the necessity for paying the interest on the bonds issued for such constructions. Expansion of capitalization, and, worst of all, excessive competition, followed by consequent combination, bring about a rate destructive of profit to the producer. Piled upon this are the transfer tribute demanded at Buffalo, and the excessive lighterage charges in New York. Of the $20 paid for bringing a car-load from Buffalo to New York, as much as $18 of it has been paid for lighterage by the railroad. Canal traffic does away with lighterage; the freight arrives already lightered. The railroads discriminate against package freight, so that the millers of the Northwest pay about three times as much per mile for transporting flour as is charged for sending wheat to the mills of England, Holland and France, where it is ground to compete on the spot with American-made flour, with the result that our millers must fail in their effort to make flour for export profitable.

An all-water route with no fixed charges, and using the cheapest form of equipment against five lines whose aggregate interest-bearing cost is not less than half a million of dollars a mile, possesses advantages not necessary to explain.

The movement of food products from Buffalo to New York by rail, and the subsequent shipment to New England and Europe, is one that if followed on the same lines much longer will prove disastrous to New York city, and reduce this great city to a second-class port. New York, unlike Philadelphia, Boston, Baltimore, Norfolk and Newport News, cannot hold out the inducements of free storage, immediate access to ship's side, and minimum port charges. The present conditions of freight handling are the worst that could be devised, even if plotted by an enemy. Nine-tenths of the freight is received on the New Jersey shore, where there are no accommodations for storage or shipment; for, as a terminal point, it is so overtaxed that vexatious delays, blockades of rolling-stock, and congestion of traffic, that flour cars that would form a train thirty miles long remained outside Jersey City last winter for months, awaiting a chance to unload. Brooklyn, where the greater part of this vast bulk of freight must be stored, because storage cannot be afforded in New York, cannot be used as a shipping point by railroads; so that the final shipment must be made from New York. The three great elements of a perfect port, viz:—provisions for receipt, storage, and shipment, are, for the railroads, provided respectively on the Jersey shore, in Brooklyn, and in New York, all separated by water. In each case the transfer must be made by lighters, with consequent inconvenience, delay and cost; and when sent to New England, we have the cars carried on floats eleven miles around the Battery and up the Harlem. In times of great cold, fogs, and winds, such service is brought to a standstill, and even at its best it is costly, slow and dangerous.

What is needed at present is a pier on North River for export; for storage, for accumulation; for New England, space must be given on the Harlem River; and for local distribution, wharves are needed on the East River, near the Battery. The export trade can be taken care of in the most excellent basin extending from 52d St. to 54th St.

During the open season of the canal, there will be a direct connection with New England by means of the New Haven system, from canal boats landing at Fishkill Landing, so effecting an enormous saving over the present cost of delivering food products to that section. As the economic possibilities of New York as a shipping port are developed, there are sure to be great warehouses built along the shores of Staten Island, fed by canals in summer and railroads during the winter.

For storing the great quantities of flour for New England's winter consumption, there is a canal basin just below Spuyten Duyvil, near the entrance to the new Harlem canal, where food products may be stored, and shipped via the Sound or by rail from the freight terminal of the New Haven R. R. at Mott Haven, close to the basin.

The local traffic of New York and Brooklyn is at present cared for at piers 2, 3 and 4, in the East River near the Battery. It is to be hoped that the charter for the Greater New York will be drawn to provide, not only for present needs, but for a proper development of the facilities that will, if properly utilized, check the decline of commerce, cheapen the food supply of the people of New York, and make it the gateway through which must pass the food products of New England and Europe. Without some such aid, the New England factories, located on a non-productive soil, cannot hope to continue in competition with western manufacturing towns situated in the midst of food-producing regions.

Already events are shaping themselves in the direction of a more perfect use of water transportation. The people of New York by a direct vote have decided to expend $9,000,000 during the next two years in deepening the entire channel to a depth of 9 ft., and enlarging the locks, thus increasing the freight carrying capacity by at least 25%, with no increase in the cost of transportation. It is confidently expected that when this is done, freight can be carried at the rate of one mill per ton per mile. Railroads paralleling this canal cannot carry freight for an average cost of less than five times this sum,[*] for, even more striking than the contrast between the vast capital needed to compass a great freight movement by rail, where roadbed and equipment are most expensive, and the small amount needed by canal, where roadbed is free and equipment cheap, is the difference in cost of carriage between the two systems.

Taking a fleet on the deepened canal, of five consorts and one steamer, carrying 68,000 bushels of wheat, we find that to carry this wheat by rail will require two trains of 68 cars and two locomotives. When the freight arrives at the harbor of New York on the cars it must be lifted into a costly railroad elevator, then put into a lighter, towed alongside of a ship, and again elevated; or if it is to be stored it must be taken to Brooklyn, all the other transfers being required subsequently. The canal-boat freight can be carried direct to the vessel's side and elevated.

The use of barges of great proportionate freight-carrying capacity, drawn by powerful tugs or by vessels similar to the barges (but with freight capacity reduced enough to carry machinery), has been shown to be a commercial success, not only on the canal, but by large handlers of coal and oil at sea; and while such a change in the handling of freight by affording safe, sure, and regular de-

---

[*] Condensed from a paper read before the Fourth General Meeting of the Society of Naval Architects and Marine Engineers.

[*] Railways are now handling such bulk freights as are carried on canals at a cost of only two or three mills per ton per mile, where the volume of traffic is large and full train loads can be hauled long distances.—Ed. Eng. News.

..veries will strike a blow at our coasting schooner fleet, it cannot help but materially reduce the cost of transfer by water; while all forms of water carriage will assist in regulating freight rates on land.

The last report of the State Engineer of New York, Mr. Campbell W. Adams, gives a description of the Cleveland steel canal boats, in which we find the following information in addition to that given by Mr. Nixon:

> The cost of this fleet will approximate $15,000 for the propeller and $6,000 for each consort. The best time made by the boats was 13 days from New York to Cleveland, they being loaded to 6 ft. draft. The best time from Cleveland to Buffalo was 30 hours in good weather, a loss of 4 hours of this time was due to a jam of boats at Tonawanda. * * * Their entire ability to weather any storm on the lakes has been proved to the entire satisfaction of the company.

NOVEL ARRANGEMENT OF A TRAVELING CABLEWAY

The accompanying cuts represent a cableway with a novel design of tower, which has been built by the Lidgerwood Mfg. Co., of New York city for the use of James Flanagan & Co., contractors, in unloading earth from scows at the foot of West 79th St., New York city. The earth had to be taken to a distance of about 500 ft. from the scows, up steep banks and over a railway, the general location being shown in Fig. 1. Teams were used at first, but were abandoned on account of the difficulty of hauling up the heavy grades. The cableway was finally adopted, and it is admirably adapted for the work, being located overhead and out of the way of the railway traffic, which is very considerable at this point.

The overhanging tower at the river terminus, which is shown in Fig. 2, enables the carrying bucket to be dropped directly into the scow and loaded, making the operation rapid and direct. The empty buckets are filled while the loaded one is in transit. The plant handles daily a scow load of about 400 cu. yds. The buckets used are of 1 cu. yd. capacity. The main cable is 1½ ins. diameter, for a load of 1½ tons. The hoisting engine is of the Lidgerwood design, with cylinders 9 × 10 ins,. and double drums of large diameter. The engineman controls the entire operation of hoisting and delivering.

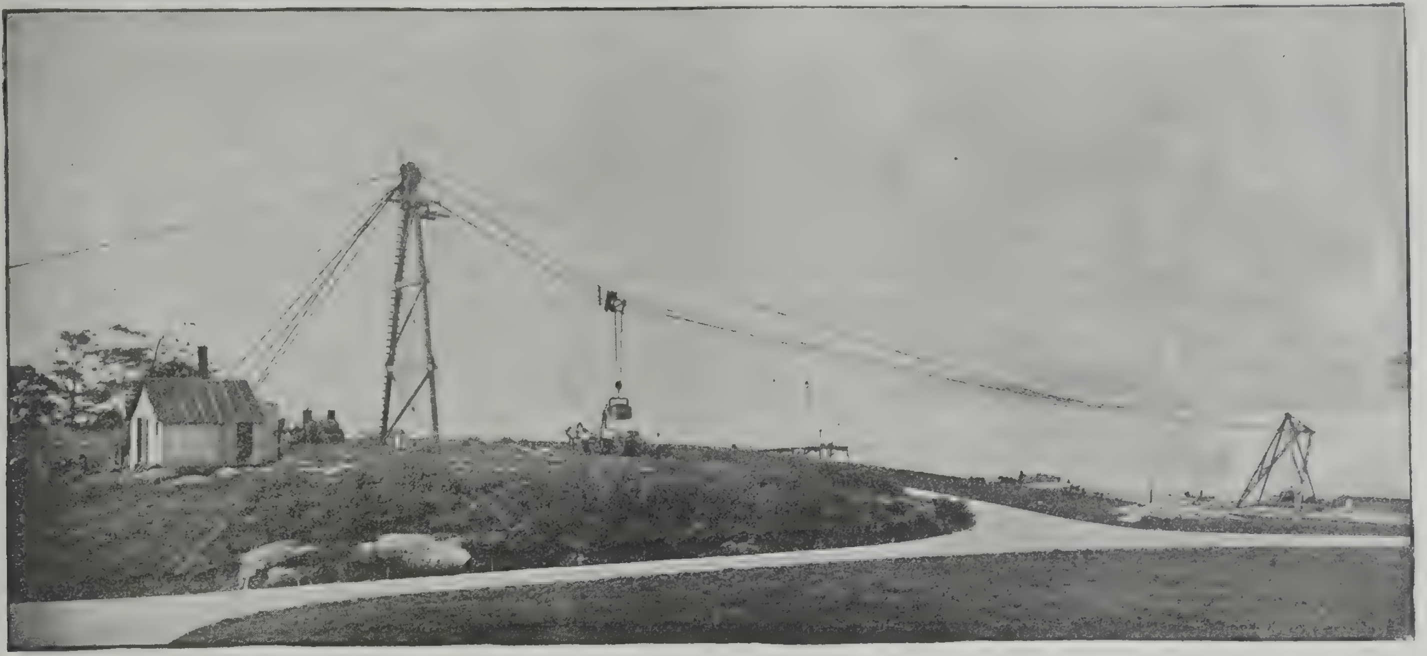

FIG. 1.—CABLEWAY FOR CARRYING EARTH AT WEST SEVENTY-NINTH ST., NEW YORK CITY.

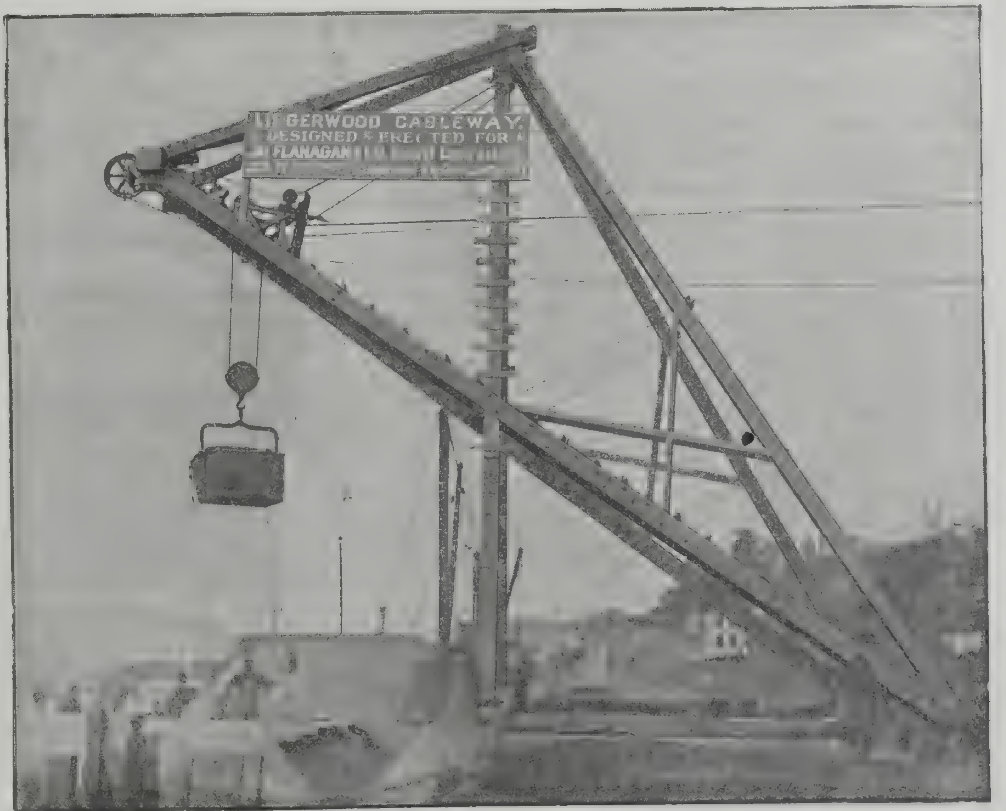

FIG. 2.—OVERHANGING TOWER OF CABLEWAY AT SEVENTY-NINTH ST., NEW YORK CITY.

THE LONGEST CONTINUOUS RAILWAY RUN IN THE WORLD.*

Ever since the middle of July the Great Western Ry. has daily made the longest run without stop ever yet regularly performed day by day by any railway in the world. The 10.25 a. m. train from Paddington station (London), which is the westbound Cornwall express, has run every week-day without a stop to Exeter, a distance of 194 miles. I do not assert that this run is the longest ever made, for I have not forgotten either the experimental run of 299¼ miles made by the London & Northwestern Ry. last year, or the occasional trips of the "American special" on the same line between London (Euston) and Liverpool (Riverside station) without a halt. But no such run as this of the Great Western Ry. has ever been made in ordinary daily practice, the nearest approach to it being that of the London & Northwestern from London to Crewe (158 miles), which is 36 miles shorter. In railway working, however, as in other mundane affairs, promise and performance are not always identical things, and it becomes interesting to see how the remarkable promise of the Great Western Ry. special time-table is fulfilled in actual working. The timing of this 10.25 a. m. Great Western down express is as follows:

Miles	............Paddington	depart 10.25
194	............Exeter	arrive 2.10

This represents an average speed from start to stop of 51.7 miles an hour. That, although a good rate of speed, may at first sight seem mild after the averages of some of the Northern lines; but several qualifying circumstances have to be taken into account, and when allowance is made for these drawbacks, it will be seen that the work demanded from Mr. Dean's fine engines is of a very high class.** That the down road for the first 117 miles or so is one of the easiest in the world may be readily admitted. But the passing of Bristol without entering the station has its serious disadvantage in point of road. It involves a diversion by way of the loop line, several chains longer, with a series of sharp curves which cannot properly be passed over (and, as a matter of fact, are not passed over) at a higher velocity than ten miles an hour; and the mile of the loop line by which the Bristol station is avoided occupies over three minutes in passage. Thus, nothing is gained by the train through passing by Bristol, except the escape from imminent risk of detentions through "blockings" by signal. The Bristol & Exeter Division is, as a rule, constructed on easy gradients, but the Wellington grade would be deemed severe even on the mountainous lines of the North, culminating—after several miles of 1 in 163, 1 in 132, and 1 in 103, started at slow speed, slackening through Taunton—in a mile and a quarter at 1 in 91, a mile at 1 in 81, and a mile at 1 in 126. So that to haul a train of heavy corridor coaches is by no means an easy task.

---

*Extract from an article by Mr. Charles Rous-Marten in the "Engineer," London, England.

**Mr. Wm. Dean is Locomotive Superintendent of the Great Western Ry., and a large number of the engines have been designed by him and built at the company's shops.—Ed. Eng. News.

Every facility of investigation having been most readily and courteously afforded to me by the Great Western Ry. authorities, I traveled by the 10.25 a. m. train from Paddington to Exeter on Sept. 7. The weather was favorable throughout, without side wind, and the rails were in good order. The train consisted of six bogie clerestoried corridor coaches (i. e., monitor roof cars, mounted on trucks—Ed.) weighing in all approximately 140 tons behind the tender. The engine was No. 3001, "Amazon," one of Mr. Dean's splendid express engines with a single pair of driving wheels 7 ft. 8 ins. diameter, rebuilt with a leading four-wheeled bogie, and with cylinders 19 × 24 ins. in lieu of 20 × 24 ins.; steam pressure, 160 lbs.; heating surface, 1,561 sq. ft.

Starting from Paddington station (London) within a few seconds of schedule time, the running, while slightly faster than usual, was singularly even and steady. The driver managed his engine admirably, keeping a minute or two always in hand, and quickly making up each loss by signal check without attaining any speed which the most timid passenger or ignorant alarmist could have deemed "excessive." We passed Chippenham (94 miles) in 98 min. 50 sec.

This manifestly was excellent and particularly even running. A signal check at Bathampton, due to a slow train having been allowed to get in the way of the express, caused a loss of a couple of minutes, but milepost 105¼ was passed in 112 min. 53 sec. from London, without allowing for the 2 mins. lost by the check. I mention this distance, as comparison with the work done on two runs of identical length on other lines may be of interest. Bath station was passed at the reduced speed of barely ten miles an hour, the slackening being protracted for a considerable distance before full speed was resumed. The actual time from London to Bath was 115 min. 47 sec., equivalent to 113¾ mins. net. At Salford another vexatious signal check was encountered, and for the third time our speed was lowered to ten miles an hour, or less, involving a further loss of at least 2 mins. We were abreast of Bristol station in 2 h. 10 min. from London, equal to a run of 126 mins. net, allowing for the time lost by signal checks, but not allowing anything for the "service" slack through Bath. It will show how very cautiously the curves of the diversion loop were negotiated when I mention that the distance of 1,980 ft. from Pylle Hill Junction to Bedminster station occupied 1¾ mins.

With the resumption of our main line running, speed was rapidly regained, and rose to a high point down the short descent of 1 in 200 approaching Yatton; maintaining a rapid pace, the 161¼ mile-post was passed in exactly three hours from Paddington. Here, however, a permanent way relaying slack brought down our average, but Taunton was passed in 3 h. 2 min. 41 sec. from the start. Then began the ascent of the Wellington bank—that terror of the broad-gage engine in former days. Mr. Dean's fine single-wheeler made very little of the incline. Skilfully handled by her driver, the "Amazon" mounted bravely, and her speed did not fall below 34.6 miles an hour up to the top of the ascent of 1 in 81, with a load of over 140 tons behind her tender. This was undeniably good work. Once through the Whiteball tunnel and over the summit, the speed quickly rose, and the distance of just 20 miles from the tunnel to the stop at Exeter was run in exactly 19 minutes, notwithstanding another signal check near Stoke Canon.

The train came to a standstill under the roof of St. David's Station, Exeter, at 2.2 precisely, according to London time, 2.4 according to the local station time, which on comparison with my watches both going and returning I found to be two minutes ahead of the Paddington clock. Thus the great run of 194 miles had been made without a stop (in spite of three bad signal checks, a permanent-way slack, and the protracted slowings round Bristol and through Bath station) in 3 h. 36 min. 43 sec., that is to say, in 216 min. 43 sec. (53.76 miles per hour). The engine arrived in perfect trim after being in constant motion for over 3½ hours, with all bearings cool, and everything quite fit for another long run had this been required. Water was picked up twice while running.

As for the traveling throughout, nothing could possibly have been steadier, smoother, or easier than the running of the splendid bogie coaches which formed the train. At the highest velocities or round the sharpest curves their steadiness was all that could have been desired by the most exacting traveller. In all respects it fully equalled the running of the newest twelve-wheelers employed in the Scottish traffic, and assuredly no higher praise than this could be awarded.

My return journey was made by the second part of the up Cornish express. It had been detained at wayside stations for luggage, notably 20 mins. at Truro, where room had to be found for no fewer than 27 bicycles, when the vans were already crammed. Consequently we started from Exeter 34 mins. late. The load consisted of nine corridor bogie cars and a six-wheel car, representing a total weight behind tender of about 515,200 lbs. Two of Mr. Dean's large 7 ft. 8 in. singles, Nos. 3047 ("Lorna Doone") and 3050 ("Royal Sovereign") took the train to Bristol—75½ miles—without a stop in 85 mins., or 3 mins. under time; the 44¾ miles from Taunton, after passing that station at reduced speed, being done in 48 mins. to the stop at Bristol. A very even rate of speed was generally maintained, and the traveling was as smooth and easy as on the down journey. At Bristol the six-wheel car and two bogie cars were taken off, bringing down the load to approximately 369,600 lbs., taken by another 7 ft. 8 in. single-wheeler, No. 3007 ("Dragon"). In spite of two extra stops (at Swindon and Westbourne Park), occupying in all 4¼ mins., a very bad signal check at Box, and a slack for bridge repairs near Reading, the run from Bristol to Paddington was made in 2 h. 13¾ min. traveling time. The loss by signal delays amounted to fully 9 mins. It is noteworthy that the speed never fell below 56 miles an hour up the Wootton Bassett bank of 1%.

◆

SPEED TRIALS OF A SCREW-PROPELLED FERRYBOAT.*

By Mr. F. L. Du Bosque, M. Am. Soc. M. E.†

The performance of the screw-propelled ferryboats now in service has been so satisfactory that, in providing the equipment for a new ferry from its terminal at Jersey City to 23d St., New York, the Pennsylvania R. R. Co. decided, from the experience they had gained with the screw boats it now operates, to adopt the same method of propulsion for the new ones. The service will require more speedy boats—in fact, as fast as can be consistently operated in a harbor as crowded as the lower North River—and a speed equal to 15 statute miles per hour was decided upon as satisfactory, considering all conditions. To determine the power required to propel such a type of ferryboat at this speed, progressive speed trials were made with the screw-propelled ferryboat "Cincinnati"; incidentally, data were taken to determine the efficiency of this system of propulsion.

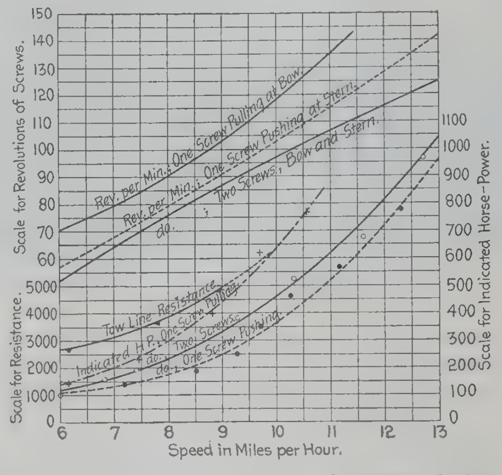

Fig. 1.—Diagram Showing Tow-Line Resistance, Indicated Horse-Power, and Revolutions of Screws at Different Speeds of the Ferryboat "Cincinnati," Pennsylvania R.R.

The trials were made as follows:

A distance of 5,600 ft. was laid off on the New York shore of the North River, extending from 94th St. to 115th St., and range poles were erected at the terminals, perpendicular to the direction of the course. At this particular part of the river there is a depth of seven fathoms, and the course is so located that projecting points of land beyond the course act as range marks, so that a boat can be steered back and forth, at uniformly the same distance from the shore, through the same strength of current, and in a straight line.

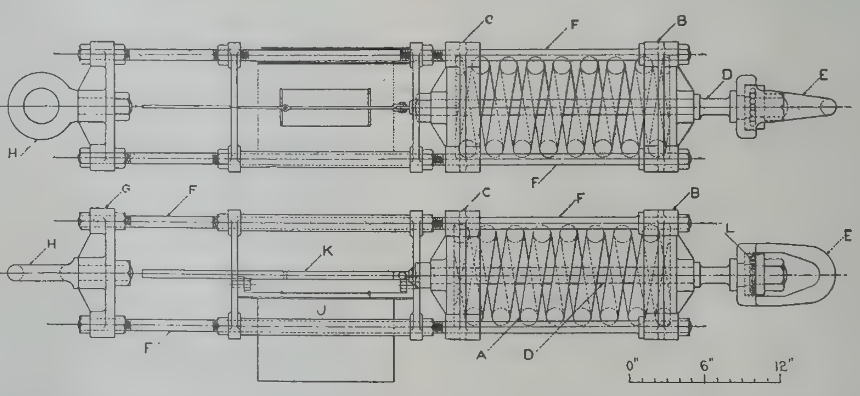

FIG. 2.—DYNAMOMETER USED IN SPEED TRIALS OF P. R. R. FERRYBOAT "CINCINNATI."

Runs were made on this course, with and against the tide, at speeds varying from 6 to 13 statute miles per hour; one series with the two screws in operation, one at the bow and one at the stern; one series with the bow screw removed and stern screw "pushing," and one series with the stern screw removed and the bow screw "pulling."

The speed of the boat was held uniform by governing the speed of the screws—in other words, by running the engines at a constant rate of revolutions per minute—and four runs, two with and two against the tide, were made at each predetermined speed of screw; the time of entering and leaving the course was noted with a stop-watch, and the final mean of the four observations taken as the mean speed; two sets of indicator diagrams were taken from the engine cylinders while on the course, the indicated horse-power calculated, and the mean of the several runs accepted as the indicated horse-power for the observed mean speed. The results of the observations have been plotted on the accompanying diagram, and curves drawn to pass as nearly as possible through the observed speed and power. This curve shows facts which are summarized in Table I.

TABLE I.—Efficiency of Various Arrangements of Screw Propulsion at Various Speeds.

Speed. Statute miles per hour.	1 Screw Pushing. I. HP.	Revs. per min.	Slip. %.	2 Screws. I. HP.	Revs. per min.	Slip. %.	1 Screw Pulling. I. HP.	Revs. per min.	Slip. %.
9	250	91	19.5	332	87	20	443	103	35.5
10	364	103	24.5	464	97	20.5	638	118	36
11	520	115	27.5	624	107	19	880	135	35
12	720	128	28	816	116	18.5			

The I. HP. given is that developed by the main engines only, and does not include the air, circulating or feed pumps.

To determine the efficiency of the system, the screws were removed and the boat towed over the measured course, twice with and twice against the tide at three different speeds, and the tow-line strain measured by a dynamometer.

The resistance observed is plotted on the accompanying diagram, Plate I, and the curve produced shows results which are given in Table II.

TABLE II.—Resistance and Work of Screws at Various Speeds.

Speed in miles per hour.	Resistance, both screws removed. Pounds.	Indicated Thrust. One screw pushing. Pounds.	Two screws. Pounds.	One screw pulling. Pounds.
8	3,880	6,700	9,050	9,380
9	4,950	8,200	11,350	12,100
10	6,400	10,250	14,120	15,440

It will be noticed that the proportion of the power put into the engine which is utilized in overcoming the actual resistance of the boat at 9 miles per hour is 43%, when two screws are in use; 60% when one screw is pushing, and 40% when one screw is pulling.

The usual speed of this boat in ferry service is 11 miles per hour, and at this speed it requires 20% more power to propel the boat with two screws than with one screw pushing, and 69% more power to propel the boat with the screw at the bow than at the stern. If the same power could be put into one screw at the stern as is used by the two screws, the speed would be increased from 11 miles to 11.53 miles per hour. It is clear, therefore, that the bow screw is inefficient. When under way, it thrusts a column of water against the bow of the boat at a velocity equal to the slip ratio of the screw, and considerable power is absorbed through friction of the blade surface; but a ferryboat's bow becomes its stern at each succeeding trip, and it is therefore impossible to dispense with the forward screw.

---

*A paper read at the fourth general meeting of the Society of Naval Architects and Marine Engineers, New York, Nov. 12, 1896. An illustrated description of the ferryboat "Cincinnati," on which the trials described in this paper were made, was published in Engineering News of Nov. 7, 1891.

†Engineer of Floating Equipment, Pennsylvania R. R. Co., Jersey City, N. J.

The screw at the bow, however, is useful, for one of the most desirable features in a ferryboat is the ability to start and stop promptly. Of the seven minutes required to go from landing to landing, two minutes are consumed in getting under way and stopping. Superiority in this respect is one of the reasons why a screw boat is preferable to a side wheeler. A half minute is more easily gained in maneuvering by using screws than by increasing the speed of the boat when under way, and it is in stopping and backing that the forward screw shows its usefulness; it is able to thrust a column of water directly ahead that will not impinge against the boat. Several means have been suggested to overcome the loss due to the use of this forward screw when underway, the most fascinating of which seems to be to so design the screw that it will have very little backing power. If this could be done, the propelling effect of the forward screw would be small, and the power required to turn it would probably be only that due to the surface friction of the blades.

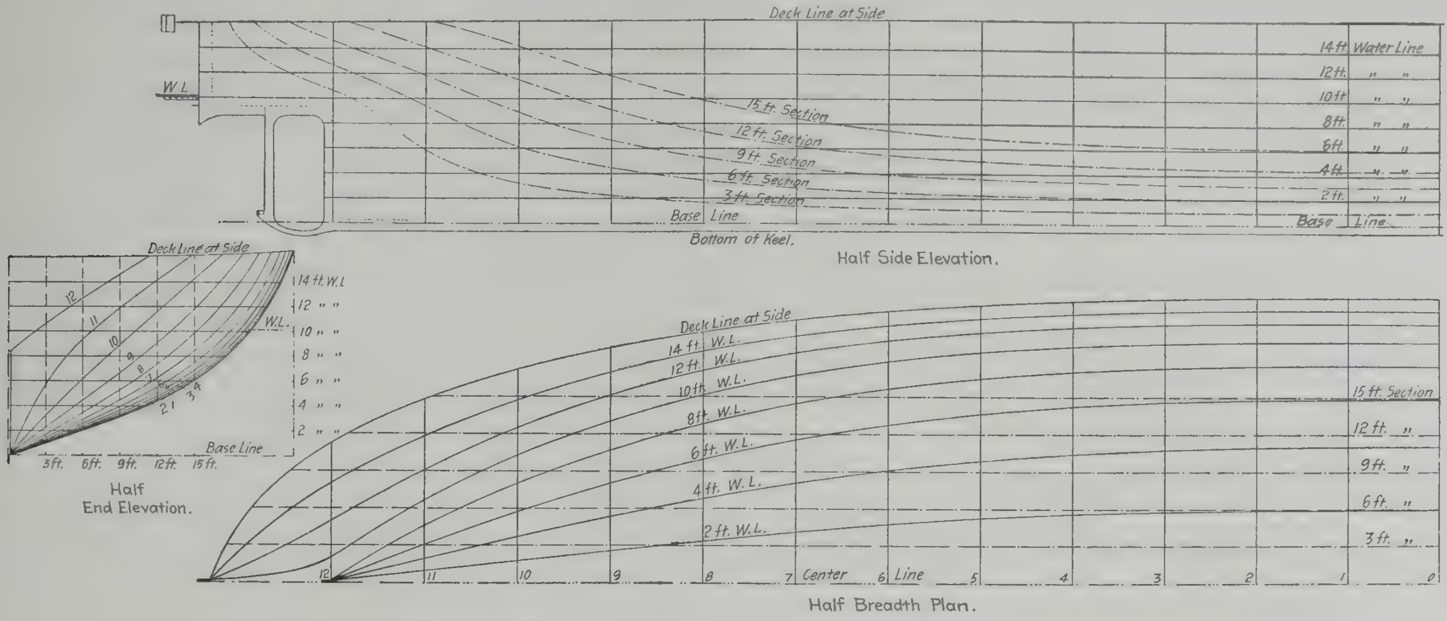

FIG. 3.—LINES OF HULL OF P. R. R. FERRYBOAT "CINCINNATI."

DIMENSIONS.

	ft.		ins.
Length on keel	180	0	
" " water line	200	0	
" over all	206	0	
Breadth at water line	39	2½	
" " deck	46	0	
" " over all	65	0	
Depth deck amidship at side to base line	18	6	
" water line to base line	10	1½	
" of keel		5	
Draft, extreme	11	2½	

Displacement	953 tons
Coefficient of fineness block	46.66
" " water lines	75.50
" " immersed midship section	61.54
Area immersed midship section	244.14 sq. ft.
Wetted surface	7469.40 "

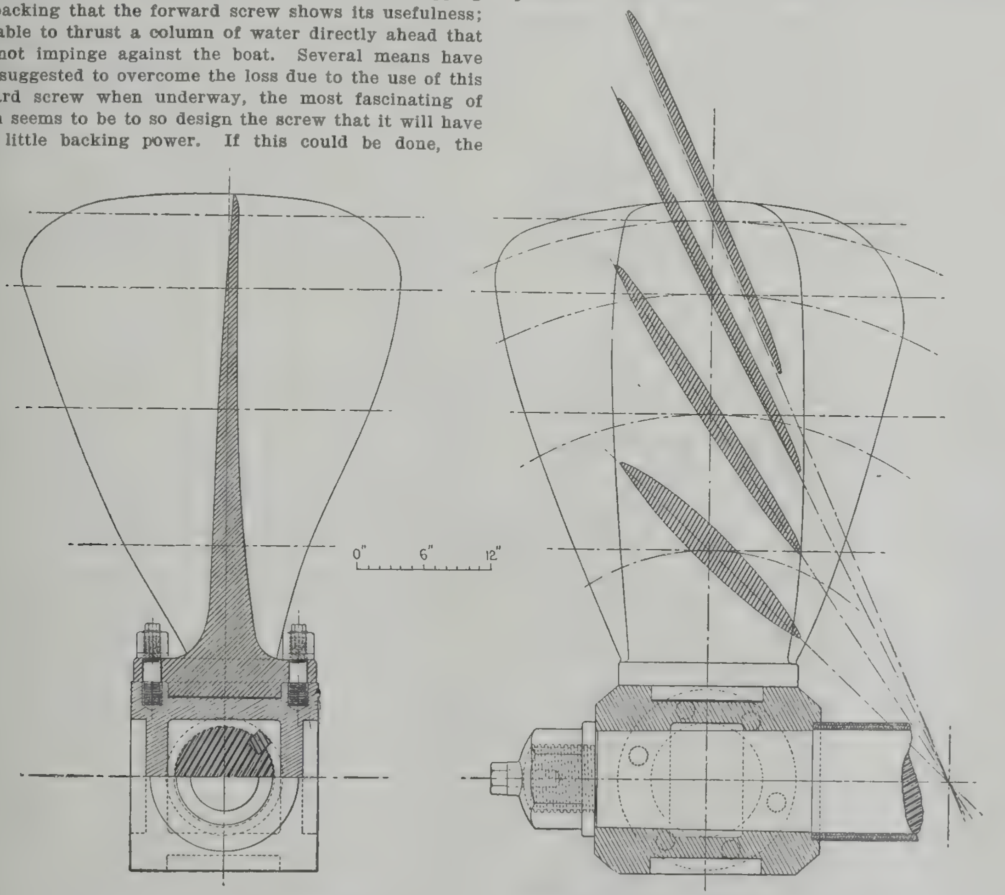

FIG. 4.—PROPELLER OF P. R. R. FERRYBOAT "CINCINNATI."

(Material, Cast-Steel; Diameter, 8 ft. 6 ins., Pitch, 11.3883 ft.; Disk Area, 113.49 sq. ft.; Developed Area, 32.26 sq. ft.; Projected Area, 26.57 sq. ft.)

The screw-propelled ferryboat is a type now so well known that it seems unnecessary to describe it, and to the few interested in the subject sufficient information is given in the accompanying plates to analyze the distribution of the power required. The service required from a ferryboat is so peculiar that the form of the hull, and the means of propelling it, are necessarily different from the usual type of boat. The propeller shaft is continuous from end to end, and to sufficiently submerge the screws the engines must be low; this requires a greater draft than a side-wheel propelled boat. On account of the height and weight of the superstructure for the accommodation of passengers and teams, the breadth on the water-line must be great, not to prevent capsizing, but because the greater number of the passengers carried are unused to the sea and become alarmed at a slight angle of heel, which is exaggerated by the great breadth of the decks. The metacentric height of the "Cincinnati" is 9 ft., and is not thought to be too great. The breadth of the water-lines is carried well to the ends to give longitudinal stability, so that the ends will not be depressed by the weight which gathers there in loading and unloading the boat. These conditions, it will be seen, impose extreme proportions; the amidship section is "V" shaped and the volume of the hull is but 46% of a circumscribed parallelepiped; though admitting of very fine water-lines and section-lines the ratio of wetted surface to displacement is much larger than usual.

The forms of hull and propeller of the ferryboat experimented upon are shown in Figs. 3 and 4, respectively.

The screw-propelled boat will eventually supplant the side-wheeled boat for ferry service, where certainty in the operation of the ferry is necessary, and where the comfort of the passengers is considered. As before stated, the boats are more quickly maneuvered at the landings, and in the winter they proceed through the ice without interruption, when the side-wheeled boats are very much delayed. A comparison of the power required to propel either type of boat shows results in favor of the side wheel. The "Cincinnati" and "Chicago" are operated on the same ferry, and their speeds are about the same.

	Propellers.	I. HP.	Displacement.	Speed.
"Cincinnati"	Screws.	624	952 tons.	11 miles.
"Chicago"	Side wheels.	530	775 "	11 "

If the power required to drive these boats varies as $\sqrt[3]{\text{displacement}^2}$, and the boats were brought to the same displacement, this would be the result:

	I. HP.	Displacement.	Speed.
"Cincinnati"	624	952 tons.	11 miles.
"Chicago"	608	952 "	11

The I. HP. of the "Chicago" includes the jet condenser.

It can, no doubt, be safely said, therefore, that the side wheel is a more economical propeller for a ferryboat than the two-screw arrangement, but it must not be forgotten that the advantages gained by the use of the screw are more valuable for the successful operation of a ferry than the amount saved in power.

Dynamometer.

So much depends upon the accuracy of the dynamometer in making resistance trials, and such good results were had from the one used in these trials, that a plan of it is shown on Fig. 2. A steel spring, A, is fitted between two caps, B and C, and a rod D, rigidly connected with the cap C, passes through the spring and the cap B, and is fastened to the tow line by the eye E.

The cap B is rigidly connected with the four rods at F, F, which passes freely through the cap C, and are rigidly connected with the casting G. This casting is fastened to the boat by means of the eye H. At J is a drum revolved by clock mechanism, and K is a guided rod, carrying a pencil, and connected with the main rod D.

The device was mounted on the boat in such a way that it was entirely clear of the deck, and was free to swing in any direction, and to follow the "lead" of the tow line, but it was not permitted to rotate; therefore, to overcome any twisting strains that would cause friction in the device, a roller bearing was fitted at L, so that the eye E could revolve freely and allow for the twisting of the tow line.

When the spring is compressed by a strain applied by the tow line through the eye E, the amount of the compression is recorded, by a pencil carried in the bar K, on a sheet of paper carried on the drum J; and as this drum revolves, the amount of the compression at any period of the run is recorded.

To determine the strain corresponding to various compressions, the complete device was calibrated by suspending weights from it and noting the amount of the compression. To determine the amount of friction, if any, the spring was taken from the device and tested between clamps in a reliable testing machine. No appreciable difference was found in the calibration by the two methods, so that is is safe to assume that the dynamometer measured the actual tow-line strains. The tow line was 360 ft. long, and it is hardly possible that the propellers of the towing boat affected the boat towed.

A WATER-WORKS PLANT FOR A VILLAGE OF 300 INHABITANTS.

A novel scheme for raising money for a water-works has been successfully carried out at Deansboro, N. Y. The population of the village was only 300, and no fire protection was available. A committee was appointed to appraise all buildings and their contents, after which fire protection was offered on all dwellings and out buildings in return for stock subscription to the amount of 2% of their appraised value; the rates for other buildings were as follows: Churches, schools and other public buildings, 2½%; stores and all buildings not included in the above classification, 3%. The owners of nearly all the buildings took stock and the works are expected to be in operation by Dec. 1.

The supply is developed from water-bearing gravel, water being collected by tile drains and brought into a central basin. From this basin the water is conveyed to the village, the main passing around the reservoir, and only the surplus above consumption going into the reservoir. This plan was adopted in order to prevent the possibility of the stored water being drawn off by excessive domestic consumption and leaving the village without fire protection.

The reservoir is excavated in red clay, and riprapped on its inner slopes. Its dimensions are 44 × 95 ft. at the top and 22 × 72 ft. at the bottom, the slope being 1 to 1. The water line is 8½ to 9 ft. above the bottom.

About 1¾ miles of mains have been laid, 13 hydrants set, and some 40 domestic services have been put in, or are expected. The pressure on the mains is given as 60 lbs. The company has an authorized capital stock of $4,000, but the cost of construction is not stated. We are indebted to Mr. Geo. I. Honey, secretary of the water company, for the above information.

Fire protection, as stated above, is furnished free to all stockholders. The rates to stockholders for a domestic supply are as follows: Family use, $5 per year; lawn sprinkling, $3; barns, $2.50. The rates to outsiders have not been fixed.

A MOTOR CARRIAGE RACE from London to Brighton, 52 miles, took place on Nov. 14, about 50 carriages starting. An American carriage, built by the Duryea Motor Carriage Co., won the race, making the run in about four hours.

VOTING MACHINES were used in several districts in the State of New York during the recent election. In most cases they gave complete satisfaction, but in some places they were found defective. In one district in Rochester the machine failed to register the votes of about 200 men, and the city council by a vote of 13 to 6 decided that the machines were not satisfactory and refused to pay for them.

A MONOLITHIC CONCRETE BRIDGE has been built at Detroit, Mich., to carry the Michigan Central R. R. across the new Boulevard. The arch is 50 ft. span and 13 ft. 6 ins. high at the center, and carries eight railway tracks. the bridge is of concrete and iron construction, having curved iron beams imbedded in the arch concrete, and the structure is faced with Berea sandstone. The bridge was designed by Mr. W. H. Ashwell, engineer of the Park and Boulevard Commission, and the contractor was Mr. T. J. Kennedy. The cost was about $30,000.

AN UNDERGROUND RAILWAY on Atlantic Ave., Brooklyn, N. Y., has been proposed by Mr. F. E. Storm, civil engineer, of that city, and the plans have been submitted to the Atlantic Avenue Commission. The work is to be all constructed in open cut, but the part from South Ferry to Fort Greene Place would be roofed over. From Fort Greene Place to the city line an open depressed track is provided for, bridged at each cross street and fenced in along the openings. The construction is to be of ironwork and concrete filling. The cost would be $2,433,525, divided as follows: From South Ferry to Fort Greene Place, 7,400 ft., at $65.30 per ft., $483,220; from Fort Greene Place to the city line, 31,100 ft., at $53.41 per ft., $1,652,654; 20 depressed stations, at $11,676.40 each, $233,528; 54 bridges, at $1,187.28 each, $64,113.12. These figures do not provide for the readjustment of water and sewer pipes, which would have to be done by the city, and which, according to the estimates of the engineers of the City Works Department, would cost from $500,000 to $1,000,000.

THE MILWAUKEE WATER INTAKE TUNNEL SUIT brought against the city by the contractors, Shailer & Schniglau, has been decided in favor of the city. A contract was signed in the summer of 1890 for this work, the price to be $250,000. In October, 1893, the city took the work into its hands and subsequently completed it. The city had paid about $80,000 on the contract and the suit just closed was for damages amounting to $170,000 to make up the difference between this and the contract price. Full details of the suit are not at hand, but such information as we have received indicates that the chief claim of the contractors was that the character of the material to be encountered was misrepresented. The city filed a counter claim for a large sum, partly as damages for delay in the completion of the work but principally for the excess of the expense incurred by the city to complete the work over the contract price. Neither claim was allowed.

THE EAST RIVER TUNNEL PROJECT, of the New York & Brooklyn R. R. Co., has been "turned down" by the Brooklyn Board of Aldermen by declining to take up the matter at this time and indefinitely postponing discussion. But Mr. Frederick B. Esler, representing the tunnel company, says that the company will now resort to its original plan providing for a Brooklyn terminus at the foot of Fulton St. This would be on private property over which the Brooklyn Board of Aldermen has no jurisdiction. The tunnel company has all the necessary authority from the New York Board of Aldermen, and the authority of New York extends to low-water mark on the Brooklyn side of the East River. The purpose of the tunnel is to connect the passenger railway systems of the two cities.

SWITCHING BY ELECTRICITY is now in use at the Brooklyn terminal of the Brooklyn Bridge cable railway. One of the new motor cars is being used instead of the steam switching engine, and all these cars will be tested in this way before being put into train service. They do the work quicker than the steam locomotives.

ELECTRIC POWER FROM NIAGARA FALLS was first utilized in Buffalo, N. Y., on Nov. 15, and the electric railways of that city are now operated partly by the current from the power plant at the Falls, this being, for the present at any rate, supplementary to the 4,000 HP. of the existing power plants of the railways. It is said that only about 1,000 HP. of the Niagara current is thus being utilized.

COMPRESSED AIR MOTORS form the subject of a late letter from Paris to the New York "Evening Post." The Mekarski system, introduced at Nantes, in 1879, includes the storage of air compressed to 25 atmospheres in reservoirs under the motor-car. This air passing through a regulator is reduced to a pressure of 5 atmospheres in the working cylinders, and the loss of energy in this reduction, estimated at 38%, is met by a reheating of the air before it enters the cylinders. The Mekarski system of motors is now used on the line from Nogent to Bry, on the Marne, from the Louvre to St. Cloud and to Versailles; and from St. Augustin to Vincennes. The objections to the system is the dead weight of the motor-car and its reservoirs, amounting to from 4 to 10 tons, and the necessity of going to a central station for re-charging. Otherwise, the system works well and grades of more than 6% are readily overcome. Mr. Popp, of the Compagnie Parisienne d'Air Comprime, now proposes to establish lines of piping carrying compressed air and so arranged as to charge the car reservoirs at short intervals along the route, and he has already laid down 2½ miles of such a line, furnishing air at 10 atmospheres, in Saint-Quentin. He would thus do away with the heavy reservoirs on the motor-car and claims a loss of only 1% in transmitting the compressed air 2½ miles, with a plant costing about the same as for electric traction; both for compressors as offsetting dynamos, and pipes as offsetting overhead wires and their supports. The extreme cost price of the Mekarski system, as originally used, is set down by this correspondent at 7 cts. per kilometer per motor car, or 11.3 cts. per mile, including the compression of the air, repairs, maintenance, interest, sinking fund and profit to factory. This is compared with 17.7 cts. per mile for horse-tramways in Paris. When the motor hauls another 50-passenger car, the supplementary expense is 3.2 cts. per mile. In Belgium, where labor and coal costs half as much as in Paris, the cost goes down to 6.4 cts. per mile for the motor-car.

THE REGULATION OF STREET TRAFFIC, by ordinance, has been attempted in New York city. The ordinance adopted applies to the Boulevard and provides that

> except when going or coming directly from or to their place of departure or destination on said Boulevard, and except when actually passing another vehicle or an obstacle, all trucks, express wagons, vans and business vehicles of all sorts shall keep in single line upon the extreme right of the Western Boulevard at all points between 59th St. and Manhattan St.

It further specifies that all bicycles and passenger vehicles shall use the part of the street not set apart for the above classes of vehicles. The enforcement of this law is already causing grumbling and trouble; but it is a wise and reasonable ordinance and should be applied on many other avenues of heavy traffic.

A PIER ROOF-GARDEN, upon the pier at the foot of East Third Street, New York city, has been ordered by the Board of Dock Commissioners, to meet the request of the Board of Aldermen for the establishment of such gardens for the purpose of providing places of healthful recreation for the people living near these piers. Plans for such a roof-garden have been prepared by Edward H. Kendall, Past President of the Institute of American Architects and consulting engineer to the Dock Board; these plans have been approved, and the preparation of the contract and specifications ordered at the earliest possible date.

THE PRODUCTION OF TIN PLATE in the United States for the fiscal year ending June 30 is reported by the Treasury Department to have been 307,228,621 lbs. The total imports were 385,070,372 lbs. and the exports 137,659,779 lbs., making net imports 247,410,593 lbs. The annual capacity of the mills completed and in process of construction on June 30 is 585,000,000 lbs., or more than the total of domestic production and net imports. Of the production, 98½% was made from sheets rolled in the United States. The report embraces the production of 53 firms making tin plates, and of 36 rolling mills producing black plates.

A HUGE GRANITE BLOCK has been quarried at Barre, Vt., for the Moriarty monument in New Orleans, but there is trouble in finding a railway that can take it, as its size is too great for the smallest bridges on some roads. The stone is 15 ft. square and 3 ft. thick.

THE HANKOW-PEKIN RAILWAY may be built with Chinese capital, says a Pekin dispatch. There is a hitch in the negotiations with the American syndicate which was lately reported as being ready to advance 30,000,000 taels for this purpose, and the Chinese government is now attempting to borrow 20,000,000 taels among native capitalists. This attempt will probably also result in failure.

THE PHILADELPHIA & READING R. R. and its leased lines, mining properties, etc., will probably be operated under the control of the Reading Co., whose capital stock has been increased to $40,000,000. Mr. Joseph S. Harris is president and Mr. Wm. R. Taylor is secretary of the company.

ACETYLENE GAS GENERATORS are now used to furnish light for magic lantern purposes. Calcium carbide is placed in the generator, and water admitted at the bottom through a stop-cock. As the water rises and comes in contact with the carbide, the acetylene is generated and escapes into a receiver and thence to the burners. When more gas is generated than is used the increasing pressure depresses the water level, and almost stops the generation of gas. The gas is burned in the lantern in four 1-ft. burners, each giving a perfectly white light of 125 c. p. It is claimed that the convenience of the apparatus will cause acetylene to entirely supplant the oxy-hydrogen light commonly used for magic lanterns.

THE VALIDITY OF THE BERLINER TELEPHONE patent is now being tried in the Supreme Court of the United States, argument having been begun on Nov. 9. Upon its decision will depend whether the Bell Telephone Co. shall retain its monopoly of the existing system of telephone transmission for 17 years from November, 1891, the date of the patent for the Berliner transmitter, or whether the system shall become free to the public. Berliner's original application was filed June 4, 1877, and came under the control of the Bell Co. in 1878, but it was not issued till 1891. Suit was begun by the government on Nov. 17, 1891, for the cancellation of the patent on the ground of the extraordinary delay, which it was claimed was in effect a fraud upon the public; and also on the grounds that a patent issued to Berliner in 1880 covered the same invention as that covered by the patent in suit; that the patent was not for the invention described in the application as filed. The first trial of the case before the U. S. Circuit Court for the District of Massachusetts, on Jan. 3, 1895, resulted in favor of the government; this decision was reversed on June 14, 1895, by the Court of Appeals for the First Circuit, and the government has now taken the case into the Supreme Court.

ENGINEERING NEWS
AND
AMERICAN RAILWAY JOURNAL.

Vol. XXXVI., No 22.

TABLE OF CONTENTS.

ENGINEERING NEWS OF THE WEEK........337, 351
- Notes of a Transcontinental Trip, V, San Francisco (illustrated) 338
- The New Power Plant of the Washington Mills Co., Lawrence, Mass. (with inset) 341
- Heavy Tank Locomotive for the Madison Incline, Pennsylvania Lines (illustrated) 342
- The Americanizing of English Railways.......... 343
- Naval Practice in Ship Rivets and Riveting (illustrated) 348
- Removal of Iron from Water from a Filter Gallery at Reading, Mass. (illustrated).......... 348
- Book Reviews 351

EDITORIAL NOTES 344
- Break-in-Twos with M. C. B. Couplers—Pin-Connections vs. Rivets in Bridge Construction—Advantages of Pin-Connections in Erection—The Need for More Engineers in the Navy—The Advantages of Tank Locomotives.

EDITORIAL:
- High Buildings and Safe Elevators.......... 345

LETTERS TO THE EDITOR.......... 346
- Early Bridge Trusses Without Diagonals—Vertical Curves for Connecting Railway Grades.

FAST RAILWAY RUNS are being made by the Baltimore & Ohio R. R. express trains, between Philadelphia and Washington, 136 miles. The schedule time is 53 miles per hour, and the maximum obtained is 75 miles per hour, the latter speed being only maintained for short distances, and in most cases when enginemen are attempting to make up lost time. On Nov. 4, train 510, with engine 1310, hauling 4 cars, covered 96.7 miles in 124 minutes and made 4 stops. This train covered 61 miles in 65 minutes, including 5 minutes crossing the Susquehanna River bridge. On Nov. 6, train 511, engine 849, with 4 cars, covered 25.6 miles from Aberdeen to Bay View in 24 minutes. On Nov. 10, train 501, engine 1309, with 6 cars, covered 96.7 miles in 123 minutes, including 4 stops; 25.6 miles of this distance, Aberdeen to Bay View, was covered in 25 minutes. On Nov. 13, train 504, engine 1308, with 6 cars, covered 96.7 miles in 121 minutes, including one stop. Probably the best performance was on Nov. 15. Train 507 (the Chicago limited), with engine 1308, hauling 11 cars, the entire train, with the exception of 3 cars, being vestibuled, left Camden Station, Baltimore, at 7.04 p. m. and arrived in Washington at 7.52 p. m., being a run of 40 miles in 48 minutes. This train covered the distance between Muirkirk and Alexandria Junction, on the Washington Branch, 8.1 miles in 7 minutes. This was an exceptionally good run, when it is taken into consideration that the speed had to be slow through the cities of Baltimore and Washington, and there was one slow order on account of sewer construction.

A PARALLEL RAILWAY SCHEME at Catskill, N. Y., was recently nipped in the bud by the New York Railroad Commission. The proposed road was projected by the Catskill, Cairo & Windham Street Ry. Co., and ran parallel with the line of the Catskill Mountain Ry. Co. for its entire length. In its decision refusing the application the Commission said:

> After a personal inspection of the proposed route and the existing line, and upon the evidence submitted, it seems to the Board that there is not business or traffic enough to authorize the construction of an additional railroad. The existing line is not self-sustaining and has not been at any time since its construction. It has ample facilities to transact all the business that is offered or which is likely to be offered for several years to come. From the applicant's own evidence it is apparent that the travel along the proposed route is not such as would make the construction of this road a public convenience and necessity as contemplated by the statute.

ELECTRIC TRACTION on the suburban and Coney Island lines of the Long Island R. R. is being considered by the company, in order to introduce a frequent service of cars instead of the less frequent service of trains now in use.

ELECTRIC TRACTION may be introduced on a part of the line of the Cincinnati, Hamilton & Dayton R. R. The company has acquired the street railways of Middletown, O., and will connect them with its own line, running cars through between Middletown and Hamilton by electricity. The system may also be extended to some of its suburban lines at Cincinnati.

A STEAM CARRIAGE OR OMNIBUS, built by Mr. M. Scotte, of Epernay, France, is now in service between Picauville and the nearest railway station. The motor car consists of a front compartment for the engine and a back compartment for 14 passengers. The trail car will seat 24 passengers. The 16-HP. engine is of the vertical compound type. The boiler is vertical, and carries a pressure of 50 lbs. per sq. in. The power is transmitted to the rear wheels, and the forward wheels are employed for steering, being pivoted around a vertical axis by means of a wheel directed by the engineman. The coal or coke for fuel is carried forward, and the bunkers will admit of about 450 lbs., or sufficient fuel to serve for four hours of travel; 150 gallons of water are carried in the tanks situated under the seats and under the floor. The dimensions of the motor car are 17 ft. in length and 6 ft. wide. Its weight is 7,700 lbs., without passengers. It will turn in a circle of 12 ft. diameter.

THE MOST SERIOUS RAILWAY ACCIDENT of the week was a derailment on the Bald Eagle Branch of the Pennsylvania R. R., at Unionville, Pa., Nov. 18. A broken car axle was the cause of the accident, and 20 coal cars were smashed in the wreck. One trainman was killed and another injured.——A runaway westbound freight train on the Denver, Leadville & Gunnison R. R. jumped the track at a curve at the foot of a steep grade east of Webster, Mo., Nov. 14. One man was killed and three were injured, while the engine and 14 cars were smashed.

A LASSOED LOCOMOTIVE caused considerable damage at East Liverpool, O., Nov. 18. While hoisting the steel floor beams of the new bridge over the Ohio River, which spans the Cleveland & Pittsburg R. R., a wire cable was allowed to slacken so that it almost touched the rails. A heavy freight train was approaching, and the bridge workmen tried to raise the cable out of the way, but the smokestack of the locomotive struck it, carrying it nearly 600 ft. Telegraph poles, signal towers, and telegraph wires were snapped off and the traveling crane cars on the new bridge were upset. The rope was pulled out of the Ohio end of the bridge reel, and this prevented injury to property and loss of life of bridge employees, and persons in stores, residences, and on the streets. One end was thus finally freed before the train was stopped, and fell from the locomotive on the side of the track next to the bridge. The engine was considerably damaged, and part of the smokestack was torn away.

A LOCOMOTIVE BOILER EXPLOSION occurred Nov. 17 on the Atlantic Coast Line R. R., near Richmond, Va., and two men were badly scalded. The engine was hauling a freight train when the crown sheet collapsed.

A BROKEN STEAM PIPE on the tugboat "Hudson," while the boat was at Kinderhook, N. Y., Nov. 18, resulted in severe injuries to the engineman and fireman, and the latter died soon after the accident.

A HIGHWAY BRIDGE OR TRESTLE over Village Creek, near Ensley City, Ala., gave way under a wagon Nov. 22; one person was killed and 12 were hurt. It is said that the stringers were too short and had slipped off the end sills.

BIDS FOR A STEEL POCKET DUMP at the foot of East 17th St., East River, New York city, are wanted by the Commissioner of Street Cleaning until Dec. 3. About 150,000 lbs. of structural steel will be required, together with wrought and cast iron in small quantities, and some 30,000 ft. B. M. of timber and boards. Col. Geo. E. Waring, Jr., M. Inst. C. E., is Commissioner of Street Cleaning.

THE BROOKLYN DRY-DOCK ACCIDENT, of last August, has at last been passed upon by the Secretary of the Navy. The court of inquiry convened held Mr. A. G. Menocal, C. E., U. S. N., and Mr. U. S. G. White, C. E., U. S. N., responsible for the accident to the caisson, stating in effect that these officers should have transferred the ballast from the hold of the caisson to the upper deck, instead of entirely removing it, before replacing it with concrete; that notwithstanding their calculations, the entire removal of the ballast was unprecedented and they should have taken no risks, even to save some trouble and expense. The court recommended a court martial; but Secretary Herbert, while upholding the finding of the court of inquiry, "in view of the long service of these officers," will not order a court martial, but "reprobates their conduct," and charges the damage done to "a want of knowledge of which you ought to have possessed yourselves before acting."

THE PNEUMATIC MOTOR SYSTEM of the U. S. Monitor "Terror," was fully tested at sea, on Nov. 19, in steering the ship, turning the turrets and loading and pointing the 10-in. guns. The two air-compressors employed compress the air directly into an 8-in. pipe running through the ship, no other reservoir being used. In this pipe a pressure of 125 lbs. to the sq. in. can be developed in 45 seconds. From this main, small pipes lead to the steering gear, turrets, shell hoists, etc. In the trial the rudder was turned from hard a-port to hard a-starboard in 6 seconds. In 3 seconds a turret weighing over 250 tons was set moving, and in 52 seconds both turrets were turned completely around by compressed air. The first 10-in. gun was loaded in 1 min. 37 sec.; including the lifting of the 500-lb. shell and the powder from the magazines, and the loading of the gun and ramming home of the charge, all by pneumatic appliances. Some trouble occurred during the test from the lack of any previous drill, but the working of the pneumatic system was pronounced successful. At the same trial the four 10-in. guns were fired simultaneously by electricity, with full service charges and shells. This is a thing said to have been never before tried on an American war-ship, and the "Terror" stood the test well.

THE NEW BATTLE-SHIP "IOWA" had a trial trip, in charge of her builders, the Cramp & Sons Shipbuilding Co., on Nov. 13. The course was 10 knots in length, located 20 miles east of the Delaware capes. Four trips were made over the course, the average speed being 16.27 knots with 112 revolutions of the screw per minute. The speed guaranteed by the builders was 16 knots. The horsepower developed by the engines was approximately 11,000. The official trial is expected to be made in February.

EXTENSIVE INDUSTRIAL DEVELOPMENTS AT NIAGARA Falls and vicinity are expected soon to result from the successful transmission of electric power from the Falls to Buffalo and the increased power equipment of the two power companies, the Niagara Power Co., which owns the great tunnel, and the Niagara Falls Hydraulic Power & Manufacturing Co., whose plant on the side of the cliff below the falls was described in our issue of Mar. 26. The former company intends to place in position as soon as possible five more 5,000-HP. dynamos. The extension of the wheel pit to receive the turbines is now being made. Among the new developments in the vicinity is the plant of the Matthiesen Alkali Co., which is expected to be ready to operate Jan. 15, 1897. The Niagara Development Co. will build 25 new houses at Echota in the spring. The Pittsburg Reduction Co. has started its new aluminum plant, taking power from the new electric plant of the Niagara Falls Hydraulic Power & Manufacturing Co. The production of aluminum by electric power from Niagara Falls is now so great a success that the Pittsburg Reduction Co. has found it advantageous to abandon its plant at Patricroft, England, and make all its product in this country.

ALUMINUM IS USED TO CONDUCT ELECTRICITY in the new aluminum works of the Pittsburg Reduction Co. at Niagara Falls, transmitting current from the generators in the power house to the electric furnaces in the melting house. The electric conductivity of aluminum, according to M. Lazare Weiler's table, is 54.2, pure copper being 100. The specific gravity of aluminum is 2.67, and that of copper 8.85, or 3.32 times as much. To carry the same current as could be carried by a rod of copper of 1 sq. in. section would require $1 \div 0.542 = 1.845$ sq. in. of aluminum, and this would weigh only $1.845 \div 3.32 = 0.556$ of the weight of the copper. If the cost per pound of aluminum were only 1.8 times as much as the cost per pound of copper, then the cost of a conductor of each of the metals would be the same.

THE NAIL TRUST has collapsed. It began in June, 1895, and it in one year had advanced the price of wire nails from 95 cts. to $2.70 per keg. In one year it made 6,000,000 kegs of nails. It taxed the dealers 15 cts. a keg, which tax was refunded to them at the end of six months on proof that they had not cut the selling prices. It paid competing manufacturers to close their works, or bought them outright. It got control of the nail machine makers so that no one outside of the trust could buy a nail machine, and ran things with a high hand generally. The yearly average prices of nails at Chicago for the five years previous to the formation of the trust were: 1890, $2.51; 1891, $2.04; 1892, $1.70; 1893, $1.49; 1894, $1.11. In April, 1895, the average price was 95 cts., and on May 1, 1896, the price was fixed by the trust at $2.70, after repeated advances during the year, and this price has since been maintained. The collapse came about through the starting of several small nail factories which bought a new nail machine recently put on the market and which the trust failed to capture. Nails at Chicago have already dropped to $1.70 per keg, and the price is expected to go to $1.25.

AMERICAN CITIZENS ONLY can be employed by the contractors for the improvement of the New York State canals. This is in accordance with the law passed May 10, 1894 (Chapter 622, Laws of 1894), relating to the employment of mechanics and laborers upon public works. This law forbids the hiring of any but American citizens for labor performed for the state of New York or for any municipal corporation in that state, and the same law requires the contractors for such work to pay the men not less than the prevailing rate of wages for similar services.

NICARAGUA CANAL LEGISLATION, says Mr. J. R. Bartlett, of the Nicaragua Canal Company, is not to be "forced" upon Congress at its next session. "A moderate attempt" will be made to secure favorable action; but meanwhile private negotiations for foreign capital will be resumed where they were broken off by the Venezuela proclamation of President Cleveland. Mr. Bartlett says that at that time English capitalists had agreed to advance $60,000,000 towards the construction of the canal.

NOTES OF A TRANSCONTINENTAL TRIP.

V.

San Francisco.

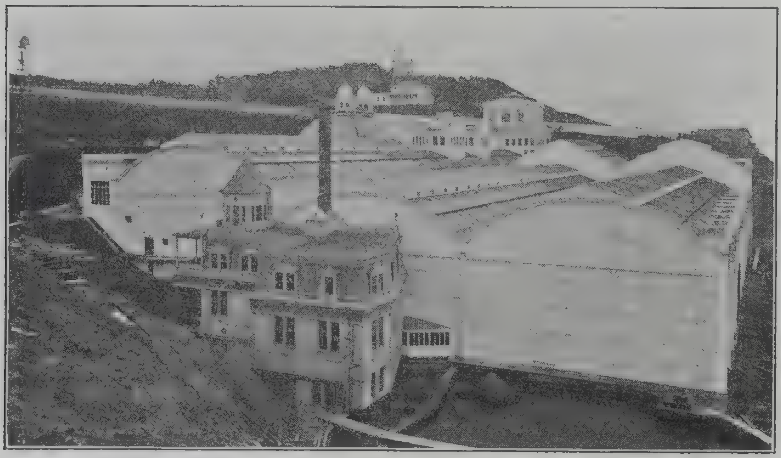

FIG. 1.—VIEW OF THE SUTRO BATHS AND SUTRO HOUSE.

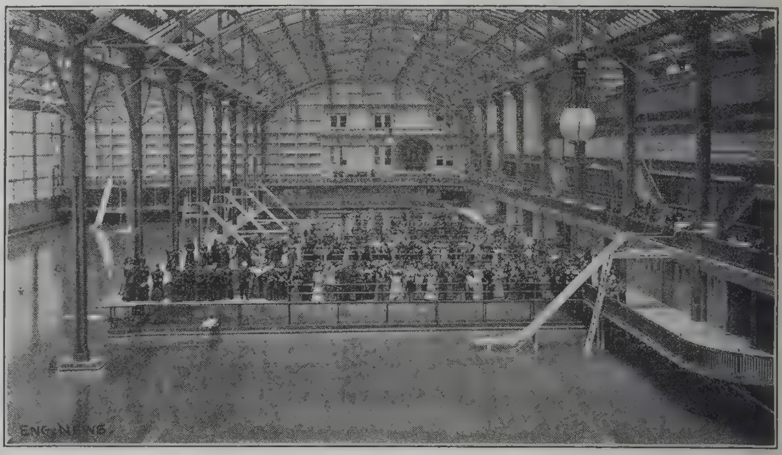

FIG. 2.—INTERIOR VIEW OF THE SUTRO BATHS; SAN FRANCISCO.

This is a large and attractive city, having a population of about 400,000. It is situated on the north point of a peninsula, 30 miles long, which separates San Francisco Bay from the Pacific Ocean, the northern side of the city fronting on the Golden Gate, and its eastern side on the bay. The far-famed Golden Gate is the narrow strait connecting the bay with the ocean, so that the great bay, with an area of about 600 sq. miles, is almost entirely land-locked. This strait forms the only break for some hundreds of miles in the low coast range of hills which rise directly from the shore. A peculiar meteorological result of this break in the range is that San Francisco is practically never hot, for in the afternoon of a warm day the wind from the sea will begin to pour through the strait as through a funnel, until by the evening there will be a chilly gale blowing. The climate is remarkably mild and equable, being free from extremes of heat and cold. I had expected to find this an exceedingly hot place after the great heat on the Sierras, but while other towns in the state were experiencing temperatures of 80 to 96°, the temperature in San Francisco rarely got as high as 75°, and then only for a short time, while every night was cool and fresh. There is a great deal of fog on the coast, and looking up Market St., during a sunny day, there is often to be seen a grey darkness over the hills between the city and the coast, which to a stranger appears to presage a heavy thunderstorm, but the clouds do not approach and the sunshine remains unobscured. Taking a car for the shore, which is about 7 miles distant, one finds the air growing colder and damper, while along the crest of the coast range can be seen a mass of white vapor rolling down on the east or landward slopes, but not getting very far. This is found to be a wet sea fog, which settles close down on the water, and it is this fog, coupled with the many dangerous points of the coast, which has led to the loss of so many steamers in this vicinity. On returning to the city, the fog is gradually left behind and the sunshine is again reached.

The city government is far from being satisfactory, as it is run mainly on a political basis and with personal and party ends in view. There is a city surveyor, but no city engineer, and the street commission has no engineer. The sewerage system is very imperfect and many of the sewers are in a dilapidated condition, caving in quite frequently. In 1892, a sewer commission was appointed to investigate the condition of the system and to report upon the means of improving it. For political reasons, however, it was legislated out of office in 1893, before it had done anything beyond making a preliminary report which conclusively showed the faulty condition of the work as existing. This commission was composed of Mr. Irving M. Scott, Col. G. H. Mendell, U.S. Engrs., Mr. Geo. Davidson, Mr. Marsden Manson, and Mr. C. E. Grunski. The street paving is not very good as a whole, but the sidewalks are in much better condition. Concrete or artificial stone is largely used for the sidewalks, and it is specially noticeable that it has a rougher and coarser surface and is consequently much less slippery, than the cement paving commonly used in the East.

An engineer notices the great extent to which concrete is used for garden walls, retaining walls, sidewalks, steps, gate posts, sidewalks, etc., and even for the basement walls of buildings, the exposed surface in these latter cases being finished to imitate rock-faced stone. The reason for this extensive use of concrete is the cheapness of Portland cement, which is brought here by ships as ballast, and costs very little, while the equable climate is very favorable to the durability of the concrete. A number of contracting firms devote themselves to this class of work as a specialty.

Fig. 3.—Plan of the Sutro Baths.

The topography of the city is irregular, there being several isolated hills, besides the range on the coast; the Mission Peaks are 925 ft. high, Reservoir Hill (in Golden Gate Park), 920 ft., while Russian Hill and Telegraph Hill are also points of interest. This makes the streets (which are laid out on a rectangular plan) very steep in places, so steep in fact that several blocks on the south slope of the ridge parallel with the Golden Gate are impassable for teams, and can only be used with much exertion by pedestrians. It was on locations like these that the cable railways were first established, and it is here that the cable railways are found to be of special interest. San Francisco is in fact the home of the cable railway, which was first introduced there by Mr. Andrew S. Hallidie, in 1873. The first line was the Clay Street Hill Ry., with 5,197 ft. of double-track and a maximum grade of 16.26%. A ride on any one of the lines built along the ridge, where grades of 18 to 23% occur, such as the Powell St., California St. or Sutter St. lines, is really more thrilling to a stranger than is the ascent of Pike's Peak. In the latter case the train ascends slowly and this gives the impression of great care and caution being taken, while the cable cars climb rapidly up a series of short steep grades (broken by the level stretches at street intersections) and then as rapidly run down similar grades from the summit level. Curves are also traversed quite rapidly and on some of the lines the up and down motion almost conduces to seasickness. Various styles of grips are used, some having the jaws moving vertically and some horizontally, and both wheels and levers are used to operate the grips. On some lines short open grip cars are used, hauling short four-wheel, closed trail cars, but the more important lines have very long cars on two four-wheel trucks, half of the car being open (with seats back to back and the grip levers between) and half closed. The car bodies are set low on the trucks, so that it is an easy step to the platform. Ordinary wheel brakes are used, but there is also a track brake fitted to one of the trucks, this brake having a wooden bar or shoe which is forced vertically down upon the rail. At many of the terminals turntables are used, smaller tables having one track engaging with one or other of the converging double tracks, while larger turntables have two tracks in line with the main tracks. The turntables are of iron construction with a wooden platform at the street level, and some of them are operated by power derived from the cable. There is a most extensive system of transfers between the various connecting and intersecting lines, while since the opening of the Sutro electric line to the Cliff House, the trip of about 7 miles from the city to the shore can be made for 5 cts. Electric traction is employed on many of the more level lines, the cars being large combination cars, as on the cable lines, and it was noticeable that here (as in other western cities) the conductors did not have as much to do in looking after and replacing the trolleys as they do in many eastern cities. There are two steam lines to the shore, operated by double-end saddle tank engines; one of these has open-sided excursion cars, while the other (following the shore of the Golden Gate and opening up some wonderful scenery) has a curious style of car with an open section at the middle and a closed section at each end.

There are many fine offices and store buildings, but the craze for "sky-scrapers" has not yet broken out to any extent, though the proprietors of the San Francisco "Call" are now erecting a 15-story building of steel skeleton construction. The new Parrott Building is a large steel building with many interesting features, including a great dome over the center of the first floor (in the central light court).

One of the notable buildings of San Francisco is the Palace Hotel, which was of almost unprecedented size and magnificence when built some years ago, and is still a very striking building. It occupies an entire block, 275 × 350 ft., and is in tho form of a hollow square, with light courts allowing for four rows of rooms on each side. It has seven floors above the ground floor and can accommodate 1,200 guests. The central court is carried up to the roof, which is of glass, and around it, on each floor, is a broad corridor or gallery. Carriages drive into this court and leave guests right at the door of the hotel office. The whole effect is enhanced by the handsome finish of the fronts of the galleries, with white balustrades and pillars, and the liberal use of palms and tropical plants. All the water for the use of the hotel is filtered in a large filter plant erected on the roof of the building.

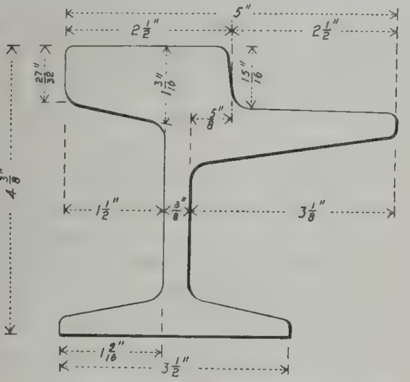

Fig. 4.—70-lb Rail for Street Railways; San Francisco, Cal.

The street cleaning of the city is done under the management of the Merchants' Association, and the men are dressed in a uniform consisting of a brown canvas jacket or jumper, overalls of coarse brown duck, and a blue cap with the name of the association in gilt letters. At the foot of Market St. is a large railway office and waiting room for the ferries to the railway station at Oakland and to the various towns situated across the bay. Work is now in progress upon a large new steel structure, which is being built under the supervision of Mr. Horace E. Brown, Engineer to the Harbor Commission. The Risdon Iron Works, of San Francisco, have the contract for this work. At Oakland some land reclamation work is going on to form a site for coal bunkers. Mr. Grunsky is the engineer, and Mr. Otto von Geldern is in charge of the work for him.

The sea coast is reached by either one of two steam railways, or the Sutro electric railway, all starting from the suburbs of the city and converging near the celebrated Cliff House in front of the Seal Rocks. The old Cliff House was burned on Dec. 24, 1895, but a larger structure was at once built, and is a great resort for tourists and people from the city. North of the Cliff House are the new and extensive Sutro baths. On top of the hill (shown in the eastern view of the Sutro baths, Fig. 1) and overlooking the ocean is Sutro Heights, the residence of Mr. Adolph Sutro, Mayor of San Francisco, but who is most widely known from his connection with the famous Sutro tunnel on the Comstock lode in Nevada. The grounds of his establishment are open to the public.

The Sutro Baths.

On the shore, and close to the Cliff House, are the new Sutro baths, established and built by Mr. Sutro, and which were opened in March, 1896. The buildings are handsome and spacious, and form a pleasure resort for visitors as well as bathers, there being a museum and other attractions, and cheerful promenades lined with palms and growing plants. The entire building is 499.5 × 254.1 ft., and contains about 600 tons of ironwork in the columns and roof trusses, 270,000 cu. ft. of concrete, 3,500,000 ft. of lumber and 100,000 sq. ft. of glass. Provision is made for spectators at aquatic sports and swimming matches, there being seating capacity for 3,500 persons in the amphitheatre, and 3,500 on the promenade, while the total capacity of the building, including the aisles, etc., is 25,000 persons. There are seven swimming tanks, as follows: One large tank, 1,409,062 gallons capacity; 4 small tanks, 70, 283, 400 and 875 gallons; 1 medium size tank, 112,500 gallons; 1 fresh water tank for plunges. There are 9 spring boards, and 7 toboggan slides lined with sheet brass and having a continuous stream of water running down them. These are shown in the general interior view, Fig. 2. There are 517 private dressing rooms and 9 club rooms, the total capacity being 1,110; 29 dressing rooms and all the club rooms are fitted with shower baths, and there are 66 shower baths in all. The laundry equipment can handle 20,000 bathing suits and 40,000 towels per day. The restaurant is on these floors, with an area of 30 × 75 ft. on each floor.

The water for the baths is taken from the waves or rollers which break on the reef on which the baths are built. A catchwater basin 75 × 150 ft. was blasted out of the rock, and this receives the water from the waves, which then flows to the receiving pond, and through a tunnel to the settling tanks, whence it goes to the various bathing tanks. With a high sea rolling in, the tanks can all be filled in an hour. A centrifugal pump with a capacity of 6,000 gallons per minute keeps up a constant circulation, and can fill the baths in from 5 to 6 hours. The tanks can all be emptied in an hour, at high or low water, through an outlet of 24 inches diameter, the waste water being led away to a point where it is discharged into a tidal current, so that there is no chance of its being at once taken in again. The water is heated by a system devised by Mr. Sutro, using direct steam driven through small tunnels. The temperature is graduated in the different tanks, and in the smaller tanks it can be raised 10 or 20° in a few minutes. The bath buildings are protected on the west by a breakwater lying north and south, 400 ft. long, 20 ft. deep, 25 ft. wide at the top and 75 ft. at the base, containing 450,000 cu. ft. of rock; another breakwater runs east and west, this latter being 300 ft. long and of the same cross section, containing 300,000 cu. ft. of rock. A general plan of the establishment is shown in Fig. 3.

The power house contains three compound vertical, direct connected engines of the marine type. Two of these operate the Sutro Electric Ry.; the larger has cylinders 16 × 24 ins. and 32 × 24 ins., and is rated at 600-HP. at 150 revolutions per minute; the other has cylinders 11 × 18 ins. and 22½ × 18 ins., and is rated at 300 HP. at 200 revolutions per minute. Each engine has its own surface condenser, through which the water from the ocean flows on its way to the baths. The engines drive dynamos of 400 K-W. and 200 K-W., respectively, the smaller being sufficient during week days, when only about 8 cars are running, and the larger being used when the traffic is heavy, while both engines are run together on Sundays, the traffic then being exceptionally heavy.

The third engine drives two 75-K-W. generators for the electric lighting of the baths. All the engines have steam jackets on the cylinder walls and heads. Each cylinder has two separate steam valves and two separate exhaust valves, the former (on both cylinders) being controlled by the engine governor. The engines were built by the Fulton Iron Works, of San Francisco, and the dynamos by the General Electric Co., of Schenectady, N. Y. Steam is supplied by three Babcock & Wilcox water-tube boilers, carrying 140 lbs. pressure, and the fuel is Welsh anthracite coal, costing $7 per ton. Records of coal consumption, currents, etc., are taken daily, and account is taken of the amount of the total power consumed by the railway, the pumps, and the Frith wheel and other attractions. The baths were designed and built under the personal direction of Mr. Sutro, and they, as well as the electric railway, are among the many works built by Mr. Sutro for the benefit of the people of San Francisco.

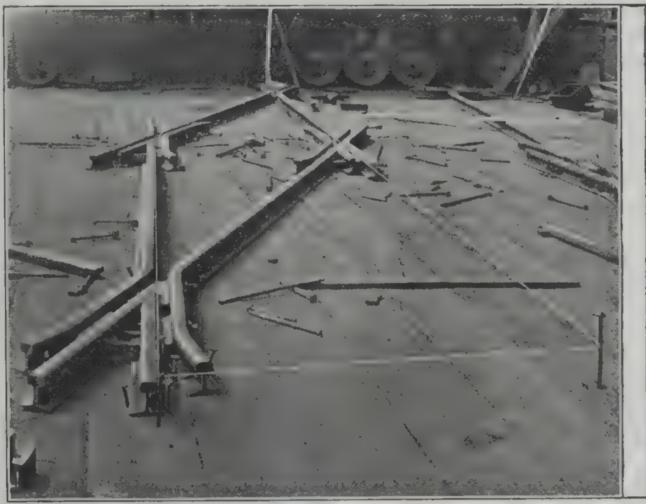

Fig. 6.—Track Crossing; Built by the Pacific Rolling Mills.

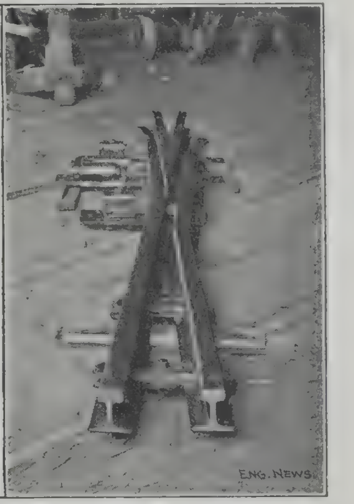

Fig. 5.—Spring Rail Frog for the S. F. & S. J. V. Ry.; Made by the Pacific Rolling Mills, San Francisco.

Business and Industries of San Francisco.

Union Iron Works.—These works have a very extensive plant for machinery and shipbuilding. The company is naturally proud of its work on the warships "Oregon" and "San Francisco" for the U. S. Navy, while since my visit it has obtained the contract for one of the new battleships, and very recently for a battleship for Japan. Besides the ordinary machine shops, foundry, etc., it has a galvanizing plant, extensive ship-yards, a large floating dry-dock and a storage space piled up with spare propellers, shafts, engine fittings, etc., for the various steamers built. A large new boiler shop is being built, and a new three-story office building, the lower story of this latter being of rock-faced monolithic concrete, while the upper part is of pressed brick with stone trimmings. The concrete work is being done by Keatings & Leonard, licensees for the well-known Ransome system of concrete and twisted iron construction, who have done a considerable amount of work of this kind. All kinds of iron and machine work are done here, and at present a good deal of mining machinery is being turned out, the works being quite busy and employing some 2,000 men. In the shops are some exceptionally large machine tools which were designed and built at the works. The great compound hoisting engines built for the Anaconda copper mines were illustrated and described in Engineering News, Sept. 3, and at the time of my visit the following work was in progress: Two sets of double-acting hoisting engines, with two cylinders, 30 × 72 ins., on each side; one similar engine, with cylinders 20 × 60 ins.; a 20-stamp silver mill for Mexico; three sets of 1,200 HP. triple-expansion engines of marine type, with direct-connected dynamos, for the Market St. Ry.; nine elephant boilers, 160 lbs. pressure, fitted with Rooney stokers, for the Market Street Ry.; triple expansion engine of 2,800 HP. for the Pacific Coast Steamship Co.; two gunboats; a steamer of 600 tons for the Sandwich Islands. The repairing and overhauling of steamers is an important feature of the firm's business.

Pacific Rolling Mills.—The works were first started for the manufacture of bar iron, and then, when the Central Pacific Railway was being built, they made great quantities of ironwork for cars, since which time the plant has grown very extensively. The principal orders now on hand are for structural work, but include also some small highway bridges (80, 120 and 140-ft. span), and there is a considerable amount of minor work in hand, such as spikes, bolts, nuts, and the rod bands for wooden stave pipe. The ironwork for the Parrott building, with its great dome, and the dome on the City Hall, were turned out from these works. Z-bars are among the sections rolled; in fact, it is claimed that this was the first mill to roll such a section in this country, it having been made originally for one of the warships, the plans for which were purchased abroad, and it was desired to substitute one section for a double-angle section shown on the plans. Short pieces of Z-bars, used in pairs, are used on some of the street railways as chairs for the side-bearing girder rails. The works have 8, 10, 12 and 15-in. mills, and also roll light T-rails, up to 40 lbs. per yd., and street rails up to the 70-lb. side-bearing section now generally used for the city's street railways, and this is shown in Fig. 4. A somewhat new line of business for the Pacific Coast which has recently been taken up by these works is the manufacture of switches, frogs and crossings for railway and street railway work, and a considerable amount of work of this kind has been done for the new San Francisco & San Joaquin Valley Ry. Fig. 5 shows a spring rail frog for this railway, and Fig. 6 shows a crossing under construction. Some large steel-framed turntables for street cars have also been built, including one in front of the Chronicle Building, which is operated by gearing, the cogs of the turntable rack being formed by bolts through two concentric rings. There is a steel plant for the manufacture of steel castings, large and small, the work including pistons for locomotives, 7 ft. pistons for some of the new cruisers, Fig. 7, and the large stern frame castings for these vessels. The rolling mills are driven by a large engine of the Corliss type with a form of valve gear specially designed to cause the engine to follow up the load on the mill quickly and then release it quickly. Oil fuel is used for the boilers, being brought up from southern California in tank steamers and pumped from the vessels to the storage tanks. Gas heating furnaces are used, having valves underneath for the purpose of economizing space, and there is a very interesting hydraulic charging machine, revolving on a turntable. The furnaces, charging machine, and many other interesting parts of the plant were designed by Mr. Patrick Noble, general manager, who has been associated with the works for 28 years, and who may be seen in Fig. 7, standing at the side of the casting.

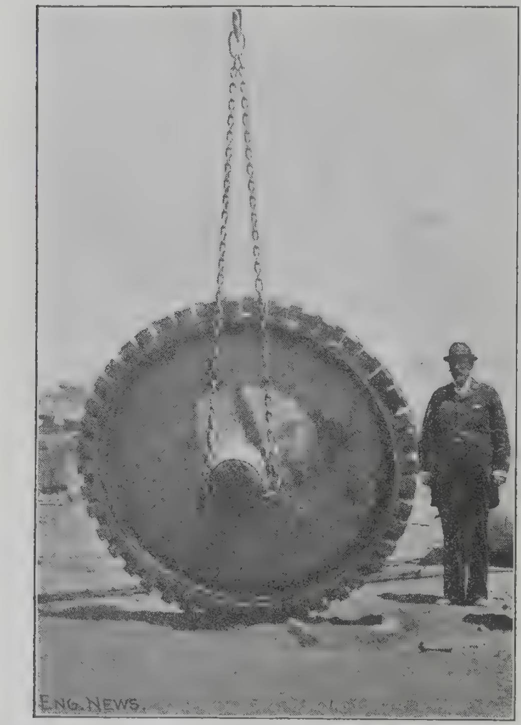

Fig. 7.—Cast Steel Piston; Made by Pacific Rolling Mills.

Pelton Water Wheel Co.—This firm is one of the few whose business does not seem to have suffered from the prevailing depression, this fact being due mainly to the present great activity in water power projects. The lowest head under which any Pelton wheel is now working is 14 ft., while the maximum is 2,100 ft., this latter being at Fresno, Cal., as described in Engineering News, July 2. Cast-iron buckets are used for the ordinary heads and phosphor bronze buckets for wheels working under high heads.

Alcatraz Asphalt Co. — This company has recently carried out some successful work of asphalt paving on a gravel foundation or base, and has lined several reservoirs for the Oakland Water Co., of Oakland, Cal. (the new rival of the old Contra Costa Water Co.), using a 4-in. layer of asphalt painted with an asphalt paint.

A. Lietz Co.—This company, manufacturing engineering instruments, makes a specialty of the cyclotomic transit, recently described in Engineering News. This instrument costs less than an ordinary transit, but is claimed to be more accurate and more durable. It is true that angles cannot be repeated with it, but it does not seem that many engineers do this, or consider it necessary, as already a large number of the new instruments have been sold. Mr. Lietz has a special aluminum alloy, containing 70% aluminum, which he uses for standards and other parts of instruments and which is sufficiently hard to require no bushing for screws and bearings. The standards are designed to give great stiffness, and the instruments are found to be very rigid, even in high winds. The aluminum is also used for the telescope tubes. An 18-in. Y level, with aluminum fittings and weighing only 6 lbs. has been successfully used in windy weather by the engineer of the Harbor Commission.

Excelsior Wooden Pipe Co.—The use of wooden stave pipe is becoming very general in the western states, to convey water over long distances for irrigation or domestic supply, and this pipe has been frequently described and illustrated in Engineering News. In the larger sizes of pipe the staves are built up to shape on a collapsible form or centering, and in pipes of less than 18 ins. diameter a "rounding-out" machine or mandrel is used to bring up sunken staves to the proper contour, as the other staves cannot be driven down. This was designed for use on the water-works system of Hollister, Cal., which were the first works on which wooden stave pipe of 10 and 12 ins. diameter was used. In adobe soil, which is corrosive to steel, the wooden pipe has many advantages. The sides of the staves are carefully trimmed by planing knives to the radius and curve of any given diameter of pipe, and then a test section is set up to test the accuracy of the fit of the staves, as any slight error, multiplied by the number of staves forming the circumference of the pipe will make a badly-shaped pipe. At each end of each stave is a saw cut, and in one of these is inserted a steel strip of such length as to leave a 1-12 in. open joint between the staves, the staves being then driven up with a 16-lb. sledge, thus forcing the steel slightly into the wood and making a tight joint. The steel strip is also slightly wider than the stave, so as to cut into the sides of the adjacent staves. It is evident that special care and attention are required for the successful building of this kind of pipe. A firm of sewer contractors which received a contract for a wooden pipe line at Los Angeles, made a failure of the work from lack of experience, and caused very considerable expense to get it in working order. The encircling bands are round steel rods, with Sternbergh's upset ends and cold rolled threads, while the clips are malleable castings. Considerable changes have been made in the form of the clips to get a continuation of maximum strength with minimum weight. Rods of oval section have been tried, but Mr. D. C. Henney, the manager and engineer, considers the circular section preferable.

Steel and Iron Pipe.—Iron and steel pipe are supplied by three principal firms. Dunham, Kerrigan & Hayden, hardware merchants, make this one of their specialties, and have an engineer, Mr. Thomas Brooks, in charge of this department. He reports a number of cases where this pipe has been used under very high heads. The collapse of riveted steel pipe by external atmospheric pressure, when the water in the pipe has been suddenly drawn off by an accident (causing a vacuum in the pipe) led Mr. Brooks to devise a special form of air valve to give ample area of opening from the exterior in case of such an emergency. This firm supplied the pipe line for the power plant at Fresno, Cal., the total length of which was 4,020 ft., with a head of 1,400 ft., including 20-in. lap-welded pipe and 24-in. riveted steel pipe. Two forms of joints were used, the Converse lock joint, and a bolted flange joint, the cast-iron flanges being shrunk on and headed to the pipe and reinforced by ¾-in. rivets. One flange of each joint has a recessed face and the other a projecting face, a 3-16-in. rubber gasket being placed between the flanges, which are then drawn up by 16 bolts 1 in. diameter, 10¼ ins. long. The 31,500 ft. of steel pipe for the Hollister water-works, above noted, was supplied by W. W. Montague & Co., of San Francisco.

CHAS. HART & SONS, LITH., 36 VESEY ST., N. Y.

ebb and the companies making this work a specialty are practically idle. The San Francisco Bridge Co. has built some wooden bridges with pile abutments for the new San Francisco & San Joaquin Valley Ry. The Thomson Bridge Co. has erected some of the bridges and trestles on the new Coast Division of the Southern Pacific Ry., including the Santa Maria River Bridge with seven spans of 183 ft., and the Los Alamos viaduct, 734 ft. long, with plate girder spans on metal bents. A view showing the erection of this viaduct is given in Fig. 8. The bents are raised by the derrick on the traveler, and the plate girders were run out onto the structure on flat cars, and then run out through the traveler trusses by means of trolleys and slings, and set in place on the bents. Mr. Thomson says that the piles along the harbor front at San Francisco are supported entirely by skin friction, not reaching any firm bottom; these piles are ordinarily 80 to 90 ft. long, but he has driven Oregon pine piles 135 ft. long, 16 ins. diameter at one end and 6 to 8 ins. at the other.

Railways.

The most important railway work now in progress in California is that of the San Francisco & San Joaquin Valley Ry., which starts from Stockton (whence steamers run to San Francisco) and runs down a rich fruit and wheat-growing country, its objective points being Fresno and Bakersfield. The railway parallels two lines of the Southern Pacific Ry. but will develop a large local traffic. All switches and frogs, and many of the cars have been built by firms on the coast, mainly to designs prepared by the engineer, as this was a new character of manufacture in that district. Particulars of this road and its structures were published in our issue of Oct. 29. The Southern Pacific Ry. is building a new coast line to Los Angeles, having maximum grades of 1% as against 2½% by the present line over the Tehachapi Pass, on which summit grades two twelve-wheel engines are used for freight trains and two ten-wheel engines for passenger trains. One of the viaducts on this line is shown in Fig. 8. The new line is laid with 75-lb. rails and has an excellent track, being intended for fast traffic. This road is also building some small branches near Pomona, for which Grant Bros., of San Francisco and Los Angeles, are the contractors.

THE NEW POWER PLANT OF THE WASHINGTON MILLS CO., LAWRENCE, MASS.

(With inset.)

The Washington Mills, of Lawrence, Mass., since their reorganization some ten years ago, have been enlarged by extending the area covered by buildings, adding stories to existing buildings, and by replacing old buildings by new ones until they are now claimed to be the largest woolen mills in the world. Originally, like all the Lawrence mills, water power was the sole reliance, but for some years a pair of 30-in. × 60-in. horizontal non-condensing engines have also been in use. They were designed by Mr. E. D. Leavitt, and were built by the Dickson Mfg. Co., of Scranton, Pa. They are worked from 2,000 to 2,400 I-HP. constantly. The exhaust steam from these engines is used in the dye-house.

Recently Messrs. Dean & Main, mechanical and mill engineers, 53 State St., Boston, Mass., have put in for the mills 1,100-HP. of Hercules water-wheels, making the total water power of the mill at ordinary stages of the river 3,500 HP., and they have designed a rope drive for transmitting the power from these wheels, and two steam boilers and an engine containing some other unusual features, the whole forming a unique power plant well worthy of description.

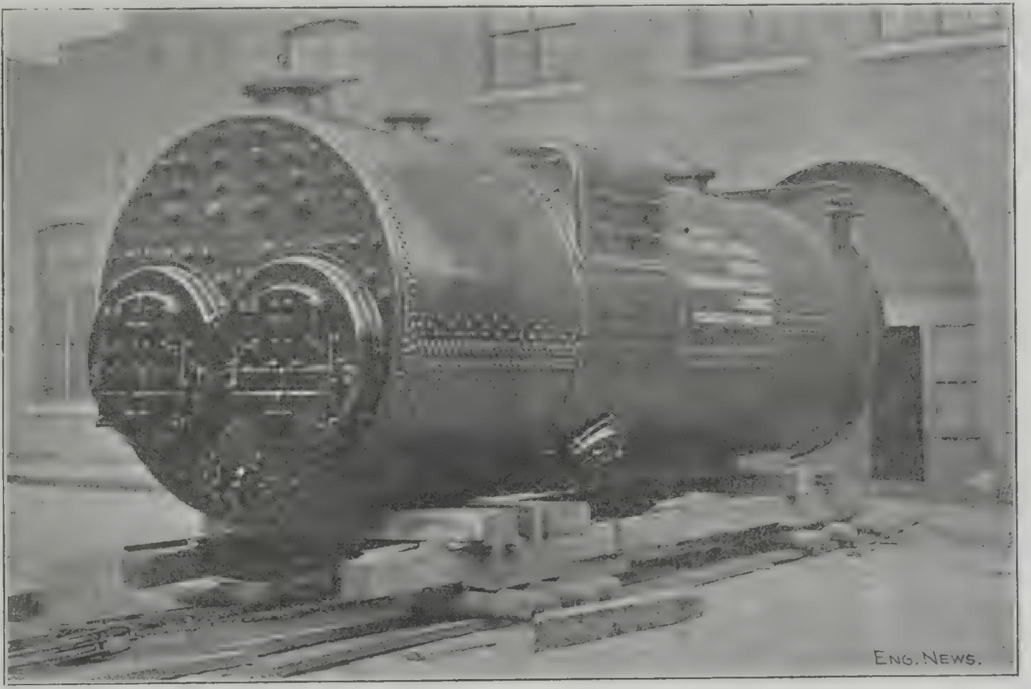
The extension of the mill have been so considerable that the total of steam and water power above noted, amounting to early 6,000 HP., has been insufficient during times of even small amounts of back water in the river, and especially during lighting up time, when 750 HP. is required to drive the electric lighting dynamos. This will soon be increased to 1,000 HP.

The Rope Drive.

The 1,100 HP. water wheels above referred to had to be so placed as to utilize an old waterway from the canal to the river; but this position was at some distance from the mill where the power was needed. It was necessary to transfer the power by a shaft westward some 80 ft., then southerly 103 ft., and vertically about 25 ft. After some scheming, it was decided to use for this purpose the "American" or continuous rope drive.

This drive is interesting, if not unique, because of its length and the great power transmitted. The rope wheels have 24 grooves for 1¾-in. rope, and 7,000 ft. of rope are used. The speed of the rope is 5,026 ft. per minute, and Kenyon cotton rope is used.

As shown in the drawing, the main rope wheel on the water-wheel shaft is 10 ft. in diameter. From it the rope passes upward, and thence over two 72-in. sheaves horizontally to the receiving wheel 76 ins. in diameter. The horizontal ropes are supported by two 72-in. carrying sheaves, and there is one 72-in. sheave used to direct one strand of the rope to the inclined take-up sheave which travels on a carriage. The movement of the take-up is very slight and maintains the tension of the rope satisfactorily.



INTERNALLY FIRED BOILER FOR THE WASHINGTON MILLS, LAWRENCE, MASS.
Designed by Dean & Main, Engineers, Boston, Mass. Built by The Atlantic Works, East Boston, Mass.

To make this rope drive a success, it was thought to be only necessary to support it on a very rigid structure from one end to the other, in order to maintain alinement and prevent vibration. A heavy timber truss was built from one end to the other, with chords and posts of Southern pine, and diagonal straining rods in vertical and horizontal planes, provided with right and left hand nuts, the whole being firmly anchored to foundations.

The drive is successful, and it is impossible to say from its behavior, when running, whether it is carrying a load or not.

The Boilers.

About the time the rope drive was undertaken, it became necessary to provide additional boilers. The existing boiler house was full, containing eleven horizontal return tubular boilers, 78 ins. in diameter, with 2,190 sq. ft. of heating surface (fire sides of tubes) each, or 24,000 sq. ft. in all, and carrying 135 lbs. of steam. Although the grates were large, being 8 ft. by 7 ft., 25 lbs. of coal were being burnt per sq. ft. per hour.

There was no place about the mill where a new boiler house could be built. There was, however, a space of little value on the other side of the end wall of the boiler house, and otherwise forming its continuation, except that the overhead floor was much lower than that in the boiler house, which had been made high to accommodate horizontal return tubular boilers. To raise this floor was a very expensive job, and besides this it would ruin the room above for manufacturing purposes.

It was seen, however, that a special design of boiler could be made that could amply be accommodated in the space at hand. The design shown on the inset sheet was prepared by Dean & Main, and two boilers were built by the Atlantic Works, East Boston, Mass. Each boiler has two 48-in. Morrison corrugated furnaces, entering a combustion chamber, from which 590 2½-in. tubes pass to the smoke box. The grates are 7 ft. 6 ins. long, the bridge wall 12 ins. long, the combustion chamber 5 ft. long and 6 ft. 8 ins. high, and the tubes are 14 ft. long between the heads. The length of the boiler over all is about 31 ft. The heating surface of each boiler is 5,300 sq. ft., the grate surface 62.20 sq. ft., and the ratio of heating to grate surface 85.2 to 1.

The unusually large ratio of 85 to 1 was adopted because it is probable that these boilers will be rushed, as the old boilers have been, and it is desirable to have enough surface to take up the heat evolved. The relation considered in designing the boiler has been that between coal burnt and heating surface, rather than the usual one between grate surface and heating surface.

The minimum inside diameter of the boilers is 9 ft. 10⅛ ins., and the maximum outside diameter 10 ft. 2 ins. The weight empty of each boiler is 90,000 lbs., and the weight of water held by it is 60,000 lbs., so that the working weight of each boiler is 75 tons in addition to the weight of the steam pipes, etc., resting upon it. Each boiler rests upon two cast-iron cradles, one of which is stationary, and the other rests on rollers of cold rolled shafting to permit free expansion and contraction.

Each boiler has two 6-in. pop safety valves which are set to blow at 135 lbs. gage pressure.

Each plate of the boiler was tested by the Pittsburg Testing Laboratory. All rivet, stay-bolt, and tube holes were drilled in place, and the rivets were driven by a hydraulic machine.

It is intended to have one fireman to each boiler and to burn one ton of coal an hour under each.

We would call attention especially to the means provided at the rear of the boilers for equalizing the flow of the gases of combustion through the upper and lower rows of tubes. In all horizontal fire tube-boilers there is a tendency for the gases to pass through the upper tubes rather than the lower, and in consequence a waste of heat results, the gases escaping from the upper tubes at too high a temperature. To counteract this tendency in these boilers three dampers have been placed in the stack, each controlling one of three portions into which the smoke chamber in the rear of the boiler is divided. These portions are made by hanging curtains or partitions in front of the tubes, so designed that they offer greater resistance to the flow of the gases through the upper rows of tubes than through the lower, which resistance may be varied at will by operation of the dampers. To secure the best effect the velocity of the gases should be the same through all the tubes and the temperature of the gas discharged by each tube should be uniform. The latter may be determined approximately by very simple means, such as placing an iron bar in a tube for a sufficient time, suddenly cooling it by plunging in a weighed quantity of water, and determining the rise in temperature of the water by a thermometer.

A number of bars may thus be used at a time, to take the relative temperatures of several tubes in a vertical row, and the three dampers adjusted until the greatest uniformity in temperatures is obtained.

The Engine.

In view of the great amount of power required to drive the lighting dynamos, and of the importance of being as independent of low and back water as possible, it was decided to put in a new engine designed to develop some 1,000 or 1,200 HP. at its point of maximum economy, but capable of working at much greater power.

The proper location of the engine was quite a problem, but it was finally decided to have it connected to the new water wheel shaft. Accordingly this shaft was extended westerly beyond the rope drive described above into No. 3 Mill basement, and arranged to drive No. 1 Mill, which adjoins No. 3.

On account of scarcity of room, it was finally decided to take the rather bold step of placing this engine in the line of the above-mentioned shaft which runs at 100 revolutions per minute. It was decided also to have a vertical engine in order to save room, do away with cylinder cutting and reduce friction, to say nothing of saving cylinder oil. There are a sufficient number of precedents for fast running large power engines at present to make this a safe project if the engine is properly designed.

Specifications were drawn up by Dean & Main for an engine having the following leading characteristics: Vertical inverted, four-valve, cross compound, surface condensing, thoroughly steam jacketed and provided with a large reheater. Diameter cylinders, 25 and 50 ins.; stroke, 36 ins.; revolutions per minute, 160; piston speed per minute, 960 ft. Shaft to be of hollow oil tempered steel, and all of the main forgings to be of the same quality of steel, made very light.

The engine was made condensing because the old engines furnish about all the exhaust steam that can be utilized, and it was made surface-condensing in order to keep the condensing water clean for the purpose of using it in the dye-house, instead of the cold river water, as at present, which is heated by exhaust steam. Thus all of the heat rejected by the engine is used in the dye-house quite as effectively as if it had entered the water at that point instead of at the engine, with the advantage that much less steam is required for the power than would be required by a non-condensing engine. There is, moreover, less condensation in the engine, and less loss of heat between the engine and dye-house, than with the non-condensing engine. All heat that enters the engine goes to the dye-house, except the equivalent of the work done, that lost in the engine by radiation, jacket and reheater condensation, and of course that contained in the air-pump discharge. By removing the oil from it, the heat in the latter can be saved. The cost of coal for running this engine is, therefore, next to nothing.

The circulating pump not only sends the water through the condenser, but continues its course to the dye-house. The surface condenser has a combined circulating and air pump, the whole was made by the firm of H. R. Worthington. There is also an automatic receiver pump for returning the separator, jackets and re-heater condensations to the boilers, and the exhaust of these auxiliary pumps goes into the exhaust system of the old engines.

The contract for the engine was awarded to the Rice & Sargent Engine Co., of Providence, R. I. It will have Corliss valves, but the specifications required the low pressure valves to be worked by positive connections with the eccentrics, and to have a fixed cut-off at ¼ stroke, capable, by adjustment when the engine is not running, of being extended any amount to ⅜ stroke. The valves will be wide open at 1-10 stroke, and the port opening is 12% of the piston area. The high pressure valves only are to be connected with the governor, and dash pots are to be used on this cylinder and closed by steam.

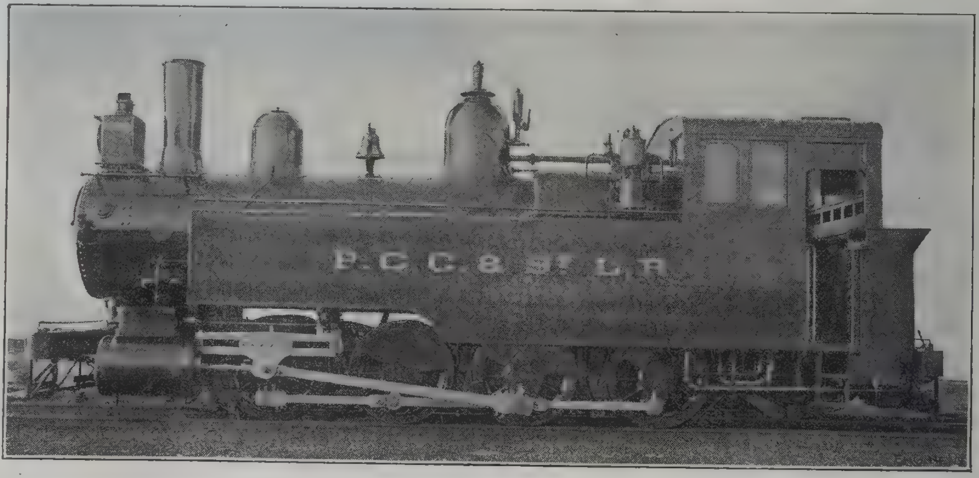
The speed of the surface of the shaft journals being great, the bearings were made sufficiently long to reduce the pressure per unit of surface considerably below that occurring in common practice, and ring oiling is to be employed. The product of journal speed by pressure per unit of surface, however, is far within that common in locomotive driving axle practice.

◆

HEAVY TANK LOCOMOTIVE FOR THE MADISON INCLINE, PENNSYLVANIA LINES.

The operation on a grade of nearly 6%, more than a mile long, of the regular traffic of an important trunk line of railway is a problem not often met with, but such a grade exists near Madison, Ind., on the Louisville Division of the Pittsburg, Cincinnati, Chicago & St. Louis Ry. (the Southwest System of the Pennsylvania Lines West of Pittsburg). It is 7,012 ft. long, with a total elevation of 413 ft., making a rise of 311 ft. per mile, or approximately 5.9%. It is undoubtedly one of the steepest long grades in the world upon which a regular passenger and freight service is maintained with the use of adhesive power only. We illustrate herewith a locomotive designed specially for service on this very heavy grade.

When ascending this grade, the cars (as a precaution in case of broken couplings) are pushed before the engine; and when descending, the engine backs down at the front of the train. It is to be understood that the regular road engines are disconnected from their trains at the top of the grade, and left there waiting for the next train brought up by the hill engine. The peculiar conditions of the service at this place necessitated many departures from customary locomotive construction, and the proportions of the engine are consequently somewhat different from ordinary practice and do not entirely conform to the rules recommended by the Master Mechanics' Association. One of the most notable features is the adoption of a tank engine, thus increasing the weight available for adhesion, a matter to which we have briefly referred on our editorial page.



HEAVY TANK LOCOMOTIVE FOR THE MADISON INCLINE; PITTSBURG, CINCINNATI, CHICAGO & ST. LOUIS RY.
S. P. Bush, Superintendent of Motive Power.

The locomotive, as will be seen by the accompanying cut, is carried on eight wheels, all of which are coupled, and has a large tank on each side of the boiler and a small coal bunker behind the cab. The fuel used is bituminous coal. The general dimensions and particulars are as follows:

Tank Engine for Madison Incline; P., C., C. & St. L. Ry.

Running Gear:	
Driving wheels, diameter	4 ft. 2 ins.
Journals, driving axles	8 × 8½ "
Wheel Base.—Driving	15 ft. 3 "
Wheels having blind tires	Second pair.
Weight in Working Order; (all on drvg wh'ls)	140,000 lbs.
Cylinders	22 × 28 ins.
Distance center to center	7 ft. 4 "
Form of crosshead and guides, Laird (cast-st'l cross-h'd)	
Connecting rod, length between centers	9 ft. 10⅜ ins.
Valve Gear:	
Type	Stephenson link.
Steam ports	1¼ × 18 ins.
Exhaust ports	2¾ × 18 "
Slide valves	Richardson balanced.
Lap, outside	1-in.
Lap, inside	3-16-in.
Travel	5 ins.
Lead	1-16-in.
Boiler:	
Diameter of barrel inside	5 ft.
Thickness of barrel plates	7-16-in.
Height from rail to center line	7 ft. 6 ins.
Working steam pressure	150 lbs.
Firebox:	
Type	Belpaire.
Length inside	7 ft. 9½ ins.
Width inside, at top	3 " 11½ "
Width inside, at bottom	3 " 6 "
Depth	4 " 9½ "
Thickness of side plates	5-16-in.
Crown sheet	⅜-in.
Tube sheet	⅜-in.
Grate area	27 sq. ft.
Tubes:	
Number	219
Pitch	2 13-16 ins.
Diameter, outside	2 "
Length between tube plates	13-ft. 4⅝ "
Total fire area of tube openings	3.65 sq. ft.
Heating Surface:	
Ratio to grate area	61.91 to 1
Tubes, exterior	1,528.89 sq ft.
Firebox	142.86 " "
Total, with exterior tube area	1,671.75 " "
Miscellaneous:	
Exhaust nozzle, single; diameter	5 ins.
Smokestack, smallest diameter	18 "
Smokestack, height from rail to top	15 ft.
Capacity of tanks	2,000 gallons.
Capacity of coal space	3,000 lbs.
Tractive force per lb. effective press. on piston	271 lbs.
Total tractive force with effective pressure equal to 30% of boiler pressure	32 520 "
Total adhesive tractive power, at 25% of weight on drivers	35,000 "

In order to prevent the trains from gaining too much headway during the descent the engine is equipped with an interesting arrangement for regulating the speed. This is based on the principal of the Le Chatelier brake, and is in some respects similar to that used on several of the western mountain railways. It consists in connecting the valve chests with a 1½-in. pipe, from which a 2-in. connection runs back to a point below the cab floor at the engineman's side, where it terminates in a muffler. When descending the hill the link motion of the engine is reversed, so that the cylinders during a portion of the stroke will force air up into the valve chests and thence through this pipe to the muffler, where it escapes into the atmosphere. By means of a regulating valve below the cab floor the escape of the air can be checked so as to obtain the most desirable speed for the pistons, and consequently for the engine. By closing the valve entirely the engine can be stopped during the descent. In order to prevent the pistons from sucking in air from the smoke box, with accompanying cinders and grit, a steam jet is directed upwards through the exhaust column from an opening in the hollow wall dividing the two exhaust passages. Fresh, clean air is instead admitted into the cylinders from a connection at the base of the exhaust column; this leads to the outside of the smoke box and is shown over the valve chest in the illustration. This connection can be opened or closed by means of a valve operated from the cab, and it is, of course, apparent that it must be opened only when descending the grade. In order to lubricate the cylinders a small jet of hot water is let into each exhaust passage. Besides this regulating device the engine is equipped with the American driving-wheel brake, and there is also a powerful screw hand-brake which alone will hold the engine and train on the grade.

As before stated, the service for which the engine was designed necessitated a departure from the customary proportions of locomotives. A little reflection will show how different the work of this engine is from that of ordinary engines. A road engine has to exercise its entire hauling capacity only when starting a train and getting up speed, but during the majority of the time it is in service only a fraction of the total power is needed. The total adhesive weight on the drivers is never utilized when the train is running at its regular speed with the lever hooked up towards the middle, and it is then that the economy of expansion comes in. If a road engine could be so situated as to have to make a continuous start lasting during its whole run, it would be under the same conditions as when going up a steep grade. The exertion of the full adhesive power is consequently not the exception but the normal condition of work on the Madison hill.

To use steam expansively under these conditions would be impossible, unless the cylinders were of much greater proportions with regard to the adhesive weight, than on the ordinary road engine. The total weight of the new engine is 140,000 lbs., all adhesive weight, but the mean weight during the ascent is about 130,000 lbs., this being based on the consumption of two-thirds of the water in the side tanks. According to ordinary practice this weight would require a cylinder proportion of about 22 × 24¾ ins. The additional 3¼ ins. of the stroke which this engine has, is a clear gain in the expansion of the steam, over and above that which may be produced when the engine does not exert its full adhesive power up to the slipping point. In other words, the cylinders were made as large as it was practical to make them, and the economy of this is shown by the fact that ordinarily the engine is able to make three round trips up and down the hill without refilling its coal bunker, which holds only 1½ tons of coal.

The engine was placed in service on Jan. 1, 1896, and has been giving entire satisfaction ever since. No official test of its hauling capacity has yet been made, although it is the intention to make such a test in the near future, in order to obtain reliable details of performance for comparison and future use. We are officially informed, however, that the engine has fully met the expectations of the officials, and that its performance during the ascent as well as the descent is entirely satisfactory.

Quite a number of interesting details had to be considered in the design of the engine. In order to keep the front ends of the top row of flues under water on the grade without filling the boiler so full as to cause the engine to get wet steam and throw water from the smokestack, the back end of the boiler is set considerably higher than the front end. The throttle valve is of the ordinary balanced type, but it has no play on its stem, the object being to avoid the clattering of the valve upon its seat in case the compression in the steam chest should exceed the boiler pressure during the descent. To protect the steam chests, a relief valve has been placed on each, which is set just beyond boiler pressure. In arranging the driving springs for the engine it was calculated that the front springs would receive the greatest load and they were designed accordingly. When the engine is on the grade, however, its center of gravity is shifted backwards, and in consequence the rear springs receive the greatest load, which caused some little inconvenience at first, until the necessary adjustment was made.

Instead of metallic piston rod packing, asbestos cord is used, as the metallic packing would be apt to be damaged when the engine is drifting down the hill without steam. The engine is equipped with pneumatic bell ringer, pneumatic sand valves, steam heat for passenger trains, and all modern improvements.

This locomotive was designed by Mr. S. P. Bush, Superintendent of Motive Power of the Southwest System, Pennsylvania Lines West of Pittsburg, and it was built at the company's shops at Columbus, O. We are indebted to Mr. Bush for the photograph and information used in the preparation of this article.

The city of Madison, Ind., is 85 miles southeast of Indianapolis, on the Ohio River. The inclined plane was built by the State of Indiana when Madison was on the transportation highway to the West. Passengers and freight came from the East over the old Portage road and the Johnstown canal to Pittsburg, thence on the Ohio River to Madison, thence through Indianapolis to central Indiana and Illinois. A portion of the plane is cut through solid rock over 100 ft. in depth, and there are two embankments nearly 100 ft. high. The incline plane was commenced in 1836 and finished in 1841. It came into the possession of the Pennsylvania System in 1874. The plane was finished in 1841 and operated by horse power until November, 1848. Andrew Cathcart's improved engine, having two sets of cylinders, and a pinion working in a rack in the center of the track, was used until July, 1868, when it was superseded by a more powerful engine designed by Mr. Reuben Wells, the Master Mechanic on the Jeffersonville, Madison & Indianapolis R. R., and built in the railway company's shops at Jeffersonville, Ind.

This old engine, which was in use until the present year, had eight driving wheels, 44 ins. diameter; cylinders, 20 × 24 ins.; wheelbase, 16 ft.; and weighed 57 tons. The boiler had a crown-bar firebox for burning wood, and carried a working pressure of 125 lbs. It was originally built with ten driving wheels, but one pair was taken off in 1886 to facilitate running over the sharp curves in the yards at Madison.

THE AMERICANIZING OF ENGLISH RAILWAYS.

A great deal has been done in the past few years in the introduction into Great Britain of features of railway practice which are practically copied from this country; and the results have been highly pleasing to the travelling public at least. Nevertheless the well-known conservatism of the Britisher makes itself heard occasionally in denunciation of these innovations. In a recent number the London "Engineer" publishes in its correspondence department a letter from a representative of this class which is most amusing for its bluntness and for the "Americo-phobia" (if we may coin a word) which its writer discloses. It will be noted that the writer, like many of his countrymen, considers that anything of old establishment must be good, and he deprecates the use of the improved American car coupler because the clumsy English coupler has been in use for 60 years. It is also to be noted that side-chains are used with the American automatic coupler for passenger cars, and it may be inferred that the writer of the letter is not very well posted on the details or merits of the devices which he criticises.

We print the letter in full as follows:

Sir: From time to time efforts are made by various well-meaning people to Americanize our English railways, apparently under the impression that whatever is American is right, and that we do not at all understand what suits us best. Differences of climate, of average length of journey, and of long custom are taken little into account by these zealous reformers, who are quite convinced that whatever pleases the American traveller ought to give equal satisfaction here. One of these periodical waves of Transatlantic influence is now passing over this country, and no doubt, like former ones, will leave some traces of its passage. We are promised the Brown coupler, the Jones "car" heater, the Robinson lighting apparatus and what not. Because Americans are content to stew themselves in winter time at 80° at the pleasure of a black attendant, who naturally loves tropical temperatures, we ought to do the same. It is stated that the Great Western Railway, with more zeal than patriotism, is ordering steam heating apparatus from America. The steam heating, to my thinking, is both unpleasant and ridiculously unnecessary in this country. What need has there been for it during the last winter for example, when not a flake of snow or a piece of ice that would bear a dog was seen? It dries rather than warms, and brings the dampness out of wet clothes, boots, and umbrellas in a most unwholesome manner.

Another great fad of the Americanizers is that a system of coupling which has answered its purpose admirably well for sixty years should be given up for a clumsy lump of metal, which can only act by the coaches being heavily bumped against each other, and which, if it should give way, has no side chains to keep the train together. Our permanent way, the best in the world for solidity and excellence, for convenience of renewals and for durability of parts, must be abandoned for one in which the rails are fastened down with dog spikes, after the manner of contractors' temporary lines, and have nothing else to prevent them from turning over. Wood being so cheap in America that the railways can afford to almost pave their lines with roughly hewn logs, we ought in this country, where every sleeper is imported, carefully selected, dressed to a standard size, and preserved by chemical means, to make our lines a continuous wooden flooring. No proof that English railways use too few sleepers is given, but American ones use more, which, of course, quite settles the question.

Our system of conveying passengers' luggage is found to be entirely wrong by the admirers of American practice. The system of checks is all very well for long journeys of two or three days' duration, but what advantages has it for those of as many hours? It is based mainly also upon the plan of having luggage conveyed to and from the stations independently of the traveller it belongs to, a system which does not obtain here, and is not the least likely to.

Even the late regrettable outrage on the Brighton Railway is turned to account by the foes of our comfortable and cosy system of compartment coaches. If we travel in huge caravans, full of draughts and smells, dust and noise, such things, it is said, could not happen. About a thousand millions of passenger journeys are made annually in this country, and such a case occurs perhaps once in five or six years. Can any American say the same for the United States? Of course we do not over here know of every outrage which occurs in American trains, but shall need a good deal of convincing that they can possibly be rarer under any system than they are in Great Britain.

In America, where many journeys run to 2,000 miles, and even a good deal more, and where passenger traffic is of much less importance than goods, it may be necessary to induce people to undergo the fatigue of such journeys by affording them far more luxury in travelling than the vast majority ever get at home. But is it really required here, where a journey of 300 miles is considered a good day's work by most people? Are these novelties in the least demanded by the British travelling public, or are they simply forced upon it by the reckless competition between the companies? I freely admit that a good deal has been copied in this country from American practice during the last few years, and with advantage; but where is the process to stop? One of the most serious aspects of the question is that concerning the enormous deadweight per passenger of the American style of coach. The latest trains of this type, just built for the East Coast joint service to Scotland, weigh 270 tons and carry 300 passengers, or 2,016 lbs. per passenger. A train of six-wheeled stock, quite as safe and amply good enough for any one not enervated by luxury he never originally wanted, could carry as many and weigh only 90 tons, including a 12-ton van. As to lunching or dining in trains, it is simply so much money taken away from the station refreshment rooms and maintaining extra staffs to do it with. To most Englishmen it is far more agreeable to leave the train for a few minutes now and then to obtain necessary refreshment, than to take it amidst the noise and vibration of even the most gorgeous dining saloon ever put upon wheels. The fact is, many English railways are so prosperous just now that they hardly care what expense they go to in order to eclipse their rivals, whether in speed or luxury. They think nothing of using a couple of enormous engines and tenders to convey two or three dozen passengers at a break-neck speed in 25-ton vehicles costing $10,000 apiece. I very much fear that when hard times come again—and they always do come again and generally stay longer than is convenient—and the companies find people have been made dissatisfied with the comfortable and profitable English coach, they will regret the necessity for building more and more of these travelling drawing-rooms, dining-rooms, bedrooms, smoking-rooms, kitchens, lavatories, and heaven only knows what. They need not think to confine them only to the very longest journeys; passengers will want them on much shorter runs, and I shall be surprised if the companies are loyal enough to each other to hold out unitedly against such a demand. W. B. Paley.

September 8th, 1896.

A PORTABLE ASPHALT PLANT has been built by the Hetherington & Berner Co., of Indianapolis, for the purpose of preparing asphalt for paving work in small cities where it would not pay to erect a stationary plant. The apparatus consists of two cars having steel frames and corrugated iron sheathing. Packed in one of these is a frame made of tubing and light steel beams, which forms the framework for the machinery when the plant is in use. The cars are run on a sidetrack and have the wheels blocked, the framework is erected and the mixer mounted in position on a tower between the cars. One car carries the power plant, consisting of a locomotive boiler and a steam engine. This car also contains the sand dryer and screens, while the other contains the asphalt kettles.

ENGINEERING NEWS
AND
AMERICAN RAILWAY JOURNAL.

Published every Thursday at Tribune Building, New York.

LONDON AGENCIES: KEGAN PAUL, TRENCH, TRUEBNER & CO. (Limited), Paternoster House, Charing Cross Road; SAMPSON LOW, MARSTON & CO., (Limited), St. Dunstan's House, Fetter Lane.

SUBSCRIPTION RATES: United States, Canada and Mexico, One Year, $5.00; *6 months,* $2.50; *2 months,* $1.00; *Single copies, 15 cents. To all other countries in the Postal Union, add* $2.08 *per annum (4 cents per number) to above prices for postage. No club rates allowed. Mailing addresses may be changed at will by sending both old and new address. We shall be obliged if subscribers who fail to receive their papers promptly will notify us without delay. The number on the address label of each paper indicates when subscription expires, the last figure indicating the year and the one or two preceding figures the week of that year; for instance, the number 326 means that subscription is paid to the 32d week (that is the issue of Aug 6) of the year 1896; the change of these figures is the only receipt sent, unless by special request.*

ADVERTISING RATES: 20 cents per line agate measure. Want notices, special rates, see page 22. Rates for standing advertisements sent on request. Changes to standing advertisements must be in hand on Monday afternoon; new advertisements, Tuesday afternoon; transient advertisements by Wednesday noon.

The uncoupling of M. C. B. couplers while trains are running, without any evident reason for the action, forms the subject of some interesting figures recently made public by Mr. J. N. Barr, Superintendent of Motive Power of the Chicago, Milwaukee & St. Paul Ry. According to this statement and to similar statements by other railway officers, these accidents are becoming frequent enough to demand the study of motive power officials and coupler manufacturers to provide a remedy. Mr. Barr's records cover a period of two years, but he presents actual figures for only two months of the period, viz., the months of August and September, 1896. These are as follows:

Causes of Train Break-in-Twos with M. C. B. Couplers.

August.		September.	
Chain too short	3	Chain too short	1
Locking block worn	1	Locking pin worn	3
Locking pin raised	1	Locking pin raised	6
Undetermined	21	Wrong knuckle	1
		Guard arm too open	1
Total	26	Undetermined	24
		Total	36

It will be seen that out of 62 uncoupling accidents occurring during the two months designated, 45 occurred without any apparent reason as far as an examination of the coupler or the observation of the trainmen gave evidence. Mr. Barr states further that the accidents were no more frequent with one make of coupler than with another, and also that as far as his observation gave evidence the uncoupling was not due to the sliding free of the knuckles without opening. As an explanation he suggested the possibility of the "creeping" of the locking device until it finally raised sufficiently to free the knuckle, which was then pulled open. This uncoupling of automatic couplers was one of the subjects discussed at the convention of the Master Car Builders' Association in June last, as recorded in our issue of June 25, and it appears that this is a trouble which is being experienced on many railways, and Mr. Barr himself stated in his remarks that the partings of freight trains by unlocking of M. C. B. couplers were four times as numerous as those from breakages of link-and-pin couplers. The general trend of the discussion appeared to show that the trouble is mainly due to the locking pin, which is caused to rise by the jarring or buffing strains or by the nipping action of the knuckle incident to the motion of the cars. The collecting of coal and dirt under the pin, and the use of too short a chain on the pin were also adduced as reasons for this very undesirable action. It would seem to be necessary for coupler manufacturers to look very closely into this matter and to discuss it with the men who are familiar with the use of the cars in actual service, so that some means may be adopted to prevent these dangerous break-in-twos. From the evidence thus far presented, it would seem that gravity alone is not a sufficient reliance to hold a knuckle lock in place, and that the lock ought to be held in its place by some mechanical connection when the knuckle is closed.

◆

The advantages which tank locomotives possess for certain classes of service do not seem to be as generally recognized as they should be by American railway managers and superintendents of motive power. The advantages of such engines for yard service are pretty well known, though engines of this type are but little used in practice even for this purpose, but their advantages for a suburban service where frequent stops are required deserve to be better known. It is to be remembered that a tank engine saves the cost of a tender, and occupies less space on the track, which latter is an important consideration in yards. In yard work, also, the tank engine gives the engineman a good view to the rear, so that he can handle his engine in such a way as to do little injury to cars in switching. The New York, Pennsylvania & Ohio R. R. (Erie R. R. system) and the West Shore R. R. are among the few roads using tank engines for yard work, and the Long Island R. R. is one of the few using engines of this type for suburban service. All elevated railways operated by steam, however, are equipped with this type of engine exclusively. The Grand Trunk Ry. (following English precedents in this as in many other matters) uses tank engines for both the above classes of service, and the traffic in its St. Clair tunnel is operated by monster tank engines mounted on ten wheels (all coupled).

In this issue we illustrate and describe a new and powerful tank engine built for working the heavy passenger and freight traffic over the Madison incline on the Pittsburg, Cincinnati, Chicago & St. Louis Ry. Here the run is short, with no trouble in taking coal, and all the adhesive weight than can be obtained is desirable, while the amount of switching required makes the shortness of the engine an added advantage. In England, tank engines of various types are used almost exclusively for suburban and switching service, and we have from time to time illustrated some of these locomotives. While the new engine described elsewhere is for special service only, and cannot be taken as an indication of any intention towards a general use of such engines, it at least serves to call attention to the tank type of locomotive, and may lead to some further consideration of the advantages of this type for other classes of work.

◆

In his late annual report, Commodore Melville, Chief of the Bureau of Steam Engineering, directs especial attention to the number of engineer officers of the navy who have been retired during the past year for physical incapacity, and to the steadily increasing number of such officers on the retired list. He says that these retirements are conclusive proof that the physical strain to which the officers of the engineer corps are now subjected is too great, and that the only remedy is an increase in the number of such officers. Commodore Melville takes the position long held by this journal—that in the modern battleship "the guns would be powerless without the machinery; also that, other things being equal, that fleet will give the best account of itself which has the best equipment of trained men in the engine room, as well as at the guns." It is to be sincerely hoped that the next Congress will handle this subject of naval personnel in a business-like, intelligent and thoroughly unprejudiced manner; and in the spirit that the real importance of the subject demands. Our Government has been liberal for some time past in its appropriations for new warships, and the results of these appropriations are a source of national pride, and are serving as models for nations with a longer experience in naval construction. But, as Commodore Melville says, it is one thing to design and build machinery for these vessels, but it is quite another thing to keep this machinery in such condition that it may be ready to respond to every call made upon it under all conditions. This naval machinery is of such a complicated character and of such common and diversified use that constant vigilance and the greatest care are necessary to keep it in the state of efficiency required. If the number of trained men demanded by these conditions is not sufficient, the efficiency of the ship as a fighting or cruising machine is correspondingly lowered, and the skill and money expended upon her design and construction are practically wasted. In our new navy a sufficient number of trained officers and men is of quite as much importance as new ships. If we are to have a new navy it is the duty of Congress to see to it that it is made efficient in all its branches.

◆

That old familiar subject for discussion, the respective merits of bridges having pin connections and riveted connections, has been left in peace for some considerable time, but was brought out again at last week's meeting of the American Society of Civil Engineers. The occasion was a brief paper by Mr. George E. Gray, Hon. M. Am. Soc. C. E., referring to old riveted bridges on the New York Central R. R., and the advantages of this type of truss were ably set forth in the discussion by Mr. George H. Thomson, who is well known as an advocate of this type of construction. The greater safety in case of a derailment on the bridge was, of course, put forward, but, on the other hand, another member considered that the fact of the far greater number of pin-connected bridges made impossible any proper comparison on this ground. He instanced some severe cases in which pin-connected bridges had successfully withstood serious damage, and yet had not collapsed in the way that the opponents of this type of construction had claimed that they would (or at least ought to) collapse. The advantage of distributing the load over a great number of points were touched upon, but curiously enough no reference was made to the multiple-intersection latticed construction in which this feature reaches its highest development. The discussion turned almost entirely upon ordinary through trusses having riveted or pin-connected members, but even Mr. Thomson admitted the applicability of the latter system for deck structures. There was not a very long or comprehensive discussion, nor did it bring out anything very new, beyond the facts of the extent to which riveted truss bridges with solid floors have been introduced on the Central Vermont R. R., and it was really but a brief revival of an old but interesting subject. It may be noted, however, that the portals of the Central Vermont R. R. bridges are distressingly ugly from an aesthetic point of view. The heavy rectangular end-posts are connected by a rectangular portal girder with triangular gusset plate connections of the girder to the posts. Considering the amount of money expended in getting a good design and a good structure, a little money might surely have been spent in securing a less harsh and unsightly treatment. An arched portal girder, or curved gusset plates would have had a lighter and pleasanter appearance, without in any way reducing the strength of these important members. It is evident that bridge engineers, as a class, have not yet began to realize the demand for some regard for aesthetic principles in their structures.

◆

There is one matter in connection with pin-connected bridges, which especially deserves to be kept in mind by engineers, and that is the advantage which they possess with respect to erection in difficult localities. On the inset sheet in our last issue was a view of a great bridge on the Trans-Siberian Ry. over the Usuri River, a structure with three long spans all made with riveted trusses. The labor required to prepare the material for such a bridge, transport it to the site and erect it, must have been enormous; and the vast amount of field riveting necessary must have kept the structure on the falseworks a very long time. The advantage of the pin-connected structure for any such situation is obvious to an American engineer. Apparently the builders of the Trans-Siberian Ry., and similar pioneer railways, could patronize American bridge companies or at least copy their practice with a great deal of profit.

HIGH BUILDINGS AND SAFE ELEVATORS.

To the European traveler in the United States at the present day there is probably no more striking feature than the prevalence of high buildings in large cities. We do not refer by this so much to the wonderful structures of 16 or more stories, of which both New York and Chicago can boast a considerable number, but to the buildings of eight, ten or twelve stories, of which great numbers exist in all our large cities, such as Philadelphia, Boston, and St. Louis, and which are becoming quite a prominent feature even in such minor cities as Pittsburg or Buffalo. The social and economic results which come from the prevalence of high buildings are of great importance. It is of enormous advantage in the conduct of business, for example, enabling a very great number of people to be concentrated in a small area, and yet giving them an abundance of light and air, and room for convenient work. Take for example the central business district of Chicago. If all the business in this district were to be transferred to buildings not more than five stories high, it would be necessary to cover an area more than twice as great. The added difficulty and cost of carrying on business when such an extended area is included in the business district are evident.

For an example on the other side we may take the city of London. As is well known, the area which the old city of London covered, now commonly known as "The City," is almost wholly given up to business; but the vast amount of business transacted on this limited area coupled with existing restrictions as to height of buildings (few office buildings being more than five or six stories in height) has compelled a crowding which an American would find most irksome and inconvenient. The contrast between the spacious and well lit offices of an American firm in a modern office building and the cramped and dimly lighted quarters which satisfy a London firm doing a similar amount of business, is one which has often been noted.

Now, while rigid building laws in European cities are partially responsible for the absence of high buildings there, it is also true that the high buildings of American cities are made possible only by a notable American invention, the fast passenger elevator. Its development has been as rapid as has the development of the high building itself, and had this not been the case, it is certain that the latter would not have taken place. We should not see a 30-story building in process of construction in New York to-day, for example, if the elevator builders had not made great advances over the slow moving machines that were in common use 15 years ago.

But a matter not less important than the features of speed and reliability is the matter of safety. It is only because it has been possible to convey passengers up and down a vertical shaft with almost, perhaps quite, as small a percentage of casualty as occurs in travel on a railway, that the elevator has become so popular. There is a sensation of risk in moving swiftly up or down a vertical shaft, and only habit and experience of its safety dispels it. But if once a serious accident occurs to an elevator, fears are aroused, people resort to stair climbing and tenants begin to look with more favor on buildings of lower height.

From this point of view the recent accident to an elevator in the 22-story building of the American Tract Society, reported in our last issue, is of importance to every one interested in any way in high buildings, or their construction. It would take only a few such accidents, should they chance to occur at about the same time, to seriously shake public confidence in the general safety of elevator service; and should this take place, the investment in present high buildings and the construction of additional ones might be seriously affected. In other words, it behooves elevator builders and those responsible for the safety of existing elevator plants to spare no pains to keep the standard of safety at its highest, not only to make safe their own business, but the investments and business of thousands of others.

Reviewing now briefly the circumstances of the accident in the Tract Society building elevator, it appears that in the design of this plant, a high-pressure hydraulic system, using water at a pressure of 900 lbs. per sq. in., was adopted in place of the lower pressure, about 150 lbs., commonly employed. It will be apparent that by this means it was possible to materially reduce the size of the hydraulic cylinders, and thus the space taken up by the elevator plant. This was, of course, an important matter in so large an installation.

In published statements the builders ascribe the troubles which have been experienced with these elevators to the use of this system; but it appears doubtful to an engineer whether this is the sole or even the main reason for the accident.. Ever since these elevators were put into service there has been difficulty in operating them. With the best care on the part of the operators they have found it difficult to run the elevator cars smoothly and to stop them at a floor landing at exactly the right point. It can easily be believed that the valves controlling the movement of the hydraulic plungers were not so well proportioned as those which the builders had for years used on low-pressure work, and to which they were accustomed; but that is hardly a fault of the high-pressure system. An accident which occurred some months ago, in which a car dropped suddenly a story or two, we have heard ascribed to air in the cylinder, a danger against which every precaution should be taken in a hydraulic elevator system; but it is not apparent why air should be more likely to give trouble here than in a low-pressure system. Again, the recent accident was due to the breakage of a bolt in a check-valve cover; but unless the error was committed of using the same check-valves for 900 lbs. pressure that was used in ordinary low-pressure works, it is again not clear what the high-pressure had to do with the accident.

The real cause of the recent accident and the root of the difficulty with which all elevator engineers are now struggling is simply the great rate of speed at which elevators in high buildings are now required to be run. Recent specifications call for a speed of 700 ft. per minute on passenger elevators, or nearly 8 miles per hour, about the speed of a Broadway cable car. The elevator car with an average load and including its counterweight will weigh, perhaps, two tons, and this weight must be started from rest and brought up to full speed in a movement of perhaps 5 ft., must stop from full speed in a similar distance, and must be capable of control by the elevator boy, so that it can be stopped at the floor level within a fraction of an inch. Besides this, the acceleration and retardation must be suitably graduated, else the passengers will be forcibly reminded of a toboggan slide, when the car starts down, and will feel as if their avoirdupois had suddenly and uncomfortably increased when the car shoots up.

The difficulty of difficulties comes in, however, when we take up the design of the safety attachments. Every passenger elevator has, or ought to have, appliances by which, when the normal speed of the car is exceeded, whether from the breaking of the rope, the derangement of the elevator machinery or any other cause, clutches automatically grip the guides at the side of the elevator shaft and bring the car to a standstill. This was an easy enough matter when elevator cars ran 200 or 300 ft. per minute; but when we reach 700 ft. per minute difficulties thicken. There must be a considerable margin between the normal speed of the car, and that at which the safety clutches is set to operate, for variations in the load on the car and the pressure in the cylinders cause large variations in the ordinary speed of the cars. If the normal speed is 700 ft. per minute, we presume the safety clutch could not be set to operate at less than 1,100 or 1,200 ft. per minute, or nearly 12 miles per hour. But the operation of a safety clutch at such a speed is a thing to be done with caution. To bring a weight of two tons or so too suddenly to rest from such a velocity might cripple the elevator guides or cause some other breakage which would make a bad matter worse.

In the recent Tract Building elevator accident, the car did not fall. It merely ran down the shaft at a speed not high enough to operate the safety clutches and struck the buffers at the bottom. Its passengers found by experience that to be brought up with a shock from even such a speed is not unattended with danger.

It was a trifling thing that caused the accident. The breakage of a bolt in a check valve on the pipe leading from the pump to the hydraulic cylinder started a leak, which caused the movement of the plunger, just as if the discharge valve from the cylinder had been opened. But this leak was not automatically closed when the car neared the bottom of its shaft, as the valve would have been, and so the car struck the bottom buffers at full speed. Any other cause which would have started a leak from the cylinder and the system of piping to which it is connected would have been equally effective in causing the accident. In most of the newspaper accounts of the accident, in fact, it was ascribed to the blowing out of a gasket. It doubtless occurred to most engineers who saw these reports that it was a strange sort of engineering that used a gasket which could by any possibility blow out, for the joints of a hydraulic elevator system. We presume that metal to metal joints, or at least some form of metallic gasket is used for such connections.

Another fact of importance comes to light in considering this accident. Suppose that the break of this check-valve cover bolt had occurred a moment sooner, just when the elevator car was standing at a floor, and passengers were getting on or off it. The car would have instantly started down and the chances are great that one or more of the passengers would have been caught in the doorway and cut in two. This is a danger which does not seem to be guarded against as it should be in elevator construction. When the car is standing still it is held in position only by the elevator machine and any break or failure occurring at that time, if passengers are entering or leaving the car, may cause a fatal accident.

It may be urged that the chances are so remote of such an accident occurring that it is not worth while to make provision against it. There is a popular idea that an elevator is a machine so simple and safe that it is very little liable to accident or to getting out of order. In this connection we find some interesting figures in the last quarterly report of the Superintendent of the Department of Buildings of New York city. This department is by law charged with the duty of inspecting passenger elevators. We quote the summary of its work in this field in the first nine months of two successive years as follows:

	Jan. to Sept. —inclus.—	
	1895.	1896.
No. inspections of passenger elevators.......	2,632	4,257
Defective passenger elevators reported........	62	856
Elevators made safe on notice from Dept....	44	912
Pass. elev. cases sent to att'y for prosecution..	16	182

It is certainly clear from these figures that unless the present inspection is too severe by far, the inspection of a year ago was a highly incomplete and perfunctory affair. Further, the fact that the inspectors of the Building Department should be able to find an average of 95 defects a month in the passenger elevators of this city is surprising and somewhat disquieting. It must be remembered that an elevator plant ought to be and generally is in the charge of competent attendants, who should discover and remedy all defects, regardless of the occasional visits of the official inspector. In addition, a large number of elevators are regularly inspected by private firms who make a specialty of this work. It will also occur to many of our readers, doubtless, that the above figures show well that safety is not to be found in reliance upon any municipal or state bureau. If we grant that the inspection of 1896 was thorough and effective, what guarantee have we that we may not in a year or two return to the conditions of 1895?

Returning to our statement above that the real cause of present troubles with passenger elevators is the high speeds at which they are required to be run, we are far from saying that because of this fact present standards of speed should be lowered. The speed of 700 ft. per minute, which is the highest now in use so far as we recall, is no more than is actually needed to give sufficiently prompt service to buildings 14 or more stories in height. We do believe, however, that it is the duty of elevator makers, and of the engineers who specify the requirements which elevator makers must fill, to pay more attention to the matter of safety when such high speeds are required.

The most fruitful direction in which to work, it appears to us, is in connection with the safety devices on the car itself. We know of no good reason why every elevator car should not be furnished with a brake, under control of the operator, by which the car could be stopped and held at any point of its travel quite independent of the operating mechanism. If this brake were interlocked with the operating lever, or with some mechanism connected with the doors at the various landings, the car could be held absolutely in place at every stop and the danger of its starting up or down while passengers are entering or leaving, either through accident to the machinery or through the carelessness of the operator, would be wholly done away with. It may also be noted that the common annoyance of cars creeping up or down on account of minute leaks when standing at a floor would be obviated by such an appliance.

A word may be said here also concerning the provision of air cushions at the bottom of elevator shafts. These were in quite general use a dozen years ago, and many remarkable tests were made with them, such as dropping a car several stories without injury to passengers. With the advent of buildings of 12 stories and upward the air cushion idea appears to have been generally dropped. This, again, seems to us a mistake, for an air cushion is not designed to catch a car falling freely from a height of a half-dozen stories or more. Other appliances on the car should prevent any such great speed as would be obtained by a free fall from such a height. But an air cushion would serve a useful purpose in arresting a car which runs down the shaft as did the car in the Tract Society building without setting the safety clutches.

That the automatic clutch alone is not enough of a safeguard for high-speed elevator service, however, seems to be amply proved. Many of our readers will recollect in the Manufacturers' Building at the Columbian Exposition a set of hydraulic elevators which carried passengers up to the roof of the building, a dizzy height. During the exposition one of these elevators fell with a load of passengers on account of the breaking of the rope. The car fell several feet and then was stopped by the safety clutches, but these released as soon as the car stopped and again it fell, to be again brought up, and so on, till it came to a final stop some 20 ft. above the bottom of the shaft.

It is a well-known principle in the operation of safety devices of every sort, that unless provision is made for their regular use or testing, they are very apt to be out of order and inoperative when the emergency comes which they are designed to meet. This is an inherent fault of the ordinary safety attachment on an elevator car. In the regular course of events it is never used during the entire life of the elevator, and it is, therefore, never certainly known whether it will operate effectively when an accident occurs which it is designed to meet. This affords another reason why the plan of having the safety clutch operated by the elevator boy at every stop of the car would furnish additional safety as compared with the present system.

LETTERS TO THE EDITOR.

Early Bridge Trusses without Diagonals.

Sir: In your issue of Nov. 19 you refer to a bow-string truss bridge at Hoosick Falls, N. Y., which was constructed without diagonals or their equivalent, and remark that it is the only instance in your knowledge of such construction.

The Mosely Bridge Co., of Cincinnati, Ohio, built bow-string highway bridges at a very early date. This firm constructed one at Galena, Ill., in 1858, and one at Rush St., Chicago, at about the same time. These were swing bridges with an iron tower, and carried rods or hog chains, which suspended two bow-string trusses. These trusses had no diagonals, being constructed on the same principle as shown in your cut. The upper chord was triangular, consisting of three plates. Several of these bridges were constructed in Illinois, but they were stationary, with the exceptions noted. One was at Golconda, Pope Co., one at Clay City, Clay Co., and one on the Little Wabash, in Wayne Co. The latter was still in use three years ago, but all the others mentioned have either fallen or been taken down.

Yours truly,
Bloomington, Ill., Nov. 21, 1896. J. H. Burnham.

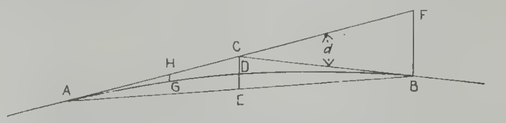
Vertical Curves for Connecting Railway Grades.

Sir: The accompanying table of corrections for grade elevations, to be used where vertical curves are used on railways in rounding off the angle formed by the junction of two grade lines, may be of interest as indicating a convenient method of tabulating corrections for any given difference of grades and length of curve desired.

The curve employed is the usual parabola, chosen because of the ease with which any correction may be found when the correction at the vertex, or meeting point of grade lines, is known. Two properties of the parabola are utilized; 1, that ordinates from tangent to curve vary as the square of the distance from the point of tangency; and, 2, that the curve bisects the vertical intercepted between the vertex and long chord joining the P. C. with the P. T.



Vertical Curves For Connecting Railway Grades.

In the figure let H G, = T, be the correction at distance x from A; M = C D, the correction at the vertex, and 2 L the length of the curve in stations, then the property first referred to gives the relation

$$T = M \frac{x^2}{L^2}. \qquad (1)$$

To find M, produce A C to F to meet a vertical through B, the end of curve. Call the algebraic difference of grades d, then will F B = L d, and since C D = ½ C E by the second property, M = ¼ F B, or

$$M = \tfrac{1}{4} L d. \qquad (2)$$

The length of curve, 2 L, may be fixed by the circumstances of the case or may be found by assuming a certain rate of change of grade per station, the rate of change increasing with d. Call this rate of change R, then for L in stations.

$$L = \frac{d}{2 R}. \qquad (3)$$

To find the correction at a point one station distant from the P. C. at A, insert the value of d from (3) in (2), and the resulting value for M in (1), x being one station; the result is

$$T_1 = \tfrac{1}{2} \frac{L^2 R}{L^2} = \tfrac{1}{2} R. \qquad (4)$$

At two stations from A, $T_2 = 2$ R; at three stations, $T_3 = 4\tfrac{1}{2}$ R; at half a station, $T_{\frac{1}{2}} = \tfrac{1}{8}$ R, etc.

The table gives values of T for points 50 ft. apart for a few values of L and d. These corrections must be added when the algebraic difference of grades is minus, and subtracted when the algebraic difference is plus. Similar tables for other lengths of curves or differences of grades may be prepared at the engineer's leisure, and time in the field may be saved by their use.

Yours truly, J. C. Nagle.
College Station, Tex., Oct. 10, 1896.

Table of Corrections for Vertical Curves.

(The advantages of the use of vertical curves in relation to the operation of train service is discussed at some length in Wellington's "Economic Theory of Railway Location," and it is there pointed out that these advantages are of far greater importance at sags than at summits, the length for such curves being recommended as 200 ft. on each side of the vertex. It is also pointed out, however, that with the universal adoption of an automatic close coupler much of the importance of these vertical curves would disappear. With trains having much slack in the couplings a rate of change of grade of 0.025 per station of 100 ft. would best fill the required conditions, but for ordinary service (especially after the introduction of improved couplers) 0.05 per station will be ample. Wellington's book, however, gives only the vertical distance between vertex and curve, while the table given with our correspondent's letter gives the vertical distances at intermediate points. —Ed.)

NAVAL PRACTICE IN SHIP RIVETS AND RIVETING.*

By J. H. Linnard, Naval Constructor, U. S. N., Member.

Among the most important details of hull construction are the methods by which the different parts are attached to each other to give strength to the whole. Too much care cannot be taken to secure such arrangements as will provide strength combined with cheapness of execution. Too often in shipyards insufficient attention is given to this matter, and while general indications as to the riveting are usually put on plating plans, the details of spacing, etc., in important connections are frequently left to the judgment of foremen, or, indeed, the ironworker who lays out the work.

In merchant work, Lloyd's rules have been adopted as the general standard, but they fail to give information in several particulars. Thus the spacing of rivets in the angles uniting water-tight frames and bulkheads to the outer skin plating is not specified. No information is given as to what is considered a suitable size of rivet head, etc. In the hulls of the very large passenger steamers these matters have assumed great importance, and we hear of riveting proving defective and of rivets having to be cut out and replaced more frequently than in times past.

In men-of-war, where scantlings have been cut down to the lowest limit of safety, the detailed consideration of the riveting becomes of capital importance. In such work, where weight-saving without sacrifice of strength becomes so necessary, certain departures from merchant practice as exemplified in Lloyd's rules have been very general in the different navies. These relate principally to the breadth of laps and straps, connection of frames to outside plating, the shape of rivet heads, etc.

In our own Navy it has been the practice to follow in general the rules of the British Admiralty. Some years ago, in the course of the work in which I was then engaged, it became desirable to draw up rules for riveting for the guidance of draftsmen and foremen in considerably greater detail than any given in the Government specifications. At that time the available information on the subject was collated, the practice in different services compared, and the results embodied in a series of tables which have since been adopted, with some minor modifications, in a number of yards in which our new vessels have been building. It has been thought that these tables might be found of interest to the Society and might lead to a profitable discussion as to whether modifications in them are desirable.

In no particular of riveting work is greater diversity shown than in the shapes of the rivet heads. This is due to the fact that, in by far the greater part of riveted connections, the principal stress on the rivets is a shearing stress and the heads are usually more than ample to resist the forces exerted on them. Where it is necessary to study weight-saving, the size and shape of the rivet head becomes of considerable importance. In a vessel such as the armored cruiser "Brooklyn," the weight of rivets driven is upward of 330,000 lbs., and, of this weight, from one-fourth to one-third is in the rivet heads. Any method by which any considerable percentage of weight can be saved in the heads is therefore worthy of consideration.

The rivet head which has the least weight is the countersunk head, since practically all of the head is simply a replacement of metal taken from the plate. It has, however, the disadvantages of increased cost due to the labor of countersinking, and the decrease in the tensile strength of the plate or shape, owing to the greater section of metal removed from the hole. In the French service the saving of weight is considered of sufficient importance to counterbalance these disadvantages, so that the greater part of the riveting, except very light work, is executed with countersunk heads. In our own Navy, such heads are only used where the character of the work requires it on other grounds. It should be pointed out that where countersunk heads are used it is important that they should fit the countersunk holes in the plate. The angle at the apex should be a very little sharper, so that the head will be sure to bottom well. The blow of the hold up will then cause the head to completely fill the countersink.

---

*A paper read at the fourth general meeting of the Society of Naval Architects and Marine Engineers, New York, Nov. 12, 1896.

In Fig. 1 are shown the dimensions of the different shapes of rivet heads adopted. The pan heads are those adopted by the British Admiralty. The tap rivet heads have squares on them of dimensions determined by experiment. They are the minimum necessary to set the rivet home strongly without wringing off the square with the wrench. It has been found by our own rivet makers that it is difficult to get these pan heads sufficiently well centered on the shanks of the rivets to meet the requirements of the inspectors.

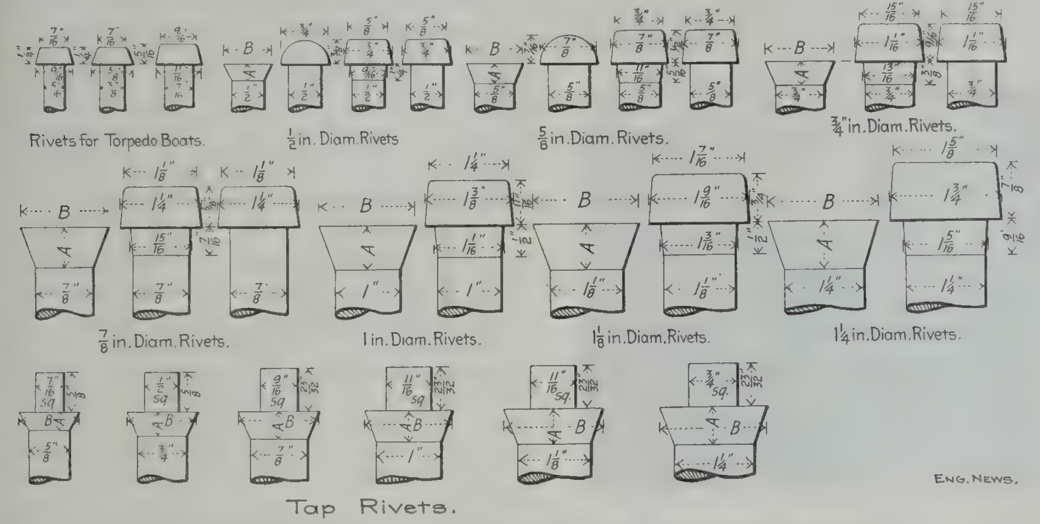

FIG. 1.—STANDARD RIVET HEADS IN USE BY THE BUREAU OF CONSTRUCTION AND REPAIR, U. S. NAVY.

(For all countersunk head and tap rivets make dimension A equal thickness of plate plus 1-16 in. Dimension B as per angle of countersink for given depth of head. Tap rivets will be ⅛-in. larger than the corresponding rivets for the same thickness of plate; except those in stem and stern post, which will be ¼-in. larger.)

The Bureau of Construction and Repair considers it of vital importance that these cone-head rivets should be true to figure. A slight eccentricity of the rivet holes is sometimes unavoidable, and if the closing rivet itself should also be eccentric, the lip would not cover as it ought, and therefore, whenever there is eccentricity apparent to the eye, the rivet must be rejected. Experienced rivet makers with the best appliances have found it practically impossible to make rivets with these heads absolutely concentric. The shortest diameter of the head is considerably greater than the diameter of the rivet blank. The result of the heading operation is that if there is the slightest crookedness in the blank, or if it is not sheared perfectly square, the head will be formed unavoidably on either one side or the other of the centre line of the rivet, because the rivet blank is free to wabble about, and is not held centrally as it should be by the heading die. A rivet head whose shortest diameter is exactly equal to that of the rivet avoids this difficulty, because if the rivet blank is bent, or in anywise eccentric or sheared obliquely, it will be caught by the header and straightened up and the head formed true and central in every instance. This is the form of cup largely used in making boiler rivets.

Years ago the Government adopted a standard for bolts and nuts, including form of threads, and this standard has been of great use not only to manufacturers of bolts, but to engineering establishments throughout the country, most of whom have adopted it. In a similar way, if the Navy Department were to establish a consistent standard for forms of rivets, it would also, no doubt, be adopted by other users of rivets throughout the country, with equal advantage.

A large manufacturer of rivets writes:

The proportions we adopted for our boiler rivet heads several years ago, and which have been used ever since with the greatest satisfaction, are as follows: The height of cone head is ⅞ the diameter of the rivet shank. The least diameter of cone head is equal to the diameter of the rivet shank. The greatest diameter of cone head and button head, 1¾ times the diameter of the rivet shank.

The height of the head of button-head rivet is equal to ¾ the diameter of the rivet shank.

This manufacturer suggested the adoption of these heads for hull-riveting also.

TABLE I.—Relation Between Diameter of Rivets and Rivet Holes and Weight of Plates.

Weight of Plates.	Diameter of corresponding rivets. ins.	Diameter of corresponding rivet holes. ins.
Up to 6 lbs. exclusive	⅜	7-16
6 " 8 " "	½	9-16
8 " 13 " "	⅝	11-16
13 " 20 " "	¾	13-16
20 " 30 " "	⅞	15-16
30 " 40 " "	1	1 1-16
40 " 61 " "	1⅛	1 7-32
61 lbs. and above	1¼	1 11-32

TABLE II.—Breadths of Laps and Straps for Riveting.

(Centers of rivets to be placed not less than 1⅝ times the diameter from the edges. In double and treble riveting, the distance from center to center of rows to be not less than 2¼ diameters in laps, and 2½ in straps.)

Breadth of laps for single riveting	3¼ diameters.
Breadth of laps for double riveting	5½ "
Breadth of laps for treble riveting	7¾ "
Breadth of edge strip for single riveting	7 "
Breadth of butt-strap for double riveting	11½ "
Breadth of butt-strap for treble riveting	16½ "

It will be observed that the rivet head proposed is considerably heavier than the Admiralty head. With the authority of the Bureau of Construction and Repair, a new type of rivet head has been adopted for the most recent vessels. They are substantially as follows: The diameter of head at top is equal to the diameter of rivet, at bottom is 1⅝ diameters; and the height is ¾ of the diameter of shank. These heads are substantially identical in weight with the Admiralty heads, except for the smaller sizes, which are from 5 to 10% heavier. The detailed dimensions of these heads are shown in Fig. 2. They have proved amply strong in use and are easily manufactured. It is possible that the height of the head could be still slightly reduced.

In sizes above ½ in., intended to be driven in punched holes, there is a taper enlargement under the head, the diameter just under the head being 1-16 in. greater than that of the rivet, and tapering down in about half a diameter. This taper under the head is better adapted to fill the hole made by the punch than the straight shank. It has been claimed by some that they are more troublesome to drive, but no difficulty has been found by those who have adopted them, and they unquestionably add materially to the strength of the riveting by better filling the rivet holes.

In table S. 8 of Lloyd's rules is indicated the shape of countersunk points required for outside plating. This requirement cannot be practically carried out with exactness, for it requires a different angle of countersink for each size of rivet and each thickness of plating. After some experiments, it was found that the countersinks could be greatly simplified. The angles adopted are indicated in Fig. 2. The trapezoids shown give convenient dimensions from which templates can be made for keeping the countersunk tools true. It will be observed that the 45° countersink answers for three-quarters of all rivets driven in a ship-yard.

TABLE III.—Spacing for Rivets.

Connection.	Number of diameters from center to center.
Single-riveted laps and straps	3½ +
Double-riveted laps and straps 15 lbs. and over	4 —
Double-riveted laps and straps under 15 lbs.	4 +
Treble-riveted laps	4½ —
Treble-riveted straps with alternate rivets in third row omitted	4 —
Longitudinal seams of plating required to be water-tight	4½ —
Connections of transverse frames not water-tight to outside plating	8 +
Deck plating to beams, and in general where special strength is not required	8 —
Connections of floor-plates, brackets, lightened intercostals, etc., to clips and angles	7 +
Connections of vertical keel angles where not water-tight, of angles and other stiffeners to bulkheads, of boiler and engine bearings and foundations generally	6 —
Connections of inner-bottom plating to all non-water-tight frames and longitudinals	5 +
Connections of angles of water-tight frames and longitudinals to all plating, and in general where water-tightness is required between plates and shapes	5 —
Connections of armor-shelf angle to shelf and outside plating	4½ —
In special cases of intercostals, beam ends, etc., where strength is required in connections of limited extent, spacing to be as required by circumstances, except that rivets in the same line should never be spaced less than	3

Notes.—The sign + indicates that if the exact spacing cannot be used, take the nearest over. The sign — indicates that if the exact spacing cannot be used take the nearest under.

A reasonable discretion should be used in connection with the signs + and — of the table, and where the spacing as laid off comes quite close to the requirements, but with the wrong sign, it will generally be better to use it than to depart too widely from the exact spacing in the direction indicated by the sign.

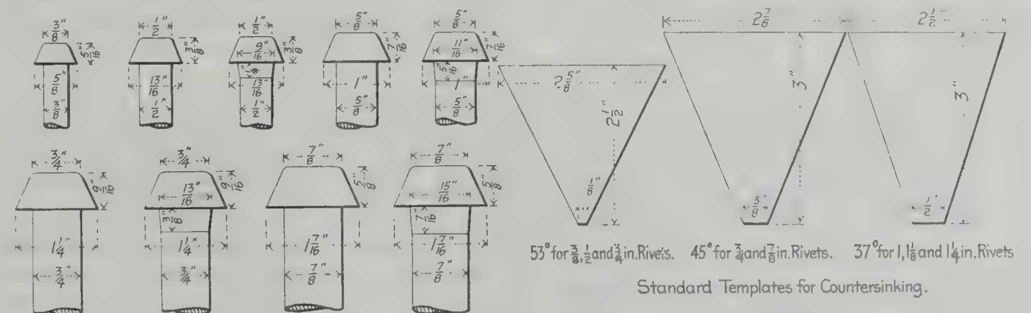
It is intended that the rivet holes should be countersunk through the plate to within 1-32 in. of the bottom of the hole in all cases. This has the advantage of removing most of the metal weakened by the punching.

This varying depth of countersunk holes leads to some slight inconvenience in ordering countersunk-head rivets, and it has been proposed to fix standard depths as follows:

Diam. rivet., ins.	½	⅝	¾	⅞	1	1⅛
Depth countersink, ins.	5-32	7-32	11-32	½	⅝	¾

The relation of the diameters of rivets to thickness of plates and shapes is regulated by a number of conditions. The rivet hole must not be too small to be punched through the plate. It must not be too large as to crush down the plate before shearing. It must not be so large as to require placing so far back from the edge as to prevent satisfactory calking. For a given thickness of plate, the strongest joint is obtained by the largest permissible rivet. The rivets must not be too large for ready hand driving. Out of these conditions there has grown up a tolerably uniform practice for ship work in all countries. The introduction of steel plates and steel rivets caused an augmentation of the size of rivet relatively to the plate, owing to the relative weakness of steel rivets to steel plates as compared to iron rivets in iron plates.

Table I. shows the sizes adopted.



53° for ⅜, ½ and ¾ in. Rivets.
45° for ¾ and ⅞ in. Rivets.
37° for 1, 1⅛ and 1¼ in. Rivets
Standard Templates for Countersinking.

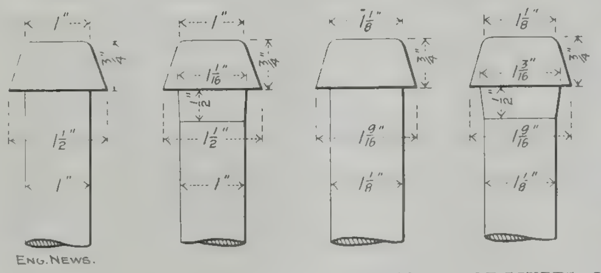


FIG. 2.—RIVETS USED ON RECENT U. S. NAVAL VESSELS.

Note.—The allowances for length of rivets over thicknesses connected, as given, are for two thicknesses only. An additional allowance of 1/16-in. is added to this length for each additional thickness of plates connected. The exception to this rule is only where the plates connected are very thin (less than 3/16-in.) then the allowance will be 1/32-in. for each additional thickness.

	DIAMETER OF RIVETS—INCHES.									
Type of points.	5/16	⅜	7/16	½	⅝	¾	⅞	1	1⅛	1¼
	ALLOWANCE FOR LENGTH OF RIVETS, OVER THICKNESSES CONNECTED=INCHES.									
Countersunk.	⅜	⅜	7/16	7/16	[illegible]	[illegible]	[illegible]	[illegible]	1	1 1/16
Mashed.	7/16	7/16	½	½	[illegible]	[illegible]	[illegible]	[illegible]	1	1 1/16
Button.				½	[illegible]	[illegible]	[illegible]	[illegible]		

In cases where a rivet connects different thicknesses of plating together, the size of the rivet indicated for the greater thickness is to be used, provided it is not more than ⅛-in. larger than the size of rivet required for the lesser thickness. But in no case is the rivet to be less in diameter than the thickness of the thickest plate. Tap rivets will be ⅛-in. larger than the corresponding rivets for the same thickness, except those in stem and stern post, which will be ¼-in. larger.

Table II. gives laps and straps suitable for plating. The widths are cut down from the requirements of Lloyds' rules, resulting in a considerable saving of weight. It is believed they are sufficient with first-class workmanship:

Table III. shows the rivet spacing adopted. The endeavor has been made to make it sufficiently detailed to provide for the greater part of the cases arising in hull work.

Where strength is required in laps and butted connections of plating, with the spacing indicated, single riveting is suitable only for plating under 12½ lbs., and double riveting under 25 lbs. Where strength is required in connections above 30 lbs., a special calculation should be made, and generally quadruple riveting will be required.

The tables of spacing have been slightly modified from those originally determined upon in the direction of closer spacing, which has seemed desirable, in view of the comparative weakness of the steel rivets used in the Navy.

In the French Navy a very elaborate series of rules for spacing of rivets in butts, laps, etc., has been adopted. These include the general use of staggered riveting, usually an irregular spacing of rivets in different rows, and, in special cases, the use of different sizes in the same joint. Some additional strength is doubtless thus obtained in the connections, but it does not appear worth the increased cost. The simpler methods of chain riveting have always been adopted by the British Admiralty and in our own service.

It has been mentioned above that on account of the comparative weakness of the steel rivets used in the Navy, it has seemed desirable to decrease the spacing. The requirements for rivet steel for the first steel cruisers were a minimum tensile strength of 60,000 lbs. per sq. in., and an elongation in 8 ins. of not less than 23%, with a shearing strength of not less than 50,000 lbs. per sq. in. The actual average results obtained from the tests were 64,740 lbs. per sq. in., and 27.41% elongation, with an average shearing strength of 53,695 lbs. per sq. in.*

The requirements for the recent ships have been between 55,000 and 62,000 lbs. tensile, with a minimum elongation of 29% in 8 ins., and a minimum shearing strength of 45,000 lbs. per sq. in. I am not informed as to the average results actuallly obtained, but with the limits between which the tensile strength is required to be maintained, the average shearing strength cannot exceed about 50,000 lbs. It seems very desirable to make a return towards the earlier specifications and sacrifice a little of the ductility in order to obtain increased shearing strength. A rivet steel for hull work, similar to the requirements of the present specifications for rivets for longitudinal boiler seams, appears very desirable. These requirements are between 58,000 and 67,000 tensile strength, with a maximum elongation of 26% in 8 inches. The maximum allowances of sulphur and phosphorus, which for hull rivets are .04 and .05° respectively, are for these boiler rivets .035 and .04 respectively, and with a metal of this character no difficulties should occur in the satisfactory driving of the rivets.

REMOVAL OF IRON FROM WATER FROM A FILTER GALLERY AT READING, MASS.

Sulphate of iron is being removed from the ground water supply of Reading, Mass., by the addition of milk of lime, combined with thorough aeration and rapid filtration, the treatment proceeding in the order named. This process was adopted by the water commissioners after some two or three years of investigation, which will first be outlined.

Water-works for Reading were completed in 1891, with the late M. M. Tidd, M. Am. Soc. C. E., as engineer. Water is pumped from a filter gallery near the Ipswich River to a covered standpipe, 30 ft. in diameter and 100 ft. high. It was first proposed to put in driven wells, but after more extended investigation Mr. Tidd recommended a filter gallery at about the same locality, and this recommendation was followed. The estimated cost of the driven wells was $5,931, and of the filter gallery, $9,000. When bids were received for the work the water commissioners found it would cost $16,000; but the bidder who named that price, Mr. J. H. Leavitt, of Boston, also offered to do the work at a stated price per day. The latter proposition was accepted and the work was done at a cost of $16,562.

The bottom of the gallery is 22 ft. below the level of the meadow. The gallery is 3½ ft. wide and 4 ft. high, inside, L-shaped, with a total length of 250 ft. The walls are of rough field stone, like "an ordinary culvert under a street," and the gallery is covered with flat stone laid in cement. A 14-in. passage, controlled by a gate, connects one end of the gallery with a circular brick well 6 ft. in diameter, covered by a house of the same size and material. A 12-in. suction pipe, 450 ft. long, leads to the pumps. Another pump well and suction main makes possible an emergency supply from the Ipswich River. About 75 ft. of the gallery is parallel with and about 40 ft. from the river; the remaining 175 ft. extends away from the river at a right angle.

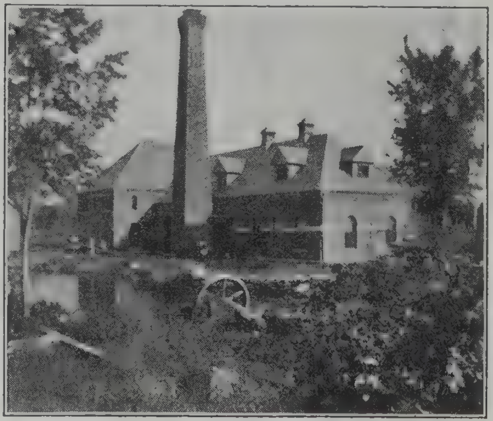

Fig. 1.—View of Pump and Filter House; Reading, Mass.

It appears that the quantity of water obtained from the filter gallery has been satisfactory, but not so the quality. The studies which have been made of the quality of the water have been very interesting.

The Massachusetts State Board of Health had recommended a "supply from the ground near the Ipswich River," in 1889, before construction was started*. In its report for 1890 it says nothing regarding the proposed supply, further than to present two analyses, without comment, of water from a test well. In its report for 1891 the Board states that the meadow beneath which the gallery is located

> is subject to flowage to a depth of 5 ft. during the six months from Oct. 12 to April 12, * * * * and it is probable that the quality of the water is effected to some extent by the fact that the meadow has always acted to a greater or less extent as a filter every time it has been flowed on account of the difference in the water level above and below the dam.

The dam mentioned was just below the filter gallery, and has since been removed to prevent flooding, the water right and a mill at this point having been bought by the water commissioners in 1895, at a cost of $2,544.

In this same report, 1891, the chemical analyses of water from the filter gallery show marked turbidity and heavy sediment throughout the greater part of the year, although the average residue on evaporation was only 12.96 per 100,000, ranging from 9.35 in August to 26.40 in November. As a whole, the monthly samples of water collected during the last ten months of 1891 are described as having an odor "generally disagreeable, sometimes offensive." Regarding this odor and the iron in the water it is stated that:

> The water contains iron in solution, which precipitates out as a reddish-brown deposit on exposure to the air. Waters of this character often have a disagreeable odor from carburetted or sulphuretted hydrogen. * * * Sample No. 8,255 (the one with high residue on evaporation.—Ed.) is exceptional in this series, containing much more mineral and organic matter than the other samples. The amount of metallic iron in this sample was 1.33 parts per 100,000, or 0.78 grains per gallon. The colors given in the table are doubtless all due to the separation of iron oxide. The water as it comes from the ground is colorless.

No determinations for iron are given except the one cited. The color was zero in April, May and the first part of July, and during the balance of the year ranged from 0.02 in December to 0.40 in August, averaging 0.13, and being only 0.04 in November, the month of heavy sediment.

In 1892, the color was higher, averaging 0.44, and ranging from 0.00 in January to 0.80 in December. Iron determinations were reported for the last four months of the year, averaging 0.235 parts per 100,000. Crenothrix, a species of fungi, were present in large quantities during the greater part of this year, as were also zo-ogloea, an organism classed neither as plant or animal, but as miscellaneous, "owing to the uncertainty which attaches to the precise nature of the substance." The peculiar characteristic of these micro-organisms is that they are massed or bound together by a gelatinous envelope. Crenothrix thrives in water containing "decomposing organic matter and iron in solution as protoxide."* Partially filtered water, like the ground water from a filter gallery, would furnish the organic matter, and with iron present in addition as at Reading, crenothrix might be expected in profusion. The color of the water at Reading in 1892 was attributed to "crenothrix or zo-ogloea and iron."

In 1893 the State Board of Health found an average of 0.1251 parts of iron per 100,000 in the water, as the result of the twelve monthly analyses, the iron ranging from 0.01 in August to 0.54 in November. The color averaged 0.64, and the odor was "faintly moldy or unpleasant, often none; in June and July disagreeable." The sediment was often heavy and rusty. Organic matter, in a partial state of nitrification, was quite prominent. The comments on the analyses were as follows:

> The water offers a good instance of the effect of a marshy soil on the character of the water percolating through it. The organic matter of the soil consumes the free dissolved oxygen in the water and reduces the insoluble iron salts to the condition of protoxide, so that iron passes into solution in the water. On exposure of the water to the air the iron is again oxidized, forming first a precipitate which gives the water a milky appearance and ultimately settles as a rusty sediment. Conditions in some respects similar to those of Reading are found in Provincetown, Bradford and Watertown, and were found in the test wells at Attleborough (see 23d Annual Report, 1891).
>
> The determinations of turbidity and color in waters of this kind do not have the same significance as in surface waters, but they are, nevertheless, of interest as showing a condition which the water may assume, and are therefore given in the table.

The first three reports of the Reading Water Commissioners, two of which were published after the works were put in operation, contain no reference to the quality of the water, but evidently it occasioned anxiety as early as the latter part of 1892, at least, for in the report for 1893 it is stated that in February of that year Mr. Desmond FitzGerald, M. Am. Soc. C. E., was engaged

> to make a careful examination of our source of supply, to ascertain, if possible, the cause of the disagreeable odor and color of the water and to advise us what steps to take to remedy the existing troubles. He was also requested to advise us in regard to other sources of supply, both within and without the boundaries of the town.

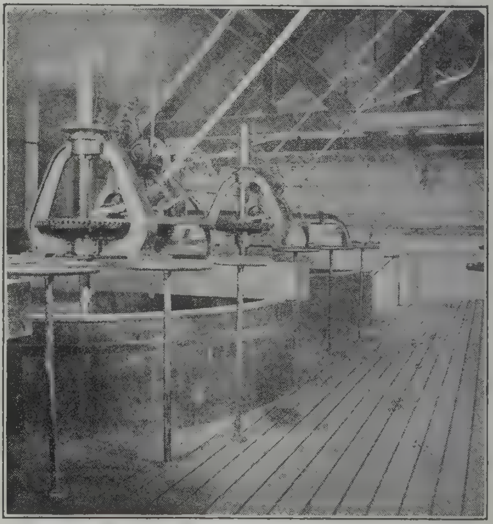

Fig. 4.—View of Top of Warren Filters; Reading, Mass.

Mr. FitzGerald continued his studies for a year, not reporting until February, 1894 (the report appears, however, in the annual report for

---

*Report of the Naval Advisory Board on "Mild Steel, etc.," prepared by Assistant Naval Constructor R. Gatewood, U. S. N., Washington, Government Printing Office, 1886.

**It must not be inferred that this recommendation related to the mode adopted years later to develop water, but only to the general source.

*Examination of Water Supplies. Special Report Mass. State Board of Health, 1890, p. 781.

1893). After preliminary remarks the report discusses the situation as follows:

> I first began to investigate the quality of the water as delivered to the consumer, and have found some curious phenomena. On the same street and in houses supplied from the same main, the quality of the water seemed to vary. At one house the water contained so much iron and had such an offensive odor that there was much just complaint. At the very next house there was no cause for complaint, the water appearing to be free from objection and used freely for drinking, for use in the teakettle and for the laundry. I soon found that the cause for this peculiar condition of things was due to the fact that where a service pipe had been in use long enough to lose its coating, the carbonic acid in the water acted with rapid effect upon the pipe.
>
> The Reading water was already known to contain a considerable amount of iron; but after I became intimately acquainted with its peculiar and varied properties, I learned to have a wholesome respect for it. At one house I found that they could either draw good or bad water from the same main.* After some thought upon this condition of things, I advised your board to use nothing but cement-lined services until the quality of the water should be improved.
>
> As might be expected, a certain amount of crenthorix is almost always present in the Reading water, and I first expected to find that this was one of the causes of complaint; but I found that this was not the case. Crenothrix is hardly abundant enough unless it is stirred up in the gallery or in other portions of the work. Samples from the manholes in the filter gallery can be taken in almost any variety of condition, according to the method of selecting the samples.
>
> In the distribution system there is generally an almost entire absence of oxygen in the water; but there is no lack of offensive gases of one kind or another to annoy the water taker. If the lack of oxygen was the sole trouble, the remedy would be a simple one. More aeration would only have the effect to drive off the obnoxious gases and change the form of the iron from the ferrous to the ferric condition; in other words, to deepen the color of the water and hasten precipitation of the iron. It soon became evident that the Reading water was no ordinary liquid. A great many experiments were made, both by myself, and under the direction of Thomas M. Drown, M. D., of the Massachusetts Institute of Technology, to whom I am much indebted for long and patient advice upon the chemical side of the subject. Assistant F. L. Hollis made many able investigations and analyses to ascertain the effect of the gases and acids in the water. A great many determinations were also made of the amount of iron in the water, and I left no stone unturned to ascertain the condition of the water in the different portions of the system at different times of the year.
>
> I found that generally one-half of the water came from the river directly down into the gallery by very rapid and imperfect filtration, and that the other half came from the ground. A careful examination of the materials in the ground between the filter gallery and the high land by means of driven wells, some of them put down especially for this investigation, showed that there was not enough water for the supply of the town from the ground alone. An extension of the driven wells up the valley of the Ipswich River gave no better results. The material underlying the meadows is of too fine a quality for a successful application of the artesian or driven well system.
>
> Having found after due consideration that there was no easy way to make the Reading water acceptable, or to procure an additional supply in the immediate neighborhood of the works, I next turned my attention to other sources of supply.
>
> The further I went into the study of the question of other sources, the more convinced I became that it would be a very expensive matter for Reading to abandon its present supply, so I applied myself diligently to the question of purification of the present water. After much study and thought and the consideration of many plans, I finally recommended to your Board the following outline of works for purifying the Reading water which, to the best of my belief, will render the quality of your water perfectly satisfactory to the citizens of Reading:
>
> 1. Pump the water from the filter gallery into a covered reservoir built in two sections, each of which should hold 500,000 gallons.
> 2. Aerate the water thoroughly on its way to this reservoir.
> 3. Build invert to the reservoir with a steep inclination towards the drains, so that the sediment precipitated upon the bottom will scour easily.
> 4. Place this reservoir high enough to filter the water and return it to its present pumps. The water drawn from this reservoir can be filtered rapidly through any cheap form of filter which can be readily cleaned.
> 5. After the plans are made, I should recommend you to put in the filters at once, and run them without the reservoir until the opening of the coming season.
> 6. The outlets or drains to the reservoir should be so arranged that the flocculent iron can be collected for use, if found necessary. I have found in my experiments, and it was suggested by Dr. Drown, that by adding some of this flocculent iron to the water, the precipitation of the iron is somewhat hastened.

Sectional Plan.

FIGS. 2 AND 3.—PLAN AND SECTION OF WATER PURIFICATION PLANT; READING, MASS.
Cumberland Manufacturing Co., Boston, Mass., Contractors.

The water commissioners stated in their report for 1893 that Mr. F. L. Fuller, M. Am. Soc. C. E., was then preparing plans for the settling tanks, filters and reservoirs necessary to carry out Mr. FitzGerald's recommendations, and that the work was to be done at once. For some reason it was concluded to investigate the matter still further before beginning work. In March, 1894, the State Board of Health was asked for advice regarding the proposed purification scheme, and also whether it would recommend the securing of water from a new source. Other sources were investigated, but none were approved, the Board recommending that Reading take steps to secure a permanent supply from the new works then proposed and now under construction for the metropolitan district of Boston, and concluding:

> In the meantime, provision should be made to improve the present supply by preventing the flooding of the meadow over the filter gallery, and it may be advisable to adopt temporarily, some system for filtering the water rapidly through sand.

The report of the State Board of Health was not made until February, 1895, owing to the desire to study the problem during the fall and winter of 1894-5, when the meadows above the filter gallery were flooded. The portion of the report relating to the studies of water from the filter gallery is as follows:

---

*The explanation of this, Mr. FitzGerald states in a letter to this journal, is that there were two service pipes of different material in the same house.—Ed.

> A very large number of examinations of the water of the filter-gallery have been made during these investigations and previously, and from these results it appears that the objectionable character of the Reading water is due chiefly to the presence at nearly all times of an excessive amount of iron in connection with other mineral and organic matter. The amount of iron found in the water varies greatly at different times, being very large in the portion of the year when the meadow is covered with water and much smaller during the summer when the meadow is dry. It has also been observed that the quantity of iron present in the water may vary greatly in the course of a single day's pumping.
>
> In contrast with other waters in which a sufficient amount of iron has been found to effect the appearance and quality of the water, it has been found that the iron in the Reading water is present as a sulphate instead of being in the form of a bicarbonate. When iron is present as a sulphate its removal from water is very much more difficult than when it is present as a bicarbonate.
>
> Many experiments have been made at different times with a view to a removal of the iron by oxidation and subsequent filtration of the water through sand to remove the precipitated iron oxide. The results obtained by this means have been very variable. But, in general, it may be said that when the iron is present in the water in small amount, say not over 0.3 of a part per 100,000, the iron will separate out of the water almost completely on exposure to the air for 24 to 36 hours in the form of a rusty precipitate, which can be removed entirely by filtration through sand at a rapid rate. This method is substantially that proposed by Mr. Desmond FitzGerald in his report to your Board. Forced aeration by filtering through sand with a current of air was found in almost all cases to hasten the oxidation and separation of the iron oxide.
>
> But in one case, at least, when the iron was only 0.14 parts per 100,000, aeration in this way had but little effect on the iron. The failure to remove the iron in this case seemed to be connected with a considerable amount of organic matter in the water which prevented the precipitation of the iron after oxidation.
>
> Again, the difficulty in removing the iron appears to increase rapidly with the amount of iron in the water, and when large amounts are present, say from one to two parts per 100,000, which has been frequently the case the past winter, the means found adequate to remove the iron when present in small amounts are unavailing. Exposure to the air for two days had practically no effect on the iron contents of the water of this character, and even after thorough aeration, it separated out only in part, leaving most of the iron still in the water, upon which filtration had no effect.
>
> During the progress of this investigation, advantage has been taken of the presence at the Reading pumping station of a small mechanical filter placed there and first operated about the middle of the summer. This filter consisted of two upright cylinders, one said to contain 30 ins. in depth of sand, and the other 30 ins. of bone-char, each having an area of about 1 sq. ft. Later in the season the number of cylinders was doubled.
>
> Experiments with this filter showed that with iron not exceeding 0.1 of a part per 100,000, rapid filtration alone without exposure to the air was capable of removing practically all of the iron in the water, but when the water contained large amounts of iron, the action of the filter was uncertain. With very high iron, say one part per 100,000, the filter had no effect whatever on the amount of iron. No special advantage was found in the use of bone-char in these experiments, and it is, therefore, probable that any sand filter capable of being readily and thoroughly cleaned would do equally good work.
>
> Any treatment by filtration which will remove the iron will be very likely also to remove the objectionable odor and appearance of the water.
>
> When the amount of iron in the water was very high, experiments were made to learn whether it could be removed by chemical means, a cheap form of which would be filtration through carbonate of lime, in the form of marble chips. The experiments in this line have indicated that the iron can be completely removed by filtration through carbonate of lime, but that in this process the water takes up lime in large amount and is made very hard. A combined process of aeration and filtration through sand and with subsequent filtration through carbonate of lime, leaves the water much less hard than when it is put directly on to a filter containing marble, and the results indicate that the hardness of the water after treatment in this way would be at least 16 to 18 parts per 100,000, while the hardness of the water after filtration through carbonate of lime, without previous aeration and filtration through sand, is likely to be at least 25 parts per 100,000.
>
> While the hardness of the water, if treated chemically, by filtration through carbonate of lime as suggested, would be very little or no greater than that of waters supplied to some of the towns in the vicinity of Boston, the board does not recommend the use of so hard a water for a permanent supply.
>
> Since the higher amounts of iron and organic matter are found when the meadow is flooded, it would seem that the quality of water in these respects might be greatly improved and the water rendered more susceptible of further improvement by filtration or other treatment if this flooding were prevented.

In 1895 the water commissioners purchased and removed the dam which had caused the flooding of the meadows and contracted with the Cumberland Manufacturing Co., of Boston, to put in a purification plant, which combined lime treatment, aeration and rapid sand filtration through mechanical filters of the Warren type. Mr. Walter B. Nye, Manager of the company, states that his company had been studying the water for three years. The purification plant is located in an addition to the pump house, as shown in the general view, Fig. 1.

The character of the plant can best be set forth by using a description of it kindly sent us by Mr. Nye, under date of Sept. 14, 1896, as follows:

> Stated briefly, we proposed to add lime to the water, aerate it, and if necessary to still further coagulate the oxidized iron in suspension in case it did not coagulate sufficiently of itself, to render it removable by mechanical filtration.
>
> The plant, shown in plan and section by Figs. 2 and 3, consists of a settling and coagulating basin, approximately 33 × 19 × 9 ft., above which is placed an aerating basin, 33 × 19 × 4½ ft., and six Warren filters, 8⅔ ft. in diameter and 8 ft. 5 ins. deep, together with a temporary storage tank for filtered water, approximately 31 × 10½ × 8 ft., from which the pumps take their supply. The water is taken from the existing suction main by a low duty Worthington pump, and by it delivered to the aerating basin. The water is delivered through a hopper at one end of this basin, and as it rises in the same meets the descending supply of milk of lime, which is prepared by the automatic slaking device used in our Keyport plant (Eng. News, June 4, 1896). On receiving the lime it passes into the aerating basin proper, which is so divided by partitions as to cause the water to travel back and forth four times before passing over the final weir and entering the settling basin below. The water, during this passage, receives violent aeration by means of 23 1¼-in. nozzles, perforated with 15 1-32-in. holes. Air for this aeration is supplied by a No. ½ Wilbraham Baker blower, which has a guaranteed capacity of 150 cu. ft. of air per min., at a maximum pressure of 3 lbs. The actual pressure due to the friction of the pipe, aerating nozzles, and the depth of the column of water at the outlet is about 2½ lbs., as shown by a mercury gage. By this method, each particle of water receives 23 successive aerations, thus thoroughly oxidizing the iron, and the water together with the suspended iron passes over the last weir and through a 10-in. pipe, at the outlet of which is one of our standard alum propellers (Eng. News, Jan. 4, 1894) whereby the water is supplied with the amount of dilute alum solution necessary for its coagulation. In this basin the water remains for about one hour, and from there passes to the filters, which are of standard type. The upper portions of two of the filters, with the mechanism for driving the sand agitators are shown by the view, Fig. 4. The filtered water, now bright, clear and sparkling, passes over the weir shown in Fig. 1, and from this is taken to a temporary storage tank, which occupies the place prepared for the addition to the filter plant.
>
> As shown on the section, Fig. 2, a storage tank for filtered water is provided underneath the filters, but owing to the necessity of constructing it in winter it was found difficult to secure a tight wall and the temporary wooden tank was constructed for use during the present season.
>
> Owing to the changeable character of the water a strict watch is kept upon it and every hour the incoming water is tested for iron, and the water both before and after aeration and after coagulation is tested both for alkalinity and iron. For the taking of these tests we have prepared a sufficient supply of standard indicator, together with the necessary simple apparatus, and the engineer in charge has no difficulty in making his tests and in so regulating the amount of lime and of alum as to prevent the use of an excess and enable the plant to properly handle the water.
>
> We use in this case our 8⅔-ft. filter instead of the larger size, for the reason that its use seemed to allow a better arrangement of the plant, both for the present and future, in view of the size of basin necessary, and the fact that the land and the development of the plant were limited by water on two sides.
>
> We enclose copies (Table I.) from the State Board of Health reports both for July and August (September and October sent since.—Ed.) and also our own analyses, recently made.* At the time the July and August samples were taken, the plant was being worked to its fullest capacity, pumping about 14 hours a day, which with the small force employed prevented giving the plant as close chemical attention as they desired and in consequence the hardness is a little greater than expected. At the present time (Sept. 14, 1896) they are pumping 7½ hours a day; the average pumpage is 247,486 gallons; the average alum consumed is 36 lbs., and the average lime, 70 lbs.
>
> As the engineer in charge becomes better acquainted with the plant and with the methods, it is probable that the consumption can be materially decreased. as in this particular instance the skill of the operator would have much to do with the economy of the operation.
>
> On starting the plant, we met with some difficulty, owing to the character of the lime, and it was only after considerable experiment that we found that a perfectly pure lime made from marble was much better adapted to this purpose than the ordinary lime of commerce, and a supply is now secured from northern Vermont which meets the requirements in every particular. The necessity for coagulation is due to the fact that the iron varies greatly in its behavior under treatment by lime and aeration. At times the hydrate of iron forms in sufficiently large flakes to serve as its own coagulum; at other times the oxidized iron is in so minute a form as to render the water brown like beer, under which conditions it will pass through any form of filtering medium, unless a coagulant is used. Without a coagulant water can be secured which will be perfectly clear and apparently white, except in large volume, where it might show a slightly greenish tinge, but by using a coagulant this is removed and the water is perfectly limpid and clear. The citizens are thoroughly pleased, the water seems to be useful in more commerical ways than it was before, and apparently the only evil to result from the installation of the apparatus is the great increase in the consumption of water, which has taxed both men and facilities ever since the plant was put in.

In a more recent letter (Oct. 31), Mr. Nye writes as follows:

> In the analyses recently sent you I would call your attention to two of them in particular, one showing about 83% removal of iron and one showing 100%. The difference in total hardness and total solids, as you will note, bears a very close relation to the removal of iron and reduction in ammonias, and the two samples show, first, the result of insufficient lime, and, second, the result of too much lime. During the warm weather the character of the water varied greatly and the consumption was large, and as a result the operators did not always catch the changes in the water sufficiently early, but at no time has there been any hardness which was appreciable to the community, and there has been nothing but complete satisfaction.

With the letter from which the above was taken

---

*The analyses sent by Mr. Nye were only partial. They showed a reduction of iron from 0.356 to 0.020 or 94%. —Ed.

*In terms of an equivalent amount of carbonate of lime in parts per 100,000. [1]Turbid.

Mr. Nye sent a copy of some analyses made for the Cumberland Manufacturing Co. by Prof. Henry Carmichael. These analyses are presented in Table II., the analyses made by the State Board of Health being given in Table I.

The total cost of the Reading purification plant has been about $19,000, divided as follows:

Building and clear water basin	$11,000
Suction pipe	1,436
Pumps, engines and connections	1,900
Settling basin, aerators and filter, about	7,000
Total	$21,336

As stated above, $2,544 was paid in 1895 for water rights and a mill in order that a dam might be torn down to prevent the flooding of the meadow over the filter gallery. In addition, $514 was expended for a dike in 1895. These items, however, should be added to the $16,562 paid for the filter gallery, making $19,630 as the cost of developing the supply.

The total pumpage in 1895 was 72,375,448 gallons, or an average of 198,289 per day. The total estimated population of Reading in 1895 was 4,717, of which it was estimated that 4,140 were on the lines of the distributing pipe, and 3,550 actually supplied. On the above basis the pumpage per inhabitant would average 42, and per consumer, 56 gallons per day.

Mr. Lewis M. Bancroft is superintendent of the Reading water-works, formerly one of the water commissioners, and has had charge of the construction of the works since their beginning. The water commissioners are now as follows: Messrs. Edward C. Nichols, Geo. E. Abbott and Calvin E. Martin.

TABLE II.—Analyses of Unfiltered and Filtered Water from Reading, Mass., made by Prof. Henry Carmichael (Samples Collected Sept. 26, 1896).

(Parts per 100,000.)

	Before filtration.	After filtration.
Total residue on evaporation	12.3000	19.1000
Organic and volatile matter	3.1000	4.6000
Chlorine	0.2655	0.2655
Free ammonia	0.0066	0.0020
Albuminoid ammonia	0.0090	0.0050
Iron as iron oxide	0.1070	0.0107
Hardness Clark's scale*	2.64°	4.51°

*Or, to make these comparable with the State Board of Health, analyses, by giving an equivalent amount of carbonate of lime in parts per 100,000, 3.80 before, and 6.40 after filtration.—Ed.

◆

AN INLAND HARBOR AT THE SOUTH END OF Lake Michigan and just southeast of Chicago, Ill., is proposed in a measure to be presented, it is stated, at the coming session of the Indiana State Legislature. The measure authorizes North Township, Indiana, to issue bonds to the amount of $200,000, for the purpose of constructing a waterway between Lake Michigan and the Grand Calumet River, at a point one mile east of Hammond, Ind. It is stated that plans for the project, which involves the building of inland harbors in Wolf and George Lakes, have been drawn in accordance with Major W. L. Marshall's views, and submitted to him for approval. They show a canal 300 ft. wide from Wolf River, where it enters Lake Michigan, to the Calumet River. Entrance will be made at Wolf Lake, where a basin 600 ft. wide and 7,500 ft. long will be dredged, the canal continuing in a direct line to George Lake, where a basin 450 ft. wide and a mile long will be built. Leaving the lakes, there will be a canal 300 ft. wide and 20 ft. deep, through sections 19, 30 and 31. The committee having charge of the movement is composed of Edward Roby, C. A. Shedd, C. F. Mott, General Charles F. Griffin, A. F. Knotts, Marcus M. Towle, Senator William H. Goslin and others. Congress has appropriated $80,000 for the Wolf Lake Harbor, and if the Indiana Legislature approves the project, it is stated that it will be begun early next spring. The place seems to be one of several which have been the outcome of the inadequate harbor facilities of the Chicago River, which were discussed at some length in Engineering News of July 16, 1896.

◆

A CHARLESTON-LIVERPOOL STEAMSHIP LINE, the Johnson Blue Cross Line, is to commence operations in December under the management of the Charleston Shipping Co. It is the first step in a proposed development of direct trade between Europe and Charleston, S. C.

◆

A $3,000,000 FILTRATION ORDINANCE has passed the Philadelphia Common Council by a vote of 99 to 3. The ordinance authorizes a loan of the above amount "for the purpose of constructing and erecting a filtration plant or plants, to connect with the several pumping stations embraced in the water supply of the city of Philadelphia." The ordinance must still pass the Select Council.

WEATHER TABLE FOR OCTOBER, 1896. (Furnished to Engineering News by the Department of Agriculture.)

	Stations.	Temperature. (Degrees Fahrenheit.)				Wind.			Precipitation—rain or melted snow—inches.

A WATER POWER AND ELECTRIC POWER PLANT is being built in Calaveras county, Cal., by the California Exploration Co., the power to be used for mining purposes. The head is about 1,043 ft.

◆

THE UTILIZATION OF WATER POWER of the flow through the Tequixquiac drainage tunnel for the city of Mexico is being arranged for by the Electric & Irrigation Co., which proposes to put in a water wheel plant for driving dynamos to generate current which can be used for lighting and power purposes. Mr. Thomas W. Orbison is the Chief Engineer.

◆

A WATER POWER AND ELECTRIC PLANT is to be established at York Haven, Pa., on the Susquehanna River. It is proposed to build a power canal parallel with the river, and using the water to drive 20 water wheels which will be connected to dynamos. It is proposed to transmit the current to neighboring towns for lighting and power purposes. Mr. Harry L. Carter, of Philadelphia, owner of the York Haven Paper Mills, is interested.

◆

THE NEW WATER POWER PLANT at Indian Orchard, Mass., will have three pairs of horizontal turbines of 950 HP. On the second floor will be three electric generators of 450 HP., with a capacity of 15,000 incandescent lights of 16 c. p., and seven generators with a capacity of 840 arc lamps. The current will also be used for driving a 400-HP. motor for commercial arc lighting. It is intended to use the current for lighting the city and the mills, and for driving mill machinery.

◆

LAND BELOW HIGH WATER MARK, on the New York water front, can not be held as private property, according to a late decision of the Appellate Division of the Supreme Court, in the case of Henry W. Sage vs. the City of New York. Mr. Sage owned land on the East River water front, between 94th and 95th Sts., and he enjoined the city from filling in there and claimed title to the bulkhead line. The majority of the court held that the property right to land between high and low water mark is invested in the city by the Dongan charter of 1686, affirmed by the charter of 1777 and reaffirmed by all subsequent charters to 1894. These charters were based on grants made by James II. and George II., through Governor Nicholls and others, and these grants expressly state that waterways up to high water mark shall not be at any time private property. The minority of the court held that in some private grants water fronts were included, and that in this case the evidence was not sufficient to show that they were not to be included. As fifty other cases depend upon this one, the Sage case will probably be carried to the Court of Appeals.

◆

THE WATER CONSUMPTION OF PARIS, says the "Revue d'Hygiene et de Police Sanitaire," touched its maximum on July 9, last, with 633,200 cu. m., or 167,290,440 U. S. gallons per day. Of this volume 64,042,080 gallons were derived from springs, or "eaux de sources;" 62,826,760 gallons were taken from the Seine; 39,101,600 gallons came from the Ourcq and 1,321,000 gallons came from the artesian wells or from Arcueil. Between July 5 and 11 the aggregate consumption was about 62.4 gallons per day per inhabitant; of which only 26 gallons, however, was from the springs, or sources of purer water. While the Parisian authorities note this consumption as abnormal and due to a season of unusual heat, the figures given prove either that the supply of potable water is a limited one, or that there is unusual care in its distribution. Considering the very liberal public use of water in fountains, etc., in that city, the aggregate daily consumption per head of population is very small compared with the lavish use, or waste, of water in American cities. And in the latter cities the best water is used for all purposes, instead of there being several distinct supplies of varying quality to draw upon, as in Paris.

◆

THE GREAT YERKES TELESCOPE, which is to be erected at Lake Geneva, Wis., for the University of Chicago, is nearly completed and the observatory building will be ready for dedication and occupancy on Dec 15. The 40-in. lens for the telescope, which Alvan Clark, of Cambridgeport, Mass., has been grinding for the last year and a half is ready for shipment. This lens is the largest in the world, the next largest being the 36-in. lens in the Lick telescope in California.

◆

BOOK REVIEWS.

POCKET COMPANION, Containing Useful Information Appertaining to the Use of Steel, as Manufactured by the Carnegie Steel Co., Limited, Pittsburg, Pa. For Engineers, Architects and Builders. Edited by F. H. Kindl, C. E., 1896. Morocco flap; 4¼ × 6½ ins.; pp. 284; $2.

A feature of the present edition of this well-known pocket-book is the conformation of shapes, weights and tables of various sections, as well as specifications, to the new standards adopted by the Steel Manufacturers' Association. It also contains additional data on steel construction.

THEATRE FIRES AND PANICS:—Their Causes and Prevention. By William Paul Gerhard, C. E., Consulting Engineer for Sanitary Work. New York: John Wiley & Sons. 12mo.; 175 pp.; $1.50.

This is not a general treatise upon theatre planning and construction, but a statistical study of theatre fires and panics, their causes and frequency, and a series of hints upon the methods of preventing the same, as deduced from the experience of recent years. The prevention of fire and panics is only accomplished by proper location, planning and construction, backed by efficient management and constant inspection. The author briefly outlines these essential elements of safety. Fireproof curtains, stage ventilators, the arrangement of aisles and chairs, fireproof treatment of stage scenery, and safe heating and lighting, are all discussed along with fire-service, life-saving appliances, fire alarms and general questions of management. The work closes with a long list of books, pamphlets, reports, etc., bearing upon theatre construction and theatres generally.

INDUSTRIAL ORGANIC CHEMISTRY: A Hand-Book Adapted for the Use of Manufacturers, Chemists, and All Interested in the Utilization of Organic Materials in the Industrial Arts.—By Samuel P. Sadtler, Ph. D., F. C. S., Professor of Chemistry in the Philadelphia College of Pharmacy and in the Franklin Institute of the State of Pennsylvania; author of a "Hand-Book of

Chemical Experimentation;" etc., etc. Second Revised and Enlarged Edition. Philadelphia: J. B. Lippincott Co. 8vo.; pp. 537; 127 figures; diagrams and tables. Cloth, $5.00; half leather, $5.50.

The range of subjects covered by this volume is amazing. The general plan followed has been (1) to present for the several industries an enumeration and description of the raw materials concerned; (2) the process of manufacture is described; (3) the products are set forth; (4) analytical tests and methods are presented; (5) the bibliography and statistics of each industry, or the most important ones, are given. Owing to the scope of the work the treatment of each subject is generally brief.

The main divisions of the subjects taken up are oils, fats, resins, sugar, starch, fermentation processes, industries based on animal and vegetable fibers and animal tissues, dyeing and coloring.

The first edition of the work was published in 1891. In this edition the body of the text has not been altered further than to make corrections, but some new sections have been added, and the bibliography and statistics have been brought down to 1895. The volume seems to be a most excellent one for ready reference where only the salient features of a process are described. If one does not find here all that is desired the bibliography will direct him to more extended sources of information.

BUILDING CONSTRUCTION AND SUPERINTENDENCE.—By F. E. Kidder, C. E., Ph. D., Architect, Author of "The Architects' and Builders' Pocket Book." Part I.—Masons' Work. New York: William T. Comstock. 8vo.; cloth; pp. 409; 250 illustrations. $4.

This author has long been well and favorably known among architects, and also to a considerable extent among engineers, through his "Architects' Pocket Book." The present volume bids fair to be a very useful book for all who have to do with the construction of buildings. It is written in the light of the most recent practice and seems to cover the subject admirably. It is essentially a practical book, but is founded on good engineering, architectural and business principles.

The first two chapters discuss, respectively, foundations on firm and compressible soils. Next comes a chapter on masonry footings and foundation walls, shoring and underpinning, followed by chapters on limes, cements and mortars, building stones, cut stonework, brick work, and architectural terra cotta. Fireproofing is given some 40 pages, in which the subject seems to be well treated, including a description of some of the best systems of construction now in use. As closely allied to the main subject, a chapter is devoted to iron and steel supports for mason work and skeleton construction. Lathing and plastering and concrete foundations, followed by a chapter on specifications, close the body of the book. Seven brief appendices give some useful tables relating to the strength and other physical characteristics of building materials and a list of building stones.

Aside from the fact that some of the illustrations were made from very poorly drawn originals, and therefore are blurred and dirty, the make-up of the book is very good.

BLOCK AND INTERLOCKING SIGNALS.—By W. H. Elliott, Signal Engineer, Chicago, Milwaukee & St. Paul R. R. "Locomotive Engineering," New York; 1896. Flexible leather; 6 × 9 ins.; pp. 277; illustrated; $3.

Books on railway signaling are so few and, for the most part, so antiquated, that this volume is especially welcome to those who desire a convenient and up-to-date work on a subject which is demanding more and more attention from railway engineers. In the past signal engineering has been almost wholly monopolized in this country by the various railway signal manufacturers, comparatively few engineers outside of these companies having devoted especial attention to it. The reason for this has been doubtless the small use of interlocking and block signals by American railways as a whole, but this condition of things is changing. The railways are rapidly coming to a realization of the advantages of thoroughly signaling their lines, and are demanding the services of men competent to superintend the installation, operation and maintenance of these signals. This makes the field for a good treatise on railway signaling practice a promising one, and the author of this book has shown a timely judgment in presenting his work.

The book before us has its limitations. It aims more toward a popular and general exposition of the subject than toward an exhaustive and technical treatment. As published in "Locomotive Engineering," a paper devoted especially to the interests of the motive power departments of railways, the original articles were admirable for the class of men they were intended to reach. It cannot be said, however, that they serve so well the purpose of the mechanical and civil engineers who desire a technical, scientific presentation of signaling problems and their solution. The book gives these engineers more information than can be had in any other one place, but not as much and not in as technical a form as they would like to have such information given, in view of the great lack of good literature upon railway signaling. These remarks are not presented as a criticism upon the matter given in the volume before us, since this matter is admittedly intended for a certain class of men only, but they are necessary to give a clear idea of the book's limitations.

To give an idea of the contents of the volume in more detail it may be stated that the first nine chapters treat of block signaling, and in them the different manual, automatic and staff systems are explained, with considerable information in relation to maintenance. In Chapter VIII. the costs of operating the simple and controlled manual systems are compared with each other and with those of operating the various automatic systems. The remainder of the book describes the operation and construction of interlocking signals, with special chapters on switch signals and on agreements, contract specifications, installation and repairs. With some of the author's opinions and examples of practice there will be dispute. We note especially the diagram of interlocking signals for a junction of a single with a double track railway given on page 166, which can hardly be recommended as representing the best practice.

In typography and make up the book is generally excellent. The type is good and the illustrations are fairly engraved and printed. The faults are the numbering of cuts by chapters and often an omission of explanatory titles. The book has no index and an inadequate table of contents to supply in part the deficiency. On the whole, however, signal engineers will find the volume an interesting and valuable description of railway signaling practice in this country at the present time.

A MANUAL OF BRIDGE DRAFTING.—By Chas. H. Wright, M. Am. Soc. C. E., Chief of Drafting Department, Edge Moor Bridge Works, and Chas. B. Wing, Professor of Bridge Engineering, Leland Stanford Junior University. University Press, Stanford University, California, 1896. 4to.; 9½ × 12 ins.; flexible canvas; pp. 214; illustrated; $4.

Bridge literature has reached such an unprecedented volume within the last few years that one turns with considerable curiosity to each addition to ascertain what new features or original method of treatment the book presents as an argument for its claim upon the attention of bridge engineers. It is gratifying in the present case, therefore, to find that an attempt has been made to cultivate quite a new field. Each year our technical schools are graduating an increasing number of men who intend to make a specialty of bridge engineering, and usually the first practical work of these men is drafting in the office of some bridge engineer or bridge shop. Fresh from the schoolrooms, these students strike the unfamiliar field of practical exigencies; individual methods of carrying on work peculiar to location, machinery and prevailing requirements of patrons; shop and drafting room precedents and rules; manufacturers' standards; consideration of erection facilities, etc. It is to connect more closely the work of the student and that of the practical bridge draftsman that this book has been written. One of its authors is a practical bridge draftsman; the other is a teacher of bridge designing to college students.

The contents of the volume before us are perhaps best given by repeating the chapter headings under which the matter is presented. These are: (1) Details of Plate Girders, Lattice Girders, Trestle Bents, Floor Beams and Track Stringers; (2) Details of Pin Connected Spans; (3) Details of Pin-Connected Spans, Continued; Tables of Useful Information, etc.; (4) Bridge Drafting; (5) Shop Work and Inspection; (6) Bridge Erection. Each chapter contains drawings of details illustrating and supplementing the text and a variety of standard tables and diagrams for facilitating calculations. These tables and diagrams have the value of being those actually used by a large and well-known bridge company, and besides their practical working value are useful as indicating the manner and methods of using time-saving devices by practical bridge builders. In the chapter on Bridge Drafting is given the organization of a bridge drafting department, and instructions for arranging, lettering and recording drawings, forms for shipping bills, etc. A portion of this chapter and of that on Bridge Erection was published in Engineering News of Feb. 7 and April 25, 1895.

In the particular field it is designed to cover, the book is on the whole a useful one, but it fails in not being uniformly useful in all parts. Some of the tables and diagrams are of universal and lasting usefulness, some are useful only locally, and still others are already antiquated, or will soon become so. The authors, however, partly atone for this last fault by announcing that additions and revisions to these tables will be published from time to time.

In the matter of its make-up the book deserves some criticism, especially in respect to the clumsy and careless lettering of many of the drawings. In this respect, however, the conditions are no worse than those found in most sheets of bridge drawings which come from our bridge manufacturers' drafting rooms, and which are the natural result of hasty production. Despite this, one ought not to find in a manual for the instruction of bridge draftsmen a seeming encouragement of the fault so common and yet so easily corrected as careless lettering. It is not copper plate letters that are wanted, but neat letters, and no such slovenly letters of mongrel style and form should appear as are some of those on the drawings on Plate 28. It is interesting to compare this, to illustrate our point, with the lettering of the cuts on pp. 211 and 213, which are reprinted from Engineering News with the standard lettering used by this journal.

HIGHER MATHEMATICS.—A Text Book for Classical and Engineering Colleges. Edited by Mansfield Merriman, Professor of Civil Engineering in Lehigh University, and Robert S. Woodward, Professor of Mechanics in Columbia University. New York: John Wiley & Sons; 8vo.; pp. 600; $5.

This book, according to the publishers' announcement, is designed especially for the use of junior and senior classes in colleges and technical schools, but is equally well adapted to the use of advanced students and readers of mathematics generally; containing a concise treatment of subjects not commonly found in text books, but upon which lectures are now given in the best classical and technical institutions. The work is divided into eleven chapters, each by a different author. Each chapter, so far as it goes, is complete in itself, and is intended primarily to give a clear idea of the leading principles of the subjects treated. The headings of the several chapters are as follows

I. "The Solution of Equations," by Prof. Mansfield Merriman. II. "Determinants," by Laenas Gifford Weld, Professor of Mathematics in State University of Iowa. III. "Projective Geometry," by Geo. Bruce Halstead, Professor of Mathematics in University of Texas. IV. "Hyperbolic Functions," by James McMahon, Associate Professor of Mathematics in Cornell University. V. "Harmonic Functions," by William E. Byerly, Professor of Mathematics in Harvard University. VI. "Functions of a Complex Variable," by Thomas S. Fiske, Adjunct Professor of Mathematics in Columbia University. VII. "Differential Equations, by W. Woolsey Johnson, Professor of Mathematics in the U. S. Naval Academy. VIII. "Grassmann's Space Analysis," by Edward W. Hyde, Professor of Mathematics in University of Cincinnati. IX. "Vector Analysis and Quaternions," by Alexander Macfarlane, Lecturer in Electrical Engineering in Lehigh University. X. "Probabilities and Theory of Errors," by Prof. Robert S. Woodward. XI. "History of Modern Mathematics," by David Eugene Smith, Professor of Mathematics in Michigan State Normal School.

The well-known reputation of Professors Merriman and Woodward is a sufficient guarantee of the excellence of this work, and it will, no doubt, prove a valuable addition to the libraries of those whose tastes incline in the direction of higher mathematices, and a useful text book to mathematical students. The progress of mathematical investigation during the present century has been so great that, in the words of the preface, "the mere quantity of information available presents a formidable obstacle to the simultaneous attainment of the breadth and depth of knowledge which characterized the mathematician of a generation ago. * * * Hence the student who seeks to gain a comprehensive view of the mathematics of the present day needs most of all that sort of guidance which fixes his attention on essentials and prevents him from wasting valuable time and energy in the pursuit of non-essentials." Quoting further from the preface:

> During the past 20 years a marked change of opinion has occurred as to the aims and methods of mathematical instruction. The old ideas that mathematical studies should be pursued to discipline the mind, and that such studies were ended when an elementary course in the calculus had been covered, have for the most part disappeared. In our best classical and engineering colleges the elementary course in calculus is now given in the sophomore year, while lectures and seminary work in pure mathematics are continued during the junior and senior years.

The change in the college course here referred to gives rise to the question whether it is a beneficial one. If the mathematical course ending in calculus is not given for the purpose of disciplining the mind then its only other reason for existence is that it furnishes a tool which is necessary to the prosecution of the higher courses in mechanics and in engineering theory and practice. The spending of time in an engineering course on higher mathematics, beyond calculus, can only be justified on the ground that a knowledge of these higher branches is a useful tool, enabling the engineer to accomplish something which he could not accomplish without it. It cannot be claimed for it that it is needed as a mental discipline, for if a student in his sophomore year acquires the calculus so well as to be able to use it in problems of applied mechanics and thermodynamics, and during the junior and senior years studies those branches of engineering science and art which require the application of the calculus, together with the most intense concentration of the mind upon the problems at hand, no higher form of mental discipline can be given by quaternious or hyperbolic functions. On the contrary it is well known that too great devotion to mathematical studies tends to narrowness of intellect, and is therefore detrimental to the training of an engineer. The use of the higher mathematics as a tool in engineering problems is exceedingly rare. Probably not one in a hundred engineers in practice can, five years after graduation, work out a problem in calculus without reference to a book, and not one in a thousand probably ever needs hyperbolic functions. Calculus may be necessary for the engineering student both as a mental discipline and as a tool to be used in the study of applied mechanics, but higher mathematics, we think, he can do very well without, unless he intends to devote his life to original research in physics, electrical theory, etc., in which case, of course, it may be of great service.

ENGINEERING NEWS AND AMERICAN RAILWAY JOURNAL.

Vol. XXXVI., No 23.

TABLE OF CONTENTS.

ENGINEERING NEWS OF THE WEEK........353, 370
- The Mt. Nebo Reservoir and Canal System, Utah (illustrated, with inset)........ 354
- The Sinking of a Wharf at St. Johns, New Brunswick........ 357
- Work of the Hoover & Mason Conveyor on the Chicago Main Drainage Channel (illustrated)........ 358
- Proper Speed for Rope Power Transmission........ 358
- The Origin of the Bessemer Process (illustrated).... 359
- The Accuracy of the Ordinary Formulas for Swing Bridges (illustrated)........ 362
- High Buildings and Safe Elevators........ 367
- Method of Determining the Work Done Daily by a Refrigerating Plant and Its Cost........ 368
- Annual Meeting of the American Society of Mechanical Engineers........ 369
- The New English Motor-Car Regulations........ 370
- The Measurement of Water for Irrigation (illustrated)........ 371

EDITORIAL NOTES........ 364

ONE HUNDRED PER CENT. OF THE GROSS RECEIPTS is the basis on which a street railway franchise was awarded in New York city by Controller Fitch on Nov. 27. This sum was bid some time ago by the People's traction Co. for a franchise for 29 miles of streets in the upper part of the city. A competing company at the time bid 6,975⅛% of the gross receipts, but the People's Co. urged that such a bid was farcical. The matter has been in the courts since October, 1895. The routes involved form connecting links between that portion of the city south of the Harlem River and outlying territory both within and without the city.

◆

AN ELABORATE SYSTEM OF SUBURBAN ELECTRIC lines in Cook county, Ill., is projected by the Metropolitan Traction Co., incorporated in Illinois, in 1895, with a capitalization of $6,000,000. When first incorporated the company introduced an ordinance into the Chicago City Council petitioning power to build underground and surface or elevated electric railways within the central part of the city, but the ordinance was never pushed and finally died of inanition. It is now alleged that the charter has been purchased by a number of responsible Chicago business men, who have remodeled the scheme and are prepared to push work as soon as the proper authority is granted. The present franchise asks permission of the Cook County Commissioners to construct electric trolley lines on practically all of the unocupied highways under the jurisdiction of that body, nearly 100 miles in all, and connecting Chicago with the suburban towns of Evanston, Wheeling, Elgin, La Grange, Blue Island, Harvey, Thornton, Chicago Heights, Hammond and others. The terms of the franchise are entirely inadequate to protect the rights of the public in the matter of fares, damages, guarantees of construction, compensation, and in other respects, and public sentiment in Chicago particularly is against its passage. The County Commissioners are divided in their attitude toward the ordinance, however, and it is entirely possible that it will be granted with certain modifications. The ordinance as it now stands is an entirely vicious one in its neglect of the interests of the public, but the scheme, if properly regulated, has considerable merit in its favor.

◆

THE ELECTRIC MOTOR CARS ON THE BROOKLYN Bridge have been successfully applied to the switching of trains at the terminals and pushing them out to the point where the cable is taken; and they are now in regular service taking the place of the old steam locomotives. The chief advantage of the new system is that while one train is loading the next train can be backed down near to it, ready to take its place. The result is that there is much less crowding and the platforms are clear even in the rush hours. Chief Engineer Martin expects to shortly run trains on 45 seconds headway, and promises to do even better when the double, or gauntlet tracks are ready. The new motor cars have also been tried in running trains all the way across the bridge, with success. Four cables will soon be in place across the bridge; two of these always being in service with the weight of the heavier trains proposed divided between them.

◆

THE TUNNELING OF UNION SQUARE, New York, to avoid the two present dangerous curves on the Broadway cable road, seems to be an eminently sensible and practicable idea. The cable company is willing to build the tunnel at its own expense, and thus to substitute a practically straight line for the present curves around the square, provided the city authorities grant permission. The tunnel would be three blocks long and interfere with no streets, as the cable would readily overcome the steep gradients required.

◆

THE CASCADE TUNNEL, on the Great Northern Railway, in Washington, is to be completed, says the St. Paul "Press." This tunnel is 2½ miles long and would reduce the elevation of the traveled line from 4,055 to 3,150 ft. above the sea. It would be 16 ft. wide and 23 ft. high, and the estimated cost is $2,000,000. At the present time the mountain is crossed by a switchback, 235 miles west of Spokane, famed for its scenic beauty. The tunnel would save 10 miles in distance and one hour in time.

◆

THE NEW RADEBAUGH TUNNEL on the realinement of the Pennsylvania R. R., near Greensburg, Pa., was "holed through" Nov. 19, the heading meeting about 3 p. m. The tunnel is 2,100 ft. long, for a double track line, as described in our issue of Dec. 12, 1895. The work has been done by the Drake & Stratton Co., of New York, with Mr. James Day, as General Superintendent, and Mr. W. R. Michie, Engineer in Charge.

◆

A NEW DOUBLE TRACK STEEL VIADUCT over Ridley Creek, one half a mile west of Media, Pa., on the Philadelphia, Wilmington & Baltimore R. R. was put in service November 28. It consists of six towers carrying 40-ft. girders, with intermediate girders 60 ft. long; the total length, backwall to backwall, being 641 ft., and height above water, 102 ft.. It supplants a single track Linville & Piper truss, with Howe truss approach at the east end, which was erected in 1877. Mr. H. C. Smith of Media, Pa., is the Engineer in charge of this division of the road.

◆

THE MOST SERIOUS RAILWAY ACCIDENT of the week was the wreck of the Southern Express on the Pennsylvania R. R., near New Brunswick, N. J., on Nov. 25, resulting in the death of the engineer and fireman. The cause of the accident was the breaking in two of a freight train on the opposite down grade track; the wild section ran into the first section and two freight cars were derailed and thrown upon the other track just as the express came along at a high speed. The engine of the express rolled down the embankment and the two express cars and a mail car of the train left the track and were wrecked; the two first sleepers were also badly damaged, but the only persons injured on these cars were the express messenger and the baggage master.——Two engines were wrecked on the Lehigh Valley Ry., near Mud Run, on Nov. 24. An engine that had been flagged by a broken coal train ahead was run into by another engine coming after it. Both engines rolled down a 40-ft. embankment, but as the crews of both jumped before the collision, no one was injured.——One man was killed and 12 persons injured near Ensley City, Ala., on Nov. 20, by the failure of an old-fashioned wooden highway bridge of very crude design.

◆

A GAS EXPLOSION AT PITTSBURG, PA., on Nov. 30, blew off a few sewer manholes and broke a number of plate glass windows.

◆

THE PINTSCH SYSTEM OF CAR-LIGHTING has been adopted for the trains of the Manhattan Elevated R. R., after a thorough investigation of the subject and in compliance with the requirements of the New York Legislature. The contract with the Safety Car Heating & Lighting Co. was signed on Dec. 1 and the cars must be equipped by April next. Gas-works will be erected by the Pintsch Compressing Co., at 159th St. and Eighth Ave., from which the cars will be supplied.

◆

THE NEW TWIN-SCREW STEAMER "La Grande Duchesse" for the Savannah Line (to run between New York and Savannah) left New York on its first regular trip Nov. 28. The vessel is 404 ft. long over all, 47 ft. 9 ins. beam, and 37 ft. 4 ins. deep, the hull framing being specially designed for mounting guns, as the vessel is classed as an auxiliary cruiser. The twin screws are driven by two quadruple expansion engines of 3,500 HP. each, steam being supplied by eight Babcock & Wilcox water tube boilers. The coal is brought from the bunkers by a conveyor, and the fireroom coal buckets are suspended from trolleys running on an overhead rail. The normal steam pressure is 210 lbs. There are two Sturtevant blowing engines delivering air to the firerooms, and two Westinghouse high speed engines for the electric light plant. A vertical engine drives the anchor hoist, this engine having been built by the American Ship Windlass Co., of Providence, R. I. The ship can accommodate 700 passengers, and all the first class staterooms have telephone connection with a central station. The ship and engines were built by the Newport News Shipbuilding & Engine Co., of Newport News, Va., for the Ocean Steamship Co., of New York city, which company operates the Savannah Line.

◆

THE HAMBURG-AMERICAN STEAMSHIP "PENNsylvania," now nearly completed at Belfast, is to be the largest merchant steamship afloat. She is 560 ft. long on the water-line, 62 ft. beam, 41 ft. deep from upper deck to top of keel, draws 26 ft. of water, and is 20,000 tons dead weight with 30,000 tons displacement. The average speed is to be 14 knots, and she will accommodate 1,228 passengers.

◆

THE LOWEST BIDS FOR STREET CLEANING, garbage collection and removal for the year 1897, received at Philadelphia on Nov. 25, aggregated $847,750, which was $65,832 more than the appropriation for the same service for the current year, and $78,750 less than the estimates. The garbage collection and disposal bids for 1897 make up $520,550 of the $847,750. The lowest bids for this service were submitted by the present contractors on the territory now covered by them, three districts being served by the American Incinerating Co., which uses the Arnold system of utilization, and two districts by the Philadelphia Incinerating Co., which employs Smith furnaces. The lowest bids for each class of work in each district are given in our Construction News Supplement.

◆

TYPHOID FEVER AT PATERSON, N. J., is reported as far above the normal for November. The water supply is said to be the source of infection, but results of a careful investigation of the subject have not been made, or at least have not been made public. Water is taken from the Passaic River, above the Great Falls. The population above this point is small, compared with that below.

◆

TRAFFIC ON ASPHALT PAVED STREETS in Milwaukee has recently been investigated at the instance of the Warren-Scharf Co., which requested the city authorities to take a count of the traffic on the principal streets. This covered seven days in September and the period between 6 a. m. and 7 p. m. Four of the seven days were cloudy; in two of them there was slight rain and in one a continuous rain. The greatest number of vehicles passing in any day of 13 hours was 5,146, and the smallest was 1,328, on Sunday. The daily average was 4,090.61. The greatest number of horses was 6,930, and the least 1,700; the daily average of horses being 5,433.40. Electric street cars were not counted as traffic, as they were supported by the rails; but the daily average of such cars was 1,902 for the 13 hours selected. The speed record showed that 48% of the horses were walking and 52% trotting. Of the weights moving, 38% were moving at a walk and 62% at a more rapid rate. The proportion of vehicles weighing less that one ton, with their load and outfits, was 29.7% of the whole; of heavier loads, 24.83%, and of horses 45.47%. The pavements showed the effect of three years' use. The average daily number, class and weight of horses, vehicles and loads is shown in the following summary of the schedules:

	Horses.	Vehicles.	Tons.
Loads under one ton:			
Walking	1,633	1,243	1,438
Trotting	2,719	2,304	2,512
Loads from one to three tons:			
Walking	543	281	834
Trotting	119	61	182
Loads from three to five tons:			
Walking	393	196	982
Trotting	5	3	13
Loads over five tons:			
Walking	3	1	5
Horses not attached:			
Walking	17	—	8
Speeding	1	—	½
Electric cars	—	1,902	—
Total daily average	5,433	4,091	5,974½

The average weight of daily traffic to each foot in width of roadway, not including weight of street railway cars, was 119,486 tons.

◆

THE NEW YORK AND NEW JERSEY BRIDGE CONstruction Co. has made a contract with the Union Bridge Co., of New York, for the building of the bridge over the Hudson River, at a cost not to exceed $25,000,000, and under a bond of $1,000,000 for faithful performance of the contract. Mr. Swan, the secretary of the bridge company, says that the bonds for this work will soon be offered to the public.

◆

RESTRICTION IN THE HEIGHT OF BUILDINGS, in New York city, is being considered by a special committee of the New York Board of Trade and Transportation, with Mr. G. Waldo Smith as Chairman. While the majority of the committee seem to favor restriction in height, there is considerable difference of opinion as to where the line should be drawn.

THE MT. NEBO RESERVOIR AND CANAL SYSTEM, UTAH.

By W. P. Hardesty, C. E.

(With inset.)

The Mt. Nebo Irrigation Co.'s reservoir and canal system is located in central Utah, in the counties of Juab and Utah. The system consists essentially of a reservoir with its dam for impounding water, a main canal line for carrying water, employing pipe and flumes as well as open canal, and a fine body of irrigable land well situated for general farming and fruit growing. This undertaking was first projected in 1892 by the Mt. Nebo Reservoir & Canal Co., and the preliminary surveys were made then, but it was not until early in 1895 that the present company was formed and construction begun.

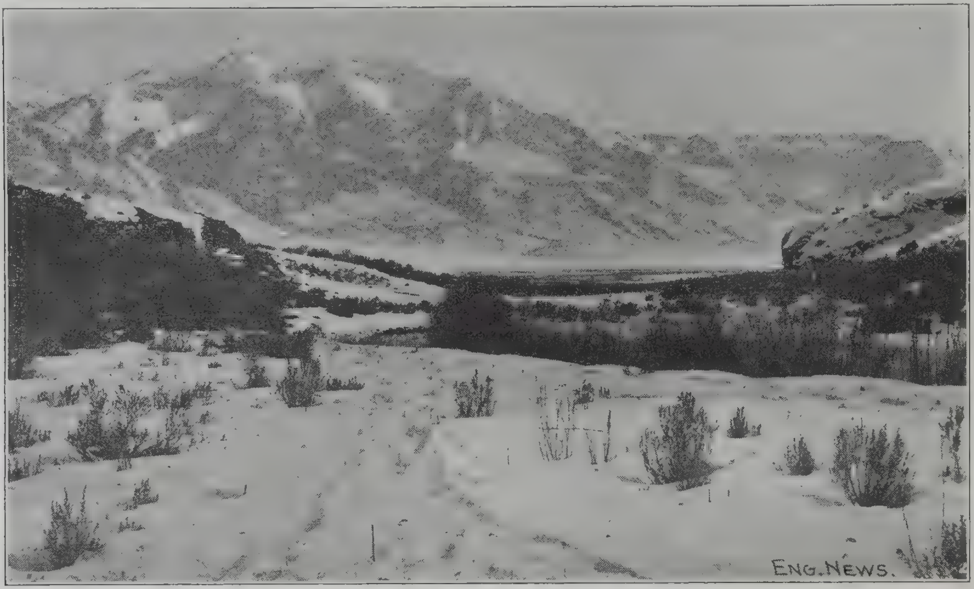

FIG. 1.—VIEW OF MT. NEBO, SHOWING DAM SITE BETWEEN PROJECTING ROCKS IN FOREGROUND.

The Mt. Nebo reservoir is located in Juab Co., in the Mona Valley (being the northern end of Juab Valley), which lies between the Wasatch Range of mountains on the east and another but much lower range on the west. The valley is a broad basin with gentle slopes, and covering the lowest part of it is the reservoir site. The reservoir is mainly fed by Salt or Currant Creek, which runs through the valley from south to north. The culmination of the Wasatch Range here is Mt. Nebo, shown in the view, Fig. 1, from which the reservoir takes its name, whose summit is 12,000 ft. above sea level. Salt Creek heads on the east side of this mountain, a branch of it coming down from the divide between San Pete and Juab Cos., and, after flowing south and southwest through Nephi canyon to the town of Nephi, it turns north through Mona Valley. It has a drainage area of over 250 sq. miles, including Mt. Nebo and surrounding mountains.

Near the north end of Mona Valley the creek cuts through the low range on the northwest, the summit of which forms the line between Juab and Utah Cos. Above this point in Mona Valley the fall of the stream is very slight, but through the mountains in Currant Creek canyon the fall is quite heavy. This canyon extends but about three miles, opening out into the Goshen and Kimball Creek valleys, where are located the lands to be irrigated. The broad basin in Mona Valley spoken of, together with the narrow outlet through the solid rock at its lower end here, constitutes an ideal natural reservoir site. Near the head of this gorge, and where two solid rock ridges face each other, the dam is located.

Reservoir.—The Milford branch of the Union Pacific Ry. traverses the Mona Valley, and on the west side of this lies the reservoir, as shown in the map, Fig. 2. It reaches from Mona at the south end to beyond Starr Station on the north, the latter being just 75 miles from Salt Lake. With the present arrangements the reservoir covers 1,850 acres, to an average depth of over 10 ft., being five miles long by ½ to ¾ miles wide. This gives a storage capacity of 838,000,000 cu. ft., or over 19,000 acre-ft.

By enlarging the dam so as to raise the water 5 ft. higher, as is contemplated in the future, the reservoir will cover an area of over 2,400 acres, giving a storage capacity of 1,300,000,000 cu. ft., or nearly 30,000 acre-ft. In surveying the site, four complete contour lines were run around it and eight cross-section lines run across it, to obtain full information as to areas covered, capacities, etc., at different elevations of water.

Besides all the flow during the non-irrigation season of Currant Creek, whose channel runs through the reservoir, it also receives the discharge of numerous springs within and adjacent to it on the east side. It is estimated that just one year will be required to fill the reservoir.

Dam.—The dam is 210 ft. long at the top, 130 ft. at the bottom and 30 ft. high. Its base is 110 ft., and its top 8 ft. wide. A plan and profile of the structure are shown by Figs. 3 and 4. The up-stream side or back of the dam has a slope of 1½ to 1 from the crest down for 10 ft., with a slope of 2 to 1 for the remainder; the down-stream side or face has a slope of 1½ to 1, with a 3-ft. berm at 10 ft. down. The high water mark for the reservoir is 5 ft. below the top of the dam.

The body of the dam is of selected clay, hauled a few hundred feet from a borrow pit on the reservoir site. The clay was thoroughly sprinkled, harrowed and rolled in layers as built, a 5,000-lb. corrugated iron roller, shown by Fig. 5, being used. The back is faced with loose rock and heavy boulders to a thickness of 3½ ft., all laid by hand and with the interstices filled with earth by washing in with water.

The face is composed entirely of heavy gravel and loose rock, the horizontal width of the layers decreasing from 12 ft. at the foot to 4 ft. at the top, the stones being assorted and graduated in size so as to have the largest on the outside and smallest inside next to the body of the dam.

Before construction, the foundation for the dam was stripped of the surface soil, and three trenches, one at each toe and one at the middle of the dam, each about 12 ft. deep by 4 ft. wide at the bottom, were dug through the gravelly clay and into the bed rock for about 2 ft. These were refilled with the best material obtainable, sprinkled and thoroughly tamped, to shut off any possible seepage of water under the dam. Where the dam joined the solid rock ledges or abutments at the ends, these were scored or trenched to form a perfect bond between the dam and the rock faces, cement being liberally used.

At the west end of the dam is located the outlet tunnel, for draining off the water from the reservoir. This is cut through the solid rock ledge or abutment at the end of the dam, thus avoiding any risk that might be incurred in passing the water through the body of the dam itself. The tunnel is 140 ft. long, has an arched top, and is 6 ft. high by 4 ft. to 5 ft. wide, and a portion of it is located on a curve. All seams in the walls of the tunnel were well filled with cement. It was put through before the dam was built, to allow the creek to be diverted through it.

The most interesting feature of the tunnel is the gate-shaft, with the gates for regulating the flow of water. The shaft is sunk from the top of the rocky ridge directly over the tunnel, and is 4×5 ft. by 34 ft. deep. At the bottom of the shaft and closing the tunnel are the gates, two in number, of the "butterfly" type. Each gate is 2 ft. 11 ins. wide by 4 ft. high, with a clear opening of 2½ ft. wide, and is revolved by a vertical shaft 39 ft. long. The head of water sustained when the reservoir is full is 30 ft. The construction of the gates is shown by Fig. 6, while Fig. 7 is a view of the gates taken in the tunnel.

Each gate is constructed as follows: Around the 2¼-in. round cast-steel shaft a core of iron is cast, to which as a central frame are riveted the plates forming the faces of the gate. These plates are of ⅜-in. flange iron of 60,000 lbs. tensile strength. Three layers are used, one for each face and one between. The frame or casing for the gates is of cast-iron, resting on old railway rails laid horizontally and fitted to rails set vertically at the sides of the tunnel, the whole being well set in concrete.

At the top of the shaft is located the operating gear. This consists of a horizontal shaft having a worm cast on it and engaging segments of gear wheels keyed onto the ends of the vertical shafts. The horizontal shaft has a hand-wheel at each end for turning. These gates and the operating gear were made by Silver Bros., of Salt Lake City. The top of the gate-shaft is enclosed by a frame gate-house.

At the head of the tunnel is a screen for catching drift, etc., and a strong frame with slides is also in place for supporting an emergency gate, should such ever be needed.

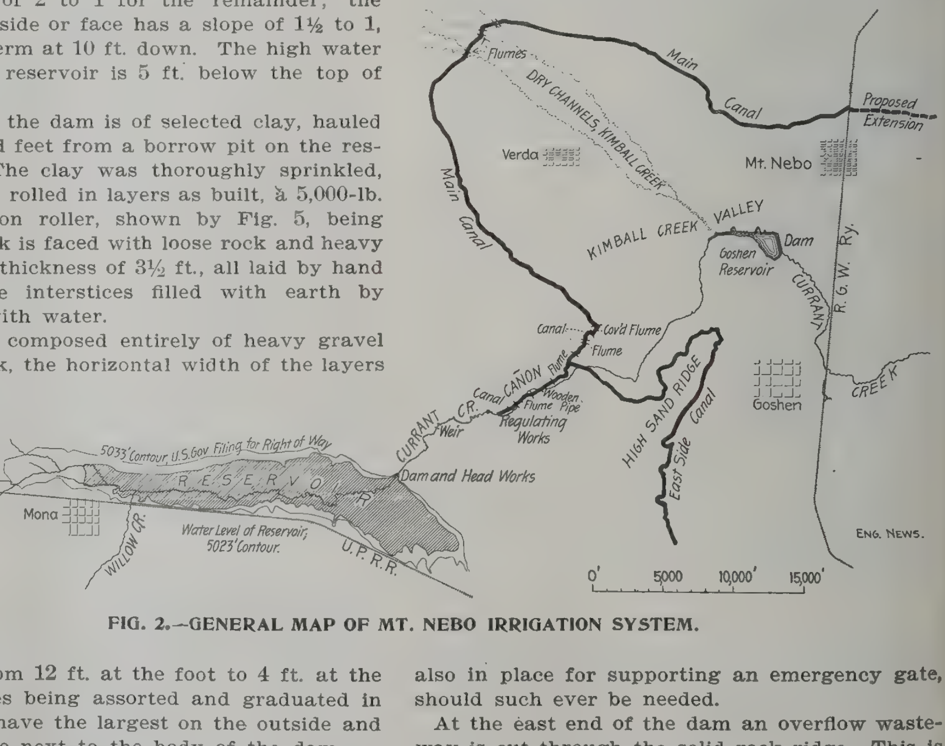

FIG. 2.—GENERAL MAP OF MT. NEBO IRRIGATION SYSTEM.

At the east end of the dam an overflow wasteway is cut through the solid rock ridge. This is 25 ft. wide and has its bottom at the flood level of the reservoir. It has ample capacity for carrying off any surplus of flood waters that may ever flow into the reservoir. The dam and all appurtenances, except the wasteway, were built by day labor, and cost about $12,000. The outlet tunnel cost $7.85 per lin. ft.

Canal System.—The water is drawn off from the reservoir during the irrigation season, being allowed to return to the creek and flow in it for about two miles before being diverted into the

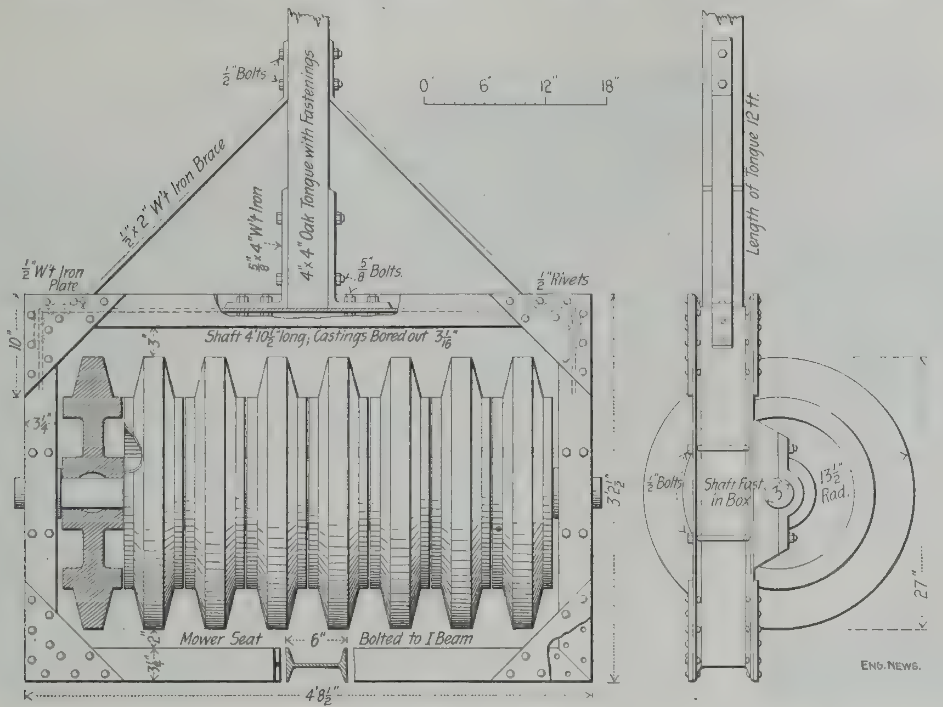
company's canal. In this distance there is a fall of but 31½ ft., and the diverting weir and headgates are located just above a very rapid fall in the creek's descent, amounting to 150 ft. in less than 1½ miles, thus securing all the elevation possible consistent with a short length of canal.

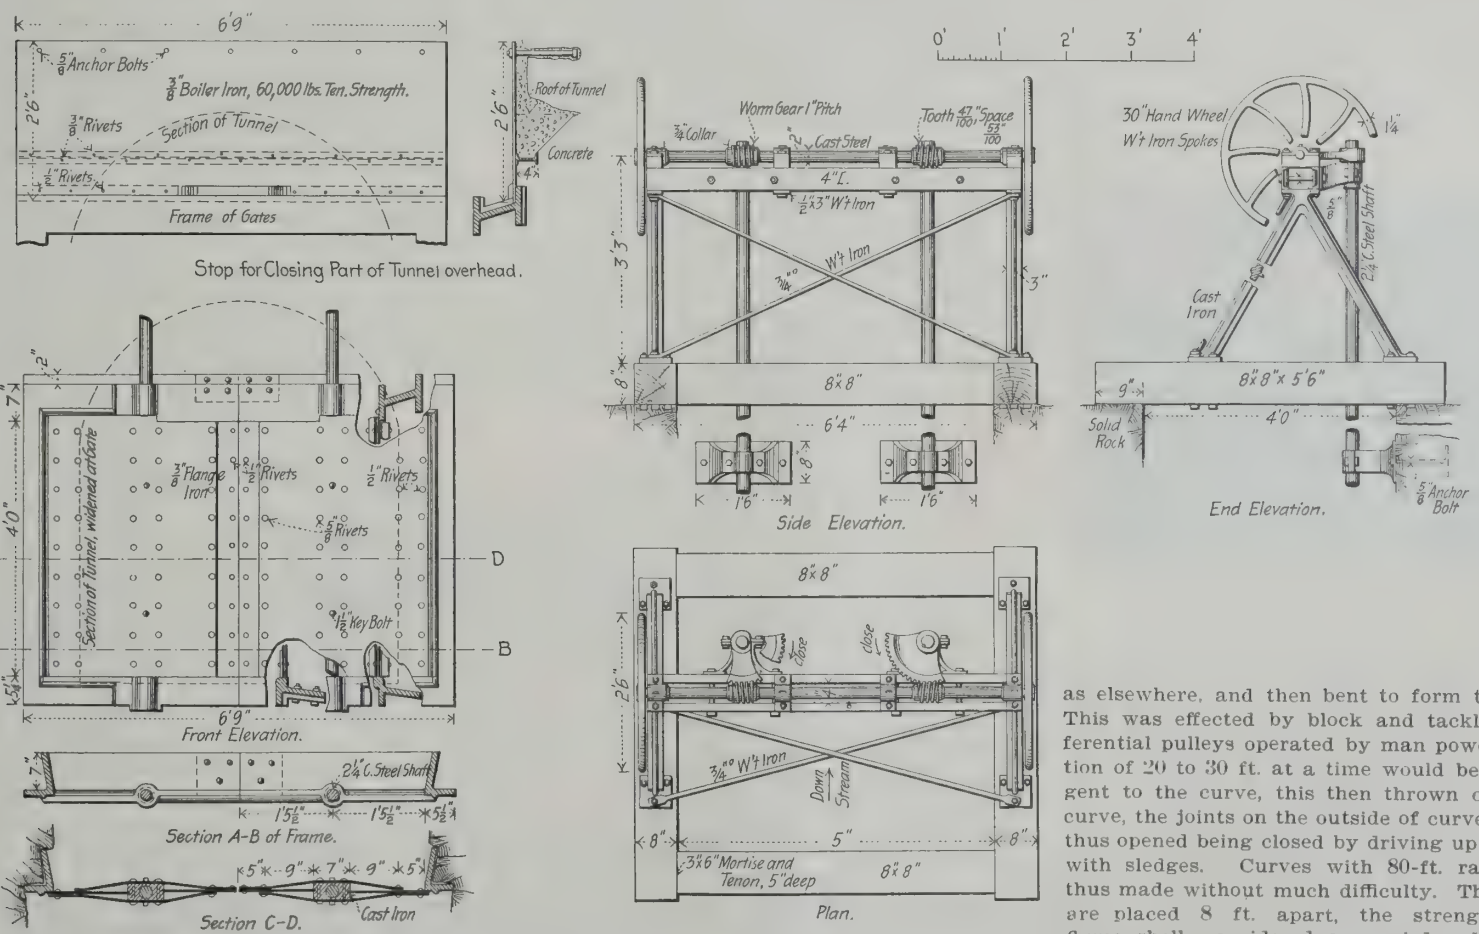


Plan. End Elevation.

FIG. 5.—DETAILS OF GROOVED ROLLER.

The diverting weir headgate proper, and the waste weir are all of the same type, with flash boards for controlling and regulating the water. Details of these are shown by Fig. 8.

There are five bays or openings to the diverting weir, four to the headgate and three to the waste weir, each opening being 3¼ ft. wide by 4½ ft. high. The flash boards slide in guides laid at an angle of 60° with the horizontal. The structures supporting the gates are of cribwork of 8×8-in. timbers, drift-bolted together and filled in with heavy rocks; a plank flooring is placed at the bottom, 4 ft. below grade, and heavily weighted.



Gates and Frame. Operating Gear.

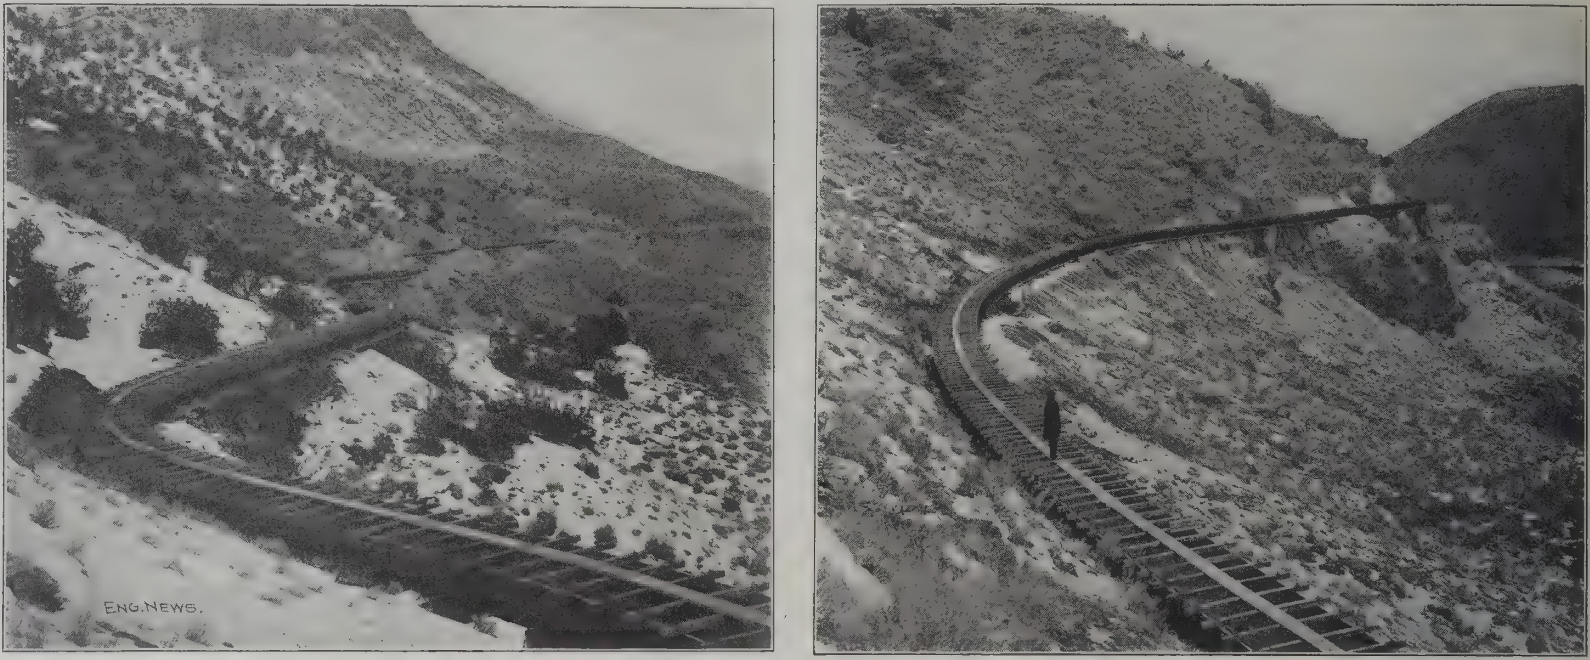
FIG. 6.—DETAILS OF OUTLET GATES AT DAM.

The gates are on the west side of the creek. The main canal follows down the canyon or close valley for over two miles before emerging and reaching the open valley to be irrigated. The line necessarily runs through a very rough and difficult country, requiring engineering skill of the highest order to successfully overcome all the obstacles. But about one-third of this portion could be built as open canal, the remainder being in pipe line and flumes. The fluming used is of a new and unusual type, being patented by Mr. Guy Sterling, C. E., of North Yakima, Wash. The section or shell forming the water-carrying channel is semi-circular, constructed of redwood staves, with true curved faces and radial joints, banded with ½-in steel bands, very similar to wooden stave pipe. Fig. 9 shows this flume and the standard type of trestle used to support it along the steep hill-sides. The section used for most of the flumes is U-shaped, being composed of a semi-circle of redwood 6 ft. in diameter, above which is a 6-in. fir stave on each side, with 4 ins. of it set vertically or tangent to the curved part. This gives increased depth. Fir is used because it withstands compression better than redwood in cinching up the bands.

This section allows 3 ft. depth of water, and is used where the flume has a fall of 0.3 ft. per 100 ft., giving an estimated capacity of 150 cu. ft. per sec., with velocity of nearly 11 ft. per sec. Where the fall is only 0.1 ft. per 100, a true segment of a circle is used, the shell being carried up three staves on each side above the semi-circle, the top ones in all cases being of fir. A clearance of 4 ins. above the water level is allowed. Outside the canyon, some short sections of flume have a true semi-circular shell, the diameter in all cases being 6 ft. The outer side of the flume shell was elevated, and the inner side depressed on curves, the amount being calculated by the usual formulas, the factors given being the top width of the water and the velocity. The right position was given by rolling or canting the flume in its supports, it not being nailed nor fastened to these in any way. No change is made in the supports of the flume on account of the elevating.

This type of flume was first used on the Santa Ana Canal of the Bear Valley irrigation system in California by Mr. Wm. Hammond Hall, M. Am. Soc. C. E., over 2½ miles of 5½ ft. flume being built. (See Trans. Am. Soc. C. E., Feb., 1895, for very full description of the Santa Ana works.) This was built with mitered joints on curves. The Mt. Nebo flume was built the same on curves as elsewhere, and then bent to form the curves. This was effected by block and tackle and differential pulleys operated by man power. A section of 20 to 30 ft. at a time would be built tangent to the curve, this then thrown over to the curve, the joints on the outside of curve that were thus opened being closed by driving up the staves with sledges. Curves with 80-ft. radius were thus made without much difficulty. The supports are placed 8 ft. apart, the strength of the flume shell, considered as a girder, being quite sufficient for this span. The flume is used in all places where a canal could not be built, except one pipe line which divides it into two sections. At the head of the upper section the creek is crossed from west to east by a trestle, 400 ft. of which averages 20 to 25 ft. high. Altogether some 5,800 ft. of flume is used in the canyon.

Figs. 10 and 11 are views of the flume in the lower part of the canyon, and Fig. 12 is a view showing the junction of the flume with the canal below. The details of one of the flume and canal connections are shown by Fig. 13.



FIGS. 10 and 11.—VIEWS OF FLUME IN LOWER PART OF CANYON.

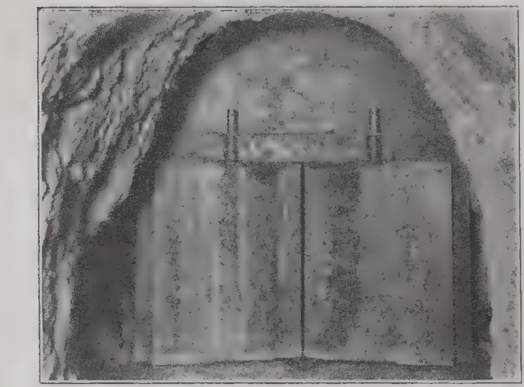


Fig. 7.—View of Outlet Gates in Tunnel at Dam.

The flume is used in some places where the canal section was first built, but where the difficulty of keeping it in repair, on account of treacherous ground or of filling up, became so apparent that the flume was afterward added. The main points of superiority of this flume as compared with the ordinary rectangular or box flume are: (1) Its adjustibility to all conditions of wetness and dryness, by means of the cinching bands. (2) Its very much greater durability, there being no nail-holes nor undrained joints in which decay can set in. (3) It requires, as an average, 40 to 50% less lumber or perishable material in the flume and its framing. (4) Curves can be followed with no special construction or joints, the flume shell being built the same as on tangents.

Just before reaching the open Kimball Creek Valley a sand ridge is passed through by a cut 700 ft. long and 30 ft. deep. As sand was drifted into this by winds, the flume was run through and covered over by a double layer of 1-in. plank, as shown by Fig. 14.

There is also one pipe line in the form of an inverted siphon for crossing from the east to the west side of the canyon. This is of wooden staves, banded at intervals of 12 to 3¼ ins., according to the head or pressure of water. The pipe is 4 ft. in diameter, and has the full capacity of the canal. It is 1,967 ft. long and has a maximum head of 75 ft. at its lowest point. Here there is a 6-in. draw off or blow-off valve for emptying the pipe when necessary.

Currant Creek is crossed on a trestle with trussed stringers, the pipe being housed in for protection against freezing, as shown by Fig. 15. The rest of the pipe is covered by 2 ft. of earth.

The connections between pipe and flumes are made by gradually changing or merging one into the other, as shown by Fig. 16, instead of using penstocks at the junction, as is customary. All the pipe and the flume shell were built by the Excelsior Wooden Pipe Co., of San Francisco, of which Mr. D. C. Henny, M. Am. Soc. C. E., is engineer and manager. The contract price for the former was $3.46, and for the latter $1.54 per lin. ft. All the other lumber structures on the canal system were built by Newton & Hobbs, of Mona, Utah, native pine being used. (See Eng. News, Sept. 5, 1895, for all contract prices, under head of same).

The Main Canal is designed to irrigate the Kimball Creek Valley, reaching west and southwest from the mouth of the canyon. The East Side canal is to branch off from the other, crossing the canyon to the east side and reaching the lands in the neighborhood of Goshen on the Rio Grande Western Ry. The connection between the two canals is shown in detail by Fig. 17. This canal line drops over 100 ft., where it leaves the Main Canal, and crosses the creek by a flume.

At the connection the Main Canal has a capacity of 120 cu. ft. per sec. and the East Side canal of 30 cu. ft. The total length of the Main Canal is over 13 miles, of the East Side line, 6¾ miles.

FIG. 14.—COVERED FLUME USED IN 30-FT. SAND CUT

The grades and sizes of the Main Canal vary according to the nature of country encountered and the capacity required. In the canyon the grade for canal excavation is 0.1%, for flumes 0.3%, and for pipe 0.63%. Out in the Kimball Creek Valley the grade of canal is 0.08%. The side slopes for earth excavation in the canyon work are mostly ½ to 1. For much of it a compound slope is used—that is, 1 to 1 above the water level, and ½ to 1 below that, or, in some cases, the reverse of this. Outside of the canyon the slopes are 1 to 1. All embankments are 1½ to 1. At one point a section of masonry retaining wall was put in where no bank could be used.

The following condensed table shows how the dimensions are gradually reduced, the first two portions being in the canyon, and all the dimensions being feet:

	Bank. Height.	Bank. Width.	Bottom.	Depth water.
First section	6	5	10	4
Second section	6½	5	6	4¾
Station 109 to 211	5½	5	6	4
Station 224 to 258	4	5	8	3
Station 258 to 452	3½	5	8	2¾
Station 508 to 640	3½	4	8	2¾
Station 640 to end	3¼	4	4	2½

Only one bank, that on the lower side, is used for nearly all the canyon work. Out in the open valley both banks are built. The grading was all done by Reynolds & Roylance, of Springville, Utah.

Box culverts are used for passing the minor drainage channels under the canal. Kimball Creek and its two branches are crossed by flumes like those in the canyon work, with an aggregate length of 375 ft. All the surveying and engineering fieldwork for this undertaking have been characterized by the most thorough methods, and elaborate designs and plans for all parts of the system were carefully worked out. The works and structures are all built in the most substantial manner, furnishing a good example of modern irrigation engineering.

About 15,000 acres of land can be irrigated from the system as at present designed, the amount being based on the supply of one acre-foot of water to each acre of land. The land to be irrigated is contiguous to the Tintic branch of the Rio Grande Western Ry. All this land to be watered lies in the large basin sloping to the north to

Utah Lake, and has plenty of fall, so as to insure ease of irrigation and drainage.

The original projector and organizer of the first company was Mr. H. M. McCartney, C. E. The chief engineer for the enterprise was Mr. O. R. Young, who designed and had entire charge of the construction of the whole system. Mr. Wm. Hammond Hall, M. Am. Soc. C. E., of San Francisco, was retained as consulting engineer. The president of the company is Mr. Gill S. Peyton, the secretary and treasurer Mr. E. G. Rognon. All of these gentlemen named, except Mr. Hall, reside in Salt Lake City, where are located the offices of the company.

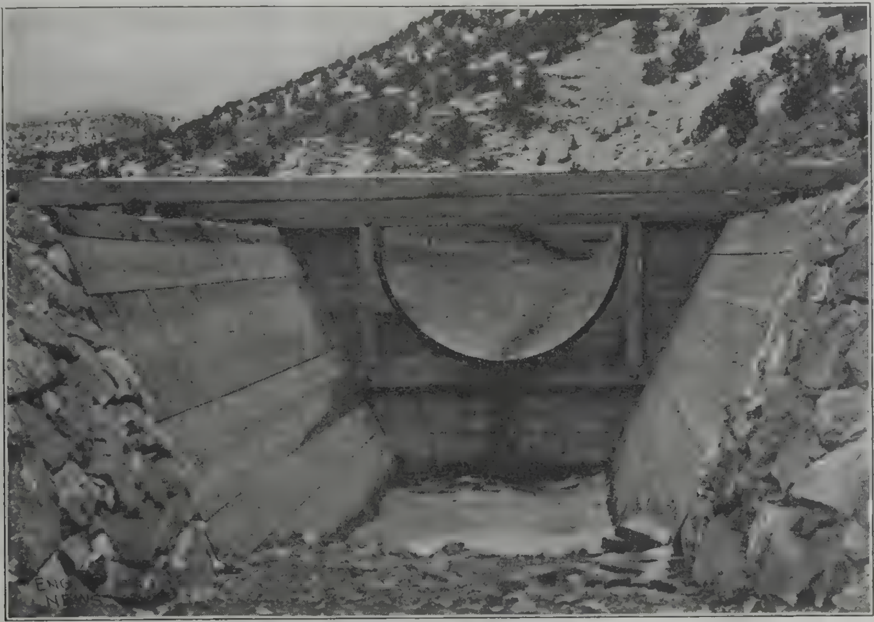

FIG. 12.—VIEW OF JUNCTION OF FLUME WITH CANAL AT LOWER END OF FLUME.

The construction work so far done has cost upwards of $100,000. The East Side canal and the laterals are yet to be constructed, but will probably be completed in the summer of 1897. The Main Canal and the two laterals so far built were operated the first season very successfully.

THE SINKING OF A WHARF AT ST. JOHN, N. B.

From the "Daily Sun" and the "Daily Telegraph," of St. John, New Brunswick, the following account is taken relating to the late collapse of a wharf on the west side of the harbor at that city: The wharf in question formed a continuation of what is known as Connoly Wharf, near the deep water terminus of the Canadian Pacific Railway. At this point a slip runs into the shore line about 1,200 ft., following the general course of what was formerly the outlet from a large tidal mill pond. Connoly Wharf occupies 400 or 500 ft. of the outer end of this slip and is a close faced cribwork structure, nearly 60 ft. high and founded 28 ft. below low water on a dredged bottom. The extreme rise and fall of the tide at St. John is about 28 to 30 ft.

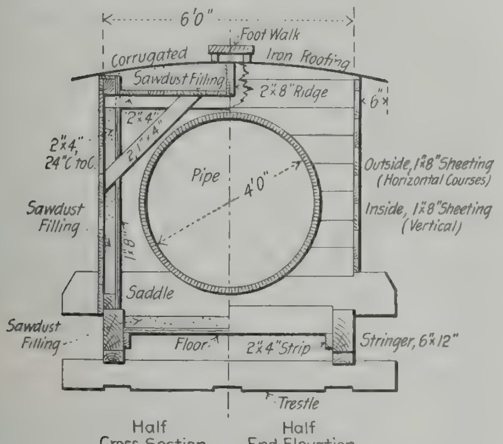

Fig. 15.– Pipe Housed In to Prevent Freezing.

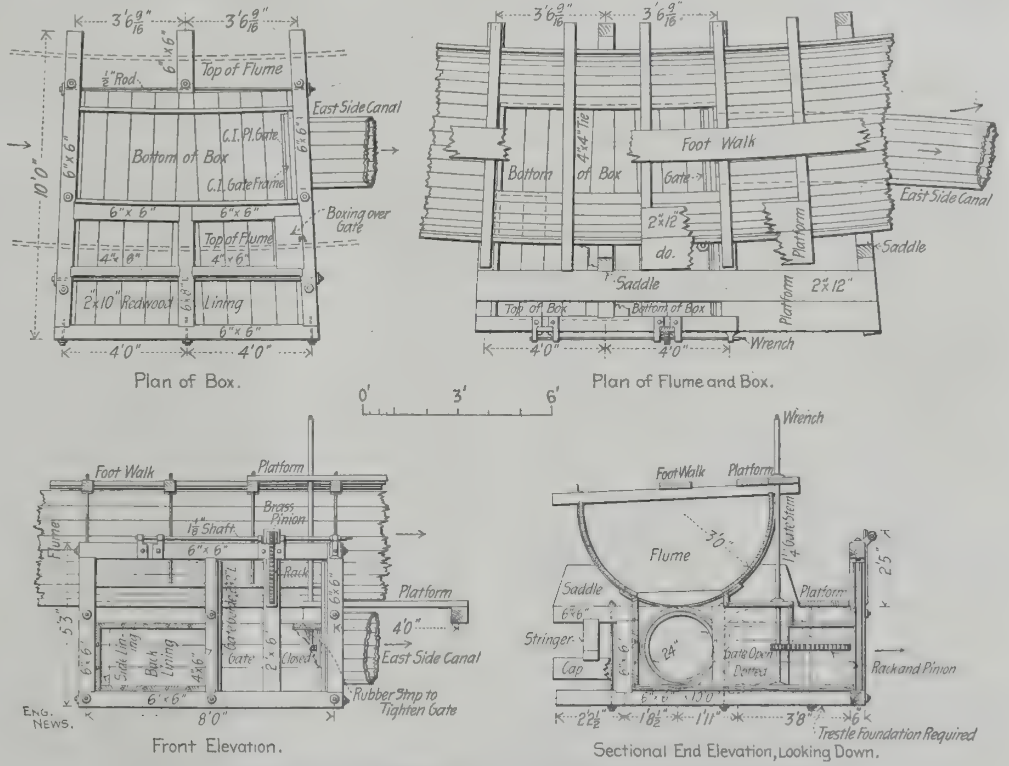
The Canadian Pacific Ry. Co. practically used this terminus for the first time last winter, and in anticipation of a large increase in business the Common Council of St. John determined to increase its wharf accommodations. The Council ordered its engineer, Mr. Peters, to prepare general plans, with the expectation that the Canadian Pacific would make more detailed examination and carry out the work in accordance with an agreement which required that company to provide terminal facilities as fast as the trade would develop, in consideration of the Carleton Branch Ry. handed over by the city authorities. Mr. Peters made no cross-sections, but submitted a general plan calling for dredging and a crib structure similar to Connoly's Wharf. But the railway company, says the "Telegraph," objected to the crib plan as being too expensive, and recommended a pile wharf, and it proposed to pay a cash sum of $50,000, and to lay tracks and otherwise provide for loading and discharging steamers, but to leave the actual construction to be done by the city.



Plan of Box. Plan of Flume and Box. Front Elevation. Sectional End Elevation, Looking Down.

FIG. 17.—CONNECTION BETWEEN MAIN AND EAST SIDE CANAL SYSTEMS.

The City Council adopted the cheaper plan, with a supposed saving of $60,000 in cost, though City Engineer Peters objected to the piling system and declined to have anything to do with it. Another engineer was put in charge who attempted to make the best of the plans, though a director of works, not an engineer, was placed upon the work with almost equal authority under the specifications. The result was the slipping out of the new wharf and its total collapse. The Canadian railway engineers defend their recommended plan by claiming that a cribwork would have met the same fate, as the accident was due to a land slip. The papers mention similar slipping away of the ground at this same Sand Point on March 17, 1870.

The "Daily Sun" enters more fully into the actual construction of the pile wharf as follows: In the first place the basin for vessels had to be dredged to a depth of 28 ft. below low water. On one side of this dredged space the wharf was built by driving four rows of piling, 8 ft. apart, between centers of rows, making a wharf 24 ft. wide. Along the line of the wharf the piles were 10 ft. apart. These piles projected about 4 ft. above low water mark as driven, and they were supposed to be driven as deeply into the mud, mixed with chips and sawdust, as a heavy hammer would drive them; but how far is not stated. Upon the piles, as cut off 4 ft. above low water, a 24-ft. stick of hemlock was drift-bolted to the heads of the four piles, and upon this was built up, log-house fashion, the alternating courses forming the crib. For about 100 ft. in length of the wharf the top of the crib was 57 ft. above the bottom dredged, while the rest was not completed at the time of the accident.

About 40 ft. back of this wharf and just behind the top of the slope a shallow crib had been built to act as a retaining wall in supporting the gravel filling brought in on trains running on two lines of pile trestles. Between this crib and the wharf a large number of piles were driven, forming supports to proposed warehouses, etc., and these piles were tied to the wharf and to the back-crib with the purpose of anchoring the whole structure and especially the main crib.

At the time of the accident about 1,600 tons of gravel and sand had been unloaded on a length of 350 ft., and six gravel cars were standing upon the trestle; these cars were first noticed as canting inward along with a settling of the trestle. The cars were hauled out, but the settlement continued and the anchor piles, designed to add to the strength of the structure, transmitted the thrust of the settling trestle and back-crib to the superstructure of the wharf; finally about 300 ft. of the wharf was pushed out for a distance of 5 to 8 ft., and the piling close behind the wharf sunk from 6 to 10 ft. The trestles carrying the tracks canted in towards the shore, and the anchor piles and back-crib canted out towards the wharf. Repairs will require the removal of the whole superstructure, and of most of the piles; and it is suggested that as this would cost probably as much as the original work, it would be wiser to reconstruct with cribs, similar to the Connoly Wharf, sunk to dredged bottom without piles.

Mr. Earle, the engineer in charge of the wharf in question, recommended an entire change of plan. Mr. Earle says that piling is not practicable on this site as there is evidence of soft clay strata underlying the line of the wharf, and the pile foundations of other wharves nearby show gradual outward settlement. He now proposed to dredge to 4 ft. below the channel to a width of at least 55 ft., and to build a crib-wharf with a base of 50 ft., and return cribs 20 ft. wide, extending back about 100 ft. at intervals of 120 ft. Col. Moore, in criticising this plan, approved of cribwork, but thought that return cribs 12 to 15 ft. wide and extending back 25 or 30 ft. would be sufficient for the conditions imposed.

The "Daily Record," of St. John, of Nov. 9, gives the results of a special meeting of the harbor improvement committee, from which it appears that the dredged slope was 1 on 1½. Soundings taken after the accident show that whereas the water was originally 25 to 28 ft. deep in front of the wharf, depths of 13, 16 and 20 ft. are now found. The piling of the wharf proper and the lines of anchor piles were driven into this slope; but the question not determined by any evidence given is that of how far into this mud the piles were driven. The general evidence favors a slide of the original bottom material, carrying out with it the cribs and the piles; the slide being brought about by the back-filling disturbing the general conditions of load which this material would usually support. An almost similar case occurred in connection with the Chignecto Marine Ry., in building a wharf on the Aulac River. In this case the same extreme range of tide was encountered and the piles were firmly driven into the natural slope of the river bank. They were simply capped and floored, without any cribwork; but it was proposed to fill in behind this wharf, and when a very small portion of the filling was in place the superincumbent weight forced the mud out below and the whole structure was carried into the river. We are indebted to the courtesy of Mr. G. Simeon Armstrong, M. Am. Soc. C. E., for collecting and furnishing to us the general information upon which this account is founded. While stating that the pile wharf was the contractor's idea, and had no connection with the engineering operations of the railway company, Mr. Armstrong believes that the case was one calling for a well-ballasted crib of proper dimensions and foundation, with the filling deposited immediately behind it and carried back, to guard against any sweeping slide. Since writing the above, the whole cribwork has slipped out into the basin, and the entire work is a wreck. Great cracks appear in the ground at the top of the inshore slope. While the evidence points to a land-slide as the active cause, the case may be quoted as one where a board of aldermen knew more than the engineers and contractors, and, as is usual in such cases—"got left."

WORK OF THE HOOVER & MASON CONVEYOR ON THE CHICAGO MAIN DRAINAGE CHANNEL.

In Engineering News of June 20, 1895, the double cantilever conveyor used for excavating and conveying earth on Section H of the Chicago Main Drainage Canal was described in some detail. At that time, however, very little actual work had been done by the machine and figures of output could not be given. These figures are now available, and are given herewith. By referring to the accompanying illustration reproduced from the issue above noted, the method of operating the conveyor will be understood. The truss spans the channel and carries an endless belt to which are attached steel pans. This belt carrier follows closely the finished lines of the bottom of the channel, and lies close up against the working face. A double-ended plow operated by steam cuts successive prisms of material off the end face and the excavated material rolls into the pans. As the pans reach the extremity of the cantilever and pass over the drums, the earth with which they are filled falls out. For further details of construction and operation the article referred to above can be consulted.

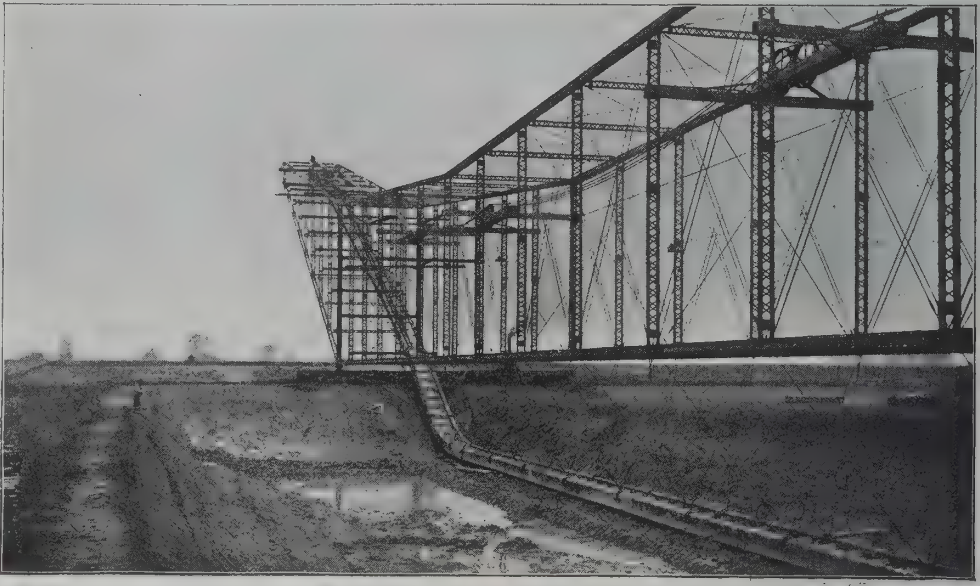
The figures of operation given us cover the three months from April 25 to July 25, and include every operation and expense to complete and trim the channel to grade. They are as follows:

Labor cost, as per pay roll	$4,714.85
Coal, 270.9 tons, at $1.70 per ton	460.54
Oil, waste, repairs, supplies and all other expenses	192.39
Total cost for three months	$5,367.78
Total cu. yds. excavated as per engineers' estimate	66,238
Total cost, per cu. yd.	8.1 cts.

This cost per cu. yd. is made up as follows:

Cost of labor	7.12 cts.
Cost of coal	0.69 "
Cost of grease, oil, waste, repairs, supplies and all other expenses	0.29 "
Total	8.10 cts.

These figures cover every detail, and moreover have been obtained while working on a face only 33 ft. high while the machine was designed for a face 36 ft. high. This reduction in height was of considerable significance on the canal work as the top 3 ft. comprised a large percentage of the total excavation and was moreover a soft prairie loam, while the material beneath was a very hard clay. As it is, however, the results are very favorable when it is remembered that the actual contract price of excavating this class of material on the Drainage Canal runs from 19 cts. to 29 cts. per cu. yd., the last being the price on Section H.



ENDLESS BELT CONVEYOR FOR EARTH EXCAVATION ON SECTION H, CHICAGO MAIN DRAINAGE CHANNEL.
Designed by Hoover & Mason, Kansas City, Mo. Gohan & Byrne, Contractors on Section H.

PROPER SPEED FOR ROPE POWER TRANSMISSION

According to a paper read recently by Mr. Abram Combe, before the British Institution of Mechanical Engineers, the speed of rope originally adopted over 30 years ago, 3,300 ft. per minute, has been found to give the best results, although speeds far exceeding this have been used in many instances. With the higher speeds it is said that the gain of power is counteracted by loss from atmospheric friction, centrifugal action, and wear on ropes and bearings. Mr. Combe gives the following sizes of ropes and diameters of pulleys, with the horse-power that may be transmitted by each size for each 100 revolutions per minute:

Diam. of rope.	Diam. of pulley.	Ratio of diams.	HP. for 100 revs. per min.
1¼ in.	3 ft.	1 to 28.8	5
1½ "	4 "	1 to 32.0	8
1¾ "	5 "	1 to 34.3	11
2 "	6 "	1 to 36.0	15

For other sizes of pulleys the power transmitted is calculated to be increased in direct proportion to the diameter of the pulleys. Mr. Combe further says:

> When working under the most advantageous conditions—for instance, where the ropes are running horizontally at good speeds, with the pulleys at a proper distance apart, and with the bottom rope acting as a driver—the above bases may be increased by 20 to 25% with safety. On the other hand, when the ropes are working under unfavorable conditions, with centers of pulleys too close together or ropes running vertically, these bases must be diminished by 20 to 25%. The exact amount of increase or decrease on these standard bases has to be determined in each individual instance, according to the circumstances under which the ropes are working.

Desiring to compare the figures given above for horse-power transmitted by different sizes of ropes with those given by American writers on the subject, we have calculated the horse-power for a speed of 3,300 ft. per minute from the figures given for 100 revolutions per minute and compared the result with figures obtained by interpolation from a table published by the C. W. Hunt Co., of New York The results are as follows:

Diameter of rope, ins.	1¼	1½	1¾	2
HP. at 100 revs. of pulley (Combe)	5	8	11	15
" " 3,300 ft. per min. (Combe)	17.5	21.0	23.1	26.5
" " 3,300 ft. per min. (Hunt)	18.5	25.4	36.1	47.1
" " 5,000 ft. per min. (Hunt)	21.4	30.8	41.8	54.8

In Mr. Hunt's table the driving power of a rope appears to increase as the square of its diameter, as might be expected if the larger ropes were of the same quality and strength throughout as the smaller ones, but in Mr. Combe's table the driving power increases at a rate which is even less than the direct ratio of the diameters. An American designer working by Mr. Hunt's table would use a 2-in. rope at 5,000 ft. per minute to drive 54.8 HP., while an English designer following Mr. Combe's figures and his statement that the best results are obtained with a speed of only 3,300 ft. would obtain less than half the power from the same rope, or only 26.5 HP. By the latter rule more than twice as many ropes would be required for a given installation, and the consequent expense might, in American practice, at least, lead to the adoption of belts instead of ropes.

We doubt, however, if the figures given by Mr. Combe are to be accepted as a record of actual English practice, for an article by Mr. Wm. H. Booth, an English contributor to the "American Machinist," a few years ago, gave the "most usual practice" in Lancashire as follows: 1¾-in. cotton ropes at 5,000 ft. per minute equal 50 HP., and he gives a table of data from English practice from which we take the following:

Diameter of rope, ins.	1¼	1½	1¾	2
HP. per rope, at 4,800 ft. per min.	24	34	49	63

These figures are in every case larger than those given in Mr. Hunt's American table. It would appear that the smaller figures given by Mr. Combe for 1¾ and 2-in. ropes are due to extreme conservatism, and to the English habit of being slow but safe and sure, carried to too great an extent, and to an extent which, according to Mr. Booth's figures, is not followed by Lancashire manufacturers.

◆

A 5,000-MILE PHOTOGRAPHIC INTERCHANGEABLE railway ticket has been agreed upon by the Central Passenger Association Committee. These tickets will cost $100 each, will bear a photograph of the purchaser and will not be transferable. The 1,000-mile "wide-open" ticket, now on sale, will also be used. The 5,000-mile tickets will cover roads in the Central district, between Pittsburg and St. Louis, but will not include the Pennsylvania R. R. lines.

THE ORIGIN OF THE BESSEMER PROCESS.*

By Sir Henry Bessemer, London, Eng.

(Honorary Member Am. Soc. M. E.)

It is generally well known that this invention had its origin in certain experiments commenced in January, 1855, for the purpose of improving the quality of cast-iron employed for founding heavy ordnance, by rendering the iron more tough, increasing its tensile strength, and making it less subject to injury by abrasion. I was aware that Fairbairn and others had sought to improve cast-iron by the fusion of some malleable scrap-iron along with the pig-iron in the cupola furnace; this fusion of scrap-iron, intermixed with the mass of coke, was found to convert the malleable iron into white cast-iron, which was at the same time much contaminated with sulphur, and thus, to a great extent, this method had failed in its object. In my experiments I avoided the difficulties inseparable from Fairbairn's plan, by employing a reverberatory furnace in which the pig-iron was fused, forming a bath; into this bath I put broken-up bars of blistered steel, made from Swedish or other charcoal iron, its fusion taking place without being further carburized by contact with the solid fuel, or contaminated by the absorption of sulphur. The high temperature necessary for the fusion of a large proportion of steel in the bath, was attained by constructing the fire-grate much wider than the bath, by contracting the width of the furnace considerably at the bridge, and also by continuing to taper the furnace slightly all the way from the fire-bridge to the downcast flue, which was connected with a tall chimney shaft. My English patent for this arrangement bears date Jan. 10, 1855. Many alterations and modifications of this furnace were made from time to time; it was found that the large volume of flame sweeping over the open hearth of the furnace was mixed with a considerable quantity of combustible gas, to consume which a hollow fire-bridge was employed, having numerous perforations made in the fire-clay lumps of which it was composed, and so arranged as to allow jets of hot atmospheric air to mingle with these combustible gases, which had the effect of producing an intense heat close down on the surface of the bath; it was also found that the admission of hot air all along the back of the fire-bridge produced a decarbonizing action on the bath; and hence the degree of carburation of the metal might be altered by regulating the admission of air. The flow of air through the hollow fire-bridge served also to moderate its temperature and render it more durable.

FIG. 1 and 2.—DECARBURIZING CAST IRON IN A REVERBERATORY FURNACE.

Some of the samples of metal which I produced by this process were, when annealed, of an extremely fine grain and of great strength. At this stage of my experiments I determined on casting a small model gun which in the lathe gave shavings slightly curled, and closely resembling the turnings from a steel ingot. The metal when polished also looked white and close-grained like steel. I was so well pleased with this casting that I took it over to Paris, obtained an audience with, and showed it to, the Emperor, who had, in fact, encouraged me to make an attempt to improve iron employed in founding heavy ordnance. His Majesty, who had desired me to report progress, accepted this experimental gun, remarking that some day it might have an historical interest, and it was in recognition of this circumstance that His Majesty, later on, intimated to me, through Colonel Belleville, his desire to confer on me the Grand Cross of the Legion of Honor, provided I could obtain permission to wear it, a privilege which our ambassadors twice refused. His Majesty also gave me permission to erect my furnace at the government cannon foundry at Ruelle, near Angouleme, to which place I went, with proper introductions, for the purpose of arranging all the necessary details. I also sent over from England several thousand special fire-bricks, etc., for the erection of the furnace.

But on resuming my further researches, after returning to London, an incident occurred which suddenly put a stop to the intended works at the Ruelle gun foundry, and, in fact, altered all my future plans and investigations.

The furnace, as it was then arranged, is shown in vertical section by Fig. 1, and in horizontal section on a line passing through openings in the perforated hollow fire-bridge by Fig. 2, where the narrowing of the body of the furnace is clearly shown, and the manner in which the jets of air were directed so as to produce an intense ignition of the combustible gases mingled with, and passing over, with the large volume of flame, from the over-charged fire-grate.

The small scale on which this experimental furnace was built (viz.: a capacity of three hundredweight only), was much against my obtaining the high temperature necessary to melt a large proportion of steel in the pig-iron bath. I was of course fully aware that a furnace of sufficient capacity to cast a five or a ten ton gun would produce a much higher temperature than it was possible to attain in my small furnace, and also that a forced draft, obtained by closing in the ash-pit and forcing air into it, would also still further increase the temperature. That this forced draft was in my mind at the time, is shown by the fact that I took out a patent for the manufacture of cast-steel, dated Oct. 17, 1855; that is, about two months after the casting of the model gun; in this patent I fully described the forcing of air by a fan, into the closed ash-pits of furnaces employed in the manufacture of cast-steel; and it has often since occurred to me that, with the additional resources still untried, I did not act wisely in so suddenly abandoning these open-hearth experiments, in favor of an entirely different system, suggested to my mind by the incident before referred to. But with my impulsive nature and my intense desire to follow up every new problem which presented itself, I at once threw myself unreservedly into this new study, which seemed to open a way to the rapid production of bars, rails, and plates, of malleable metal direct from the blast furnace.

Before dismissing this subject it may be interesting even at this distant period to speculate on what would have been the natural outcome of the open-hearth furnace experiments, had I not been so suddenly diverted from their further pursuit.

Such a furnace, with a forced draft and a capacity of ten tons, would undoubtedly have melted malleable iron or steel in a bath of pig-iron, and have decarburized it to the desired extent, for I had, in fact, in this small furnace already fused steel in a bath of pig-iron, on the open hearth of a reverberatory furnace, and as far back as January, 1855, I had claimed in my patent "the fusion of steel in a bath of melted pig, or cast-iron in a reverberatory furnace, as herein described."

This was about ten years prior to the first patent taken out by M. Emile Martin, and now generally known as the Siemens-Martin process. This patent was obtained in England in the name of Emile Martin only, and is dated Aug. 18, 1865, or more than ten years after my patent of January 10, 1855. M. Emile Martin, in his patent, says: "The manufacture is effected upon the principle of fusion of iron or natural steel in a bath of cast-iron, maintained at a white heat, in a reverberatory furnace such as a Siemens gas-furnace."

I desire to say that I make no claim whatever to the prior invention of the Martin-Siemens process, nor do I for one moment assume that my patent of 1855 furnished any information which either of these gentlemen availed themselves of; but I think I am justified in saying that the fusion of steel in a bath of pig-iron, on the open hearth of a reverberatory furnace, which I had patented and successfully effected, was, to use a favorite expression of Mr. Gladstone, "approaching within measurable distance" of that now well-known and successful process.

On my return from the Ruelle gun foundry, I resumed my experiments with the open-hearth furnace, when the remarkable incident I have twice referred to, occurred in this way: Some pieces of pig-iron in one side of the bath attracted my attention by remaining unmelted despite the great heat of the furnace, and I turned on a little more air through the fire-bridge, with the intention of increasing the combustion; on again opening the furnace door after an interval of half an hour, these two pieces of pig still remained unfused. I then took an iron bar, with the intention of pushing them into the bath, when I discovered that they were merely thin shells of decarburized iron, as represented at Fig. 3, thus showing that atmospheric pressure alone was capable of wholly decarburizing gray pig-iron and converting it into malleable iron without puddling or any other manipulation. It was this which gave a new direction to my thoughts, and after due consideration I became convinced that if air could be brought in contact with a sufficiently extensive surface of molten crude iron the latter would rapidly be converted into malleable iron.

This, like all new problems, had a special interest for me, and I became impatient to test it by more than a laboratory experiment; without loss of time I had some fire-clay crucibles made with perforated covers, and also some fire-clay blow-pipes, which I joined to a 3-ft. length of 1-in. gas-pipe, the opposite end of which was attached by a piece of rubber tubing to a fixed blast-pipe. This elastic connection permitted the easy introduction and withdrawal of the blow-pipe into and out of the crucible, as shown at Fig. 4, which represents a vertical section of an air furnace. containing a crucible, which in this case represented the "converter." About 10 lbs. of molten gray pig-iron about half filled the crucible, and 30 minutes' blowing was found to convert 10 lbs. of this gray pig-iron into soft malleable iron. Here at least one great fact was elicited, viz.: the absolute decarburization of molten crude iron without any manipulation, but not without fuel; for had not a very high temperature been kept up in the air furnace all the time this quiet blowing for 30 minutes was going on, it would have resulted in the solidification of the metal in the crucible long before complete decarburation had been effected. Hence arose the all-important question: Can sufficient internal heat be produced by the introduction of atmospheric air to retain the fluidity of the metal until it is wholly decarburized in a vessel externally heated?

This I determined to try without delay. I fitted up a larger blast cylinder in connection with a 20 HP. engine which I had daily at work, and I also erected an ordinary foundry cupola capable of melting half a ton of pig-iron. Then came the question of the best form and size for the experimental "converter." I had very few data to guide me in this, as the crucible converter was hidden from view in the furnace during the blow. I, however, found that slag was produced during the blow and escaped through the holes in the lid; this fact guided me to the construction of a very simple form of cylindrical converter, about 4 ft. in height in the interior, which was sufficiently tall and capacious, as I believed to prevent anything but a few sparks and heated gases from escaping through a central hole made in the flat top of the vessel for that purpose, as shown in vertical section at Fig. 5. The converter had six horizontal tuyeres arranged around the lower part of it; these were connected by six adjustable branch pipes, deriving their supply of air from an annular rectangular chamber extending around the converter, as shown.

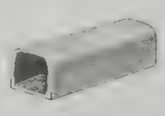

Fig.3.

Fig. 3.—Shell of Decarburized Pig Iron.

All being thus arranged, and a blast of 10 or 15 lbs. pressure turned on, about 7 cwt. of molten pig-iron was run into the hopper provided on one side of the converter for that purpose. All went on quietly for about ten minutes. Sparks, such as are commonly seen when tapping a cupola, accompanied by hot gases, ascended through the opening in the top of the converter, just as I supposed would be the case, but soon after a rapid change took place. In fact, the silicon had been quietly consumed, and the oxygen next uniting with the carbon, sent up an ever-increasing stream of sparks and a voluminous white flame; then followed a succession of mild explosions, throwing molten slags and splashes of metal high up into the air, the apparatus becoming a miniature volcano in a state of active eruption. No one can approach the converter to turn off the blast, and some low flat zinc-covered roofs close at hand were in danger of being set on fire by the shower of redhot matter falling on them. All this was a veritable revelation to me, as I had in no way anticipated such violent results. However, in ten minutes more the eruption had ceased, the flame died down, the process was complete, and on tapping the converter into a shallow pan or ladle, and forming it into an ingot, it was found to be wholly decarburized malleable iron.

---

*A paper presented at the New York meeting (Dec., 1896) of the American Society of Mechanical Engineers. Another account by Sir Henry Bessemer of his great invention, communicated by him to the International Engineering Convention of 1890, was published in Engineering News, Oct. 18, 1890.

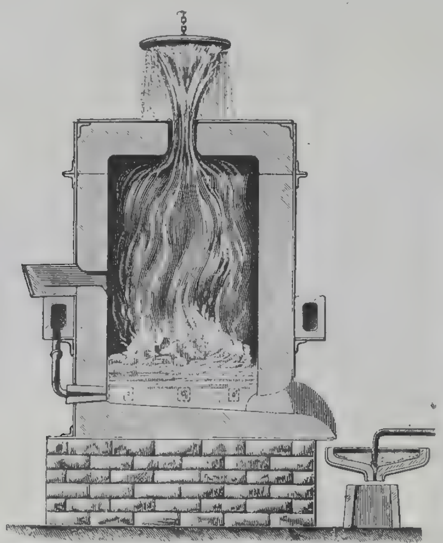

Fig. 5.

Fig. 5.—Bessemer's First Converter.

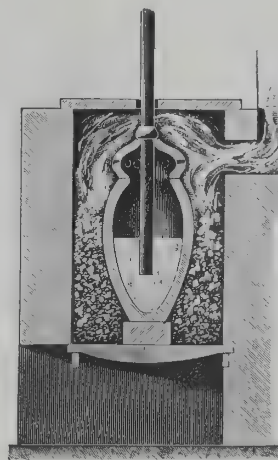

Fig. 4.

Fig. 4.—Bessemer's First Experiment—Decarburizing Iron in a Crucible.

Such were the conditions under which the first charge of pig-iron was converted into malleable iron in a vessel neither internally nor externally heated by fire.

I, however, desired to convert a second charge of pig-iron, which had been put into the cupola, and in order to prevent this dangerous projection upward of sparks and molten slags, a temporary expedient was resorted to which, however, failed in its object. I procured one of those circular chequered cast-iron plates so much used in the London pavements to allow coals to be put into the cellars below the pavement. This plate, which was about a foot in diameter, was suspended by a chain at a distance of 18 ins. above the central opening, in the top of the converter, as shown in Fig. 5.

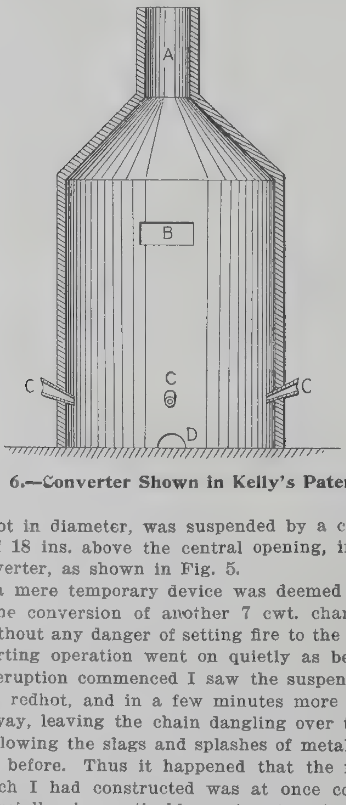

Fig. 6.—Converter Shown in Kelly's Patent.

This as a mere temporary device was deemed sufficient to allow the conversion of another 7 cwt. charge to be effected without any danger of setting fire to the premises. The converting operation went on quietly as before, but when the eruption commenced I saw the suspended plate get rapidly redhot, and in a few minutes more it melted and fell away, leaving the chain dangling over the opening, and allowing the slags and splashes of metal to shoot upward as before. Thus it happened that the first converter which I had constructed was at once condemned as commercially impracticable, owing to this vertical eruption of cinder, and for this reason only. All attempts to lessen the violence of the process by a reduction of the number of tuyeres, or by lessening the diameter of the tuyere pipe orifices, or by diminishing the pressure of the blast, cnly resulted in a reduction of the necessary temperature, and in preventing the conversion of the molten pig-iron into malleable iron. In one case the trial of a diminished area of tuyere opening, resulted in nearly the whole charge of metal, after more than an hour's blowing, being converted into a solid mass of brittle white iron similar to ordinary refiners' plate metal. Indeed, I may say that the results of all my early investigations proved to me, beyond the possibility of doubt, a fact which has since been confirmed in every Bessemer steel works throughout Europe and America, viz., that rapidity of action ending in a violent eruption are absolutely necessary conditions of success; and when we take into consideration the fact that the converted metal must be made to acquire an enormously high temperature, so that it may not be chilled in tapping, or pouring it out of the incandescent converter into a cold open ladle; that it be not chilled by the addition of a large quantity of much cooler metal employed to deoxidize it; that it does not chill and form a skull in the casting ladle during the comparatively long time required to form it into ingots; it is obvious that to carry out the Bessemer process successfully, a temperature must be obtained very considerably above the mere melting temperature of malleable iron. In order to obtain this temperature it is necessary to drive powerful streams of air into the metal, so as to divide it into innumerable fiery globules diffused throughout the whole body of metal under operation, which for the time being may be likened to a fluid sponge, with the active combustion of carbon with oxygen going on in every one of its myriads of ever-changing cavities.

It has been found that the union of carbon and oxygen takes place so rapidly at this high temperature as to produce a series of mild explosions, which are scarcely noticed in the large converters in common use which have a space for the violent expansions, of some 8 or 10 ft. in height above the normal level of the metal; in this space the violent action expends itself unseen, and is only partially recognized by a small additional quantity of slags leaping out of the mouth of the converter.

With these facts before us it must be self-evident that all attempts to produce malleable iron in a plain cylindrical vessel which has no top to it, and in which the metal rises to within a few inches of its open mouth, must utterly fail from two causes. First, because heat would fly off so freely that the temperature of molten malleable iron could never be reached, and, second, because nearly all the metal contained in such a shallow open-topped vessel would leap out of it, and be scattered in all directions when the explosive eruption takes place, without which no charge of molten pig-iron can be converted into fluid malleable iron. This violent eruption of slags, accompanied by an immense volume of flame which issues from the mouth of the converter, has surprised every one when witnessing the Bessemer process for the first time. Nor was I an exception to the rule, for I was as much astonished as others at this violent eruption, or most assuredly I should never have been so stupid as to design a converter so as to discharge a shower of slag vertically upwards, and thus insure its falling back on to and all around the converter. Till that time no one had ever seen a converter in operation, but no one who had once witnessed the conversion of fluid pig-iron into malleable iron by a blast of air, would ever propose to construct a converter with an opening at the top so as to direct this fiery stream vertically upwards. Later experience allows me fearlessly to assert that a charge of molten crude iron cannot be converted into fluid malleable iron or steel by forcing air through it, without this violent eruption taking place. Hence it is to me utterly inconceivable that any man who had once witnessed the violent eruption invariably accompanying the converting process, should, after such an experience, design and patent a converting vessel with a sloping top and a vertical outlet so admirably adapted to throw upward and discharge so large a proportion of its contents as that shown in Fig. 6, which is an exact reproduction of an authorized drawing of the converter of an American patentee who, it has been asserted, had successfully carried on this converting process many years prior to his taking out this patent in 1857. The original patent is headed: "W. Kelly, No. 505. Re-issued, Nov. 3, 1857."

I had no sooner condemned my first cylindrical converter than I commenced to remedy its defects. The most obvious and ready way of doing this would have been simply to make an opening near the top, on one side of it, and thus allow the escape of the ejected matter to take place horizontally, and direct the discharge against a wall, or allow it to fall into a pit, etc., but I desired to prevent the discharge of metal splashes as far as possible, so that I determined on constructing the new converter with an upper chamber having an arched roof and a conical sloping floor. This converter is represented at Fig. 7 in vertical section, and at Fig. 8 in horizontal cross-section, taken through the tuyeres. When a converter is so constructed the fluid matters which would otherwise pass vertically upward into the air are thrown against the arched roof, and any fluid metal which may be thrown up falls upon the sloping floor of the upper chamber, and again returns to the lower one, while the flame and a portion of the slags find their way out of the two square lateral openings provided for that purpose. This upper chamber serves also as a receptacle for heating up any metal intended to recarburize or alloy with the steel in course of being converted. The section Fig. 8 shows six well-burned fire-clay or plumbago tuyere pipes, fitted to openings left in the lining for that purpose. Their outer ends are made conical to facilitate the ramming in of loam around them, and which effectually holds them in position, and at the same time admits of their easy removal when worn out; a jointed piece of iron tube, with a catch to hold it in place, communicates the blast to each tuyere.

Another view of this converter, taken at right angles to Fig. 7, is represented in Fig. 9, showing in one side the hopper by which the molten iron is run in by a movable spout direct from the cupola. This view also shows the tapping hole open, and the spout which conducts the converted metal into a movable shallow pan or receiver supported by a long handle (not shown). A fire-brick plug, attached to a long handle, is fitted to a fire-brick ring or opening in the bottom of the pan, and prevents any debris from the tapping hole being carried into the mold.

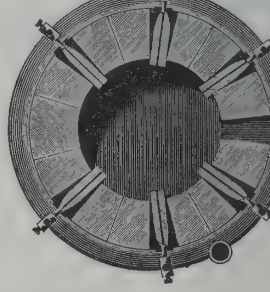

Fig. 8.

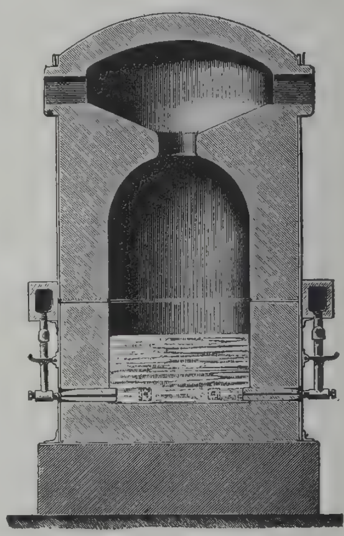

Fig. 7.

Figs. 7 and 8.—Bessemer's Second Converter.

As this apparatus was intended to exhibit the process, it was essential that an easy way should be provided for getting away the ingots and quickly repeating the process. This casting apparatus, constructed precisely as represented in Fig. 9, was erected at my bronze manufactory in London about two months prior to my reading the "Cheltenham Paper." It is represented in vertical section Fig. 9. The interior of the mold was 10 ins. square and about 3 ft. in length, and was made in two pieces planed quite parallel and then permanently bolted together. The mold had a massive square lower flange resting on four dwarf columns, which stood on the square upper flange of an hydraulic cylinder. Massive bolts passed through these dwarf columns and through the square flanges, and thus united the ingot mold and hydraulic cylinder, in which a ram or plunger was placed, having a movable square head which accurately fitted the mold and formed a closely fitting movable bottom to it. Both the ram and the external surface of the mold were kept cool by a water jacket provided with supply and waste pipes. Matters being thus arranged, the converted metal was allowed to fall in a vertical stream from the receiver on to the head of the ram. The receiver was then removed, and water under pressure was turned on to the hydraulic cylinder as soon as the steel was solidified, when a beautifully square ingot, 10 ins. square and weighing about seven hundredweight, steadily rose and stood on end ready for removal, the head of the ram rising one or two inches above the top of the mold. There are, no doubt, many persons still living who witnessed this combined converting and casting apparatus in successful operation at my bronze works in London.

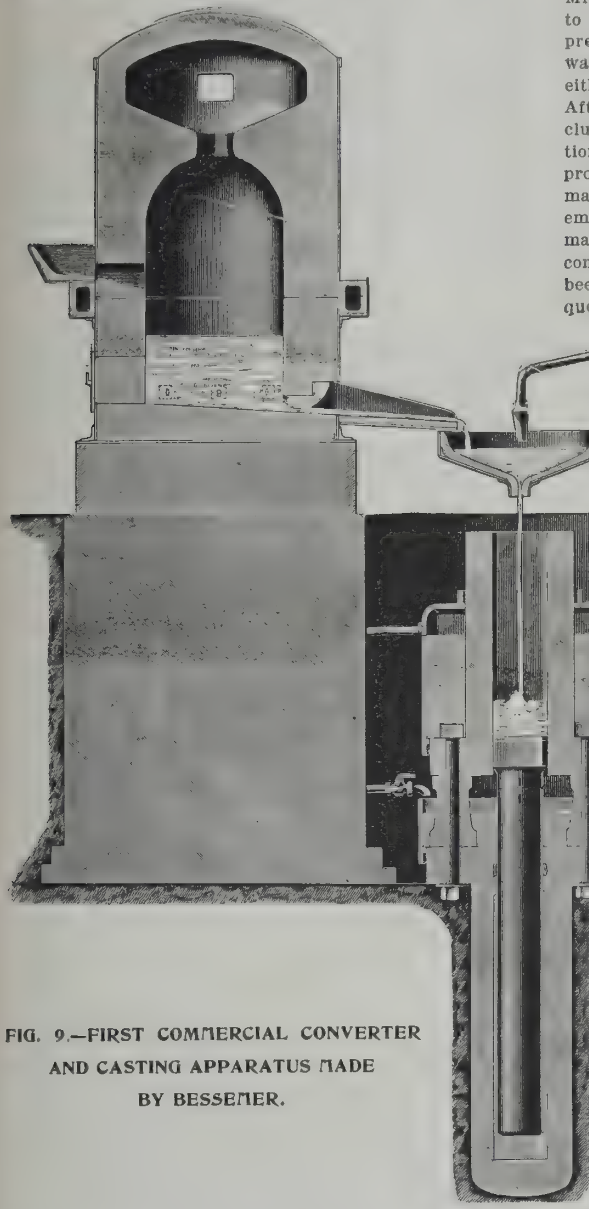

FIG. 9.—FIRST COMMERCIAL CONVERTER AND CASTING APPARATUS MADE BY BESSEMER.

Two ten-inch square ingots made with this apparatus were sent to the Dowlais Iron Works in Wales, and without hammering, were rolled into two flat-footed rails, on Aug. 26, 1856—that is, thirteen days after the reading of the "Cheltenham Paper." They were rolled under the personal superintendence of Mr. Edward Williams, Past-President of the Iron and Steel Institute, where two pieces of these rails are still kept as examples of the early working of my process in London.

I may here call attention to the fact that in my patent, dated Oct. 17, 1855, I described how the state of carburation of the converted metal might be regulated by the addition of molten pig-iron after the blow had taken place; and as this patent was dated eleven months prior to Mr. Mushet's patent, claiming to recarburize the converted metal with the German pig-iron known as spiegeleisen, Mr. Mushet could not prevent my use of that, or any other pig-iron, to recarburize the converted metal after the blow. There was also another absolute bar to Mr. Mushet's claims to the exclusive use of manganese in my process besides its public use in all countries by cast-steel manufacturers, for in another patent of mine, dated May 31, 1856—that is, 16 weeks prior to either of Mr. Mushet's three manganese patents—I gave the right to the public to alloy steel in my process with any metals previously used to alloy cast-steel, by showing various ways in which these alloys might be made in my process, either by fluid or solid metals, or by metallic oxides. After this description I entered a disclaimer to their exclusive use, by means of which disclaimer and publication, all alloys of steel might be made in my converting process which had hitherto been made by other cast-steel manufacturers; so that the three patents of Mr. Mushet, embracing, as they did, every known means of employing manganese, and which were intended to corner me and control my patent, utterly broke down simply by having been anticipated in my two former patents. In consequence of this, Mr. Mushet did not think it worth while even to give me notice that in using spiegeleisen for recarburizing I was infringing his patents, nor did he make any attempt legally or otherwise to prevent me and all my English licensees from the free use of manganese; and I could never understand why American steel manufacturers paid a roylty for the use of these invalid patents.

In this same patent of May 31, 1856, I anticipated the invention of Sir Joseph Whitworth for casting steel under great pressure in order to render the ingots or castings more sound. I stated that

> "I have observed that the cellular condition of cast-steel, and more especially malleable-iron castings, is more or less owing to the spontaneous disengagement of gaseous matter in the interior of the fluid mass. Now, it is well known that substances capable of vaporizing, or of evolving gaseous matters, do so with greater difficulty if surrounded by a dense atmosphere. I therefore make use of this peculiar property of matter in order to increase the soundness of ingots or other articles formed by casting in fluid malleable iron or steel."

Then follow details of apparatus both for casting under gaseous pressure and also by the direct action of an hydraulic plunger acting on the fluid steel during its solidification. I have no doubt whatever but that when Sir Joseph Whitworth applied for his patent for casting steel under the pressure of an hydraulic plunger, he was wholly unaware of what I had patented nine years previously, and it is only due to Sir Joseph to say that immediately on his patent agent pointing out this fact to him, he came to me and took a license under my patent, paying me a royalty on all the compressed steel made at his works up to that date at which my patent ceased to exist. That his special mechanical arrangements were an original invention I have never had any doubt whatever, and he had the additional merit of successfully carrying them out.

Before concluding this brief sketch of the more salient points connected with the many forms of apparatus designed by me to facilitate or improve my process, I must revert to the difficulties inseparable from a fixed converter, for in this form of apparatus much heat is dissipated by the necessity of blowing before running in the metal, and—what is still worse—the necessity of continuing the blast after the metal is converted and during the whole time of its discharge. Then there is the uncertainty as to the time employed in tapping, during which time the blowing must be continued, and there is also the difficulty of stopping the process, if anything goes wrong with the blast engine, or if a tuyere gives way.

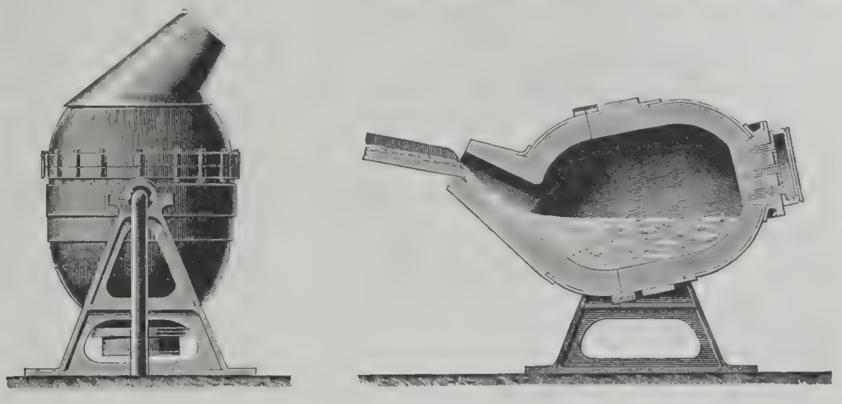

Fig. 10. Fig. 11.

FIGS. 10 and 11.—BESSEMER'S IMPROVED CONVERTER.

These difficulties and many others caused me to search diligently for a remedy for these grave defects, which at that time appeared impossible to overcome, until the happy idea occurred to me of moving the converter on axes, so as to be able to keep the tuyeres above the metal until a charge of molten iron was run in, and which permitted the whole charge to be commenced at one and the same time, and admitted also of the cessation of blowing during its discharge. This movement of the converter also permitted a stoppage of the process to take place at any time for the removal of a worn-out tuyere if necessary, and afforded great facilities for working the process. The peculiar form of the movable converter was a matter of great importance, as there were several necessary requirements to provide for. First, in order to make the heavy lining secure when turned upside down, a more or less arched shape in all directions was necessary, and a long oval form seemed best adapted to the purpose, as it allowed some eight or nine feet in height for the metal to throw itself about in, without leaving the converter. Then the large mouth or outlet pointing to one side was necessary to direct the sparks to be all discharged in a

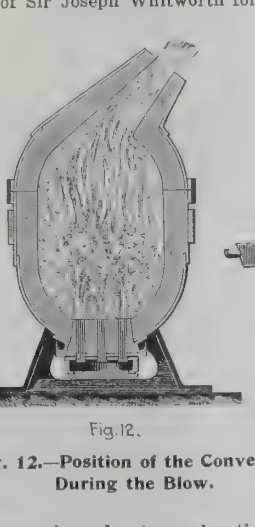

Fig. 12.

Fig. 12.—Position of the Converter During the Blow.

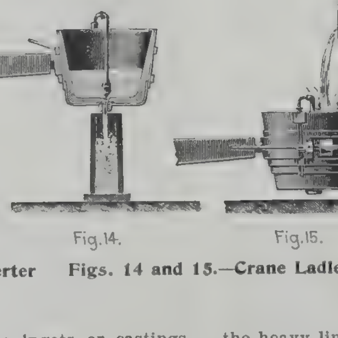

Fig. 14. Fig. 15.

Figs. 14 and 15.—Crane Ladle.

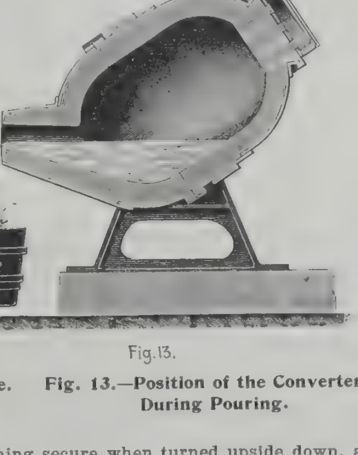

Fig. 13.

Fig. 13.—Position of the Converter During Pouring.

direction away from the casting pit. After much study the precise form arrived at is shown at Fig. 10, which is an external elevation, and of which Fig. 11 is a vertical section, in the position in which the vessel is retained during the running in of the metal; Fig. 12 shows the position it occupies during the blow; Fig. 13 shows the position is assumes during the discharge of the converted metal into a loamed-up casting ladle provided with a discharge valve at the bottom; the ladle can be moved from mold to mold by closing the valve during such movement, and on opening it a vertical stream descends into the mold, perfectly free from any admixture of slags. The advantage of this mode of filling the molds will be understood when it is borne in mind that the latter are necessarily narrow, upright iron vessels. Now, it is well known that a stream of molten metal, poured from the lip of a ladle, will describe a parabolic curve in its descent, and tends to strike the further side of the mold before reaching the bottom. The surface of the cast-iron mold so struck is instantly melted by the incandescent stream of steel, and the ingot and the mold thus become united, causing great inconvenience and destruction to the mold; nor is it easy in pouring the steel from a ladle to prevent some of the fluid slag floating on its surface from flowing over with the steel and spoiling the ingot. All of these difficulties are avoided by the valvular ladle discharging a vertical stream down the centre of the mold. the quantity and flow being regulated with great facility by the hand lever on the side of the ladle.

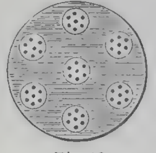

Fig.16.

Fig. 17.

Fig.18.

Fig. 16.—Arrangement of Tuyeres in the Converter Bottom.
Figs. 17 and 18.—Section and Bottom View of a Tuyere.

Many other mechanical contrivances were necessary to perfect the process; such, for instance, as a patent blast engine with noiseless self-acting valves; the hydraulic casting crane carrying the casting ladle over every mold in the semicircular casting pit, and capable of rising and falling to correspond to the descent of the mouth of the converter when filling the ladle for casting. Then there are the direct-acting ingot cranes which clear the pit and refill it with another set of molds rapidly and with little manual labor; then we have the elevated "valve stand," called in America, "the pulpit," from which safe position a single workman can overlook the whole converting apparatus, controlling all their movements, governing the blast, working the hydraulic cranes, etc.

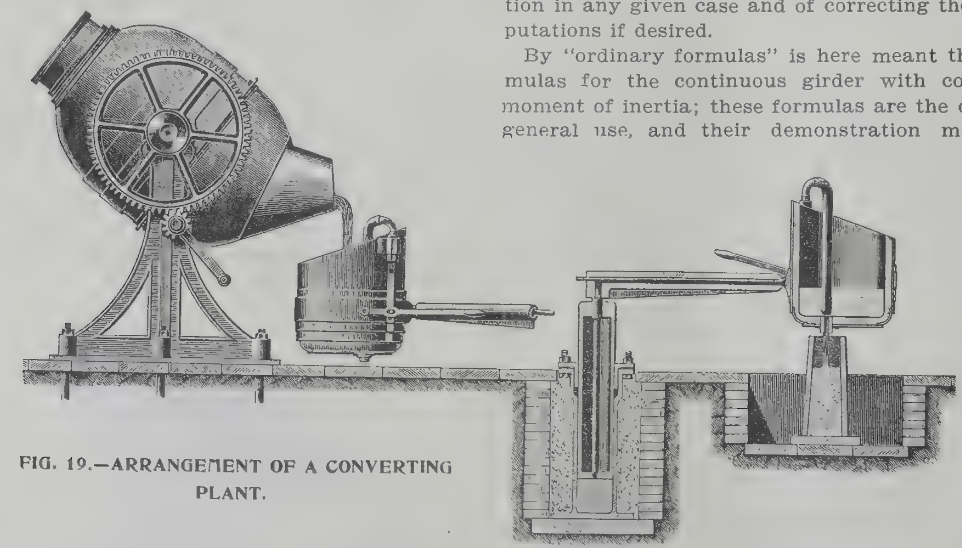

FIG. 19.—ARRANGEMENT OF A CONVERTING PLANT.

The mode of transmitting semi-rotary motion to the converter was another important question which I had to solve. I was of opinion that ordinary shafting and straps were out of the question in dealing with this fiery monster; five or ten tons of fluid metal had to be lifted in one direction, the load diminishing until the fluid running to the opposite end of the converter tended to drive the lifting gear in the reverse direction, so that if anything went wrong or slipped, the converter might swing itself round and discharge these five or ten tons of incandescent steel on to the floor or among the workpeople. This determined me to adopt the hydraulic apparatus now universally employed for governing the motions of the converter, for with this simple and reliable apparatus, a lad at safe distance can start it in motion or stop it instantly, can alter its speed of motion, and control the pouring out of ten tons of incandescent steel as easily as a lady pours out a cup of tea.

The first movable converter was erected at my steel works in Sheffield, and was moved by hand gearing, because at that early date I had not invented the hydraulic apparatus just described. This early converting apparatus did good work at Sheffield, and was constructed precisely as represented in Fig. 19, which shows also the first modification of the hydraulic casting crane, afterwards elaborated and rendered suitable for casting heavy charges of steel.

In conclusion, permit me to say that I have great pleasure in bringing before the many eminent engineers of which this society is composed a brief sketch of the early days of this invention, and although many interesting details are necessarily omitted, I trust that I have said enough to show how the Bessemer process originated, and how, by constant study and practical research it was developed from a mere abstract theory, nearer and nearer to a degree of practical development at my bronze works in London till I was justified in erecting the Bessemer Steel Works in Sheffield, which still remain in active operation under the style of Henry Bessemer & Co., Limited. These works were established for commercial purposes and also to serve as a pioneer works or school, where the process was for several years exhibited to any iron or steel manufacturers who desired to take a license to manufacture under my patents; during that time all who desired to do so were allowed to bring their own pig-iron, and personally, or by their managers, see it converted prior to taking a license.

And now, when I contemplate the great steel trade of Europe and America, with an annual production of 10,000,000 tons of Bessemer steel, I may be pardoned if I express some pride and satisfaction when I find that, notwithstanding the keen competition of rival manufacturers and the ceaseless activity and inventive talents of mechanical engineers, my original invention has not been swept away, but still exists in active operation in every steel-making country in the world, intact in all its main features and in almost every detail as it left my hands forty years ago.

* * *

THE ACCURACY OF THE ORDINARY FORMULAS FOR SWING BRIDGES.

By. F. E. Turneaure.*

In view of the statements which are occasionally seen, to the effect that perhaps our ordinary formulas for swing bridges may some day be replaced by more accurate and desirable ones, and of various remarks concerning the accuracy of these formulas, it may not be amiss to examine into their accuracy and to point out an easy method of determining the degree of approximation in any given case and of correcting the computations if desired.

By "ordinary formulas" is here meant the formulas for the continuous girder with constant moment of inertia; these formulas are the ones in general use, and their demonstration may be found in any modern work on bridges. Furthermore, in this discussion, truss bridges only will be considered.

The method of computation to be explained assumes that the stresses have been determined by some approximate method (preferably by the use of the ordinary formulas) and the sections of the members computed. By this proposed method we may then determine the true reactions and if it is found that those determined by the approximate methods are largely in error the stresses and cross-sections can be corrected accordingly. This would change the reactions to some extent and therefore, in turn, the stresses, but it will be found that the computations need never be repeated for any swing bridge as the second approximation will be abundantly accurate. In fact, it will be shown that the usual formulas are sufficiently accurate in all ordinary cases.

We will consider first a bridge of two equal spans. It will usually be sufficient to make the computations for one case only—that is, for a uniform load covering both spans, bridge acting as a continuous girder. The reactions for this case are determined as follows:

Assume first the bridge loaded with the given load and supported only at the center, both arms deflecting equally. Determine the deflection of the end point by the formula†

$$D = \Sigma \, \frac{P\,u\,l}{E\,a}, \tag{1}$$

in which

D = deflection of the end point,
P = stress in any member due to the assumed load,
u = stress in the same member due to a load of 1 lb. applied at the end,
l = length of the member,
E = modulus of elasticity, and
a = area of the cross-section of the member.

Now find in the same way the upward deflection of the end point due to a load of 1 lb. applied upwards at the end, The stress in each member due to this load, and which corresponds to P in the above formula, will be u, the value of which is already known. This upward deflection will then be

$$d = \Sigma \, \frac{u^2\,l}{E\,a}. \tag{2}$$

The necessary reaction to produce an upward deflection equal to D, or to bring the end back to normal position, will be

$$R = \frac{D}{d}. \tag{3}$$

The stresses "P" can be quickly found from a single stress diagram and if the dead load is taken as a uniform load, they will be proportional to the dead load stresses for bridge open. Stresses "u" can also be found from a single diagram, while all other quantities are known. A convenient form for computation will readily suggest itself.

For a symmetrical truss symmetrically loaded it is necessary to sum the terms $\frac{P\,u\,l}{E\,a}$ and $\frac{u^2\,l}{E\,a}$ for one-half the truss only. For symmetrical trusses unsymmetrically loaded we can first assume symmetrical loads and determine the corresponding reactions; then from these get the reactions for the unsymmetrical loading by use of the principle that the moment at the center due to a load on one span is one-half the moment due to two such loads symmetrically placed. Thus, for the case where the first span is fully loaded and the second span has no load, we find in this way the value of the left reaction,

$$R' = \frac{R + \dfrac{\Sigma\,P\,a}{L}}{2}, \tag{4}$$

in which R is found from (3), L = span length, and Σ Pa = summation of the moments of the loads about the center support.

Since equation (4) holds true when R and R′ are determined by formula, and since Σ Pa is independent of R, it follows that the discrepancy between the values of R′ as determined by deflections and by the ordinary formula is one-half the discrepancy between the values of R. That is, the error in reaction due to the use of the formula is twice as great for bridge fully loaded as for one span only loaded. As these two cases determine the maixmum stresses in nearly all the members, it will not usually be necessary to determine true reactions for other partial loads. However, if thought desirable, the reactions can be found for each panel load and the results combined. The additional labor involved is not so great as would seem to be the case, for many of the terms involving P disappear.

---

*Professor of Bridge and Hydraulic Engineering, University of Wisconsin, Madison, Wis.

†For a demonstration of this formula see Johnson's "Framed Structures," p. 220. The method here explained is essentially the same as that used by Prof. Swain in his discussion of the general case of the continuous girder in the Journal of the Franklin Institute, Vol. CXV, 1883.

For a bridge of unequal spans it is necessary to sum the terms $\Sigma \frac{P\,u\,l}{E\,a}$ and $\Sigma \frac{u^2\,l}{E\,a}$ for all members of the bridge. In this case it is convenient to assume the truss supported at the center and at one end and determine the deflections and reaction at the other.

The foregoing method is applicable not only to a two-span bridge but also to a three-span bridge in which the web members are omitted in the center span or panel; for, assuming such a truss supported at the center, or at the center and at one end, the stresses due to any load are fully determinate.

To get some notion of the accuracy of the ordinary formulas, reactions have been computed for several cases by the above method and also by the use of the formulas; the results are given below. In every case a load of unity per lineal foot extending over the entire bridge has been assumed. The following bridges have been treated:

(a) The Winona Bridge, a description of which will be found in Engineering News, vol. XXVI., 1891, p. 370. A sketch of this bridge is given in Fig. 1.

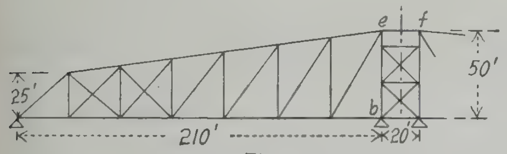

Fig.1.

(b) A series of designs with the half-truss containing 6, 5, 4, 3 and 2 panels successively. The general dimensions of these truses were chosen by taking a corresponding number of panels of the Winona Bridge. Cross-sections of members were properly determined from stresses due to certain assumed dead and live loads. In each of these cases computations were made for trusses with and without a central panel.

(c) Another bridge of a form similar to the Winona Bridge, but with five 18-ft. panels, a central panel of 18 ft., a center height of 32 ft. and end height of 25 ft.

(d) The Milwaukee drawbridge of the C., M. & St. P. Ry., which is described in the "Engineering and Building Record," vol. XVI., 1887, p. 747. Fig. 2 is a sketch of this bridge.

(e) The Sabula swing bridge as shown in Fig. 3.

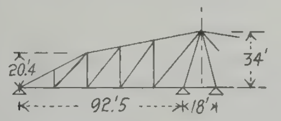

Fig.2.

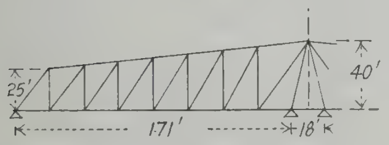

Fig.3.

This truss is analyzed by Prof. M. A. Howe in his book entitled "The Continuous Girder," p. 72, form which the dimensions of the truss and of the chord sections have been taken. The cross-sections of the web members not being at hand, the required sections have been obtained by computation, making reasonable assumptions as to loads.

The results of these computations are given in the following table:

Truss.	Reaction True. (a_1)	 True. (b_1)	 By form. (a_2)	 By form. (b_2)	 From chords.
a.	64.3	65.9	64.3	67.4	52.9
b. 6 panels	55.7	57.7	53.1	56.3	44.1
b. 5 "	45.8	47.0	42.0	44.7	34.7
b. 4 "	35.2	36.1	30.9	33.1	25.3
b. 3 "	24.3	25.2	20.0	22.1	14.7
b. 2 "	11.8	11.9	9.4	11.0	8.5
c.	36.8	38.2	34.2	36.7	31.3
d.	44.5	....	47.5	....	39.2
e.	56.6	....	58.1	....	50.9

Columns headed (a) are the reactions for the several trusses with the central panel omitted, while columns headed (b) are the reactions for the trusses having this panel.[*] The column headed "Reactions from Chords" contains the reactions as determined by deflections, but in the computation of which the chord members are alone considered. These have been figured for trusses without center panel only, and should therefore be compared with columns (a). These reactions are the same as would be found by the use of formulas which take strict account of the variation of the moment of inertia of the truss.

The principal points brought out by this table are: First, the comparatively close agreement between the true reactions and those found by formula, much closer than the writer had supposed would be the case; second, the fact that the formula taking account of the central panel gives results usually more accurate for these cases than the formula neglecting this panel—compare columns (a_2) and (b_2) with (b_1); third, that the reactions found by treating chords only are in every case much more in error than those found by the ordinary formula.

There are in the ordinary formulas two sources of error, one due to assuming the moment of inertia constant, and the other due to neglecting the distortion due to the web members. A decrease of moment of inertia towards the end of the truss tends to decrease the reactions while the effect of the web members is the reverse. This is clearly brought out by the table. The resultant effect is, however, small, at least in the examples given, and the statement appears to be warranted that the ordinary formula will give more accurate results than a formula involving variable moment of inertia, and that in most cases the results given by the former are sufficiently accurate. If it is desired to know the error in any case it can be readily found by the method here explained and corrections made accordingly.

The neglect of web distortion gives rise also to very erroneous conclusions in regard to the action of diagonals in the center panel of a three-span swingbridge. We will find our previously computed deflections of assistance in discussing this question.

Take for example the Winona Bridge and let us see what will be the effect of unsymmetrical loads on the bracing of the center panel, assuming this bracing to be attached at points e and f instead of lower down. The maximum distortion, or horizontal movement of the point e, will occur when the first span only is loaded. Assuming a uniform load of 3,000 lbs. per ft. on this span, the right reaction is found to be —19,000 lbs. Referring now to Fig. 4, let the full line a b c represent the axis of the bridge before the load is applied, the dotted line a b c the axis afterwards, and b c′ the tangent to this line at b. The horizontal movement, x, is evidently equal to $D' \times \frac{h}{L}$. The deflection D′, will be equal to the reaction R_2 multiplied by the deflection d (due to 1 lb.) as previously found. Or, in this example, d having been found equal to .0000334-in., we have

$$x = .0000334 \times 19{,}000 \times \frac{50}{210} = .15\text{-in.}$$

The vertical movement of the point e is that due to the stress in the member e b. This stress being 154,000 lbs. and the area of the section of the member 33 sq. ins., the vertical movement

$$= \frac{154{,}000 \times 50 \times 12}{30{,}000{,}000 \times 33} = .093\text{-in.}$$

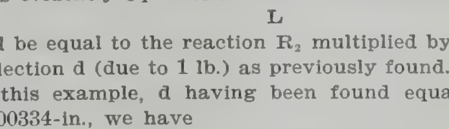

Fig.4.

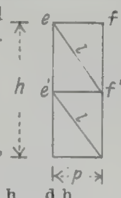

Fig.5.

In Fig. 5 is represented the center panel. The length of the diagonal is l, and the panel length, p. Differentiating the equation

$$l^2 = p^2 + \left(\frac{h}{2}\right)^2$$

with respect to both p and h, we have

$$2\,l\,d\,l = 2\,p\,d\,p + 2\,\frac{h}{2}\,.\,\frac{d\,h}{2},$$

whence

$$\frac{d\,l}{l} = \frac{p\,d\,p + \frac{h}{2}\,.\,\frac{d\,h}{2}}{l^2}, \qquad (5)$$

that is, applying this equation to the lower panel, the elongation per unit length of the diagonal

$$= (p \times \text{horizontal movement of } e' + \frac{h}{2} \times \text{vertical movement of } e') \div l^2,$$

in which an upward movement of e′ is positive. In the present case, both horizontal and vertical movements of e′ being one-half those of e, we have

$$\frac{d\,l}{l} = \frac{20 \times 12 \times \frac{.15}{2} - 25 \times 12 \times \frac{.093}{2}}{(20 \times 12)^2 + (25 \times 12)^2}$$

Multiplying this by 30,000,000, the modulus of elasticity assumed in the other computations, we have finally the unit stress in the diagonal = 830 lbs. per sq. in., tension, a result independent of the size of the member. The stress in the upper diagonal will be somewhat less since the point f′ does not move downwards as much as e′. If h were 64 ft. instead of 50 ft. there would be no stress in the diagonals. In many cases the diagonals are much more inclined to the horizontal than in this case and the stresses are correspondingly small or even compressive. This is true in several of the trusses described in this article.

It has usually been assumed that heavy diagonals in the center panel cause the bridge to act as a beam would act when resting on four supports, or at least that such diagonals seriously interfere with the use of the formula for a two-span bridge. The results so far obtained by the method here given would seem to show that as large diagonals may be used as is thought necessary and then entirely neglected in the computations. If the diagonals are stressed, then the horizontal and vertical movements will be slightly modified thereby, which in turn will decrease the stresses in the diagonals. Hence the stresses found as above are greater than those actually occurring.

A very important question, and one of especial significance when discussing accuracy of formulas, is that of the effect of a variation of temperature between different members of a swing-bridge. The effect on reactions of any given difference of temperature can very quickly be found from our previous computations.

Let

t = change of temperature of any member,
c = coefficient of expansion, = .0000065 per 1° F.,
l = length of member.

Then c t l = total change of length of any member. The deflection of the end of the truss due to the change of length of this member will be u c t l, where u is the same as in our previous work, and for a change of temperature of any number of members the deflection,

$$D_t = \Sigma\,u\,c\,t\,l. \qquad (6)$$

The reaction necessary to produce a like deflection, or the reaction produced by the assumed temperature changes will be

$$R = \frac{D_t}{d}, \qquad (7)$$

in which d = deflection due to a one-pound load, as before. For example, suppose the lower chord of the Winona bridge to drop in temperature 1° F. In this case c t l for each member = .00234 and $\Sigma\,u = 20$, whence

$$D^t = .047 \text{ and } R^t = \frac{.047}{.0000334} = 1{,}400 \text{ lbs.},$$

a very large amount for a change of temperature of only 1°. Considering a possible difference of temperature of 30° or even more, the great effect of this element can be appreciated. The effect is so great as to evidently render much refinement in calculation entirely useless and to support the statement previously made that the ordinary formulas are accurate enough for all ordinary cases.

---

[*] The formula used for column (b) will be found demonstrated in Johnson's "Framed Structures," second and succeeding editions, p. 194, and in Engineering News, vol. XXXIV., 1895, p. 150.

SUBSCRIPTION RATES: United States, Canada and Mexico, One Year, $5.00; 6 *months,* $2.50; 2 *months,* $1.00; *Single copies,* 15 *cents. To all other countries in the Postal Union, add* $2.08 *per annum* (4 *cents per number*) *to above prices for postage. No club rates allowed. Mailing addresses may be changed at will by sending both old and new address. We shall be obliged if subscribers who fail to receive their papers promptly will notify us without delay. The number on the address label of each paper indicates when subscription expires, the last figure indicating the year and the one or two preceding figures the week of that year; for instance, the number* 326 *means that subscription is paid to the* 32d *week* (*that is the issue of Aug* 6) *of the year* 1896; *the change of these figures is the only receipt sent, unless by special request.*

ADVERTISING RATES: 20 *cents per line agate measure. Want notices, special rates, see page* 22. *Rates for standing advertisements sent on request. Changes to standing advertisements must be in hand on Monday afternoon; new advertisements, Tuesday afternoon; transient advertisements by Wednesday noon.*

In view of the annual convention of the American Society of Irrigation Engineers to be held at Denver next week, and the National Irrigation Congress to be held in the week following at Phoenix, Arizona, we this week devote an unusually large proportion of our space to papers on irrigation engineering, and in order to do this without encroaching on the space allotted to other departments of engineering, we have added eight extra pages to this issue. The tables by Mr. Pope, for the flow of water over weirs, which are given in this number, will be found useful, we believe, by hydraulic engineers generally as well as by those who desire to measure water for irrigation purposes. For the benefit of any of our readers who may desire to have these tables in a shape more handy for use, we would say that they are to be published by the author very shortly in a convenient pocketbook form.

◆

In our correspondence column this week we publish a letter from Mr. Josiah Pierce, Jr., concerning the topographical survey of the City of Baltimore, and we ask the careful attention of our readers to its contents. This letter was written in reply to one stating the grounds upon which we made our recent comments on the work of this survey, and it should be read in connection with the statements made in the expert's report in our issue of Nov. 12. Our criticism in that issue upon the methods of obtaining data for the detail maps, was based upon information gleaned from the official proceedings of an investigating committee appointed by the City Council of Baltimore. These proceedings stated that Mr. Pierce, as acting chief of the survey, and other officers of the survey had been before the committee in their own defence; and that reputable expert witnesses, like Major N. H. Hutton and Mr. O. H. Tittman, the latter of the U. S. Coast and Geodetic Survey, had testified in support of the report of the committee. We assumed that the investigation was fairly and honestly conducted and criticised the reported results accordingly.

◆

From the letter of Mr. Pierce, and from other recent information furnished us, it would now seem that the manner and methods of this investigation are themselves open to criticism, and that the whole subject is to be submitted to another board of experts, of such professional experience and reputation as to leave no doubt as to the accuracy and honesty of the verdict to be rendered. We regret that the nature of the evidence previously submitted should have placed us in the position of possibly doing an injustice to engineers who have certainly done exceptionally good work in a great part of this survey. And under the newly developed conditions we can only ask our readers to await the more exhaustive report referred to before passing final judgment upon the work of those in charge of the Baltimore topographical survey.

◆

The paper by Sir Henry Bessemer, presented at the meeting of the American Society of Mechanical Engineers, which we print in full on another page, is one which will be found of great interest, as being probably the clearest account of the details of the work done by the eminent inventor which has ever been published. We regret, however, that Sir Henry has seen fit to include in the paper some matter which is outside of the description of his own work, and which tends to detract from the credit which should justly be given to other inventors in this field, especially Heath, Kelly and Mushet. For the sake of the truth of history it is desirable that the work of these men should not be allowed to fall into oblivion and their credit be hidden by the overshadowing fame and honor which Bessemer has deservedly obtained. Some of the history of the origin of the Bessemer and open hearth process has for many years been a matter of controversy, and it seems only fair for us to give in connection with Bessemer's account a statement of some of the evidence which tends to show that while Bessemer is justly entitled to the credit he has received, some credit also is due to others, which he seems inclined in his paper to withhold.

◆

The first statement to which we would call attention, relates to Bessemer's connection with the open hearth process. Sir Henry says:

> As far back as January, 1855, I had claimed in my patent the fusion of steel in a bath of melted pig or cast-iron in a reverberatory furnace, as herein described. * * I think I am justified in saying that the fusion of steel in a bath of pig iron, on the open hearth of a reverberatory furnace, which I had patented and successfully effected, was, to use a favorite expression of Mr. Gladstone, "approaching within measurable distance" of that now well-known and successful process.

The fact is that the fusion of steel in a bath of cast iron on the bed of a reverberatory furnace had been practised in England and described long before 1855. In Hasenfratz's "La Siderotechnie," Paris, 1812, Vol. IV., pp. 93-99, there is described the method of manufacturing two varieties of steel, known in England as Marschall and Huntzmann steels. It is stated that

> A mixture of gray and white cast iron is made. Sometimes also there is mixed either with the gray cast-iron alone or with the mixture of these two cast irons, clippings of iron, old bar iron, scales and even clippings of steel. The mixture described to make the second kind of steel is melted in ordinary reverberating furnaces in which one has prepared a sort of crucible in the lowest position. As soon as the cast iron begins to refine itself the principal workman introduces a small spoon into the bath. He continues to take out tests until that which he withdraws can be forged; then he examines the grain of the steel; if it is too soft the workman throws into the bath bars of steel too much cemented, which gives it carbon without altering its refining. If it is too hard he throws into it clippings of iron—sometimes even of bar iron—to diffuse the carbon through a larger mass or to burn a portion of it; then he withdraws the slags; he runs the cast-steel into the molds and it is afterwards forged to be sent forth into commerce. The facility which they have in England of procuring scraps to melt for steel gives to the inhabitants of that island a considerable advantage over all the other nations of Europe.

In the "Dictionnaire des Arts et Manufactures," Paris, 1845, A-F., p. 48, it is stated that

> M. Breant has proposed two different processes for directly manufacturing cast steel. In the second process one oxidizes on the hearth of a reverberatory furnace a certain quantity of good pig iron to which one mixes subsequently an equal quantity of the same nature, but not oxidized. On stirring well the materials the whole soon goes into fusion and furnishes a steel of good quality.

Josiah Marshall Heath, English Patent No. 10,798, of 1845, describes a process for the manufacture of cast steel on the bed of a reverberatory furnace, and states that the furnace may be heated by gas formed in a separate gas producer.

> The interior of the furnace should be kept at the highest temperature that can be produced. A bath of cast iron is formed on the bed of the furnace and it is refined by the addition to it of malleable iron in scraps or in any convenient form, or of iron which has been made from iron ore by cementing it with carbonaceous matter at a red heat in a close vessel.

It is thus seen that the fusion of steel with pig iron on the bed of a reverberatory furnace, for the purpose of making cast steel was known at least as early as 1812; that the fusion of pig iron, together with oxidized pig iron (that is, wrought iron), on the bed of a reverberatory furnace for the purpose of making steel was described in Paris in 1845; that Heath's process for making cast steel differs in no respect from that described by Bessemer, except that it states "the addition of malleable iron," instead of steel. But steel was used in a bath of cast iron, as already stated, as early as 1812.

All the early attempts to make steel on a reverberatory furnace by the mixture of cast iron and of wrought iron or steel seemed to have failed commercially prior to 1855 for three reasons:

(1) The lack of the Siemens regenerative furnace, (invented by Frederick Siemens, brother of Charles William Siemens, in 1856), or of any furnace which could produce and steadily maintain the temperature necessary to hold in fusion iron low in carbon.

(2) The want of knowledge how to overcome red-shortness, which was not known until Mushet described the use of spiegeleisen, in 1856.

(3) The lack of knowledge of the chemical composition of pig iron required to make good steel.

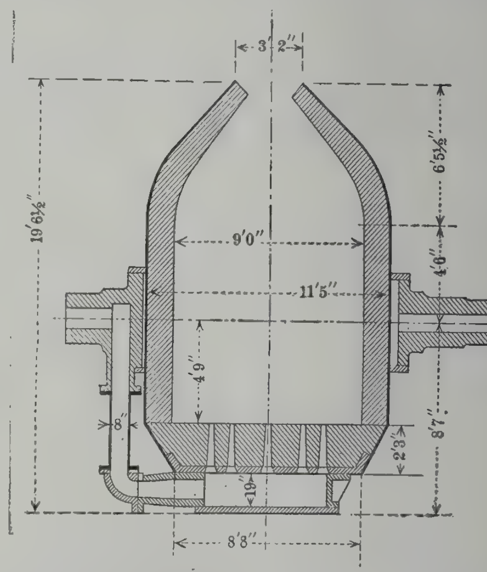
Bessemer, therefore, in 1855, was not "within measurable distance" of the modern open hearth process any more than Heath was, who anticipated him in date by nearly 10 years.

◆

The next point raised by Sir Henry Bessemer which is open to criticism relates to the converter of Kelly, and to Kelly's claim to priority of invention of the pneumatic process. He says:

> No one who had once witnessed the conversion of fluid pig-iron into malleable iron by a blast of air, would ever propose to construct a converter with an opening at the top so as to direct this fiery stream upwards. It is to me utterly inconceivable that any man who had once witnessed the violent eruption accompanying the converting process should, after such an experienoce, design and patent a converting vessel with a sloping top and a vertical outlet so admirably adapted to throw upward and discharge so large a proportion of its contents as that shown in Fig. 6.

It appears that the converter now used in the most modern American works is exactly of this description; it has a sloping top and a vertical outlet admirably adapted to throw up and discharge its contents. On p. 63 of Mr. Harry Huse Campbell's recent work on "Structural Steel," is shown a sectional view (which we reproduce herewith) of an 18-ton converter, used in the works of the Maryland Steel Co., at Sparrows Point, Md., which has the sloping top and the vertical outlet.



18-Ton Converter in Use by The Maryland Steel Co., 1896.

◆

Referring to the claims made on behalf of Robert Mushet, Sir Henry states that he (Bessemer) described in his patent of Oct. 17, 1855, how the state of carburation of the converted metal might be regulated by the addition of molten pig iron after the blow had taken place, and as this patent was dated 11 months prior to Mr. Mushet's patent, claiming to recarburize the converted metal with the German metal, known as spiegeleisen, Mr.

Mushet could not prevent the use of that or any other pig iron to recarburize the converted metal after the blow.

But the fact is that Mr. Mushet's patent of Sept. 22, 1856, clearly shows that the effect of the addition of spiegeleisen was not merely a recarburizing but also a deoxidizing of the bath. Mushet says in his provisional specification:

> When cast-iron has been purified or decarbonized by blowing air through it when in the metal state, it is difficult to convert it into malleable iron or steel. I have discovered that by combining such purified iron in a heated state with a triple compound consisting of or containing iron, manganese and carbon, also in a heated state, I can obtain malleable iron or steel.

In his complete specification he describes at length the difficulty referred to and describes the product of simple decarburizing as "red short" or "hot short," and says the ingots so made are also generally porous or cellular in structure. He says further:

> To the purified cast iron when it has become wholly decarburized or nearly so by the action of air forced into or among its particles whilst it is in a molten or fluid state, I add a triple compound alloy or material of or consisting of iron, carbon and manganese, which mixture I effect in any suitable furnace, vessel or ladle. * * * I prefer to use the white crystalline cast-iron metal thus obtained and known in Prussia as spiegeleisen—and I prefer to use such varieties of this white crystalline cast-iron metal as are found to contain a large alloy of manganese.

Mushet further states:

> As the triple compound of or containing iron, carbon and manganese parts with a portion of its manganese every time it is remelted, I prefer to use that which has not been previously remelted and I avoid as much as possible any repeated remelting of it.

Mushet's claim is "the addition of a triple compound or material of or containing iron, carbon and manganese to cast iron which has been purified and decarburized by the action of air whilst in a molten or fluid state, or in any convenient manner."

Sir Henry Bessemer classes "the German pig-iron, known as spiegeleisen," as being simply a particular kind of pig iron. It is, nevertheless, as different a material from what is ordinarily called pig iron in commerce as ordinary pig iron is different from tool steel, or tool steel from wrought iron, in appearance, in chemical constitution and in physical properties; and spiegeleisen moreover differs wholly from pig iron in containing metallic manganese, which has the peculiar property of overcoming the red-shortness of steel. Sir Henry further says: "I never could understand why American steel manufacturers paid royalty for the use of these invalid patents" (that is the Mushet patents). The fact is the Mushet patents were not invalid in America, and it is very doubtful if they or the Kelly patents could have been made invalid by litigation. In 1865 the Kelly Process Co., owning the U. S. patents of Kelly and Mushet, and Winslow, Griswold & Holley, owners of the American Bessemer and Holley patents, concluded that it would be better to combine their interests than to enter into expensive litigation, and a combination was effected on the basis of 70% of the royalties going to the owners of the Bessemer and Holley patents and 30% to the owners of the Kelly and Mushet patents. (See Robert W. Hunt's "History of the Bessemer Manufacture in America," Trans. Am. Inst. M. E., Vol. 5). The owners of the American patents granted to Bessemer and Holley in 1865, no doubt considered there were strong reasons for believing the Kelly and Mushet patents to be valid, or they would not have entered into such an agreement.

THE OWNERSHIP AND CONTROL OF WATER IN THE IRRIGABLE WEST.

The saying, WATER IS KING, is as popular and well-warranted in the Irrigable West to-day as was ever the same ascription to cotton in the South. In fact it has more complete sovereignty, and that over a far more extended area, than was ever true of cotton; for at best cotton shared its rule with sugar, rice, corn and tobacco, as well as minor crops, while upon water, artificially applied, depend all crops in the West, and thus to a large extent all material progress. To carry the idea of the kingship of water a little further, it may be said that the monarchy is a limited rather than an absolute one, operating under both written and unwritten constitutions which are determined by the real and higher sovereigns, the people. This brings us directly to the question which it is the purpose of this article to discuss, the ownership and control of water in the Irrigable West. The region designated as the Irrigable West is meant to include all the Western States, where the culture of the land is dependent on irrigation, rather than the comparatively small areas which are actually irrigable. The question is many-sided and intricate. It will be possible for us to discuss only some of its broader phases which, governing the development of the country through the building of irrigation works, are intimately connected with the character of such works, and therefore deeply interest and affect engineers and contractors.

First, it may be said that as all cultivation of the land in many sections of the West is absolutely dependent on irrigation, ruin continually menaces agriculturalists unless they can be sure of an unfailing and ample supply of water at a reasonable price. Next, it should be noted that there is not enough water to supply all the arid land that is within reach of the streams, and hence the available supply must be most judiciously developed and conserved, and, equally important equitably distributed. Finally, economy demands that many or even most irrigation works be carried out on so large a scale as to make construction impossible except by large private companies or at public expense, while the sums of money thus involved are subjected to great risks unless a good market and sure pay can be obtained for the water developed.

The gist of the whole matter is, water and land must be wedded, each being well suited to the other, and having been once united never be divorced under any pretext, but always live amicably together with a due regard to economy of use and the rights of neighboring lands.

All this seems simple enough in the abstract, but the practical application of these principles sometimes bid fair to divide the irrigable territory aganst itself, while at least one of the problems involved, the public land question, may yet become the cause of a temporary bitter feeling between East and West. Certainly such feeling is likely to arise unless the East informs itself much more fully than it yet has regarding the various aspects of the question, and unless the West continually bears in mind that the remaining public lands are as much as ever a national possession, and not wholly of local interest and importance.

A few facts regarding the present status of both the public lands and the water problem may be given here. These points are some of many salient ones brought out by Mr. Elwood Mead, M. Am. Soc. C. E., State Engineer of Wyoming, in a paper to be read before the meeting, next week, of the American Society of Irrigation Engineers.

It will come as a surprise to many in the East to realize that the great bulk of the area west of the 100th meridian, is public land, owned by the United States, and not subject to taxation, therefore, by the states themselves. No less than 84% of the entire area of the nine states enumerated below is public land. Thus, these nine states as a whole have to maintain a law and order over a territory of which only 16%, on the average, is subject to taxation for either state or local purposes, or subject to the irrigation laws which the separate states may enact.

State.	Total area, sq. miles.	—Taxable area,— sq. miles.	per cent.
Montana	145,310	16,196	11.14
Idaho	84,290	5,708	6.77
Wyoming	97,575	6,051	6.20
Colorado	103,645	30,104	29.04
New Mexico	122,460	29,688	24.24
Arizona	112,920	6,634	5.87
Utah	82,190	7,812	9.51
Nevada	109,740	3,906	3.55
California	155,980	56,445	36.19
Total	1,014,110	162,544	16.03

These figures are very significant as showing the vast areas of the public domain in these nine states; the comparatively small area under settlement, taxation and state control generally, including irrigation matters; and the slow rate at which these conditions are changing.

By an act of 1894, each of these states may have transferred to it 1,000,000 acres of the public lands, under certain conditions looking to reclamation by irrigation. Five states have accepted the grant, but only one, Wyoming, has proceeded sufficiently far to select and secure the approval of the area donated, and none of this land has yet been transferred to actual settlers. Mr. Mead urges that the conditions of the grant are not conducive to the best results, and, while apparently welcoming the move as a step towards a proper solution of the problem, considers it as only a step. One condition of the grant he most heartily approves, and that is the making the right to the use of water inalienable from the land reclaimed by it.

Having extracted the above from Mr. Mead's paper a return may be made to the general subject under discussion.

The water problem has been solved, or left to a large extent unsolved, as each of the Western States has seen fit. In many of these states, if not all, the water has been considered as public property, but it has been subject to appropriation for use in irrigation under legislative enactments.

Such appropriation has the effect, to a greater or less extent, of making the water private property, and sometimes of giving it a speculative value, this speculative quality depending on the character of the appropriation laws and the manner in which they are administered. These statements do not apply to the water flowing through the public lands of the several states. The general government does not, and the state governments cannot, at present control such water supplies. Consequently water appropriations may be and are made with utter disregard to any interest but self interest, often to the great detriment of existing and future settlers. When the vast areas of public lands yet remaining are taken into account, the importance of establishing control over the water supplies pertaining to the public land becomes apparent. Of course only a small percentage of the public lands is irrigable, but the water rights on a far greater proportion of the land have a definite relation to the irrigable area, while, as Mr. Mead points out in the paper mentioned above, the condition of the forest areas vitally affects the water supply, and the administration of grazing lands has a direct bearing upon the prosperity of irrigators.

From the above, it is evident that the water question and the public land problem are most intimately connected. If all remaining public lands were to be turned over to the several states within which it is located, the water would go with it, and thus come under present state laws, unless the grant contained conditions to the contrary. If the national control of land is continued there will con- from many of those who believe in state control, over vast areas, unless a change of policy is inaugurated by Congress. Such a change would probably have to be sweeping to be of any effect and would meet with much opposition, notably from many of those who believe in state control as postponing that, and from those who have profited by the past and present let-alone principle.

To discuss adequately these great land and water questions would require a careful study of the history of our public land system, and of the water legislation of the several states, together with the practical working and results of each. This is, of course, far beyond the limits of the present article, and we may add that the magnitude and far-reaching importance of these questions is scarcely dreamed of by most of the people of the East, and fully appreciated by only a limited number in the West.

What we wish to do now is to call attention to this great Western problem and point out some of its main factors. This we have attempted to do above. We shall conclude by stating briefly the governing principles which seem most clearly established and freest from controversy, as follows:

(1) The agricultural products of the so-called arid region are its greatest source of wealth, and upon these all other industries and all progress are dependent.

(2) Irrigation is essential to agriculture in this region, and both depend for their success upon the wise solution of the great land and water questions.

(3) The public lands have long been regarded as the Nation's heritage and safety, but their value depends upon the public water supplies, so each

should be equally held in trust for the people and neither should become subject to speculative control for private profit.

(4) While speculative profit should be prevented, capital and labor must each have its legitimate reward.

(5) Economy of construction and operation demands that many irrigation works should be built on a large scale, to water great tracts. The volume of capital thus required renders the enterprises risky, and tends to the establishment of high water rates in order to produce returns commensurate with the risk, while at the same time the water company often controls the only available source of supply, and thus is tempted to demand high rates, whether or not the risks involved warrant them.

(6) As the uses to which land may be put, and thus its value, depend upon the amount of water available, and, moreover, as land without water is only a drug on the owner, the construction of irrigation works should precede, or at least accompany, the settlement of the land.

(7) As there is not enough water for all the land, the water should be conserved with the utmost care, and the land to be watered chosen with equal consideration. Water conservation includes the preservation of forest areas, the development of the greatest possible percentage of the rainfall, a minimum loss through evaporation and percolation, and a wise application to crops. It may even go farther in some cases and include the reclamation of the seepage water from irrigated areas.

(8) As the land and water are mutually dependent for value, and the water development comes first, and must be made to suit the land, evidently their development under joint ownership or some common regulation is desirable. This, we believe, has been done very advantageously in California under the Wright Irrigation District law, where the land owners build and own the irrigation works. The same plan has more recently been adopted by other states, and bids fair to gain in favor now that the U. S. Supreme Court has upheld the California statute.

In closing, attention must be called to one phase of the water problem of the public lands which seems to be almost wholly overlooked in the discussion of the subject, but which in many sections has not escaped investors, the value of natural water powers. . We cannot enlarge upon this subject at present, but throw out the question, should not the national government, or, if the lands are turned over to the states, the latter, retain control of the water powers, leasing the right to use them under proper conditions? The aggregate value of these rights is great. Does not the principle, all water should be held as public property, adopted by so many Western states, apply to water for power as well as for irrigation? Just now irrigation is uppermost in many sections, but the time will come when water power will be in great demand, a fact that should be borne in mind by all concerned.

LETTERS TO THE EDITOR.

Scherzer Rolling Bascule Bridge for Newtown Creek.

Sir: I desire to call your attention to some of the reasons why I found it impossible to present a complete design of a Scherzer rolling bascule bridge, adapted to the locality, within the 20 days limited by the joint committee on bridges of Kings and Queens counties, in their advertisement requesting designs for a new bridge to be built at Vernon Ave. across Newtown Creek.

The advertisement called for drawings showing the general design of the proposed structures with length of movable span or spans, and of stationaries, if any, width of clear waterway, width of roadway and of footways, loads proposed to be sustained and carried, dimensions of all the parts, and modes of construction and strain sheets showing the forms and construction of typical members with strains sustained. Also the metals proposed to be used, style of flooring and motive power, with sufficient detail to indicate the manner of the application and operation of the same, and a type-written description of the proposed structures. Each design to be in accordance with the regulation of the U. S. War Department.

The data given in the advertisement and that supplied upon application to the engineer designated was very inadequate, and I found it necessary to visit the site of the proposed bridge and there carefully study the situation, and the highway and water traffic to be accommodated. I also found it necessary to have a survey and map made of the vicinity of the bridge.

A careful study of the situation convinced me that any bridge at the level of the present swing structure would be a very poor solution of the problem, as the old bridge is opened from 100 to 200 times in 24 hours at the present time; and this large amount of navigation is constantly increasing. Such a low-level structure would be more expensive to operate, and would afford no accommodation to the large highway travel across the bridge, as it would have to be opened for every passing craft. If built it would at once necessitate the building of more new bridges to afford relief.

The low bridge would be in constant danger of being struck by the hulls of heavily loaded vessels, and greatly injured thereby, for the current caused by the tide is very strong in Newtown Creek, and vessels are frequently uncontrollable. Great delays and constant exposure to accidents would also result from the grade crossing of the Long Island R. R. tracks, which are about 200 ft. from the bridge, and form a very serious interruption to traffic.

Believing that the citizens and taxpayers who would have to pay for the new bridge wished to have the best structure to be obtained, I expended, gratuitously, a large amount of time and money to prepare the design which I submitted to the bridge committee. It required more than 20 days to prepare my design, and I believe that is one reason why it is especially worthy of consideration.

The design consists of: (1) A Scherzer rolling bascule bridge placed sufficiently high to allow about 70% of the water traffic to pass beneath without opening. (2) A viaduct which affords a safe and continuous overhead passage across the tracks of the Long Island R. R. The only objection to a viaduct would be that of a few abutting property-owners, but as the larger part of the abutting property is at present unimproved, the objection could not be serious, for many of the most prominent streets of Brooklyn are occupied by elevated railway structures, which are certainly more objectionable than a short viaduct in a less important street. However, should the viaduct be dispensed with, the bridge ought still to be elevated and be reached by short approaches. (3) The bridge is not an experiment, as it is similar to the two Scherzer rolling bascule bridges now in successful operation at Chicago, and also similar to the new Scherzer bascule bridge at North Halsted St., Chicago, rapidly nearing completion. The latter bridge is 50 ft. 2 ins. wide; has a clear opening between piers of 121 ft.; is designed to carry the heaviest electric car and highway traffic, and with the approaches is 327 ft. long. It cost complete, including approaches, machinery, and electric equipment, only $113,425, less than one-half as much as the Waddell lifting bridge, located upon the same street, upon the south branch of the Chicago River. (4) The large Scherzer bascule bridges are opened or closed in less than 30 seconds; and a similar Scherzer bridge across Newtown Creek would be operated in the same time. (5) The bridge requires no center supports or piers. It does not encroach upon valuable dock room; and when opened it closes the highway absolutely, thus preventing accidents. (6) It is economical in construction, as it only requires sufficient material to bridge the chasm, and dispenses with expensive towers, ropes, cables and movable counterweights. (7) It forms a very rigid, simple and artistic arched structure, adapted for the heaviest traffic, and wherever it has been tested it has given complete satisfaction. (8) It can be completed to work successfully in less than one year, and during its erection does not interfere with navigation.

I believe that a final decision has not yet been made, and hope that the ultimate decision will be solely upon the merits of the various designs. Yours very truly,

Albert H. Scherzer.

Chicago, Ill., Nov. 23, 1896.

The Topographical Survey of Baltimore.

Sir: In reply to your letter of the 20th inst., regarding the investigation of the topographical survey of the city of Baltimore, I am not surprised that you have been misled as well as others by the reports you have examined, as they contain statements which will not bear analysis.

I cannot make this point clearer than by calling your attention to the report of the survey, published January, 1895, in which you will find illustrations, upon a reduced scale, of property maps, upon which all dimensions are given in feet and decimals, based entirely upon locations of all details by transit observations and steel tape measurements. There exist about 150 such maps in the office and 100 note books containing the records of field measurements from which these maps were drawn, as well as innumerable notes and computations bearing upon the use of these notes in the problems involved in the analysis and adjustment of property and street lines.

There exists no evidence that the telemeter-rod has been used beyond its legitimate and economic use in topographical work, under well-known conditions and limitations, in spite of the assertions of Messrs. Sudler and Donn to the contrary, and the denial in their report of the existence of any such records as I have described.

It needs no expert examination of the published maps to show that they do not contain dimensions and lengths, "in feet and inches," etc., nor of the unpublished maps to show that they do contain the desired information and that they could not have been drawn and the dimensions given from telemeter readings.

The committee chose to disregard the requests made to examine the work as a whole and failed to verify the testimony given by the engineers of the survey, either by their own personal examination of the records and unpublished results, or by bringing this evidence to the attention of witnesses. It consequently lay in the power of this committee, by their presentation of their report to the city council without granting the opportunity which was requested for a defence to be made, and by withholding from examination the report of Messrs. Sudler and Donn, to very seriously influence public opinion, particularly by the publication of the latter report in the press before any of the testimony taken had been examined or officially acted upon by the commission authorized to conduct the topographical survey.

It is impossible for any fair-minded person to regard such reports as unbiased or expert when overwhelming evidence exists in the records of the survey to show that their foundation rests upon falsehood.

Major Hutton, Mr. Tittman and others, being unfamiliar with what had been done, with the problems involved, and with the progress made, and having upon no occasion examined the office work of the survey, were called upon to answer categorical questions, and were not called upon to discuss that section of the ordinance which provides for the publication of the topographical maps, nor the act of the State legislature, which gave the authority for their publication, consequently their testimony carries little weight.

It should be borne in mind that the work proceeded for 2½ years without interruption, with full authority for every step taken, and that complete records of all measurements, notes and drawings exist. In addition, during the current year, appropriations were granted for the continuation of the property work of the survey, designed for tax valuation and other purposes, outlined in the ordinances, including all of those details not carried in the topographical maps.

The latter maps were never intended to have street widths, etc., given upon them, because they were designed for use mainly in the annexed portion of the city, covering an area of 17 sq. miles, over the greater portion of which no streets exist; for the study of street lines and grades and their extension over the entire city, and their publication, before full information could be given on a larger scale of the details of the property work, was a necessary consequence of their requirement for the study of drainage. The charge that these maps are inaccurate and unreliable is untrue in view of their having fulfilled every requirement for which they were designed, and they are as free from mistakes and errors of appreciable magnitude as could possibly be expected with an average of 7,000 locations and elevations per sq. mile.

The investigation was first requested by Colonel Douglas before a board of competent experts, and the consent of the superintendent of the U. S. Coast and Geodetic Survey, the director of the U. S. Geological Survey and the Chief of Engineers of the U. S. Army, was obtained to appoint such a board, if called upon to do so officially, but the opportunity was denied. We have now demanded the right to present our statements before a competent board, and it is no longer our purpose to defend what we know to be right, but to show that the reports made are neither expert nor professional.

This will probably occur in a week or ten days, when a very full exposure of the entire matter will be given by Colonel Douglas, myself and others.

From a technical standpoint quite a number of important questions have arisen in this discussion, notably in the assumption of Mr. Donn that the principles of geodesy had been ignored by the adoption of a central meridian, and the computation of positions by rectangular coordinates with which he has shown his unfamiliarity.

He asserts that the instruments placed at his disposal for field tests were ineffective and not adapted for work of a critical character and also to the contrary that with these instruments we were able to detect errors of plotting as small as the 1-200th part of an inch. He has yet to prove that the graphical errors, which he asserts exist, were not largely of his own making, with one or two exceptions of evident mistakes—and he has not hesitated to assert without positive proof that these graphical errors were due to errors in location measurements of from 1 to 14 ft., and to carry his point has had the assurance to contradict the accuracy of my statements regarding the records of the office.

He asserts that upon the scale of 1-600 or 50 ft. to an inch, 2-10th of a ft. is discernible, or the 1-250th part of an inch, and 1 ft. on a scale of 1-2,400th, or the 1-200th part of an inch. This is not logical, and his argument is hypercritical. I leave it to your readers to decide what is an open question. Taking into account the processes required in drawing a topographical map from field notes, how close can a map be relied upon for scale measurements, allowing a reasonable amount of error to occur in every operation of plotting? Or, in other words, what is the accuracy of the location of a dot?

The errors due to the shrinkage of paper or the effect of the atmosphere, as well as those due to distortion in printing, far outweigh any errors made by the draftsmen in plotting maps. Yours very truly,

Josiah Pierce, Jr.,
Assoc. M. Inst. C. E.

921 Equitable Building, Baltimore, Md., Nov. 23, 1896.

(We have commented upon this letter upon our editorial page.—Ed.)

◆

Economy of Gas Engines using Gas made from Anthracite Culm.

Sir: I have received a marked copy of your issue of Nov. 12 calling my attention to a garbled extract from a paper recently read by me before the Scranton Board of Trade. The slur you cast at "the inventor" would deter me from giving the article any attention were it not for the request of the Secretary of the Board of Trade by whose solicitation the paper was prepared and read. Aside from some verbal corrections a portion of the extract should be corrected to read, "By actual measurement we produce and store from 118,000 cu. ft. to 120,000 cu. ft. of gas with one ton of fine waste from the washery." The "230 HP." you recognize as probably a misprint for 280."

Your assertion that "it would be interesting to know what kind of gas it is that can be obtained from anthracite culm in such large volume as 140,000 cu. ft. per ton" shows great lack of knowledge for a critic. The chemical analysis as made at the laboratory of the Lackawanna Iron and Steel Co. is:

C. O_2	3.80	C. H_4	0.66
O.	0.40	N.	46.49
C. O.	28.80		
H.	19.85		100.00

I should get about 170,000 cu. ft. of this gas from 2,000 pounds of coal. Notwithstanding many leaks, after washing and cooling I collect in the holder about 140,000 cu. ft. You can verify this by sending an agent to investigate—but, perhaps, if you will consult authorities on this subject you may think is unnecessary.

Mr. H. L. Gantt in "Cassier's Magazine," Nov., 1895, p. 48, tables 2, 3 and 4, give volume of anthracite gas from steam blown producer per 100 lbs. coal, varying from 7,580.15 cu. ft. to 8,114.0 cu. ft.

Mr. W. J. Taylor gives about 170,000 cu. ft. per ton of coal as his experience.

Now as to the allowance of 50 cu. ft. of gas per HP. per hour. There are responsible gas engine builders, who guarantee their engines not to consume more than 17 cu. ft. illuminating gas per HP. per hour. By reference to a long list of tests given in "tables of trials and tests of French and German gas engines, using lighting gas, 1885 to 1895," by Bryan Donkin, London, I find the consumption of gas, including ignition per brake HP. to be from 14.20 cu. ft. to 45 cu. ft. in different engines; 20 cu. ft. per HP. per hour being a fair allowance for average illuminating gas, and eliminating the 46% nitrogen as an inert quantity, in our producer gas, it would seem as if 50 cu. ft. per HP. per hour was a liberal allowance.

Now as to the quantity of culm consumed per HP. per hour. Culm is very pure carbon, the finer it is the freer of slate, and the gas we produce with it is higher in C. O. and H. and lower in N. than that from prepared coal.

The "Dowson gas" has become celebrated in Europe as a cheap power and fuel gas. It is made with anthracite coal or coke, and contains about 55% N. By reference to the table of "Trials and tests of gas engines, using power gas, 1881 to 1895, English, French and German," given by Mr. Donkin, I find that coal consumed per I. HP. per hour was from 0.76 lbs. to 1.45 lbs., and per B. HP. per hour was from 1.02 lbs. to 1.97 lbs. In test made by Prof. H. W. Spangler, of the University of Pennsylvania, and quoted by Mr. Gantt in the article before referred to, the results are stated as follows, viz.:

Coal used per I. HP. per hour............ = 0.9511 lbs.
Coal used per B. HP. per hour.............. = 1.315 "
Combustible per I. HP. per hour.......... = 0.8302 "
Combustible per B. HP. per hour.......... = 1.148 "

The engine was the Otto and the gas analyzed as follows, viz.:

C. O.	25.38	C. O_2	4.02
H.	4.51	N.	64.04
C. H_4	1.79		
O.	0.26		100.00

If you will compare this with the gas we are producing from culm you will not find my statements so very extravagant in the light of what has been before accomplished. In fact I expect to do considerably better, and if you will study up what has been accomplished in this line, you may be less sarcastic in your reference to the "inventor."

I remain, very respectfully,
J. Gardner Sanderson, C. E.,
M. Am. Soc. C. E.

Anthracite Gas Producer Co., Scranton, Pa.,
Nov. 18, 1896.

(Answering the first paragraph of our correspondent's letter, we would disclaim any intention to "cast a slur" at the inventor. It is our constant endeavor in the preparation for publication of notes concerning new inventions, etc., to point out briefly those features in which claims made seem to most need checking and verification. The "garbling" to which reference is made was not done by us. We reprinted the extract as we found it in the Scranton newspapers.

Taking up now the questions raised, it appears from Mr. Sanderson's letter that he makes even a larger claim than we supposed. We computed that he claimed a fuel economy of 0.8 lb. of culm per HP.-hour, on the basis that he allowed 2,240 lbs. to a ton. It appears from his letter above, however, that he referred to a ton of 2,000 lbs. in his estimate of a gas production of 140,000 cu. ft. per ton of culm. Hence we have 140,000 cu. ft. $\div 50 = 2{,}800$ HP.-hours. Then 2,000 lbs. $\div 2{,}800 = 0.714$ lbs. of culm per HP. per hour. If Mr. Sanderson were to reach a product of 170,000 cu. ft. of gas, as he says he ought to do, this remarkable efficiency would be still further reduced, and would become only 0.588 lbs. per HP.-hour.

We must still refuse to believe that so economical a figure for power generation by gas engines is feasible until it is verified by actual tests. The best results obtained by Prof. Spangler, which are cited above, were 0.951 lbs. of fuel per I. HP. The 0.714 lbs. claimed by Mr. Sanderson is 25% better than this.

It seems highly probable that the point in which Mr. Sanderson's estimates are defective is his assumption of 50 cu. ft. of his gas as sufficient for a horse-power hour. He calls this "a liberal allowance." We do not think it is at all liberal. Accepting this analysis of the gas given in his letter, although it is surprisingly high in hydrogen, we have computed its heating value per cubic foot, and find it to be 41.72 calories (=165.6 British thermal units), using the figures given in Butterfield's "Gas Manufacture" for the heating value of the constituent gases. Butterfield gives 37 calories for the heating power of Dowson gas, and 155 calories for London illuminating gas. The average heating value of New York city illuminating gas is 710 heat units (= 179 calories), according to Dr. E. G. Love. The average of these two figures for illuminating gas is 167 calories, or just four times that of Mr. Sanderson's gas. The consumption of illuminating gas per I. HP. being 20 cu. ft., which Mr. Sanderson says is a fair allowance, it would be reasonable, in the absence of direct evidence to the contrary, to say that the consumption of a gas of only one-fourth the heating value would be four times as great or 80 cu. ft., instead of 50 cu. ft., as he assumes. This would raise the consumption of culm per I. HP.-hour from 0.714 to 1.14 lbs. which we should consider reasonable.

Again, taking the above figures of 165.6 B. T. U., as the calorific value per cu. ft. of Mr. Sanderson's gas, we find that 50 cu. ft. would contain 8,280 B. T. U. In the table in Donkin's work of efficiencies of gas engines worked with illuminating gas, to which Mr. Sanderson refers, the British thermal units per I. HP. developed are given for each test, and the average is, we should judge, about 13,000 B. T. U. Still, again, the same authority gives the consumption per I. HP. of Dowson gas as 90 to 100 cu. ft. and over, and its calorific value is not very dissimilar to that which we have computed for Mr. Sanderson's gas.

It will be a surprise to most of our readers to learn that "culm is very pure carbon—the finer it is the freer from slate." We have always supposed the reverse. The late Eckley B. Coxe (Trans. Am. Inst. Mining Engrs., Vol. XIII., p. 706), gave the following percentages of ash in different sizes of anthracite coal shipped from one mine: Egg, 5.66; stove, 10.17, chestnut, 12.67; pea, 14.66; buckwheat, 16.62. In the article on Utilization of Anthracite Culm, published in our issue of Dec. 26, 1895, we gave the value of No. 1 culm as 78% and No. 2 as 70% of the value of egg coal, on the authority of Mr. Wm. McClave, of Scranton. The culm is apt to contain a greater quantity of moisture than the screened sizes and also a greater quantity of dirt. Further, if we are not misinformed, in the culm piles generally the pieces of slate from the breakers are mixed with the fine refuse.—Ed.)

◆

Notes and Queries.

C. H., Macomb, Ill., asks, "What is the angle or grade of repose of an ordinary four-wheeled wagon on a brick pavement?" It would doubtless vary within wide limits with the condition of the surface as respects mud, dust, smoothness, etc. If any of our readers have made any tests, however, we shall be pleased to print their results.

◆

HIGH BUILDINGS AND SAFE ELEVATORS.

We have received from a number of the principal makers of elevators, letters discussing the questions raised by the editorial in our last issue, and present herewith such portions of them as are of general interest.

Mr. L. S. Graves, President of the Graves Elevator Co., of Rochester, N. Y., presents what to us is an entirely new reason for limiting the height of buildings in proportion to the width of the streets on which they are built, as follows:

> You speak of the economical value of high buildings, which is probably true, but as a citizen I should say there was another very serious side to this question. If there is no legal limit to the height of buildings in New York or other large cities, how will Broadway (for instance) and the other streets of New York look in 50 or 100 years from now, lined on both sides with buildings twice as high as the width of the streets? But a more serious question is, how will the streets and sidewalks, and transportation facilities take care of the greatly increased number of people which can be accommodated for business and office uses in those high buildings, crowded as they are now, and no chance to increase their capacity. It seems to me curious that the papers have not taken up and discussed this subject before.
>
> I think the heights of buildings should be regulated by the width of streets. London and Paris, as you say, seldom have buildings more than five stories in height, and very few elevators to my knowledge. The tendency in this country is for buildings from 15 to 24 stories in height, but with our elevators and our Americanism, perhaps we could afford to double the height of buildings in the old country. A happy medium, it seems to me, would be from ten to twelve stories high.
>
> With our extremely high buildings, 700 ft. per minute for elevators may not be too high a speed for economy and convenience, but if buildings were limited to 12 stories and the speed of elevators limited to 500 ft. per minute, I think we should be in a much more sensible condition as to the question of safety and the future condition of streets and sidewalks.

The need of broad and unobstructed sidewalks, in an office building district, is already apparent, both in New York and Chicago, and we believe to some degree in the narrow streets of Boston and Philadelphia as well. The great trouble, however, is that the present sidewalks are constantly obstructed. The solution of the problem may, perhaps, be found in adding stories to the sidewalks as well as to the buildings.

A prominent New England elevator manufacturer sends the following discussion respecting elevator safety devices:

> We have read with great interest your article on safe elevators and high buildings, and believe you have reviewed the subject very thoroughly.
>
> There is one suggestion in your article that we think you lay too much stress upon; that is, that every elevator should be furnished with a brake under the control of the operator to suspend the car from the safety devices at every landing. There may be instances in which such an arrangement would be the cause of very serious trouble; especially on elevators where the motive power was other than hydraulic. Suppose a car to be suspended in this way in the downward trip, and for some reason the mechanism would keep on running, there would be nothing to indicate this to the operator in the car, and as he would be obliged to release his safeties before applying his power, the result would be that the moment the safeties were released the car would drop. We might cite several circumstances under which this same difficulty would arise.
>
> We note you refer to the infrequency with which safety appliances are inspected, and on this you touch a vital point. Few safety devices on elevator cars are inspected regularly, and a safety which is not kept in free working order is worse than no safety at all.
>
> Another point which we think you might emphasize is the tendency in elevator construction to increase the amount of mechanism between the operator in the car and the controlling valve of the hydraulic machine. We have, as you know, lever devices, wheels in the cars, and

> even electric buttons, and in each of these cases the mechanism between the operator and hydraulic valve is quite intricate. The simple method of passing a wire cable from the valve, passing directly through the car, and in control of the operator, removes many opportunities for breakages or disarrangement of fine mechanical parts.
>
> Another source of danger which you have failed to touch, and which has caused many accidents, especially on the direct plunger type of elevators, arises in this way: The elevator is built to raise a maximum load of say 2,000 lbs.; on special occasions the elevator may be loaded beyond this point, with the result that the car will fail to ascend, the load in the car overbalancing the pressure on the hydraulic piston. Before ascertaining that the car is overloaded the operator has been obliged to open his hydraulic valve, and quite often will start to lighten his load by asking his passengers to step out of the car without reversing the valve; but as soon as the load comes below the maximum the car will immediately start, and a number of people have been killed by being caught in the act of stepping from the car.

We may best answer the objection raised above by explaining more in detail our suggestion for the safety attachments of an elevator car as follows:

Let safety clutches be arranged to automatically grip the guides either when the elevator reaches a certain speed, or when the rope supporting the car breaks or is slackened. Let either these safety clutches or a separate and independent pair of safety clutches be placed under control of the operator and so interlocked with his operating lever and with the gates, that he must apply these clutches whenever he brings his elevator to a stop before he can let off passengers, and must release them before he can move his operating lever from the stop position.

Now, suppose that at some stop the machinery goes on moving while the elevator car stands at the floor. If the car were on its way down, the suspending rope would slacken. This would at once lock the safety clutches, and the operator, if he attempted to start the car down, would find it impossible to do so, for the safety clutches would be held fast by the slackening of the suspending rope.

On the other hand, suppose the car is on its way up. It stops at a floor, and while it stands there by some accident the machinery starts up again; but the operator's safety clutches being locked fast the machine is stalled, and the car cannot start until the passengers are on and the operator releases the safety clutches.

It may be remarked here that the most fruitful cause of accidents in connection with elevators is not failure or defects of the apparatus by any means, but carelessness on the part of the operators. There is a constant tendency to hurry-up things in the average office building elevator service, and there is always a certain amount of risk that a green or nervous operator will start his car a little too soon and catch a passenger in the door.

Every owner of a building in which an elevator is operated is liable to damage suits from accidents of this sort, and every elevator manufacturer has to subject his reputation to a certain extent to risks of this class. The value of a mechanical check to prevent such accidents ought to be clear.

We may note that the very class of accidents referred to in the last paragraph of the letter above would be prevented by the apparatus we have suggested. An operator with an overloaded car would be obliged to move his lever to the stop position and apply his safety clutches before he could open the gate to let passengers off.

The Crane Elevator Co. of Chicago writes us as follows:

> Agreeing with you thoroughly as to the comfort, convenience and business necessity of the high office building, we may as well also agree that that type of building has come to stay. It would seem to us, from what we have heard of it, that this accident at the American Tract Society Building occurred primarily from there not being a sufficiently large factor of safety in that part of the elevator equipment which gave way. What should and must be thoroughly understood by elevator builders is that it is far more necessary to exceed in strength in every part of the elevator plant than by safety devices to guard against possible weaknesses. While it is true that the latter duty should be deeply and thoroughly considered, still that is secondary to the first duty of providing a very large factor of safety. First, decide what that factor of safety will be, erring if anything on the side of extreme precaution, then make the most thorough and rigid tests of the entire plant, in position, to such an extent as will be far beyond anything that we know it is possible to put upon the plant in actual service. After this is done every means may be considered of avoiding unforeseen accidents or latent defects which have not shown up in tests.
>
> While the height of a building has nothing to do with the safety of its elevator, yet it must always be borne in mind that the farther you fall the harder you hit, and that in extremely high buildings the requirements of the elevator service are much more exacting than in the ordinary six to ten-story building. In providing against all possible weakness in elevator service, the same rule prevails as in all other lines of manufacturing business, namely, that long experience is an absolute necessity for arriving at the best results. This is emphasized strongly by the very accident that has called forth your editorial. In this case a manufacturer of long experience, admirable equipment, engineering talent, and every facility for giving first-class work, is yet confronted with an accident which evidently had not been provided against. In considering the matter of safety in elevators, it must be remembered that accidents involving the risk of loss of life or actual injury to passengers are extremely rare on first-class elevators, when the enormous travel in this line is taken into consideration; indeed, it is probable that a hundred times more people are killed by falling down stairs than by falling with elevators, and the scarcity of such accidents cannot but reflect credit on those manufacturers who have for so many years supplied the public with this class of machinery.
>
> We agree with you that the statement that the cause of the accident at the American Tract Society was the high pressure upon the system, is not correct. A high pressure, such as was sustained at this building (about 900 lbs.) is as perfectly safe as the ordinary pressure of say 125 lbs. All that is requisite is that the proper factor of safety should enter into every detail of the construction of the plant, and then there is not one particle more danger in the 900 lbs. pressure than there is in the 125 lbs. We think you are correct in ascribing the cause of such an accident as the one under discussion largely to the severe requirements as regards speed which are now imposed upon elevator builders, by architects and owners of these high office buildings. We think you are in error, however, in one or two points on this particular subject. A speed, such as that you mention, of 700 ft. per minute, is not absolutely requisite for first-class elevator service in office buildings even of 16 to 25 stories, except on elevators which are used as "express" elevators; that is to say, running from the first to the eighth or tenth story without stop. During this through run the speed of 700 ft. per minute, or even more, may be desirable or may be attained without any inconvenience or risk; but when stops are made at every floor, say every 12 ft. or so, a speed exceeding 500 ft. per minute is unnecessary, undesirable, and practically impossible; that is to say, if between the throwing a lever on the "up" and the centering of that lever for a "stop" a speed of 700 ft. per minute had been attained in 12 ft., the stop cannot be nearly as good as if the speed were only 500 ft. per minute, and consequently the results, so far as time is concerned, are not as good as if the lower rate of speed were adhered to.
>
> As regards safeties, few or none of the modern elevator builders construct an elevator without an automatic safety device which is intended to be thrown in when the car attains an excessive speed. The trouble, as you rightly say, is that elevator builders are now required to construct their work so that the cars will come down, even with light loads, at such a high rate of speed that the safeties must be set to throw in at such a rate of travel that passengers may be injured by the descent of a car less quickly than the figure at which the safeties are set to act. At 200 ft. normal speed the safeties will generally be set to throw in at about 400 ft. per minute, and at 500 ft. normal speed at about 800 ft. per minute. It can readily be seen then that in the case of such an accident as has happened at the Tract Society Building, if the normal speed were 500 ft. the car might come down at a speed of 700 ft. per minute without throwing the safeties, although we know that the landing of the passengers at the bottom of the shaft at such a rate of speed as this involves an absolutely serious risk. There is no good reason, as you say, why a device should not be put in the elevator car which would enable the operator to throw the safeties in and hold the car at any point in the hatchway. It must be remembered, however, that such a device would only be good if the operator preserved his coolness and presence of mind, still it is a step in the right direction, and will undoubtedly be used in connection with the high speed elevators which have necessitated it. Another element of safety which should always be present, is that every elevator plant should be in charge of a first-class engineer thoroughly competent and versed in the proper methods of caring for elevator machinery. Too often owners of buildings seem to think that elevator machinery and its care needs no skilful attention, and they are willing to entrust one of the most vital points of their building, and one on which the lives of their tenants and others are trusted every day, to the care of a man who has not the capacity or experience necessary for such a task.
>
> In conclusion, we can but reiterate that the main elements in a safe elevator service are:
>
> First, a very large factor of safety. Second, the testing of all the machinery in place rigorously and carefully. Third, the providing of every approved device against unforeseen accidents; and lastly, a most intelligent and careful maintenance of the entire plant in every particular.

In our last week's issue we referred to the fall of an elevator in the Manufactures Building at Chicago in 1893. Fuller details of this accident are sent us by a correspondent as follows:

> Sir: In your issue of Nov. 26 you mention the accident which happened to one of the elevators in the Manufactures Building at the Columbian Exposition. As I happened to see the car drop, I will give an account of it.
>
> The accident happened on the night of Oct. 21, 1893, to one of a group of four electric elevators (not hydraulic elevators, as you say). Without any warning, one of the outside cars, which had just started to go down, filled with passengers, began to drop with a series of lurches in its descent, and was finally stopped by becoming jammed between the guide posts, about 60 ft. from the ground. The outside guide post was a stick of timber about 12 ins. square, which was forced out of line by the automatic clutches under the car. This allowed the car to list to one side and become jammed between the guides. The timber broke when the car came to a stop. Fortunately, it did not give way entirely, but held the car in its distorted position until a fire company brought ladders and released the passengers from their perilous position. If the guide post had broken, so as to allow the car to drop entirely out of its guides, every one in the car would have been killed. The lesson is a valuable one, as the lack of rigidity in the guide posts is a defect which can be seen in some of our modern elevators.
>
> Yours truly,
>
> J. W. Schaub, M. Am. Soc. C. E.,
> Chief Engineer and Manager Hamilton Bridge Works.
> Hamilton, Canada, Nov. 30, 1896.

Besides the above correspondence, several elevator builders have favored us with their opinions in personal interviews. One of these gentlemen makes some interesting comments upon the city inspection of elevators. He says that this official inspection is, as a rule, either a farce or a piece of blackmail. The inspectors are not expert elevator mechanics, and as a result their investigation is superficial and of no account. The "defects" which they find are, as a rule, not real defects at all; but are either trivial things of no importance, or else they condemn parts of the machinery which are actually in perfect condition. The cases taken to court are, in practically every case, instances where the long-suffering owner refuses to submit to downright imposition or blackmail, and prefers to fight the case in court. It will be readily understood that most owners will prefer to submit to a good deal of loss rather than go to law, for the mere fact that fault had been found with an elevator, justly or unjustly, which is made public by an action at law, would be sufficient to prejudice tenants against a building.

On the other hand the systematic inspection of elevators which is made by elevator builders and by companies insuring against elevator accidents, is exceedingly valuable. These companies employ elevator constructors of thorough experience, and as they have a financial interest at stake, careful and intelligent work is assured.

It will be remembered that in our editorial last week, we ourselves pointed out that to rely on a municipal inspection for safety was leaning on a broken reed. The above opinions lend additional force to what we then said. Whether the charges made are true or not, it is clear enough that under political conditions which may at any time obtain in any city, they may become true. It may indeed be that a certain amount of municipal inspection is a necessity to check dangers in the cheapest class of buildings, where a cheap elevator is put in charge of a cheap engineer and is left to take care of itself; but as we recently said with respect to municipal building inspection, we hold it to be a mistake to so greatly magnify this work, that owners and builders will begin to rely on such inspection instead of on the watchfulness of their own architects and engineers for good and safe construction.

METHOD OF DETERMINING THE WORK DONE DAILY BY A REFRIGERATING PLANT AND ITS COST.*

By Francis H. Boyer, M. Am. Soc. M. E.**

The refrigerating plant in the Abattoir of John P Squire & Co., East Cambridge, Mass., was installed by the De La Vergne Refrigerating Machine Co., during the winter and spring of 1890 and 1891. It is composed of two machines rated by the builders as 150 tons ice-melting capacity each daily or a combined capacity of 300 tons, this to be accomplished by running 24 hours daily with a return pressure of 26 lbs. above atmosphere, a condition of 40.7 lbs. pressure absolute, running at 40 revs. per minute. The size of the gas compressing cylinders were 16 ins. in diameter and 32 ins. stroke, being double acting, four gas cylinders all told.

The condition and amount of work being done is indicated by the back or return pressure of the gas—this condition being maintained by the speed of the gas pump—the engines being directly connected and constructed to allow of a variation of speed from 15 to 75 or more revs. per minute.

It became desirable to establish a method to obtain the amount of work accomplished daily in order to arrive at the expense of operation, and to make comparison with results of other departments of the abattoir. By taking the cubic displacement of the compressors with a given amount of return pressure the amount was obtained easily.

The accompanying table is a copy of the Engineer's log for July 18, 1896:

"P. D." indicates direct pressure or pressure at which the ammonia gas is being liquefied.

"R. P." indicates return or suction pressure—all pressures starting at atmosphere.

Engines Nos. 1 and 2 are refrigerating engines. Engine No. 4 is a 200 HP. electric light engine. Engine No. 5 is an air compressor for testing car-brakes.

"Salt-water column" is expressed in feet of hydrostatic pressure. It is pumped 1,800 ft. through a 12-in. cast-iron pipe, steam being conducted under the ground. Water is taken from the bay, and is therefore salt water. The water is first used to condense ammonia, and finally to condense the steam in a Wheeler 1,000 HP. surface condenser.

In "Water Condenser" columns, "I" is initial temperature to ammonia condensers; "C" is temperature of water on entering steam condenser; "F" is final temperature of water leaving steam condenser.

"Engine Hours run" indicate the number of hours the engine has run from the time they started. This I find quite an important item as engine drivers are apt to become prejudiced against one or the other engine where one engine remains idle, as it does in this case during the cold winter days.

"Remarks" come in shape of instructions from Department Superintendents—test and fire alarms.

The engine had run from 7 a. m. to 10 p. m. at 45 revs. per minute, during which time between 2,000 and 3,000 hogs had been slaughtered and placed in the "hanging-rooms" for cooling, which has a floor space of about one acre, or to be exact 42,240 sq. ft. Rooms No. 1-2-3-4-6 and 7 have the same floor area. The temperature of the hanging-room increased from 38° to 33° at 7 a. m. to 42°—36° F. at 2 p. m. At this time the most severe work was being done by the machinery. This is shown by the return pressure of the gas being at 15 lbs., and the direct pressure at 180 lbs. per sq. in. As the temperature in the hanging-room decreases so does the work on the engines. Reference will be made only to the hanging-room, as there is where most of the work comes from. Rooms No. 1-2-3-4-6 and 7 are used for curing and storage purposes, and work coming from there comes from heat radiating from workmen, from lights, from decomposition in process of curing, and from imperfect insulation. From the last source there is but little trouble as the building has few windows, no hallway or elevators, no communication between floors, and brick walls 48 ins. thick.

As the coils circulating the ammonia becomes cold, and the unexpanded liquid returns to the engine, the attendant reduces the supply. This first makes its appearance from 7 to 9 o'clock p. m., and at 10 p. m. the volume of return pressure of gas has become so low that the attendant has slowed down the machines from 45 to 36 revs. per minute, and at this condition the work is kept up until 7 a. m. the following morning. At 2 a. m. there is an increase of a return pressure, which continues until 7 a. m.; this is caused by a gang of about 100 workmen beginning at 1 a. m.

A little story is told in the Water Condenser column in the initial column marked "I."

At 7.00 a. m.	the temperature	was	....	67 degrees.
" 1.00 p. m.	"	"	....	73 "
" 8.00 p. m.	"	"	....	67 "
" 2.00 a. m.	"	"	....	70 "
" 6.00 a. m.	"	"	....	67 "

This is due to the condition of the tides, the coldest water coming at high water and warm at low water. Here we find that our thermometer gives us a correct reading of conditions of the tides, clearly defining high and low water.

The object of this paper, which is to ascertain the amount of work done daily under these varying conditions under the heading of "Daily Tons of Refrigeration" is the following:

$$\frac{48}{24} \times \frac{40.6}{40} \times \frac{12.4}{26} \times \frac{150}{1} = 145.2 \text{ tons},$$

$\frac{48}{24}$ being the number of hours which the engines have done service.

40.6 is the average number of revolutions for the day, 40 being a fixed number of revolutions necessary to establish a given result of effort.

12.4 is the average return pressure of the gas from the refrigerator.

Twenty-six lbs. per sq. in. is the fixed pressure for a given result, 150 being the rated capacity of the machines when the fixed conditions are maintained, or we should have as a fixed formula:

Hours. Revolutions. Return Pressure. Tons Refrigerating.

$$\frac{\quad}{24} \times \frac{\quad}{40} \times \frac{\quad}{26} \times \frac{150}{1}$$

Average varying being daily entered.

To prove the statement is an easy matter by taking the weight of the condensing water from the ammonia condensers, also the oil cooler, and multiplying by the heat units will establish the amount of heat being given. I will not attempt to go into detail, as this is already on record in the Society Transactions, in the able paper on "Refrigerating Machinery," by Professor Denton, Vol. X., p. 792.

In determining the cost of operating, several tests had been made on the boiler and engine plant, which showed an average of 10.4 lbs. of water vaporized per pound of coal consumed, Pocahontas coal from Virginia being used, and with an efficiency of 16.44 lbs. of steam per hour per HP., or 1.56 lbs. of coal per hour per HP. From this data is established the amount to be charged to electric light and car department for the air compressor for testing air-brakes.

The total amount of expense for operating is taken monthly from the store-room accounts; from the year 1894 we have the following:

Tons of refrigerating produced	48,466½
Cost of maintaining refrigerating department, including annual repairs	$28,471.03
Average cost per ton for refrigeration for 1894.	58.7 cts.

An interesting feature of the monthly production and cost per ton of refrigerating is shown as follows:

1894.	Tons.	Cost per ton.
January	1,816	85 cents.
February	1,423	86 "
March	1,538.3	33 "
April	2,821.7	73 "
May	4,747.3	46 "
June	5,491.7	38 "
July	6,736.4	31 "
August	7,596.6	27 "
September	6,283.4	24 "
October	5,419.5	52 "
November	2,647.5	78 "
December	1,945.1	82 "

ANNUAL MEETING OF THE AMERICAN SOCIETY OF MECHANICAL ENGINEERS.

The annual meeting of the American Society of Mechanical Engineers, which is being held at its house in New York city this week, promises to be the largest meeting ever held by the society. Over 300 members and guests were registered before the close of the first session on Tuesday evening, and the list was enlarged by Wednesday noon to 394. One of the features of the meetings of this society, which contributes largely to facilitating the making of acquaintances, is the wearing by each member and guest of a badge with a number in figures, which may easily be read a few feet distant, and the printing once or twice a day of the complete members registered with the badge number adjacent to each name. This system is especially valuable to those who have an imperfect memory of names and faces.

The opening session on Tuesday evening consisted first of an informal gathering of the members and guests, among whom were many ladies, in the rooms, both up and down stairs, which lasted till 9 p. m., when those who could find seating or standing room crowded into the auditorium to listen to the address of the retiring president, Mr. John Fritz. We postpone the publication of this to our next issue.

It is not the usual custom to discuss the address of the president, but Lieut. W. H. Jacques, U. S. N., who is a member of the society, made a brief response, in which he told something of the history of the beginning of armor plate and heavy gun forgings in this country, and of the work of the Naval Advisory Board of which he was a member, which led to the starting of the new manufacture at the Bethlehem Steel Works. He was followed by Mr. Andrew Carnegie, who, in a most happy speech, paid tribute to Mr. Fritz and to the other metallurgical and mechanical engineers who had done so much for the iron and steel industries. Historical reminiscences of the steel men being in order, Messrs. Robert W. Hunt and Robert Forsyth were called on to speak on behalf of the Bessemer steel manufacture, and Mr. Samuel T. Wellman on the open-hearth process. After the speechmaking, the informal reception was continued, and lasted till midnight.

On Wednesday morning, the session began with formal business, consisting of reading of the reports of the council, of the tellers of election, and of the chairmen of several committees.

The Report of the Council.

The report of the council opened with a tribute to the late Mr. J. F. Holloway, Past-President of the Society. The membership of the society is now 1,762, of which 104 are Associate Members, 300 Junior Members and 16 Honorary Members. The society has been officially represented upon the commission for revising the New York Building laws by Messrs. Henry R. Towne, C. W. Hunt and S. W. Baldwin. A delegate to the National Conference on Standard Electrical Rules was appointed in the person of Mr. C. J. H. Woodbury. The council presented a memorial to Congress respecting the position of the naval engineers; but refused a request that the influence of the society be excited in favor of the bills proposing the wholesale establishment of engineering experiment stations. The council has appointed Messrs. Coleman Sellers, John E. Sweet, Chas. T. Porter, Geo. M. Bond and Coleman Sellers, Jr., a committee to prepare material to be used in opposition to proposed Congressional legislation to make the metric system compulsory. Invitations were received from Nashville and Milwaukee, urging that those cities be selected for holding the spring meeting of 1897, but the council has practically fixed on Hartford, Conn., for this meeting. The tellers reported the result of the election of officers for the ensuing year as follows:

President, Worcester R. Warner, Cleveland; Vice-Presidents, Edwin S. Cramp, S. T. Wellman, W. F. Durfee; Treasurer, Wm. H. Wiley; Managers, H. S. Haines, G. C. Herring, A. W. Robinson. A letter from the secretary of the American Association of Steel Manufacturers was read, informing the society that the association had adopted the "Decimal Gage" for measuring materials. This is the system of measuring sizes such as thickness of sheets and plates, and diameters of wires, rods, etc., in thousandths of an inch instead of by the ancient wire and sheet metal gages.

Reports of progress were read by the chairmen of committees on a standard method of testing boilers, and on standard methods of testing materials of construction. The business meeting being concluded, the presentation and discussion of professional papers was then begun. Under the admirable rules of the society all of these papers were printed and distributed in advance to those members who signified their intention to attend the meeting, so that those who wished had ample time to study them and prepare written discussions. The first paper was one by Sir Henry Bessemer, honorary member of the society, entitled "History and Technical Sketch of the Origin of the Bessemer Process." It was read in abstract by Prof. R. H. Thurston. This paper we present in full in this issue, and comment on it in our editorial columns. Mr. Wm. F. Durfee, who is the only surviving representative of the owners of the Kelly process patent of 1857, read a discussion of the paper in which he pointed out the relations of Kelly and Mushet to the Bessemer process. He was followed by Mr. Allan Stirling, who read an encomium upon Mr. Bessemer and upon the value of his services to the world. Mr. Robert W. Hunt and Mr. William Kent continued the discussion, both expressing their regrets that Mr. Bessemer had not seen fit to give due credit to the other inventors of the process which bears his name.

"Ancient Pompeiian Boilers" was the subject of the next paper. It was presented by Mr. W. T. Bonner, and illustrates and describes some bronze relics of Pompeii which are preserved in the National Museum at Naples. They are vessels for heating water, and show a remarkable analogy to the water-leg, water-grate, and water-tube boilers of to-day. The grate bars are tubes made from sheet bronze, rolled, and soldered or brazed. They open at both ends into the bottom of the water jacket, thus forming water-tubes through which traversed the water as it circulated in the boiler. "Method of Determining the Work Done Daily by a Refrigerating Plant and its Cost," by Francis H. Boyer, was the next paper. This paper we print in full in this issue. "The Promise and Potency of High Pressure Steam," by Prof. R. H. Thurston, of Cornell University, was then presented by its author. We shall print an abstract of the paper at an early date.

Wednesday afternoon was left free to the members, without any formal session. Invitations were received from many industrial establishments and other places of interest, and parties were formed for visiting these, while others of the members remained in the rooms and attended a meeting in honor of the memory of the late J. T. Holloway, past president of the society, at which addresses were made by some of his numerous friends.

The remainder of the report of the meeting will be given in next week's issue.

THE NEW ENGLISH MOTOR-CAR REGULATIONS.

The Local Government Board has issued to the County Councils and certain other local authorities of England and Wales, regulations with respect to the use of light locomotives on highways, their construction and the condition under which they can be used. These regulations went into effect on Nov. 14, 1896, and are practically as follows:

The expression "light locomotive," means a vehicle propelled by mechanical power, which is under 3 tons in weight unloaded, and it can only draw one other vehicle, with a weight for both not exceeding 4 tons, unloaded. The locomotive must be so built as not to emit smoke or visible vapor, except from temporary or accidental cause. The conditions imposed for a locomotive, exceeding 5 cwt. in weight, are that it shall be capable of traveling backward or forward; that it shall not exceed 6½ ft. in extreme width; that the tire shall be smooth, and 2½ ins. wide, up to 1 ton in weight of vehicle; 3 ins. wide for a locomotive weighing between 1 and 2 tons, and not less than 4 ins. for any weight exceeding 2 tons. In case a pneumatic or other soft and elastic tire is used, it may be rounded and provided with bosses or projections of the same soft material as is used in the tire. In this case the width of tire is measured when the tire is not under pressure.

The light locomotive must have two independent and efficient brakes; and the vehicle must be so constructed as to be always under control without causing undue interference with ordinary traffic. The weight of a light locomotive exceeding 1½ tons, and of a car hauled, must be conspicuously painted on such vehicles; the weight, not including that of the water, fuel or accumulators used. The name of the owner and the place of his abode or business must also be similarly displayed in letters not less than 1 in. high.

The person in charge must be competent to control and direct its movements, and lights must be lit between sunset and sunrise, with a red lamp in front and a white light in the rear. This latter regulation does not apply to any bicycle or trycicle provided for under the act of 1888. The maximum speed permitted is 12 miles per hour. If the light locomotive weighs between 1½ and 2 tons, the speed is limited to 8 miles per hour, and to 5 miles if the weight exceeds 2 tons. If any light locomotive is used on any highway to draw another vehicle the maximum speed is 6 miles per hour.

Various other minor regulations follow. The Secretary of the Local Government Board calls attention to the fact that light locomotives which are carriages or hackney carriages, under the definition of the Inland Revenue Act of 1888, must pay an additional excise duty at the following rate: £2 2s. if the weight exceeds 1 ton but is under 2 tons, unladen; and £3 3s. if the weight exceeds 2 tons.

PURIFICATION OF THE SEWAGE OF WATERbury, Conn., is recommended in a report just made by Mr. Rudolph Hering, M. Am. Soc. C. E. Two plans are reported as feasible: Intermittent filtration on 100 acres of land, nine miles from the city, or combined chemical precipitation and filtration, using for the latter 33 acres of land 1.4 miles distant. In either case a 40-in. outlet sewer would be required for an estimated daily flow of 17,000,000 gallons. This allows about 85 gallons of sewage per day for 75,000 people, together with a considerable amount of surface water. The filtration plans calls for a present outlay of $609,730 and yearly charges of $28,489; a final outlay of $767,580 and yearly charges of $40,000; the average yearly charges being $34,246. The combined precipitation and filtration plan could be carried out for an initial outlay of only $138,380, and at an ultimate cost of $336,270; the yearly charges would range from $21,335 at the outset to $59,569 at the finish, with an average of $40,452. The low first cost of construction and operation under the second plan is due to the possibility of entirely omitting filtration for a time.

A 59-STORY BUILDING was announced to be under contemplation by the New York "Evening World" of Nov. 27. This veracious sheet went so far as to publish an elevation and plan of the structure, and stated that "the plans have been prepared by the firm of Chadwick & Wilbert, of the Bennett Building." A visit of a member of the staff of Engineering News to the Bennett Building showed that no such firm had offices there, and their names do not appear in the city directory. The description in "The World" stated that the building was to have seven sub-cellars; the outside was to be "of sheet-iron sheathed with brownstone," and the interior "furnished in Italian marble and brass." This charming structure was to be located at the corner of Tenth Ave. and 25th St., a locality where even an ordinary skyscraper would be absurd from the investors' point of view. We feel like begging our readers' pardon for paying any attention to this fake story in our columns, but we are aware that in many parts of the country, where "the new journalism" is not yet fully understood, people sometimes believe such newspaper fictions as the above.

A WATERFALL 1,600 FT. HIGH is reported as having been found in Venezuela by Mr. Donald Grant, of the Orinoco Company. A letter written from Santa Catalina, Venezuela, by S. A. Thompson, C. E., of Duluth, says that during the explorations of a concession to this company, in the Imataca Mountains, a large river was discovered cutting diagonally through an almost perpendicular cliff, estimated as being 1,600 ft. high. The water breaks into a dozen different streams, and spreads out in "fanlike expansions." This is at least interesting—if true.

WAR ON BRITISH DREDGES has been declared by some of the leading dredging companies of the United States. These companies have filed protests at Washington against permitting dredges from Canada working upon the government contract in Delaware River and Bay. The dredge lately towed from Montreal has been seized by the Philadelphia custom officials for violating the customs laws of the United States. Other dredges are on their way from Canada. A transfer to American owners is now being examined by the authorities, the new owners claiming that they thus have the right to use the plant in American waters. At the bottom of this trouble lies a row between rival American dredging companies and contractors for dredging.

AN AMERICAN PAPER-MAKING MACHINE is to be set up in the "Daily Chronicle" paper mill, at Sittingbourne, England. The machine is furnished with all the latest improvements and is said to be the first paper machine ever sent to England.

THE TOTAL JAPANESE RAILWAY MILEAGE, on March 1, 1896, was 2,290 miles, says Consul Uchida. At the same time 1,368 miles more were under construction and charters have been applied for covering an additional 655 miles. A ship-canal, from Osaka, across to the west coast of the island, is also under discussion. The actual cutting would be about 22 miles, and the river Uji and 9 miles of Lake Biwa would be included in the route. The Japan Mail Steamship Company, which recently opened a line to Seattle, has established a monthly service between Yokohama and Sidney and other Australian ports, and another Australian line is projected. The annual report of the Japanese Bureau of Merchant Marine shows that Japan has registered for foreign trade 109 iron and steel steamships, of 231,139 gross tons. Since 1890 twenty shipyards have been established in Japan, and 40 were started in the previous decade. The stone dry-dock at Nagasaki is 438 ft. long and 26 ft. deep. The Japanese subsidy law, which went into effect last October, gives shipbuilders a bounty of $10 per gross ton on steel vessels over 1,000 tons, and grants also $2.50 per horse-power.

THE CHINESE-RUSSIAN TREATY, reported as lately confirmed, grants important railway and other concessions to Russia, permitting that government to build its Trans-Siberian railway across Chinese territory, in Manchuria; to guard the railway with troops; to build other railways for China, terminating at Port Arthur, and to mine and transact other business. The representatives of other nations are inclined to publicly minimize the import of these concessions. Some of the lines of railways referred to will not be completed for two years, and others are only projected. They say that while the treaty gives Russia power to station troops in Chinese territory, it is not believed that this will be done except in urgent cases as such action would be regarded by other powers as a dangerous menace to their interests. But the same powers practically admit that Russia now politically dominates all China; though they say that England still holds the commercial supremacy.

GOVERNMENT CONTROL OF RAILWAYS has been mainly unsuccessful from an economic point of view in South America, and it is said that the Brazilian Congress will lease the Brazilian Central Ry. (operating 500 miles) to a foreign syndicate, the price being $90,000,000 for a 90-year lease. Under the imperial government this line was styled the Don Pedro Segundo Ry. It is charged that employment on the road has been given as a reward for political activity, the partisans of one party succeeding each other with the various changes of administration. In many cases the salaries were largely disproportionate to the character of the service performed, while in nearly every case except where experts were employed the appointees were unfit for their places. The debates in the Congress, which disclosed these facts, also showed conclusively that the road, instead of being a paying investment, is steadily losing money at the rate of $2,000,000 a year.

THE PACIFIC CABLE BILL, advocated by the Pacific Cable Company, is to be pushed in the next Congress. This bill would authorize the Postmaster General to contract to pay $100,000 per year for 20 years, for the construction and operation of an electric submarine cable connecting San Francisco and Honolulu, and such places on the coasts of Japan and China as the company may select, with the approval of this government. The company is to deposit $100,000 in U. S. bonds, to be forfeited in case of nonfulfilment of contract. This contract would require the company to complete the line to Honolulu before Jan. 1, 1898, so that it be capable of transmitting not less than 15 words per minute; within one year thereafter the line to China and Japan must be built. The company may establish landing stations on the Midway Islands, between Hawaii and Japan, and belonging to the United States. U. S. government messages are to be transmitted free forever and to have preference, and the rate for ordinary messages between the United States and Japan and China shall not exceed $1.25 per word, and 35 cts. per word to Honolulu. Press rates shall not exceed one-fourth of the cost of private messages. The House Committee has reported favorably upon this bill. The length of the cable route would be 2,097 miles to Honolulu, and 6,500 miles to Japan; and with 16% of slack the cable itself would be about 7,500 nautical miles long. The cost of the cable and the necessary repair ship is estimated at $7,500,000. This would be the longest cable in the world, and the deepest soundings show 3,185 fathoms. The Pacific Cable Company is a New York State corporation, with $10,000,000 capital.

WIRES UNDERGROUND AT ST. LOUIS seems to be the order of the day, 14 applications for permits to put in conduit systems having been filed recently by light, telephone and other companies.

THE MEASUREMENT OF WATER FOR IRRIGATION.*

By J. B. Pope, C. E.

Introductory.

The question is often asked, what is a miner's inch? and the answer often given is, that "quantity of water which will flow through an aperture 1 in. square under a 4-in. pressure." Frequently the "authority" will call it a 6-in. pressure and sometimes the pressure-head is measured from the center of the aperture, or the top or bottom. Seldom is it stated whether the discharge is through a thin or thick plate, although this condition is a very important factor.

An attempt will be made in the following pages to demonstrate the importance of abolishing the "miner's inch," and adopting cubic feet per second as a unit of measurement for all water systems. Irrigating water will then assume a value according to quantity.

The principles of making distributions and constructing adjustable measuring weirs are original, and, as submitted, represent a considerable expenditure for testing and experimenting. The tables were carefully calculated and checked over, and their correctness demonstrated by many crucial tests.

Tables I. and II.

Table I. is simply a reduction of the California miner's inch, and the Colorado miner's inch, to cubic feet and acre feet for irrigating seasons of 3, 4, 5, 6 and 7 months, and every ten days thereof.

The Colorado miner's inch is equal to a flow of 1.56 cu. ft. per min., or .026 cu. ft. per sec., and 1 cu. ft. per sec. equals 38.46 Colorado miner's inches. (See report of State Engineer to Governor of Colorado for 1883 and 1884, page 60.)

The California miner's inch is equal to a flow of 1.2 cu. ft. per min., or .02 cu. ft. per sec., and 1 cu. ft. per sec. is equal to 50 California miner's inches. (See Irrigation in California, Wm. Ham. Hall, Part II., p. 27.)

The California miner's inch seems to be in greatest favor, possibly by reason of its convenience as a mathematical factor. In a few localities other values are adopted and called "miner's inches," but not to an extent worthy of notice.

The first left hand column of Table I. gives the number of days for irrigating seasons from 90 up to 210 days, or from 3 to 7 months. Opposite each irrigating season the double lines in the second column gives the quantity or value of a California miner's inch, flowing continuously for that length of time in the lower line, and the value of a Colorado miner's inch, flowing continuously for the same length of time is given in the upper line of the second column.

For example, one Colorado miner's inch flowing continuously for five months, or 150 days, equals 336,960 cu. ft., and one California miner's inch flowing continuously for five months, or 150 days, equals 259,200 cu. ft.

The other columns to the right give the values in acre feet for Colorado miner's inches above, and California miner's inches below, for the respective irrigation seasons, and continuous flow. Thus, with an irrigating season of six months, or 180 days, and a water right of one Colorado miner's inch continuous flow, we find in the first column six months, 180 days; opposite this, in the second column and above, we find 404,352, the quantity in cubic feet for that period of time; in the third column and above, we find its value 9,283 acre feet for one acre, or in the seventh column, which is headed 5A, we find 1.857, its value in acre feet for five acres, i. e., the depth in feet which one Colorado miner's inch, flowing continuously for 180 days, will cover one acre, or five acres, as the case may be. Opposite 180 days, in the column headed five acres, and on the lower line, we find 1.628, or the value in acre feet for one California miner's inch, flowing continuously for 180 days.

Table II. gives the required flow in cubic feet per second to cover one acre a given depth in one hour's time, or with from 1 to 30 irrigations of one hour each. The first column gives the number of irrigations during the entire season; the top line of figures gives the value of the water right in acre feet for the entire season, and the quantities below give the flow in cubic feet per second required to supply this water right, or any portion of it, in one hour of time. For example, with a water right of 1 acre foot, and an irrigation season of 180 days, it is desired to irrigate every nine days, allowing one hour constant flow for each acre, required the flow in cubic feet per second; we thus have 20 irrigations. Reading down the first column to the number 20, then to the right along this line to the column headed "1 acre foot," we find 0.605, the flow in cubic feet per second that will cover one acre 0.20-ft. deep in one hour of time.

Again, with a water right of 1.6 acre feet and ten irrigations during the entire season, required the flow in cubic feet per second for each irrigation to irrigate one acre in one hour of time. Find 10 in the first column opposite, and in column headed "1.6 acre feet" appear the figures 1.936, the flow in cubic feet per second required to cover one acre 0.16-ft. deep in one hour of time.

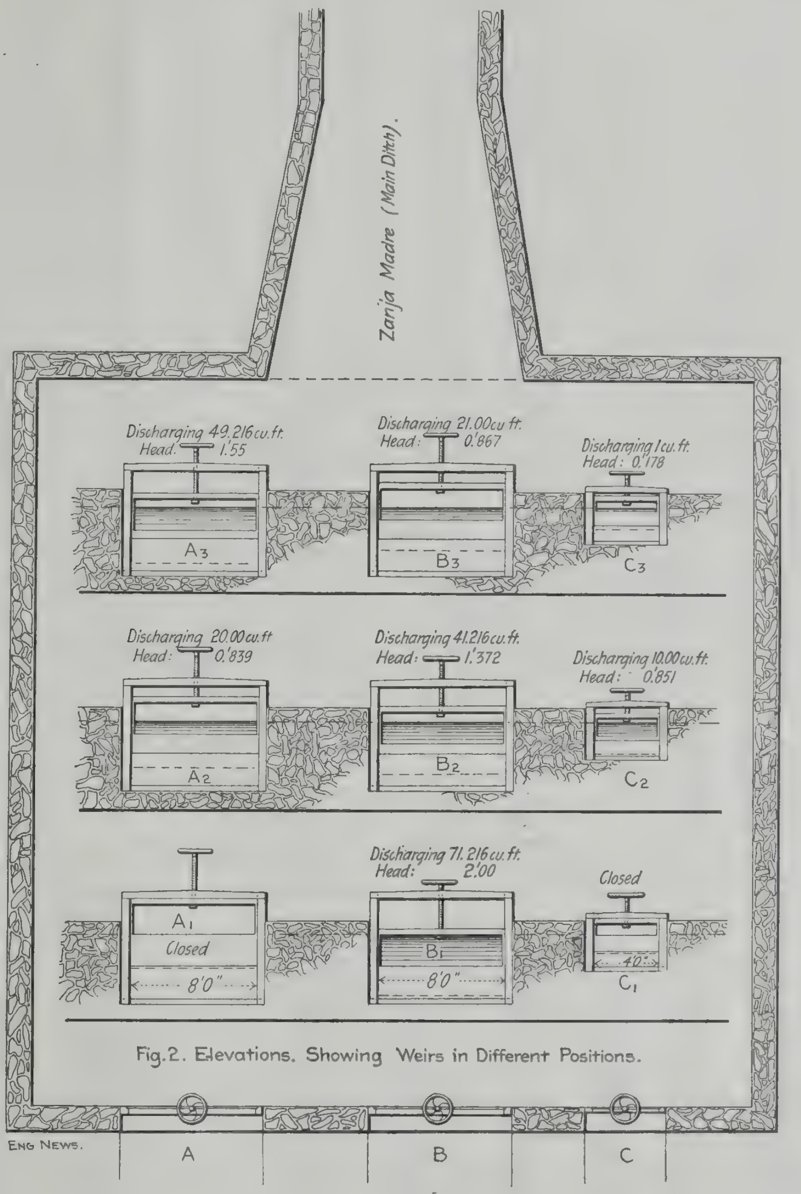

Fig. 2. Elevations. Showing Weirs in Different Positions.

Fig. 1. General Plan.

ELEVATION AND PLAN OF ADJUSTABLE DISTRIBUTING WEIRS.

J. B. Pope, Engineer, San Bernardino Cal,

With Tables I. and II. we can readily reduce water rights quoted in Colorado or California miner's inches per acre to acre feet.

For example: With a water right of one Colorado miner's inch to eight acres during an irrigating season of five months, or 150 days, by Table I. we find that the total flow is 336,960 cu. ft., and that the value of the water right in acre feet is 0.967, which may be called 1 acre-ft. for all practical purposes, and with the aid of Table II. may be successfully delivered in any desired number of irrigations at the rate of one acre per hour, or any fraction or multiple thereof. The same is true with the California miner's inch. The water right being quoted in miner's inches per acre, we have only to follow the explanations given to find the tables applicable and sufficient for all ordinary cases.

The advantage of measuring and distributing irrigation water in cubic feet per second and in acre feet is obvious when compared with the troublesome and ambiguous "miner's inch" method. At present the policy of the irrigator is to irrigate as often and freely as possible, seldom admitting that the supply is sufficient. Little effort is made to determine the actual quantity of water required during an irrigating season to produce the best results for different crops and soils under cultivation. With water rights in acre feet, and the several distributions made in cubic feet per second, the user will, in the course of time, be enabled to determine many economical questions, such as the actual quantity of water required, number and time of deliveries for each crop, etc. There are few systems in operation at present that do not waste at least 40% of the supply, owing to ineffectual distributions and misleading measurements.

To make a practical and accurate distribution of the water flowing in a main irrigating canal so that one or more lateral canals will be supplied with certain quantities, while the remainder continues through the main canal, the maximum flow of main and laterals must first be determined, and the following requisite conditions complied with:

For a short distance immediately above the distribution box the cross-section of the main canal must be enlarged, and the grade flattened, so that the velocity will not exceed 1 ft. per sec. where it enters the distribution box. This box should be

---

*Copyright, 1896, by J. B. Pope, Andreson Block, San Bernardino, Cal.

square, as shown in Fig. 1, with the sides equal to four times the length of the longest weir required. The depth should equal the length of the longest weir measuring down from its crest. Should the water carry a perceptible amount of silt the depth should be increased. Let the spillway equal twice the maximum head of its respective weir, measuring down from the crest. This will allow a free discharge. The weirs may be placed in the wall opposite the inflow, with small weirs on either side of the greater.

Great care must be exercised in placing the weirs, the crest of each being exactly its maximum head below the surface of the intake during a maximum flow. This done, there will be no material acceleration of flow from the intake through the weir box to the discharging weirs. A datum point must then be established on the working surface of the box, on the level of the water at the intake and working head of the weirs, and should be located at the middle of either side of the weir box. This point is the hydraulic head of all of the weirs when the requisite conditions have been attained in the weir box, which then becomes a still pond.

TABLE I.—Values of California and Colorado Miner's Inches in Cubic Feet and Acre-Feet for Various Periods.

*A continuous flow of 1 in. for the period named in the first column.

The writer has designed and tested a very satisfactory weir, consisting of a rectangular weir-plate that is raised and lowered by means of a screw. The water in the division box presses the weir-plate against the frame and fixed plate, making water-tight bearings. The weir-plate is flush with the inside wall of the division box; the uprights of the fixed frame are channeled to receive the beveled edge and uprights of the weir-plate. The length of the crest should be even feet.

*Or the number of irrigations during the season.

A graduated scale of a special design should then be placed on one or both of the fixed uprights, the vernier for the scale being fixed on the upright of the movable weir-plate. The lower end of the screw acts as a swivel in the horizontal member that carries the weir-plate. The upper horizontal member of the frame is fixed firmly, and is threaded to carry the screw which governs the weir-plate. A datum point with graduated scale and vernier is then set in the division box on a level with the crest of the weir when it is closed up, and its scale reading zero.

We are then ready for

Table III.

This table gives the discharge in cubic feet per second for rectangular weirs of several lengths, with end contractions, for heads of every .001 ft. from .01 up to one-fourth the length of the weir. It is based upon the well-known weir formula of the late J. B. Francis, i. e.: Discharge in cubic feet per second $= 3.33 \times \left|\begin{array}{c}\text{length of weir,}\\ \text{minus 1-5th head}\end{array}\right| \times$ $\sqrt{\text{cube}}$ of head, special notice being taken of his statement that "where more than common accuracy is aimed at, we may take co-efficients between 3.41 and 3.33 for heads betwen ½-in. and 5 ins., and 3.3 instead of 3.33 for heads greater than 2 ft. (Trautwine, 13th ed., p. 265.)

The coefficients used in calculating the table were obtained by interpolation in accordance with the above suggestion.

The correctness of this method the writer demonstrated to his satisfaction by placing a number of weirs of various lengths continuously one upstream above the other in a cemented canal. The weirs were so placed that all requisite conditions regarding still water and spillways were obtained. The respective heads were determined with needle-point gages, on the plan of hook gages. These experiments were often repeated during the summer of 1894, and always with satisfactory results. Thus encouraged, the task of completing the table was cheerfully resumed. Figures for 1, 1½, 2, 3, 4, 5, 6, 8 and 10-ft. weirs are given.

(To reduce the weir discharge given in the tables to California miner's inches, we have only to multiply the quantity given by the constant 50. Multiplying by 38.46 the result will be in Colorado miner's inches.)

Fig. 2 shows three of these weirs in a division box, two 8 and one 4-ft. A1 and C1 are closed. B1 is discharging 71.216 cu. ft. per sec. The scale on the upright reads 2 ft. even. The line indicating the surface, or hydraulic head, is at zero, the datum point. In the second series, A2 has been lowered by means of the screw until its graduated scale reads 0.839, and is discharging 20 cu. ft. per sec. B2 has been raised, its scale reading 1.372, and is discharging 41.216, according to the part of the table for 8-ft. weirs. C2 is now discharging 10 cu. ft. per sec., its scale reading 0.851 nearly, according to the part of the table for 4-ft. weirs. The datum line, or hydraulic head, is unchanged.

A third distribution is shown by A3, B3 and C3, the hydraulic head remaining unchanged. A3 discharges 49.216 cu. ft. per sec., with a head of 1.55 nearly. B3 discharges 21 cu. ft. per sec., under a head of 0.867, and C3 discharges 1 cu. ft. per sec., with a head of 0.178. The scale in all cases gives the head, feet and decimal parts thereof, the first column giving feet and hundredths thereof, the thousandths being indicated at the top.

The graduated scale attached to the zero point, which is the hydraulic head, is used only when an increase in the flow occurs unexpectedly. When this happens, it is only necessary to measure up by means of this scale. This increased head is added to the head of each of the weirs, the several flows noted and corrected by adjusting one of the weirs, so that it will take the surplus in addition to its previous flow. This done the others carry their required volumes, and the hydraulic head soon settles back to its proper place. When a deficiency occurs, it but remains to raise whichever weir is to lose it, according to the amount of the deficiency, then the hydraulic head is quickly resumed. Thus it is seen that there is no limit to the relative proportion of distributions that may be made with this method.

The first cost does not exceed very materially that of less satisfactory division boxes. The weirs are durable, and can be made of wood, or iron, or brass. The graduated scales can be obtained at very reasonable figures from Mr. J. C. Sala, 429 Montgomery St., San Francisco, Cal. The author will supply plans and specifications, or furnish weirs of all sizes, place and test them, guaranteeing satisfactory results.

TABLE III.—DISCHARGE IN CUBIC FEET PER SECOND FOR WEIRS WITH END CONTRACTIONS FOR LENGTHS OF FROM 1 TO 10 FT., AND HEADS OF FROM 0.010 TO ONE-FOURTH THE LENGTH OF THE WEIRS.

THE JERSEY CITY WATER CONTRACT has been awarded to the East Jersey Water Co. by the Board of Street and Water Commissioners. The Board of Finance must concur in the award and the Mayor must approve it, after which it must be executed and signed. The accepted proposal is for a gravity supply from the Rockaway River, to be delivered at the present high service reservoirs in Jersey City, 210 ft. above the tide, through a single pipe line with a daily carrying capacity of 50,000,000 gallons. Storage will be provided to ensure a daily supply of 35,000,000 gallons at the start, with an increase at any time to 50,000,000 gallons, on three years' notice from the city. The city agrees to take at least 20,000,000 gallons of water per day, and 30,000,000 gallons in case it orders the works increased to a capacity of 50,000,000 gallons. The prices by the million gallons, are $35 for the first 20,000,000; $36 for all between 20,000,000 and 30,000,000; $35 for between 30,000,000 and 40,000,000; and $34 for between 40,000,000 and 50,000,000 gallons. This curious sliding scale, with its upward and downward turn, results in an average price of $35 per 1,000,000 gallons when the full contract quantity is reached, and makes the average cost for all water between 20,000,000 and 40,000,000 gallons per day greater than the first 20,000,000 gallons. The city has the option of buying the plant at the end of 5, 10 or 15 years for $6,990,000. The other bids, submitted both by the East Jersey Water Co. and its only competitor, the Rockaway & Hudson Water Co., were given in our issue of Aug. 27, 1896. Legal proceedings to upset the award are already promised, in case the other authorities concur with the Street and Water Commissioners. Editorial comment on this subject is made elsewhere in this issue.

◆

THE NEW DRIVEN WELL WATER SUPPLY for Brooklyn is said to fall short by about 2,000,000 or 3,000,000 gallons of the 25,000,000 gallons called for by the contract with Edwards, Monohan, Miller & Edwards. No official information is at hand. All possible capital is being made of the above report by those who wish the city to take steps to secure water outside of Long Island. Some of the expressions of opinion are doubtless due to real concern for the city, but others bear the stamp of the ceaseless agitation of some months past, in the apparent interest of private parties who wish to sell the city distant water or water rights.

◆

THE DU BOIS, PA., RESERVOIR, now under construction for the water supply of that town, is located on the Juniata River, very close to the limits of the watershed. The reservoir is made by building an earth and rock-faced dam, 150 ft. long, across a ravine, the reservoir covering about one acre and having a capacity of 3,000,000 gallons. But to obtain more water than the Juniata at this point affords, a tunnel is being driven 1,542 ft. through the dividing ridge to the streams heading on the other side. In this manner water will be obtained from the upper Juniata Narrows Creek and by Wolf Creek. The engineer is Mr. H. S. McMinn, and the reservoir is being built by Mr. John E. Du Bois, who owns all the land covered by this watershed.

THE REMOVAL OF SNOW from the streets of New York during this winter will probably be done by Mr. G. M. Furman, of 1 Broadway, Col. Geo. E. Waring, Jr., M. Inst. C. E., having recommended the award of the contract to Mr. Furman. The price will be 42 cts. per cu. yd., against 56 cts. paid last year.

◆

THE ANNUAL TRACK INSPECTION on the Columbus, Hocking Valley & Toledo Ry., shows that the general average condition of the track has advanced from an average marking of 78.2% to 80.4%. The report issued to the supervisors, foremen and section men states that there has been a marked improvement in the condition of switches and frogs, and the leads connecting them, but that there is a tendency to neglect the condition of the sidings. The premiums are awarded for the greatest improvement resulting from the labors of trackmen during the year. The company is responsible for the quantity and quality of materials furnished, and those who have made the best use of such materials are entitled to the most credit. The report is issued by Mr. F. B. Sheldon, Chief Engineer, and Mr. Wm. Michel, Engineer of Maintenance of Way.

◆

A DOUBLE DECK TUNNEL is the project of the Metropolitan District Ry., of London, for facilitating traffic on its underground line in that city. The present underground line has a double track, and it is proposed to build two single track tunnels at some distance below this line, to be used for express trains, there being only one station between the terminus and the point where the low-level line will rise to the grade of the existing line.

◆

THE BOSTON TERMINAL CO. is making good progress with the acquisition of land and the preparation of plans for its great terminal station at Summer St. and Atlantic Ave., Boston, Mass. The station and yards will occupy about 40 acres, and 30 acres have already been purchased and paid for. This station will take the place of the present Park Square and Kneeland St. terminals of the New York, New Haven & Hartford R. R., and the Kneeland St. terminal of the Boston & Albany R. R. Special attention is being given to secure a prompt and easy handling of the very heavy suburban traffic. Mr. Geo. B. Francis, M. Am. Soc. C. E., is the engineer.

◆

A RAILWAY TERMINAL on a large scale at Washington, D. C., is proposed for the joint use of the Pennsylvania R. R., Chesapeake & Ohio Ry. and Southern Ry. The plans will include a large union station with depressed approaches, and extensive freight yards.

◆

PLANS FOR RAILWAY TERMINALS at Christiania, Norway, are invited by the government, and prizes of $2,500, $1,000, $500 and $250 are offered for the best plans submitted in competition. Further information may be obtained on application to the Railway Office of the Department of Public Works, 6 Victoria Terrace, Christiania, Norway. Plans must be sent in by March 31, 1897.

◆

100-LB. RAILS are being used quite extensively on the Chesapeake & Ohio Ry. With a recent order of 1,000 tons of these rails, now being laid, this company will have 45 miles of track laid with 100-lb. rails, all on the Huntington Division. About 1,800 tons of these rails are in lengths of 60 ft.

◆

A DOUBLE-END TANK LOCOMOTIVE has been built by the Brooks Locomotive Works, Dunkirk, N. Y., for service in Japan. It is for a gage of 3 ft. 6 ins., and has six driving wheels and leading and trailing pony trucks. The tanks are at each side of the boiler, and there is a completely enclosed cab and a rear coal bunker. The leading dimensions are as follows:

Driving wheels, diameter		4 ft. 0 ins.
Cylinders		15 × 22 ins.
Boiler, diameter		4 ft. 6 ins.
Firebox		6 ft. 6 ins. × 2 ft. 5 ins.
Heating surface,	tubes	895 sq. ft.
" "	firebox	83 " "
" "	total	978 " "

◆

THE MOST SERIOUS RAILWAY ACCIDENT of the week was a head collision Dec. 7 on the Baltimore & Ohio Southwestern Ry. at Sodamsville, O. An inspection train carrying officers of the road ran into an accommodation train, three persons being killed and eight injured. The accident is said to have been caused by a misunderstanding of orders on the part of the crew of the special train.——A freight train on the Gulf, Colorado & Santa Fe R. R. ran into an open switch at a gravel pit near Justin, Ind. Ter., Dec. 4. Three men were killed.

◆

A COAL YARD FIRE occurred Dec. 1 at the Charlestown yards of the Boston & Maine R. R., and the coaling station and about 10,000 tons of coal were destroyed. A fire had been smouldering in the coal pile for some days, and the men had been at work trying to reach it, but it broke out suddenly, and it was then too late for the fire department to do much good. Traffic was blocked for several hours.

ANOTHER SERIOUS FLOOD in the Pacific northwest has again caused extensive damage to railways and serious interference with traffic. In Washington the greatest damage has been done, bridges and banks having been washed out on the Great Northern Ry. and Northern Pacific R. R.——Severe floods have been caused near Chippewa Falls, Wis., by a heavy jam of ice and logs in the river.

◆

GOVERNMENT AID TO RAILWAYS in Canada has been pretty expensive, according to the "Canadian Magazine." On June 30, 1895, there were 16,091 miles of track laid in Canada, and the Dominion Government has contributed to this at the rate of $9,369 per mile constructed, the Provincial Government at the rate of $1,847 and the municipalities at the rate of $81 per mile. That is, for the net result of 16,091 miles, Canada has contributed about $195,000,000. In Cape Colony the proportion of net revenue to capital cost of railways is 5.75%; in India, 4.96%; in South Australia, 3.13%; in New South Wales, 3.46%; in New Zealand, 2.73%; in Queensland, 2.13%, and in Canada, 1.57%. In only one British colony is the proportion lower than in Canada, and that is Tasmania. The "Magazine" thinks that this seems to indicate that Canada is building railways too fast.

◆

ELECTRIC TRACTION is contemplated for the suburban and branch lines of the New York, New Haven & Hartford R. R. According to a published statement by Mr. C. F. Clark, the President, the general policy of the road relative to the introduction of electricity as a motive power may be given as follows: Electricity as a motive power is foreshadowed in the last annual statement of the road. On the South Shore branch of the Old Colony system, the current has been successfully and economically conveyed in a third rail, insulated upon wooden blocks in the center of each track. The results have surprised experts, and it is now probable that a third rail will be laid at various points upon the company's property during the year to come. Short branches to the centers of business and population may then be constructed from the company's lines.

◆

AN ELECTRIC RACK-RAILWAY to the top of the Jungfrau, in Switzerland, is proposed. The line would be 7½ miles long, starting at Scheidegg, and of this distance about 6 miles would be in tunnel. Grades of 25% are proposed and on the Eiger, the Mouch and other points will be stations selected with regard to scenic features. The maximum speed on grades of 15% and more will be 5 miles per hour, and 5 to 6 miles on other parts. At the foot of the main peak of the Jungfrau an inclined elevator shaft would be operated by electricity, with a lift of 330 ft., leading to the very summit. The estimated cost is $2,000,000, and the project is the outcome of the engineering and financial success of the Mont Saleve electric road, near Geneva. The cars would be lighted and heated by electricity, the latter provision being especially necessary as the average temperature in the tunnel is estimated at 2° to 3° below zero C., to the Mouch, and at from 6° to 10° below from that point to the Jungfrau.

◆

THE ERIE CANAL SEASON OF 1896 lasted seven months. The Collector of the Port of Buffalo says that while the showing of traffic is decidedly superior to that of 1895, it can not be said to be satisfactory. The shipments of grain from Buffalo aggregated 35,868,966 bushels, an increase of nearly 16,000,000 over the preceding year, but nearly 13,000,000 bushels less than the record for 1894. But the grain receipts by the lake at Buffalo for this season are the largest on record, aggregating 154,338,921 bushels, for 1896, exceeding the receipts of 1895 by 51,000,000 and those of 1894 by 57,500,000 bushels. The previous largest record was 132,808,234 bushels in 1893.

◆

A NEW SYSTEM OF VENTILATION has been put in use in the U. S. Senate chamber at Washington, designed by Prof. S. H. Woodridge, of the Massachusetts Institute of Technology. The benches in the visitors' gallery have been removed and theater chairs, with folding seats, substituted. The legs of the chairs are hollow, with perforated sides, and the fresh air for ventilation is distributed through the perforations. The air is furnished by a fan driven by an electric motor, and in warm weather it is first cooled to 60° by an ammonia refrigerating apparatus, depositing its moisture, and is then dried and heated to 70° or 75° by passing over hot water pipes. In cold weather the refrigerating apparatus is omitted and the air is warmed to the desired temperature.

◆

CIVIL SERVICE EXAMINATIONS will be held by the New York Civil Service Commission as follows: Dec. 17, building inspectors of masonry; Dec. 18, inspectors of pier building. Particulars may be obtained from Mr. S. William Briscoe, secretary to the commission, New Criminal Court Building. The Civil Service Commission of Brooklyn, N. Y., is receiving applications for the following positions: Expert civil engineer, chief examiner of plans, expert for steel and iron construction, engineer of sewage purification, superintendent of sewer and water pumping station, inspector of construction of buildings, and inspector of sewers.

MASONRY VIADUCT OVER KINNICKINNICK CREEK; CHESAPEAKE & OHIO RY.

The accompanying illustration shows part of a five-arch masonry railway viaduct built over the Kinnickinnick Creek on the line of the Chesapeake & Ohio Ry., in southeastern Kentucky. This bridge was originally built, in 1856, under the direction of Col. Childs, for the Maysville & Big Sandy Ry. Co. The builder was a Cincinnati contractor, who also constructed the arch culvert over Briary Creek, at Quincy. The railway company failed when the bridge was only partially completed, the arches being sprung and the spandrel filling in place. As the work was not in a condition to stand the weather, Col. Childs, at his own expense, put on enough of the upper courses to preserve the masonry, and the bridge stood in this condition for a number of years. The country people in the neighborhood, sometime in the "60's," built a wooden approach at each end of the viaduct and used the structure as a highway bridge. In 1886 the Chesapeake & Ohio Ry. extended its line to Cincinnati, under Col. Childs as Chief Engineer, and buying out the old charter this company completed the bridge.

Masonry Viaduct Over Kinnickinnick Creeek, Ky., Chesapeake & Ohio Ry.

The viaduct has five full-center arches of about 50-ft. span each, with a width of 8 ft. at the piers, and racked out to a finished width of 12 ft. above by means of projecting courses. The bridge carries a single line of rails with inside iron guard rails. The work is in excellent condition, without a crack in the masonry or a spawled joint and is a fitting monument to the skill of the designer and to the honest work of the contractor.

It is worth noting that the failure of the railway company of 1856 to pay for this masonry caused the financial ruin of this honest contractor. The Chesapeake & Ohio Ry. Co., after coming into possession, 30 years after, sought out the widow of this man and paid in full this old debt. For the view and the interesting notes accompanying it we are indebted to Mr. S. P. Baird, of Portsmouth, Ohio.

◆

THE LATEST AMERICAN BATTLESHIPS.

(With inset.)

At the recent fourth annual meeting of the Society of Naval Architects and Marine Engineers Mr. Philip Hichborn, Chief Constructor, U. S. N., described the special features of the "Alabama" class, the most recently designed of the battleships of our new navy. These features are briefly set forth as follows:

The shallowness of our harbors is one of the first and chief difficulties met with by our naval architects; imposing as it does limitations and restrictions which greatly complicate the general design where so many other elements have to be considered. But the success attained in this direction is quite satisfactory, and in these new battleships the draft is only 23 ft. 6 ins. at their normal displacement, with all outfits and two-thirds supply of stores, ammunition, etc., on board, and 800 tons of coal in the bunkers.

The freeboard forward is increased, as contributing not only to the sea-going qualities of the vessel, but as also giving additional berthing space in the forecastle deck provided, and this increase in height lifts the axis of the forward turret guns and enables them to be worked in almost any weather. In the matter of speed, our designers believe that it is not desirable, in battleships, to sacrifice other and essential qualities to obtain the high speed aimed at in some foreign navies. The highest speed heretofore adopted in fleet tactics with these vessels does not exceed 12 knots; while the "Alabama" class is designed for 16 knots, thus still greatly exceeding the speed called for in the actual operations of war. On the other hand, the contract speed required in our new ships must be steadily maintained for four hours, and is not a mere measured mile record such as is demanded for foreign ships.

The framing of the new battleships differs slightly from that in vogue in other vessels of this class in our navy. The main frames are continuous from the keel to the armor shelf, and again from the armor shelf to the deck. The longitudinals are, of course, continuous, their lower edges being scored over the main frame angles and the lower angles of the longitudinals being worked intercostally. The upper angles of the longitudinals, however, are continuous while the reverse bars are worked intercostally. Between the frame angles and the reverse bars are worked bracket-plates of uniform width, flanged at one end so as to connect with the longitudinals, and also flanged at the other end to give local stiffness. In this manner great rigidity is given to the floors, and there is less liability to damage in grounding or in docking. The flanged floor plate provides greater strength with less weight. Docking keels are provided, and the bilge keels are narrowed down to nothing as they approach the midship section, thus forming no obstruction in passing the gateway of the dry docks. The continuous bilge keel would be preferred for increased resistance to rolling and diminished resistance to progress through the water; but dry-docks impose limitations in this direction, and the plan adopted is a compromise.

In the arrangement of coal-bunkers especial care has been taken to provide easy storage and accessibility for firing, while affording good protection for the boilers. A distinct departure is made in setting the boilers athwartships instead of fore and aft, as in former practice. The advantages of the new arrangement are the increased and excellent facilities for firing and easy communication between the fire-rooms.

The hull is protected against injury at the water line by heavy tapering armor of a maximum thickness of 16½ ins., extending from 3 ft. 6 ins. above to 4 ft. below the normal load water-line. The maximum thickness covers the entire length of the engine and boiler spaces; from the forward cross coal-bunker bulkhead the thickness is gradually reduced to 4 ins., and this thickness is maintained to the bow. At the top of the armor belt, and covering the engine and boiler spaces, is a flat protective deck, 2¾ ins. thick, worked in three layers and extending from side to side of the ship. This deck is tap-riveted to the upper edge of the side armor. Forward of the machinery space, however, the protective deck is turned down to the armor shelf level, so that any projectile passing through the vertical armor would have to encounter a sloping deck 3 ins. thick. Aft of the armor-belt the protection deck is inclined in a similar manner, except that this deck is 4 ins. thick to better protect the steering gear. Where this protective deck is inclined at the sides, coffer-dams are provided, 3 ft. wide, and extending to the top of the armorbelt, and packed with corn-pith cellulose compressed to a density of 6 lbs. per cubic foot. To meet a raking fore or aft fire, and to protect the boilers and engines, the opening between the flat deck and the sloping sides is closed at each end by diagonal armor bulkheads, 12 ins. thick.

From the top of the thick belt, extending to the main deck, the hull is further protected by a belt of 5½-in. armor, extending from barbette to barbette, and ending in diagonal bulkheads on a line with the 12-in. armor below. Within the limits of this belt the broadside torpedo tubes are placed. Inboard of this 5½-in. armor, and extending well forward and aft, are other corn-pith cellulose coffer-dams, 3 ft. high by 3 ft. wide, with the top of these dams 6½ ft. above the load water-line. Between the main and upper decks, and from the forward barbette to a point just forward of the after turret, the side of this ship is protected by 5½-in. armor, with diagonal armor terminations. Within the armor are placed eight of the 6-in. rapid-fire guns. The central part of the ship is thus completely enclosed in a continuous wall of armor, extending from 4 ft. below load water-line to the level of the upper deck, about 23 ft. in all, with the walls nowhere less than 5½ ins. thick. As additional security, 1½-in. splinter bulkheads are placed between each pair of 6-in. guns; and the other 6-in. guns on the gun deck forward and on the upper deck amidships are protected by special armor 6 ins. thick and curved to protect against a raking fire. The conning tower is protected by 10-in. armor, and it is connected with a central station below the protective deck by a tube with walls 7 ins. thick. In addition to the forward conning tower there is a signal tower at the after end of the superstructure deck, with walls 6 ins. thick.

In the character and arrangement of the battery decided changes have been made. The 8-in. battery has been entirely abandoned and only two calibers of heavy guns are used, 13-in. and 6-in. The special board on battery arrangement, to which this question was submitted, decided that the use of an intermediate caliber was unnecessary and complicated the arrangement for ammunition supply, and the arrangement adopted is in line with recent foreign practice. The main battery includes four 13-in. guns, mounted in pairs in forward and aft turrets placed on the midship line, and protected by 15-in. armor with 17-in. port-plates. The ammunition hoists and revolving gear for the turrets are protected by barbettes 15 ins. thick, except over the arc within the diagonal armor, where it is reduced to 10 ins. to save weight. The turrets are oval in shape, with the front plates slightly inclined, and the rear plates vertical to give more room for loading. The center of gravity of the turret is in the axis of rotation, so that the turret is balanced and can be turned without serious retardation when the ship has a heavy list.

The forward turret is at the level of the forecastle deck with the axis of the guns 26 ft. 6 ins. above the normal load water-line. The after

CTION.

AN.

T THE "ALABAMA" CLASS.

chborn, Chief Constructor, U. S. Navy.

Naval Architects and Marine Engineers.)

CHAS. HART & SONS, LITH., 36 VESEY ST., N. Y.

turret is on the main deck, with the axis of the guns 19 ft. above the same water line. Each pair of guns sweeps an arc of 135° from the midship line. Three sighting hoods are provided for each turret; one in the middle for the turret-turner, who simply keeps the guns pointed at the target, and two side hoods for the gun-pointers. The eight 6-in. guns in broadside have a total arc of train of 90°, and are each protected by 3-in. shields on the carriage and the 5½-in. armor of the sides. The auxiliary battery consists of 17 6-pdr. and 6 1-pdr. guns, mounted wherever they obtain good command and are yet clear of the blast from the heavy guns. Four broadside torpedo tubes, in the 5½-in. armor, complete the armament of these ships.

Mr. Hichborn gives the following table, showing the weight of fire of one discharge, neglecting the auxiliary battery, from all the guns available for the bearings given and for several classes of our war ships:

Class.	Ahead or astern, lbs.	Bow to quarter, lbs.
"Alabama"	2,400	5,100
"Kentucky"	2,700	5,750
"Iowa"	2,766	4,499
"Indiana"	3,400	5,600

This weight of discharge is obtained from the following primary and secondary batteries, the auxiliary battery being added for comparison:

	Batteries.		
Class.	Primary.	Secondary.	Aux'lary.
"Alabama"	(4) 13-in. B.L.R.	(14) 6-in. R.F.	(17) 6 pdrs. (6) 1 "
"Kentucky"	(4) 13-in. " "	(14) 5-in. "	(20) 6 " (6) 1 "
"Iowa"	(4) 12-in. " "	(6) 4-in. "	(20) 6 " (6) 1 "
"Indiana"	(4) 13-in. " " (4) 8-in. " "	(4) 6-in. "	(20) 6 " (6) 1 "

The general dimensions of the battleships of the "Alabama" class are given as follows:

Length on load water line	368 ft. 0 ins.
Length over all	373 " 9 "
Breadth molded	72 " 0 "
Breadth extreme	72 " 2½"
Freeboard forward	20 " 0 "
Freeboard aft	13 " 3 "
Freeboard amidships	19 " 10 "
Mean draft (800 tons coal, ⅔ stores, ammunition)	23.6 ft.
Corresponding displacement	11,520 tons.
Speed, per hour	16 knots.
Steam power	10,000 I. HP.
Mean draft (1,200 tons coal, all stores, etc., on board)	24 ft. 7 ins.
Corresponding displacement	12,140 tons.

General Schedule of Weights.

	Tons.
Hull and fittings, including wood-backing, etc.	4,918
Armor and bolts	2,719
Protective deck armor	593
Armament and two-thirds ammunition	864
Equipment and two-thirds stores, water, etc.	498
Machinery, with water	1,128
Normal coal	800
Total	11,520

The main propelling engines will be of the vertical, inverted cylinder, direct-acting, triple expansion type, and they will be placed in two water-tight compartments, separated by a middle line bulkhead. The propelling air-pump and circulating pump engines will have a collective power of 10,000 1 HP., at 120 revolutions per minute. The cylinders are 33½, 51 and 78 in. in diameter and 48 in. stroke; there are 7,000 sq. ft. of cooling surface in main condensers and 800 sq. ft. in auxiliary condenser. There will be 8 single-ended steel boilers of the horizontal-return fire-tube type, placed in four water-tight compartments. These boilers have the following general dimensions:

Length	9 ft. 11¼ ins.
Diameter	15 " 6½ "
Working pressure, per sq. in.	180 lbs.
Total heating surface for all boilers	21,000 sq. ft.
Total grate surface	685 " "
Number of furnace flues	4
Diameter of flues	39 ins.

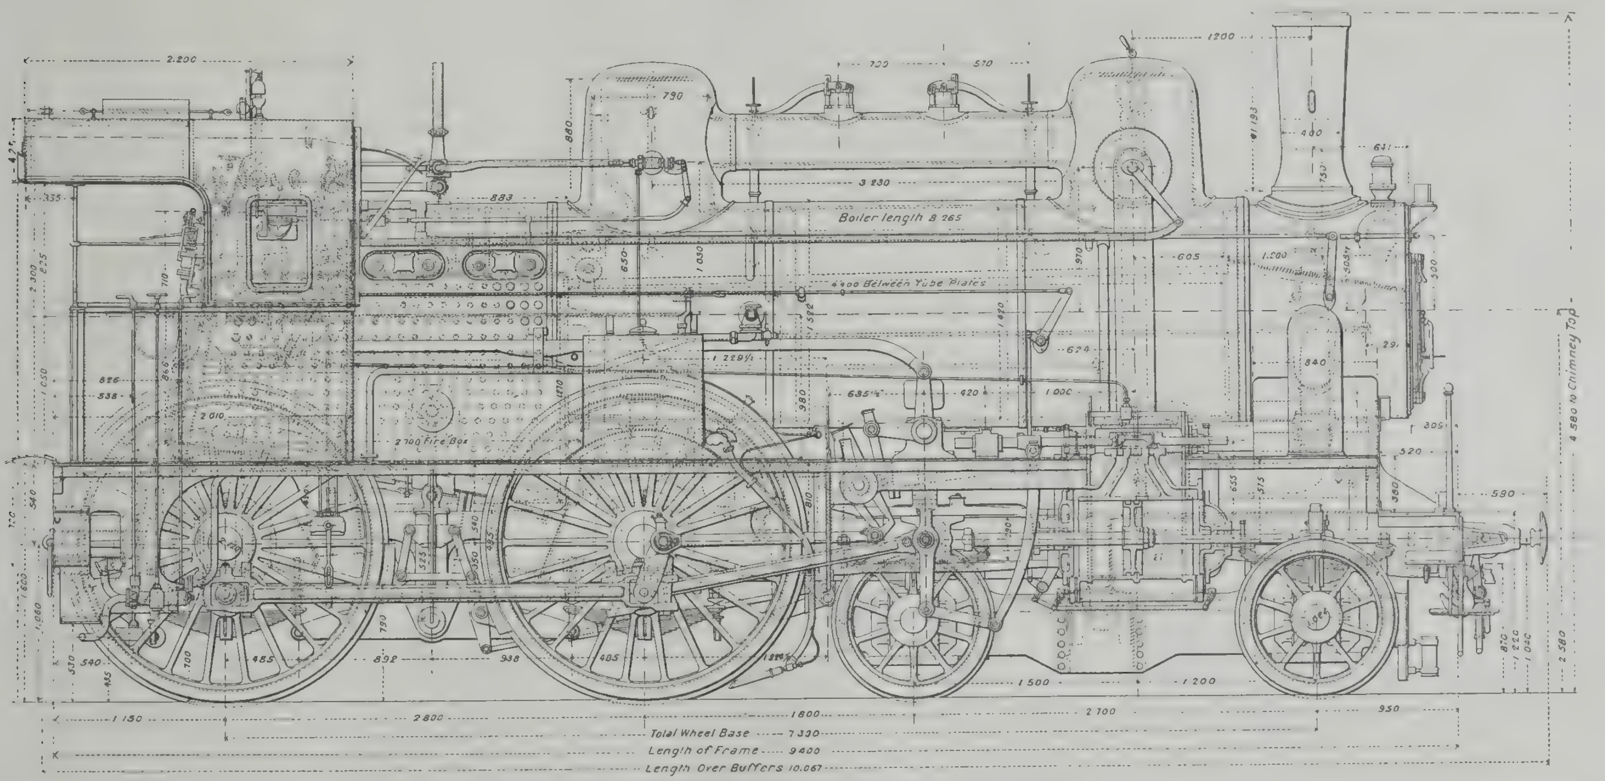
An interesting table herewith compares the "Alabama" type with the recently built battleships of foreign nations.

◆

TWO-CYLINDER COMPOUND LOCOMOTIVE; AUSTRIAN STATE RAILWAYS.

The compound locomotive continues to grow in favor on the railways of continental Europe, and we illustrate herewith one of a large number of two-cylinder compound express engines, designed by Mr. Golsdorf, Superintendent of Motive Power of the Austrian State Railways, and built by the Wiener Locomotiven Fabriks-Actien Gesellschaft, of Florisdorf, Austria. The details of the compounding arrangement are on the Golsdorf system, which has recently been applied to a freight engine of the Pennsylvania R. R.

The engine shown is of the eight-wheel type, with a long truck wheel-base, and is of considerable weight and power, designed for heavy express service and for hauling the Oriental Express (from Paris to Constantinople) between Vienna and Linz. The trains average from 15 to 18 cars, or about 240 tons behind the tender. The general style of the engine is shown in the accompanying cut, reproduced from the London "Engineer." The boiler is of large capacity, and has two domes of 102 cu. ft. capacity connected by a horizontal pipe 11¾ ins. diameter, on which are mounted the safety valves. The throttle is in the forward dome. No special starting valve is used, but steam inlets are bored in the faces of the low-pressure steam chests and controlled by a special form of slide valve. The general dimensions of the engine are as follows:



COMPOUND EXPRESS LOCOMOTIVE; AUSTRIAN STATE RAILWAYS.
The Wiener Locomotiven Fabriks-Actien Gesellschaft, Builders

Running Gear:	
Driving wheels (4), diam.	6 ft. 11½ ins.
Truck wheels (4), diam.	3 " 4¼ "
Tender wheels (6), diam.	3 " 4¼ "
Journals, driving axles	7⅞ × 10½ "
Journals, truck axles	7⅛ × 9⅝ "
Wheel Base:	
Driving	9 ft. 2 "
Truck	8 " 10 "
Total engine	23 " 10¾ "
Total tender	10 " 5¾ "
Center of truck pin to c. of leading driver	10 " 0 "
Total length of engine	33 " 0 "
Weight in Working Order:	
On driving wheels	63,392 lbs.

Size of l. p.	29 × 26¾ "
Distance center to center	6 ft. 3⅜ "
Piston rod, diam.	3¼ "
Connecting rod, length between centers	6 ft. 5 "
Boiler:	
Diameter of barrel inside (largest ring)	4 ft. 9 ins.
Thickness of barrel plates	9-16-in.
Height from rail to center line	8 ft. 5½ ins.
Length of smokebox	3 " 11¾ "
Working steam pressure	190 lbs.
Domes (2), height	2 ft. 10½ ins.
Firebox:	
Length inside	8 ft. 3½ ins.
Width inside	3 " 8½ "
Depth at front	5 " 0¾ "
Depth at back	3 " 9 "
Thickness, side and back plates (copper)	½ and ⅝-in.
Thickness of tube sheet (copper)	½ and 1 in.
Grate area	31.2 sq ft.
Tubes: Material, steel; No.	205
Diameter outside	2 ins.
Length between tube plates	14 ft. 5 "
Heating Surface:	
Tubes	1,554.8 sq. ft.
Firebox	118.3 "
Total	1,673.1 "
Miscellaneous:	
Smokestack, diam. bottom, 1 ft. 3⅝ ins; top, 1 ft. 6¾ ins.	
Smokestack, height	4 ft. 2⅛ "
Smokestack, height from rail to top	15 " 0 "
Capacity of tank	4,422 gallons
Capacity of coal space	11,650 lbs.

◆

FRICTION HORSE-POWER IN FACTORIES.*

By C. H. Benjamin, M. Am. Soc. M. E.†

During the winter of 1895-96 a series of experiments were made under the direction of the writer to determine the ratio of the power required to drive shafting and belts in various factories in this city to the total power consumed. In the course of these investigations visits were made to 16 different establishments, comprising rolling and stamping mills, bridge works, general machine works, and screw factories.

---

*A paper presented at the New York meeting of the American Society of Mechanical Engineers.

†Professor of Applied Science in the Case School, Cleveland, O.

Indicator cards were taken from the engine during the day, at intervals of about one hour, while the factory was in full operation. During the noon hour or after working hours at night, cards were taken from the same engine when it was driving line and counter shafts only, no machines being in operation. Averages of these two sets of cards were assumed to show respectively the total horse-power and the friction horse-power of that establishment.

During the day the observers measured the lengths, diameters, and speeds of rotation of the line shafts, estimated the number and lengths of bearings, and noted the method of oiling. They also counted the belts running from line shafts and estimated their widths and the average diameter of pulleys. The number of counter shafts was noted, and the number and character of machines in operation. As far as possible an estimate was made of the actual number of men at work with machines during the day. These are the data which seemed to the writer most likely to be useful in determining the power consumed under various conditions, and while a great degree of accuracy in all the estimates was not practicable, the average results will be reasonably close to the truth.

The tabular form is best adapted to comparisons of this nature, and the accompanying table is largely self-explanatory.

The first main column of the table gives simply the data on which were based the calculations with regard to each factory. In all the tables the establishments are arranged according to the character of the work done in each. The next four columns show how the horse-power was divided between the machinery and the shafting and belts.

The percentage of power lost in overcoming friction depends more upon the arrangement of the shafting and machinery than upon the particular character of the work done. For instance, in the case of Works No. 4, there are two one-story buildings, covering considerable territory and containing machinery distributed at wide intervals. The power is transmitted from one shop to the other by a long shaft, and there are numerous transverse shafts driven by bevel gears. This would seem to be one of those cases where electrical transmission would be a good investment. A somewhat similar condition of things exists in Works No. 3.

The record of the shafting at Works No. 13 is remarkable, especially when it is noted that the works were running at only one-quarter their capacity. As the machinery is of the automatic type, very compactly arranged, the conditions are about the same as in several other shops visited; but an inspection of the shafting shows that great care has been exercised in its construction and operation. It is in perfect alinement, runs in cast iron boxes, without babbitt metal, and supported by unusually rigid hangers, while it is oiled by hand instead of by wick-oilers. That these conditions do not always obtain is shown by the remark made to the writer by the superintendent of one of the establishments visited, who said that he wished the test could be repeated, as after the first visit he had examined his line shafting, and found that one length was about 3 ins. out of line.

It will be seen that the figures for horse-power per 100 ft. and per 100 lbs. of shafting show a wide variation in different factories, since the work of friction is dependent on speed as much as on pressure.

By "HP. per 100 sq. ft. of shafting per min." is meant the friction horse-power was divided by the number of hundreds of square feet of shafting surface passing a given line in a minute, in much the same manner as the horse power of belting is often calculated. With one or two exceptions the figures in this column are nearly the same throughout, the general average for heavy and light machinery being about .046 HP. per 100 sq. ft.

The horse-power per bearing is nearly as great for light machinery as for heavy, probably on account of the greater speed of the former. The friction horse-power per counter shaft and per belt runs quite uniformly in the two classes of heavy and light machinery, being about three times as much in the former case as in the latter. It seems to the writer that either of these would offer a convenient and reasonably accurate method of estimating the horse-power required to run shafting and belts in ordinary situations.

The results given for the friction horse-power per 100 sq. ft. of belting per minute are more or less approximate, since the average size of the pulleys was rather roughly estimated; but they are as uniform as could be expected. The heavier duty per square foot of belt in the four heavy machinery establishments is partly due to the fact that the belts were thicker and required more power in bending.

The figures in the last two columns were worked out from the useful horse-power or that required to drive the machines alone, more as a matter of curiosity than with any expectation that they would be useful.

The figures for "Useful HP. per machine" are not nearly as uniform as those for shafting, since machines vary much more widely in construction than do line and counter shafts. In fact, it is not possible to give any average or state any rule that would be of value in special cases. The same may be said of the results in the last column, which show that any rule for estimating horse-power from the number of men employed would have a very narrow application.

Conclusions.

One would naturally inquire, after looking at the averages in the table, if it is necessary that from 55 to 65% of the power generated by the engine should be absorbed before the machines are reached. The isolated case of Works No. 13 would seem to answer this question.

One explanation of the large loss by friction in many shops is the fact that economizing in either quantity or quality of oil has at once a favorable effect on the bills, while the corresponding increase in coal and water consumption may be unnoticed or attributed to other causes. This is a case of saving at the spigot and wasting at the bung.

Where the loss is due to a necessarily extended and complicated system of shafting, it would be wise to determine if electrical transmission of the power would not be cheaper in the end.

No doubt it is true that to-day the question of time is more important than that of power, and that, in the endeavor to get the most product per machine and per man, the minor subject of coal and water consumption has been overlooked. This is, however, the age of small economies—economies that would have been laughed at a generation ago, and no manufacturer can afford to neglect the losses shown in these experiments.

It seems to the writer that in ordinary machinery establishments an observance of the following rules might effect a saving that would be noticeable in the annual balance.

1. Use pulleys of large diameter on counters and narrow fast-running belts.

2. Use nothing but the best oil and plenty of it, catching all drip, and either purifying it or using it for some other purpose.

3. Have all the shafting and counters oiled regularly, and do not depend too much on automatic oiling.

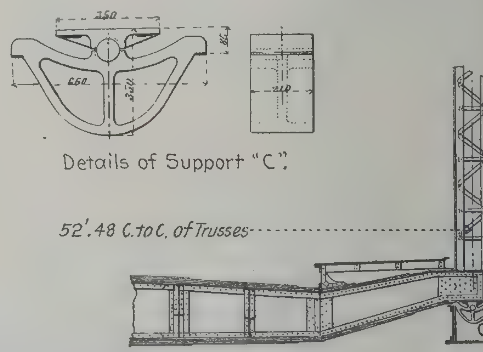

Fig. 2.—Detail of Support for Floor Beam at Vertical Posts.

4. Inspect line shafts from time to time, and see that they are in line and can be turned easily.

Many line-shaft boxes bind at the sides when screwed down, sometimes increasing the turning moment 100%.

TABLE SHOWING RESULTS OF TESTS OF THE LOSS OF POWER BY FRICTION IN 16 MANUFACTURING ESTABLISHMENTS OF CLEVELAND, O.

No.	Nature of work.	Total length of line shaft, ft.	Diam. of line shafts, ins.	Revolutions per minute.	No. bearings.	No. of belts.	Ave. width of belts, ins.	No. counters.	No. machines.	No. of men. A NOVEL FRENCH HIGHWAY BRIDGE.

We reproduce herewith from "Le Genie Civil," the general elevation and several details of a highway bridge of French design which is somewhat novel in one or two features. This structure is located in the city of Paris, and carries an important street over the tracks of the Orleans Ry. The conditions required that the dimensions and number of supports, or piers, coming in the railway yards should be as small as possible, and also that the street level should be raised no more than

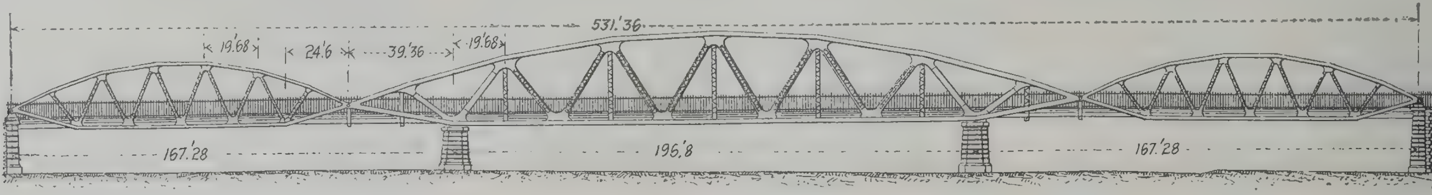

FIG. 1.—GENERAL ELEVATION OF HIGHWAY BRIDGE OVER ORLEANS RY.; PARIS, FRANCE.

was absolutely necessary to give head-room to the trains passing under the bridge.

Fig. 1 is a diagram elevation of the bridge as constructed. As will be noticed, the trusses of the center span are continuous over the piers and carry the inner ends of the side spans. The loads coming on the center span outside of the supports or piers produce, of course, stresses in the members of that span contrary in character to those produced by the loading between the piers. In the fewest words, the bridge is practically a continuous girder bridge, and the principle of the continuous girder, as far as the stresses are concerned, is applicable to the center trusses. The design goes further, however, and attempts to secure, besides the reduction of stresses peculiar to the continuous girder, also freedom from the danger of settling piers, by making the connections of the side and center girders flexible pin connections. The general character and purpose of the design is plainly indicated by these statements and need no further explanation except, perhaps, to state that the lack of rigidity which would naturally be expected on account of the flexible joint has not been shown in the completed bridge, probably on account of the floor being a solid iron plate floor and also being placed well below the joint.

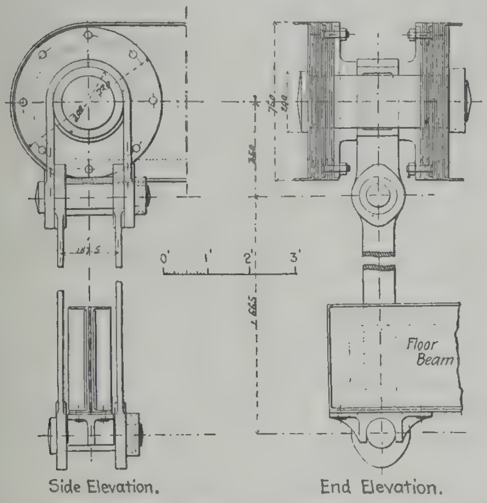

Fig. 3.—Floor Beam Hanger at Junction of Side and Center Spans.

The top chord of all the trusses is polygonal, and the bottom chord is straight, except at the end panels, where it bends up to meet the top chord. Both bottom and top chords are box girders, made up with plates and angles, and all the web members are latticed channel shapes, made up of plates and angles. The trusses are spaced 52.48 ft. apart, c. to c., and provide for a 32.8-ft. roadway and two 8-ft. sidewalks. Floor beams are placed at each panel point and also at the foot of the verticals in the center span. The manner of supporting the floor beams at these vertical posts is shown by Fig. 2, and Fig. 3 shows the hangers carrying the floor beams at the junctions of the side and center spans. This last illustration also shows quite clearly the character of the pin connection at this point.

This bridge was designed and constructed by the Department of Public Works of the city of Paris, M. de Tavernier, Chief Engineer.

◆

PROGRESS IN THE MANUFACTURE OF IRON AND STEEL IN AMERICA.*

Prior to 1838 the manufacture of pig iron was in a primitive condition, that metal being practically all made in charcoal furnaces, producing from 15 to 30 tons per week, and was converted into wrought iron in the old-fashioned charcoal fires, and was shaped into blooms for the rolling mill, and into bars for the smith, by a helve hammer. The furnaces, forges and mills were all driven by water power, and were kept in order by what was sometimes called a forge carpenter, or millwright. At this time the mills were all geared, the shafts being square, hexagon, or octagon, according to the fancy of the millwright; the wheels were secured on the square shafts by wooden blocks, and in them were driven thin iron wedges; the segments of the wheels were secured to the center in the same manner; the rolling houses were all set on wood. All this crude machinery the millwright was called upon to keep in good running order; consequently he became an important man.

In 1840 the use of anthracite coal and coke in blast furnaces was commenced. This required a much higher pressure of blast. Previous to this time the blowing cylinders had been made out of wood, the pressure of blast being very low, not exceeding 1½ lbs.; hence a great improvement in blowing machinery became necessary.

In 1842 puddling began to come into more general use, and puddling trains had to be built, and better merchant or bar trains were now required; they were all geared and gave much trouble. The machinist now had to be called in to help keep things in shape, and he soon took the millwright's place, and laid the foundation for the mechanical and metallurgical engineer.

In 1845 the rail mills were being built, and stronger and better workmanship was required. These mills were all geared, but the shafts were generally turned up, and wheels all bored out, and fitted up in a much better manner, which required more skill and better workmen. Puddling now became an important branch of the iron business, and the Old Harry was generally to pay to get the balls in proper shape; to do this mills were using the old Welsh hammer. Numbers of squeezers were tried and failed; finally the Burden squeezer was invented, and adopted by the mills generally, and to this day is the best machine that has ever been devised for the purpose.

In or about the year 1848 "boiling" came into use, which was a great improvement over ordinary "puddling," and gave a new impetus to the trade. From 1848 to 1856 there was no great change or marked improvements made in the business. In 1857 the three-high rail mill was successfully introduced, and in a very short time practically revolutionized the manner of rolling rails. From this time on all the new mills that were built were driven direct, without gearing, and much stronger and better in every way. It was during this time that the great changes and improvements were being made in rolling-mill and blast-furnace machinery, and also in machine-shop tools of all kinds, which enabled much better work to be turned out than had been previously possible; and this was an advance for the mechanical engineer, and prepared him for the great work that he was soon to be called on to accomplish.

In 1864 the Bessemer process was introduced, and it soon became evident that it would in a short time revolutionize the iron business. Its introduction and perfection will ever remain one of the most interesting and important epochs in the whole history of the iron business.

In order to show what the Bessemer process can do in coal and labor, as compared with puddling, the former can produce in 10 minutes ten tons of steel ingots, with a consumption of 1 ton of coal. It will require a puddling furnace ten days, with practically three men, to produce a like amount of puddled iron, and will require about 20 tons of coal. The puddling is a hard, laborious and exhausting occupation. With the Bessemer it is care and attention only, but that it must have.

We left the blast furnaces in 1840, making 15 to 20 tons per week, and produced in that year 286,903 gross tons. In 1895 we have furnaces producing between 2,000 and 3,000 tons per week, and others building that are expected to make much more. The total output in 1895 was 9,446,308 gross tons, which exceeds the quantity made by any other nation.

It was the marvellous increase in the production of iron and steel which took place after the year 1865 that gave such a remarkable impetus to the engineering trades. The demand for Bessemer pig iron caused new blast furnaces to be built of much larger size than formerly. The blowing engines were required to be of much greater capacity and more powerful. The material used in the construction of these furnaces stimulated other branches of business, in many instances beyond their capacity. When the Bessemer process came into use blooming mills had to be built, new rail mills, billet mills, and plate mills; in fact the introduction of Bessemer rendered the old iron rolling machinery practically useless; consequently new, heavier, and more powerful mills had to be erected.

The rail mills, with one exception, are three-high, and fitted up with tables arranged for automatically handling the work, and they are equipped with every facility that will quicken and cheapen the handling of the material. In 1866 the Siemens open-hearth furnace for making steel was introduced, but it was some time before it came into general use; the Bessemer for quite a while held it in check. To-day it occupies an important position, and, in connection with the Thomas basic process, one of the great metallurgical inventions of the age, is sure to become a strong competitor of the Bessemer process. When I allude to the Siemens open-hearth furnace I do not mean that their form of hearth and ports should be strictly adhered to, as there are other styles of furnaces which have their advocates; among them are the partial revolving hearth, which so far has shown good results, and it certainly has advantages over the fixed hearth. What I refer to is the Siemens regenerative principle, which is truly scientific and yet perfectly simple in its construction, and so far is the only method by which the metallurgist has been able to secure the heat necessary for making steel on the open-hearth plan; and all steel-melting furnaces, of whatever form the hearth has been constructed, use the Siemens regenerative principle. Much as I admire the Bessemer process and well know what can be accomplished with it, yet, if the users of steel insist on lower phosphorus, it will have to be made in the open hearth, and by the Thomas basic process, as the ores that will make steel of high grade by either of the acid processes are, so far as known, quite limited; and the Thomas basic Bessemer requires high phosphorus, as the pig iron should have at least 2%, and this is more difficult to obtain in quantity than the low is for the acid processes. Steel can be made in the open hearth, on acid lining, quite low in phosphorus, but at a greater cost, as you must start with first-class material, while the basic might be called a kind of scavenger. I do not say this in a disparaging sense, but, on the contrary, a material that is perfectly useless (so far) in either of the acid processes, can be utilized, and a fairly good steel can be made out of it, by the basic process, and it is this quality which makes it such an important improvement in the science of metallurgy. It is, however, like all other processes; if you want to make a good article you must have the proper material to start with. Now, while it is being rapidly introduced in many parts of the country, I think it proper to say that there are large users of steel of high quality that will only use the acid open hearth.

There are several other forms of steel-making furnaces, among which are the Pernot and Ponsard; both of them were designed for more rapid working. The former has an inclined rotating hearth, which keeps the metal in motion, and is supposed to work more rapidly than the fixed or stationery hearth. The later (Ponsard) is in its construction very similar to the Pernot, it being designed to work more rapidly than the Pernot, and introduces blast same as Bessemer, thereby combining the two processes by blowing the metal partially, and then finishing it by the Siemens process. Both systems use the Siemens regenerative principle.

Having given you a very brief account of the progress of the iron and steel industry from its infancy up to the enormous production in 1895, I shall now endeavor to show the wonderful changes that have been made in machine tools and shop practice.

I look back to my early days in the shop, now nearly 60 years ago, and call to my mind the equipments of the shop in the way of tools, and compare the facilities for making drawings of to-day with those at that time, when the complete outfit consisted of a board, a carpenter's square, a pair of compasses (as we then called them), a bevel, a lead pencil and a piece of chalk, and a jack plane to prepare the board for another drawing. After a time we adopted the plan of making models in skeleton, full size, especially when any motion was to be worked out, and also made, when it was possible, all the drawings full size; when too large to admit of this we would make important sections full size, and this practice I am not ashamed to follow at the present time, as it has many advantages.

The small shop tools for a lathe consisted of a hook tool with a sharp tit on the bottom to hold it on the rest (which was made of soft wrought iron); the tool was made out of a steel bar about ½ by ¾-in., generally put in a wooden stock some 2½ ins. in diameter, with a handle on the lower side. In addition to the tool just described, there was a finishing tool made in the shape of a spike-head, cutting edge on both sides, one to do the cutting or finishing, and the other to keep it in position on the rest; it also had a wooden handle, but of different construction from the handle of the hook tool, as it was held against the shoulder instead of under the arm; next was a chaser, and last, as usual, was the "doctor," to cure in a measure "drunken threads," which frequently occurred. The small tools consisted of a pair of outside and an inside pair of calipers, a file, and a steel straight-edge (home-made), 12 ins. long.

Now let us for a moment note the equipments of a modern machine shop for comparison. First, they have the great drawing room, and a good corps of men well skilled in their art, and are equipped with everything that is essential for producing work correctly and with rapidity, having special small tools for all purposes. The accuracy with which their round gages are fitted up is such that a machinist of 50 years ago could not possibly realize how it could be done.

The Bethlehem Iron Company has four lathes in use, all of the same pattern; one of them is used for what is called a cutting-off lathe, and frequently employs twelve tools, six on each side, made out of the best steel that can be had, size 1 in. by 6 ins., and are forced to cut all they will stand. These lathes have had work in them weighing over 190,000 lbs. They have planers that have finished castings that each weighed 165 tons, and the finishing of nickel-steel armor-plate requires tools of great power and special design.

In speaking of the manufactured products of iron and steel, I shall take up first the subject of forgings made of iron. These were originally made out of fagots (bundles of iron bars) heated in a reverberatory furnace, and welded and shaped under a hammer which was generally too light; the force of the blow did not reach the centre, and the result was that forgings of any considerable size were unsound in the middle. This occurred to such an extent that, in my early connection with machinery, I discarded forged shafts entirely and substituted cast iron melted in an air furnace, and continued to use it, with one single exception, until we learned how to make, heat, forge, and treat steel in such a manner as to practically get it solid and free from internal strains, and was ready to recommend it as the proper material for shafts and miscellaneous forgings.

---

*Presidential address of John Fritz, delivered at the annual meeting of the American Society of Mechanical Engineers (slightly condensed).

I shall now refer to the single exception which I have before alluded to, believing a brief description of the shafts, and giving the reason why I used wrought iron and steel in place of cast iron, which had served me so well for a period of nearly fifty years, will be both interesting and instructive to you all, as it was to me at that time. First, the reason for using wrought iron and steel in place of cast iron was, I wanted a three-throw crank for a three-cylinder engine, and had to use a built-up crank; at that time a solid forged crank of such dimensions as was needed could not have been made in this country. The stroke of the engine being short, reduced the distance from center of shaft to the center of crank pin to such an extent that I was compelled to reduce the diameter of the shafts to the smallest size consistent with safety in order to get sufficient metal between the holes in the crank to give the required strength. Steel at that time being more expensive than wrought iron, it was economy to use iron when it would answer the purpose. I concluded to use steel for the main shaft and the first crank pin, and for the others wrought iron. Not having at that time any overflow of confidence in either forged iron or steel shafts, and being anxious to get the best that could possibly be had, I consulted a friend who was using steel as to where was the best place to go for the steel shaft and crank pin, and took his advice and so ordered them. The iron shafts and crank pins were from what I considered at that time, the best forge plant in the country.

Having had some previous experience in a small way with both metals, and the results not being altogether lovely, I thought it prudent to see in what condition the metal in the center of these forgings was. In order to show this, a hole about 4 ins. in diameter was bored through the center of them all, seven in number, and all were unsound in the center; in the iron the imperfections ran longitudinally, and the 4-in. hole practically cleaned them out. The steel shaft, which was about 14 ins. in diameter and some 12 ft. in length, proved unsound in the 4-in. hole, and showed serious imperfections in the form of large cracks or openings running, as it were, circumferentially on the inside of the shaft; the hole was enlarged to about 6½ ins. in diameter, and some of the imperfections were still visible. The position of the shaft was such when in use that, should it give way, it would not be likely to do any serious damage, so we concluded to use it. When the hole was bored through the steel crank pin it showed so badly that we split it in two lengthwise. It was full of cracks, some of them extending almost to the outer edge. Its condition was frightful to a person who was contemplating the building of a large plant for the purpose of making steel forgings, as I was at that time.

My experience in making steel, in heating, rolling, and forging, had already convinced me that it would require great skill, and still greater care, to prevent imperfections in the interior of steel forgings, yet I was not prepared to witness anything approaching the condition which the splitting of this forging revealed. The chemical analysis, as I remember, was fairly good. There had been some blow holes in the ingot, as there is in too many of them.

To my mind the trouble was almost entirely due to two causes: first, the ingot had been put into a hot furnace and heated up too rapidly, pulling the center apart, causing internal ruptures; secondly, by being forged under a light hammer, in all probability using steam on top of piston, which gives a quick stroke, and does not give the metal time to flow, or the force of it to reach the center of the ingot, consequently elongating the outside more rapidly than the interior; and the imperfections, whatever they may be, are always the weaker parts, and the effect of the blow on the outside elongates them, as it were, by pulling them apart more rapidly than the sound outside of the ingot; consequently the imperfections were greatly augmented.

Mr. W. F. Durfee, in a paper read before the Franklin Institute on the "Conditions which Cause Wrought Iron to be Fibrous and Steel Low in Carbon to be Crystalline" —and a most admirable paper it is, and one which every maker and user of steel should read, and study, in regard to unsound ingots—says:

> It is a common opinion that one of the reasons why steel forgings are often found hollow in the interior is the failure to work them under a sufficiently heavy hammer, but no hammer, not even the hammer of Thor, can do more than aggravate the evil of internal ruptures of ingots in steel.

This is well said, and is a truth that cannot be gainsaid. It was due to imperfect or unsound ingots, lack of knowledge in heating, in forging, and also the want of proper skill to treat the forgings properly, after they were made, that caused so many failures in the early days of its manufacture, which made many people think and believe that there was some mysterious uncertainty in the metal, consequently they discarded its use altogether; and to some extent this impression is still in existence, and, to my surprise, only a short time since quite a prominent engineer said to me that he was still using wrought-iron shafts on account of the uncertainty of steel forgings. To those persons who were using steel low in carbon, for various purposes, I would urge the use of a higher grade of steel, well knowing it would answer their purpose better; but was answered by saying that it required too high a grade of skill to utilize it; they must have a material that any one could handle, consequently the steel was so low in carbon that it was no better than iron, and in many instances not as good. My own early experience having fully convinced me that nearly all the failures were due to the use of improper kind and grade of steel, being too low in carbon, and in most instances so high in phosphorous and sulphur that nothing but failure could be expected, yet it was useless to attempt to convince them that a higher-carbon steel of proper analysis would answer their purpose. They said no; we are going back to iron; we know what that is, and we can trust it. I was told that a machinist had let a locomotive crankpin fall off his shoulder on the shop floor and it broke in two pieces, and I could readily imagine that a condition could exist that would render it liable to break from the most trifling cause. I also was told that in pinching a locomotive back and forth in the shop, in order to set the valves, that a steel crank pin was broken, and many other mysterious cases, as the laymen called them, were reported. At all events the general condition of steel forgings was such that it was not safe to use them where loss of life might result from failure.

I have already alluded to phosphorous and sulphur as most deleterious elements in steel. There are, however, still some people who contend that its presence to an extent not in excess of 0.12 will do no harm in low steel, and I have been told quite recently that a person who posed as a mechanical engineer and a steel maker, endorsed that position. He may be both, but I will take this occasion to put myself on record by saying that I have no use for it in any shape or form whatever, and by keeping it low you can increase the carbon, which is in the right direction for good steel.

Having shown you something of the character, of steel in its early days, and its failures, and the disrepute into which it fell, let us suppose the mechanical engineers, who at that time were the men who had charge of the practical part of the steel business, would have said that steel was no good, and dropped it, and said we will go back to the old concrete of metal and cinder again, it is good enough, then where would we have been to-day? But they did nothing of the kind, and let me tell you the mechanical engineer of that day was not made of that kind of material, for the engineers who, in face of the prejudices of a continent, advocated the substitution of steel for iron, were men who regarded obstacles and prejudices as things which were made to be conquered. He having been on many occasions placed in much the same situation in other lines, had gone far enough to see that there was a valuable germ in it for the future, and, if properly cultivated, was sure to produce great results. What did he do? Took off his coat, called to his aid that all-important adjunct to steel makers, the chemist, and then went to work as he had done many times before when things looked equally discouraging, saying this looks to be a great thing, and we will put it through, and produced the grandest material for construction purposes that the world has ever known, and, as I said before, which will enable engineers to solve great constructive problems, that, but for the improvements in the art of steel making, could not have been accomplished.

The subject of hollow forgings being one in which the mechanical engineer is more or less interested, I will give a brief description of the process, and how the ingot is prepared. Having already told you that the metal is subjected to pressure while in a fluid condition, I will now commence with a cold ingot. It is first examined externally, and if there are no imperfections visible, it is then put into a powerful lathe, and after the proper discard is cut off it is then cut to the proper length, that being determined by the final weight of the forging it is intended for. Next it goes to the boring mill, and is bored out to a size corresponding to the diameter of hole in finished forgings. You now have the ingot (or such part as you want) in the best possible shape for examination; and this is not all, for the center of the ingot is always the most undesirable part of it, and the boring of the hole gets it out of the way entirely. We now have it in the most desirable condition possible for the heating furnace, where it next goes, and it is in the heating that it is exposed to its greatest danger, and where skill and the greatest possible care are required, and it must be charged in a cold furnace, which should be a preheating furnace, and heated up slowly until the heat reaches the center; it is then taken to the forge furnace, and heated slowly and regularly (in order to prevent internal strains), until it reaches the proper temperature for forging. The higher the carbon, the more care is required, especially in the first heating, it being the crucial test, and where the damage is generally done, and if once done, it cannot possibly be repaired. When it is finally brought up to the proper heat it is taken to the press, and a mandrel is put in, and the forging commenced, and this part of the operation requires skill, sound judgment and great care to see that it is worked at the proper heat, and in a manner that will not produce any undue internal strains, and in irregular forgings special care must be taken in shouldering down and in working up flanges or projections, in order to prevent "fins," or excrescences, from forming, that may unnoticed work into the body of the forging. One of the great advantages of hollow forgings over solid is that by boring out the center of the ingot the metal is reduced to less than one-half the thickness of the solid forging, and by using the press, the action being slow, the ends of the forging are convex, showing that the force of the press had reached the center of the metal, while the hammer strikes a quick and sharp blow, affecting the outside of the metal to a much greater extent than the inside or center, consequently the end of the forging is concaved, showing at once the superiority of the press over the hammer. There are other advantages in the use of the press for forging purposes, but time will not permit a proper description of them.

The first shafting made was in 1888. The tensile strength of the steel was about 60,000 lbs., and elongation about 28 or 30% in 2 ins. At that time but little attention was given to the elastic limit or the contraction of area, which is now considered important, especially the latter.

I shall now give you the result of some physical tests in order to show the progress that has been made. First I will give one test of iron as a starting point, it being up to the introduction of cheap steel, the metal of the world. I can only give you the one test, it being the only one available at this time, but it is more than a fair one for comparison of a wrought-iron shaft with one of steel, for no such results could have been obtained from wrought-iron shafts as formerly made. The tests were taken from a puddled bar reworked car axle. The tensile strength in the different test bars taken from this axle vary between 44,000 and 45,000 lbs., the elastic limit between 18,000 and 23,000 lbs., the elongation between 21 and 27%, the contraction of area between 40 and 48%. Compare this with some results obtained in hollow-forged, oil-hardened, and annealed nickel-steel shafting, the physical properties of which are: tensile strength, 95,000 to 100,000 lbs.; elastic limit, 60,000 to 65,000 lbs.; elongation, 20 to 25%; contraction of area, 55 to 60%. It is safe to assume that in shafts of any size a nickel-steel shaft as above would have three times the elastic strength of a wrought-iron shaft, and taking into consideration the fact of hollow forging with judicious proportioning of inside and outside diameter, it would be possible to make a nickel-steel shaft of one-quarter the weight of a wrought-iron shaft, and obtain the same elastic or working strength. The greater contraction of area shown by the nickel steel proves it a safer material against shock, as the greater the contraction the greater will be the amount of local distortion that can take place without rupture. This is clearly shown by the old but still reliable bending test, which is always in proportion to the contraction of area, and not to the elongation, as most commonly supposed.

This nickel-steel test is no fancy one gotten up for show, but was taken from the forging, and was the test the work was actually accepted on, and was taken from a prolongation of the forging of a shaft 17 ins. diameter, and the hole was 11 ins. diameter. You will notice that the shaft which this test was taken from was specially treated by oil-hardening and annealing. While I am fully aware that there are many persons, and some of them high in authority, that doubt the propriety of such treatment, yet when the work is in a proper shape to receive the treatment, and it is made with intelligence and care, my experience has fully convinced me that this special treatment produces the best possible results, and for many purposes it is indispensable. Steel can be made higher in tensile strength and elastic limit than the test referred to, but to some extent it will be at the expense of extension and contraction of area.

Under ordinary conditions the elastic limit is about 50% of the tensile strength. In order to increase this proportion special treatment of the forging is resorted to. The elongation and contraction of area are also increased by treatment, especially the latter, so that with the elastic limit and contraction we have a safe index as to the condition of the metal, and as these two properties vary much less with the length and diameter of test bar, they are more valuable in comparing results from varying sizes of test bar. As the carbon in steel increases, the variation, due to work reduction, becomes less, while that of annealing becomes greater. The variation obtained by treatment increases rapidly with increasing carbon.

Steel .45 in carbon showing:

Tensile Strength.	Elastic Limit.	Elongation.	Contraction of Area.
90,000	45,000	15	40%
By oil-tempering:			
96,000	55,000	18	50%

The above are about the best figures to be used in forging ordinary work. If higher or lower strength is required, it may be obtained by varying the carbon. If increased strength and elastic limit are required, without sacrificing toughness, it may be obtained by using nickel steel.

As illustrative of the advantage of the use of higher carbon steels may be cited the piston rods of steam hammers, especially those of large size, where the strains were found too severe for the softer steels to stand them for any length of time, proving beyond question the value of considering the effect of the fatigue of metals, rather than a rupturing force of sudden application. In view of the above well-known facts it must seem strange that many progressive builders of steam engines still continue to use soft steel rods as an alleged means of safety. In this instance it seems fair to congratulate the bicycle-maker as the first to recognize the value of the development in the manufacture of steel, with all its salient advantages, with regard to combining strength with lightness.

The modulus of elasticity being constant in both high and low carbon steels, cases may arise in structural work where the higher steels, owing to the greater care necessary in working, with the consequent increase of cost, may offer no compensating advantage over the use of softer steels.

In conclusion, the modern practice of steel-making has, in the hands of the mechanical engineer, the metallurgist, and chemist, wrought wonders in producing a material which in quantity, physical qualities, and cheapness, would have been regarded as utterly impossible half a century ago when steel rails, beams, angles and plates were not thought of, and steel was regarded as a luxury of the material of the working artisan. The labor of the men of iron and steel have so cheapened their products that to-day we are enabled to use steel for the commonest purposes as well as for the most expensive articles produced by the skill of the mechanic. No article is too humble to be made of it, and no structure so grand and important as to refuse its services; it is demanded in the frying-pan as well as in the vast bridges and viaducts, as well in the housewife's needle as in the great leviathans that have made the ocean but a span of less than a week; thus we find steel asserting its value through every walk of life, and extending to every clime, linking lands in that bond which grows broader and stronger with the years, till even now we can see, if but dimly, on the horizon the promise of the linking of nations in the universal brotherhood of mankind, and bringing the longed-for era of eternal peace.

TRIAL OF STEAM JACKETS ON A LOCOMOTIVE ENGINE.*

The object of this experiment was to ascertain the advantage gained by jacketing the cylinders of a locomotive engine. The trials were undertaken, and carried out on the Lancashire & Yorkshire Ry. (England), at the suggestion of Mr. John A. F. Aspinall, Chief Mechanical Engineer.

Owing to the fact that these trials were carried out on a locomotive doing its ordinary train service, it was impossible to obtain results as complete and thorough as would have been aimed at had the experimenters been able to make the trials on a special train, the working of which could have been arranged to meet the necessities of the experiment. The trials were of short duration, and the condition of the fires at the start and the finish of each had to be determined by the necessities of the traffic requirements, and could not therefore be varied to suit the wishes of the experimenters. The consumption of steam was obtained with a close approach to absolute accuracy; but the same cannot be said respecting the fuel consumption, owing to the above circumstance with regard to the condition of the fires. The results obtained are therefore not such as will enable any definite conclusions to be drawn as to the value of the steam jacket on locomotives, but they are nevertheless interesting and valuable.

The experiment was made on a passenger locomotive, No. 1093, during its regular work of taking the 7.30 a. m. express train from Manchester to York, a distance of 76½ miles, and returning with the 3.0 p. m. express from York to Manchester. Both engine and tender are the ordinary standard pattern of this railway. The engine is of the eight-wheel type, the driving wheels being 7 ft. 1 in. diameter and the truck wheels 3 ft. 0½ in. The cylinders are inside and horizontal, with their valve chests on the top. The engine wheel-base is 21 ft. 6½ ins., and the total wheel-base of engine and tender 41 ft. 1½ ins. The weight of engine and tender when empty is 56.287 tons, and when in working order 70.925 tons, the tender carrying 1,800 gallons of water. The boiler is of steel, 4 ft. 2 ins diameter and 10 ft. 7⅜ ins. long; the fire-box shell of steel, and the fire-box of copper, 6 ft. long, 4 ft. 1 in. wide and 5 ft. 10 ins. high. There are 220 tubes, 1¾ ins. outside diameter. The heating surface in the tubes is 1,108.73 sq. ft., and in the fire-box 107.68 sq. ft.; total, 1,216.41 sq. ft. The grate area is 18.75 sq. ft., the ratio of heating surface to grate area being 65 to 1. The fire brick arch in the combustion chamber is about 2½ ft. long. The height of the chimney above the fire grate level is 10 ft. The cylinders were originally of the normal pattern, 19 × 26 ins. For this experiment they had been bored out and fitted with cast-iron liners, which reduced the internal diameter to 17½ ins., thus providing a body jacket of ⅜-in. space. The front cylinder covers were fitted with external covers, the space between the two forming a steam jacket. The back covers, however, were imperfectly jacketed by fitting over them, as close to the actual covers as possible, an annular wrought-iron ring with an inner and outer cover, the space between the latter two forming a jacket space. The external surfaces of the end jackets were much exposed, and not well covered. The proportion of the clearance surface jacketed is only about a quarter of the whole, and this is mainly due to the cover jackets; of the back ends, therefore, a large part is hardly jacketed at all, in the true sense of the word.

Four trials were made, lettered A, B, C, D, on Sept. 18 and 19, 1894; A unjacketed and B jacketed on the 18th; C jacketed and D unjacketed on the 19th. A and C were made on the runs from Manchester to York, and B and D on the return runs from York to Manchester. On each trial the weights of coal and feed-water consumed were measured, and readings of the various gages were taken, and the position of the reversing gear was noted. Indicator diagrams were obtained, and in trials C and D samples of the furnace gases were collected from the smoke-box below the exhaust pipe.

Samples of the coal were submitted to Mr. Charles J. Wilson for determining the calorific value in a calorimeter. The mean value from his tests was 14,200 thermal units per pound of dry coal, equivalent to an evaporation of 14.7 lbs. of water from and at 212° F. The coal was placed on the tender in sacks holding 200 lbs. each; and the time of emptying each sack upon the foot-plate was noted, as well as the total weights. An attempt was made to have the fire in the same condition at the end of each run as at the start; but it was difficult to carry out this arrangement, since the trials were made during ordinary runs, and could not be allowed to interfere in any way with the regular working of the traffic. The grades at the two ends of the journey are different, and different fires were therefore needed to ensure adequate steam at the beginning and end of each run. The ashes and clinkers from the smoke-box and fire-box were weighed off at the end of each run, but those in the ash pan were weighed only at the end of each double journey. As each trial lasted only about two hours, errors introduced by variation in the condition of the fire might be thought to bear rather a large proportion to the total coal consumption; but, bearing in mind the rapidity of consumption, amounting to about 50 lbs. or 60 lbs. per sq. ft. of grate per hour, this was probably not the case. The actual coal consumption per indicated horse-power per hour of steaming time in the four journeys was respectively 2.87, 3.07, 2.73 and 2.79 lbs.

The difficult operation of collecting the gases while going at express speed was carried out by Mr. Michael Longridge. They were drawn off through a ¼-in. copper pipe, and then through a rubber pipe into a gasometer containing water, whilst a branch pipe led to a collecting bottle filled with mercury. After drawing off all the air in the pipe connections, the cock on the branch was opened, so that part of the current of waste gases passing to the gasometer could be diverted and collected by displacement over mercury in the collecting bottle. During the outward journey C much trouble was experienced, owing to the heavy chimney-blast; but in the return journey D everything worked quite satisfactorily. The mean results of the three analyses made from the sample collected on each journey are the following volumetric percentages: Trial C, carbonic acid, 12.85%; oxygen, 4.15; carbonic oxide, 0.80; nitrogen, 82.20. Trial D, carbonic acid, 15.10; oxygen, 1.97; carbonic oxide, 0.85; nitrogen, 82.08%. The feed-water was measured by means of a Siemens water meter on the pipe between the tender and the injector. It was originally intended to have a means of making direct measurement of the feed-water. The meter was read at the time of starting from each station, and thus a fair approximation to the rate of consumption was obtained, as well as the total quantity. The overflow from the injector was caught and allowed for. After the trials were over, the meter was sent to University College, London, and tested there by Prof. Beare at rates of flow similar to those in the trials. The error was somewhat variable, but the meter was found to be registering on the average 2.6% too low. In order to be able to correct for differences of level in the boiler, the quantity passing through the meter to raise the level in the gage glasses one inch, for each inch in their height with the engine standing under full steam, was determined by Mr. Donkin after the trials.

The jacket was drained into three small tanks carried upon a temporary staging on the front of the engine; one measurement was made for the two body jackets together, another for the two front covers, and a third for the two back covers. While standing at York on each day radiation tests were made, by measuring the quantity of steam condensed in each pair of jackets with the engine standing, all hot; these lasted 2½ hours on the first day and 1½ hours on the second. The following were the results obtained:

Condensation of steam in jackets, lbs. per hour.

	—While running.—		—While standing.—	
	Sept. 18, B.	Sept. 19, C.	Sept. 18.	Sept. 19.
Two body jackets..	267	241	35.0	26.7
Two front covers...	123	103	16.0	13.7
Two back covers...	65	55	12.0	15.8

The times of passing all the stations were noted, and also the times during which the steam was shut off, in order to determine the actual running time and the actual steaming time in each trial. Whenever a set of indicator diagrams was taken, a note was made of the boiler pressure, of the pressure in the jackets, of the position of the reversing gear, and also of the gradent and mileage.

Indicator diagrams were taken simultaneously from both ends of each cylinder. The springs of the indicators used were not tested for errors, since these would not affect the comparative results of the four trials. Unfortunately no counter was fixed for the trials, as had been intended. The speed in miles per hour was continuously registered by a Boyer speed recorder upon a paper wound on a drum which was driven from the rear truck axle. If this instrument recorded correctly, the circumfrence of the driving wheels being known and all slip neglected, the revolutions per minute of the driving wheels can be calculated. An attempt was made to count the revolutions at the time the diagrams were being taken; but it was found impossible to do this correctly at the high speeds. After much deliberation, it was decided to make a series of tests of the Boyer recorder, by driving it at known speeds, in order that any errors in the diagram it recorded might be ascertained. This was afterwards done by Mr. Donkin.

Comparing trials A and C, both from Manchester to York, the jacketed trial C shows a consumption of 24.49 lbs. of steam per I. HP. per hour against 26.70 lbs. for the non-jacketed run A, or a saving of 8.3% by jacketing. Comparing trials B and D, both from York to Manchester, the figures are 24.48 lbs. and 24.87 lbs. respectively, or a saving of 1.5% by jacketing. Comparing the figures for coal consumption in trials A and C, the jacketed trial C shows an economy of 0.14 per HP. per hour, or practically 5%, the increased consumption per train mile on this run being accounted for by the greater load hauled; the load was 8% greater in C than in A, the average speed being nearly the same in both runs. Comparing trials B and D, however, the jacketed trial B is distinctly less economical, the coal consumption being 0.28 lbs. greater per HP. per hour than in the non-jacketed trial, or 10% more; and the consumption is also greater per train mile. In these two trials, while the weight of train hauled was the same, the speed was nearly three miles an hour greater in the non-jacketed run D, with a correspondingly much increased horse-power.

A WATER POWER PLANT WITH ELECTRIC TRANSmission, in which the water power is developed under a head of 1,000 ft. is in process of construction near Jackson, Cal., by the Blue Lakes Water Co., of 202 Sansome St., San Francisco.

THE NEW UNITED STATES NAVY is fully discussed in the annual report of Secretary of the Navy Herbert. Congress has authorized the present administration to build 28 vessels with an aggregate tonnage of 65,886 tons; of these, 5 are first-class battleships, and 16 torpedo boats. As to the increase of the navy he says that on June 30, 1893, we had in commission 30 vessels aggregating 62,820 tons; on June 30, 1896, we had 40 ships in commission, aggregating 122,528 tons, with 8,165 men and 1,378 apprentices. On Dec. 1, the "Brooklyn" and "Puritan" went into commission, bringing the total tonnage up to 137,859 tons. During the last four years the following guns have been manufactured: 70 4-in., 71 5-in., 6 6-in., 45 8-in., 1 10-in., 8 12-in., and 12 13-in.; and at the present date there are 196 guns in course of manufacture, ranging from 4 to 13-in. In addition to the above, 100 3-in. field and boat guns are on hand. Secretary Herbert recommends the immediate building of three battle-ships of 23 ft. draft, for use in the Gulf and at harbors in the North not admitting vessels of deeper draft, and also 12 more torpedo boats. He advocates the increase of the steam engineering staff to 250, the present limit, and proposes to save money by laying up heavy ships in ordinary, with only sufficient crew to keep them in working condition.

Changes to standing advertisements must be in hand on Monday afternoon; new advertisements, Tuesday afternoon; transient advertisements by Wednesday noon.*

The account of a test of a locomotive with steam jackets on its cylinders, which is given on another page of this issue, is of interest because it is a record of an experiment in a field almost or quite untouched rather than because of any definite results obtained which show either the value or the absence of value in this application of the steam jacket. The trifling gain shown by one comparison is as inconclusive as the small loss shown by the other. It is to be doubted, in fact, whether any road test of a locomotive could be relied upon to give reliable results as to the economy or waste which a steam jacket might cause. American experience goes to show that accurate results in short time tests on a locomotive are only to be obtained by tests of the machine on a stationary plant, such as that which the enterprise of Purdue University has established, or that of the Chicago Northwestern Ry.

As to whether a steam jacket might be expected to effect a fuel saving on a locomotive or not, opinions will doubtless differ very widely. On the one hand the locomotive has a high ratio of expansion and a wide range of cylinder temperatures which would favor economy by the steam jacket. On the other hand the loss of heat from the exterior surfaces of the cylinders would be much greater than in stationary engines, and would continue while the locomotive was standing still. The jacket water would doubtless have to go to waste, too, instead of being returned to the boiler, as in stationary practice. Still, we do not see why there are not quite as good chances of good results in this as in many other of the new departures proposed for improving the locomotive, and we hope some American engineer or railway company will make a trial of the scheme.

◆

The serio-comic water war in Jersey City has been resumed, but with little prospect of an early termination. A contract has been awarded by the Street and Water Commissioners, as noted in our news columns, to the East Jersey Water Co., but the rival bidder and some of the citizens are reported as sure to fight it in the courts, should it receive the approval of the various city authorities, which still have to pass upon it. The main legal objection to the award thus far made is that it is for a single pipe line, whereas the specifications call for two or more conduits. The contestants seemed to have overlooked the fact that the specifications call not only for "either two or three pipes," but also that these must be "of equal capacity." The defeated bidder proposed one 35,000,000 and one 15,000,000-gallon conduit. The successful company made two bids, one for a 50,000,000-gallon conduit and the other for two 25,000,000-gallon conduits. Neither the one single pipe line nor the two of unequal capacity comply with the plain provisions of the specifications, and the two of equal capacity are distinctly at variance with the apparent intent of the specifications.

These specifications emphasized the fact that the city wanted two distinct advantages, or what it considered as such, offered it: (1) More than one conduit, as a safeguard against accident to the supply; and (2) a choice between buying works with capacities of 35,000,000 and 50,000,000 gallons, respectively. To this end the plural, "conduits," is everywhere used throughout the specifications, and it is stated, first, that the contractor must provide storage and "conduits" with a capacity of 35,000,000 gallons; next that he must increase these, on demand, to 50,000,000 gallons, and that, speaking of the "conduits," "when so increased where metal pipes are used, there shall be either two or three pipes of equal capacity." Finally, the bidder was required to name a price at which he would sell to the city works of either ot the capacities named. Obviously, the only way in which all these conditions can be met is by building two 17,500,000-gallon conduits at the start, to give 35,000,000 gallons of carrying capacity, and then adding another one of the same size, in case the city ordered the plant increased to 50,000,000 gallons. A 35,000,000-gallon pipe at the start fails to give the city the safety which it thought would result in having two conduits; and either a single 50,000,000 or a double 25,000,000-gallon line, built at the outset, deprives it of the full advantage of the lower cost of a 35,000,000-gallon supply. This advantage may or may not have been more fancied than real, but the specifications demanded it and the unsuccessful bidder was governed accordingly, put in a bid for two pipe lines instead of one, in case the works were to be increased to 50,000,000 gallons, and now finds himself the highest bidder on this basis, although the lowest for a 35,000,000-gallon plant. The successful bidder names the same figure for the smaller as for the larger plant, and thus the city gains nothing by its efforts to make it easier for it to become the owner of its water supply. On the basis of buying water by the million gallons, the successful bidder is the lowest one on all the quantities involved, but the difference would be only 80 cts. per million gallons when the full 50,000,000 gallons was required, and might well have been on the other side, and greater in quantity, had the specifications plainly said that bids were wanted on a single 50,000,000-gallon conduit.

If the plain language and intent of the specifications is to be regarded, it appears to us that the Rockaway & Hudson Water Co. is fully justified in its claim that the award to its rival is illegal, being based on conditions more favorable than the specifications admit. But the only advantage the Rockaway Co. can reap from upsetting the award to its rival seems to be a possible new opportunity to bid on the contract, since its own proposals are also at variance with the specifications.

Perhaps more amusing still, to people outside of Jersey City, is the fact that while this matter is in dispute the East Jersey Water Co. will be furnishing Jersey City with a temporary supply of water at $43 per 1,000,000 gallons, or $8 more than the average price it would receive under the permanent contract. Unless some new arrangement is made between the company and Newark, the former cannot continue the temporary service after 1900, but a modification was made in the specifications before the last call for bids, giving contractors three instead of two years to build works, so if it found it advantageous to do so, the East Jersey Water Co. could take care that its permanent supply was not ready until the last extra dollar had been secured from the temporary supply contract. This all shows most excellent business management on the part of the company, but the ways of the city authorities for years past have been inexplicable, when viewed from the standpoint of those who believe in able and honest city government.

◆

England is apparently going wild over the passage of the Light Locomotive act, which now permits a mechanically propelled vehicle to travel faster than "four miles per hour" over British highways, and does away with the old enforced necessity of sending a man with a red flag ahead of all such vehicles. About the middle of last month a parade of motor cars was organized in London to celebrate the so-called Emancipation act; and as measured by public enthusiasm, great crowds, speeches, etc., the demonstration was a veritable triumph. About thirty or forty motor cars participated in the race, for race it was, says London "Engineering," in spite of all efforts to make it a procession. These cars represented every type that had stood the test of previous trial, and a number that either worked badly, or would not work at all, "owing to the dense crowds." Practically all of the cars taking any active part in the exercises were propelled by oil engines, giving out clouds of vapor and the rank smell of benzine. They steered well as a rule; but they were very much at fault in starting off; generally going ahead with a rush, after a succession of preliminary "bucks," and break-downs in some detail were frequent. "Engineering" editorially describes the whole demonstration as a farce, and warns its readers that despite the blatant prospectus of the motor-car promoter, a vehicle of this type, of practicable form and fit to be used by the thousands as a substitute for horse-drawn carriages does not yet exist. Some years of patient study and experiment are yet needed to develop the acceptable motor-carriage; and meanwhile the innocent public had better abstain from investment in enterprises of this class, for the "boom" will surely be followed by a most decided "slump." It is satisfactory to know that the people of the United States are less sanguine of the immediate use of motor-carriages than are the English and French, and the American promoter makes so little progress at home that he goes to England to sell stock in his new and crude device. Like every other revolution in methods of transport, time and experience are required to develop the new idea and to make the road motor a practicable machine fit for every-day use; and in this country especially the improvement of the surface of city streets and country roads must precede any very extensive use of the mechanically propelled carriage.

◆

Philadelphia might have had a pure water supply, in place of its present foul one, many years ago if half the energy wasted to further the schemes of speculative promoters for its improvement had been devoted to a sensible and honest attempt to solve the problem in a scientific and business-like way. Just now there is much agitation over a proposed contract with the Philadelphia Water Supply Co. This concern offers to enter into a 50 years' agreement to relieve the city of the burden of delivering water to its reservoirs in return for 60 per cent. of its gross water receipts. The water is to be brought from the Delaware River, after filtration, through two conduits of 175,000,000 gallons capacity each. The city is to distribute the water and collect the water rates, maintaining them through the whole 50 years of the contract at the same figures as are now charged. Curiously enough, the Council's Water Committee is seriously considering this proposition to contract with a private company, notwithstanding the fact that both branches of the City Council have just passed a bill providing for a $3,000,000 loan for a filtration plant, or plants, to be built by the city.

Aside from some highly objectionable details of the proposed contract, in themselves sufficient to condemn it, the general principle of turning over to a company any part of the water supply system of a great city is a bad one. We will not further discuss this scheme at present, but leave it to faithful and intelligent public officials, and an enlightened press and people, who will doubtless dispose of it as they have of similar proposals in the past.

A NOTABLE DEPARTURE IN MACADAM ROAD CONSTRUCTION.

We have several times pointed out in these columns a fact which many of our readers are, we know, learning by experience, that a macadam road is far from being a durable highway. In the "good roads" agitation which has gone on for a decade or more, there has been a certain tendency to hold up the macadam highway as a panacea for all ills and an absolutely perfect system of road construction. Unfortunately this is by no means the case. A broken stone covering for a highway, if it is made thick enough to be reasonably durable, must of necessity be a somewhat expensive system of construction, in first cost. In eastern New Jersey, where trap-rock is abundant and can be generally secured with a very moderate haul, the cost of a 16 ft, macadam road with a telford bottom may be set on the average at about $5,000 per mile. Roads which cost such a sum are out of the question in purely agricultural districts, except possibly for much traveled highways. In Northampton County, Pa., the County Commissioners are about to build some samples of good road construction in several different towns of the county for the purpose of interesting the people and the township authorities in good road construction. But the committee in charge of this matter strongly recommended that the sections of improved road proposed to be built should not cost more than $1,500 per mile, as the township authorities would not accept more expensive prices of construction as good examples for them to follow. The difficulty in making good examples of macadam road at this figure will be apparent, we presume, to our readers.

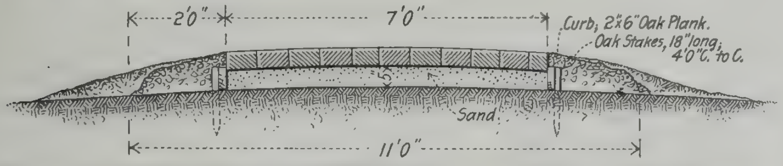

FIG. 1.—CROSS-SECTION OF COMBINED BRICK AND MACADAM ROADWAY AT MONMOUTH, ILL.

Designed by J. E. Miller, Engineer and County Surveyor; Brodine & Dungan, Contractors.

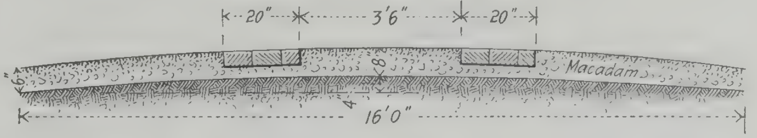

FIG. 2.—CROSS-SECTION OF PROPOSED 16-FT. MACADAM ROADWAY WITH PAVING BRICK TRACKWAY IN CENTER.

The fact of the case is (and the people who pay for road construction appear to be aware of it, if "Good Roads" advocates are not), that a macadam or telford road will not pay except where there is traffic sufficient to warrant its construction.

It may be asked, What is this amount of traffic? We can best explain by an example. Suppose that a certain highway can be left as a dirt road and will cost to keep in repair $50 per mile per annum. Suppose that a narrow macadam covering can be laid on this highway for $2,000 per mile and can be maintained for $150 per mile per annum. Then with interest at 5% there will have to be a saving of $200 to the traffic that passes over this mile of road in a year, unless the macadam road is to be a losing investment.

It is plain from the above that wherever the natural soil is fairly good for roadmaking, or wherever gravel is to be had, a highway must have a very considerable amount of traffic in order to make macadam pay.

On the other hand, as we said at the outset, when we come to roads which have a heavy traffic, and especially where the traffic is largely of heavily loaded wagons, the macadam road proves itself surprisingly shortlived. We are aware that there is a great difference in macadam roads, that some stone proves much more durable under heavy traffic than others, and that such local conditions as the effect of frost, the amount of rainfall and of sprinkling have an important influence. But none who carefully study macadam streets about a city suburb, or better still, upon a much traveled highway where the traffic follows parallel lines, can fail to appreciate the rapid wear that takes place on even the best macadam roadways. The result is that only for a few months while such a road is new is it in first-class condition.

In Jersey City a few days ago the Street and Water Board adopted a resolution directing their Chief Engineer to prepare no more specifications for macadam pavements until further notice. The reason for this action is given by the Jersey City "Journal" as follows:

> This action is the outcome of careful deliberattion on the part of the Commissioners, and is due to their conviction that macadam pavements in this city have not been a paying investment. They have not lasted long enough. They are not practical, it is claimed, for a city with so much heavy traffic as has Jersey City.
>
> Arlington, Bayonne and Garfield Aves. were macadamized only recently. Already those thoroughfares have been so badly cut up by heavy trucks that the Street and Water Board last week had to pass an ordinance to prohibit the passage of heavy vehicles on those streets unless provided with wide tires.

The fact of the rapid wear of macadam roads has led to various suggestions to improve them by embedding lines of rails in their surface. We reviewed various schemes of this class in our issue of May 7, 1896. As we then pointed out, there are numerous difficulties in the way of such schemes.

What appears to us a much more hopeful plan for an improved highway construction has recently been tried at Monmouth, Ill. It consists, briefly, of a combination of brick pavement and macadam road. The accompanying cut (Fig. 1) shows a cross-section of this road taken from the "Monmouth Daily Review," from which we take also the following particulars as to the method of its construction:

> The ground was prepared for it by grading and being allowed to stand for two months. It was treated to an occasional scraping so that it would pack evenly, and when the contractors were ready to lay brick it was as hard and even as a floor.
>
> The first thing was setting the curbing. This was made of 2 × 6 in. oak plank, set 7 ft. apart, and held by oak stakes 18 ins. long, and put down every 4 ft. Inside this was put a 5-in. bed of sand. This was evened up and the single course of No. 1 paving brick, made by the Galesburg Paving Brick Co., was put down. They were set on edge, and make a fine roadbed. Outside the curb 2 ft. of the crushed rock was laid, graded up to make an easy approach. This makes a road 11 ft. wide, and the finest in the land. The earth road on each side was graded and worked, making it in all 40 ft. wide and affording tracks on each side for use in dry weather.

We learn further that 3,000 ft. in length of this road was built during the past season. The contractors, Brodine & Dungan, who did the work, received for it $2,650 or 88.3 cts. per ft. The ordinary macadam roads in the same locality, 9 ft. in width, cost 70 cts. per ft., and have to be made with the country limestone of the vicinity, as harder stone is not available. Under these circumstances it may well be believed that the brick roadway will show great superiority over the stone roads.

But it seems to us that this new departure is of interest to other sections besides those where good macadam is not to be had while paving brick are cheap. Would not the laying of a strip of brick paving in the center of almost any macadam road be an improvement worth at least careful consideration?

The much easier traction upon the brick would not only be in itself a benefit to those using the road, but would cause the traffic to follow it almost entirely, especially the loaded wagons, which effect the most wear and do the most injury to a macadam road.

But in localities where there is a long freight haul on paving brick, the expense of even a 7 ft. strip of brick in a road might be prohibitory. In such localities the scheme is worth considering, it appears to us, of laying two parallel narrow strips of paving brick through the middle of a macadam road, as illustrated in the accompanying cross-section. These strips might be 16 to 20 ins. in width and of such gage that vehicles of all classes could follow them as they would a line of rails. The decreased traction on such a surface would be practically as great as if steel rails were laid in the macadam, as has been proposed, and if properly laid they would wear a very long time under any traffic where a macadam road is justifiable at all.

The details of construction, such as the foundation under the bricks, the construction of the macadam at their sides and between them, the filling between the bricks, etc., would vary with local circumstances and with the teachings of experience; but they need not be considered in a study of the merits of the scheme generally.

It appears to us that this combination of brick and macadam is the most promising plan for the improvement of suburban streets and country roads of heavy traffic that has appeared in a long time, and deserves consideration by every engineer who has to do with macadam roads. There are thousands of miles of city streets where the abutting owners can ill afford the assessments for the cheapest of block or asphalt pavements, and on the other hand the traffic is such that the maintenance of present macadam streets is a heavy burden. Cannot the needs of such cases be met by placing a brick roadway in the middle of the street and covering all the rest of the width between curbs with broken stone?

Again, there are thousands of places where a short piece of roadway is subjected to a very heavy traffic. Such roads occur around factories, mills, mines, quarries, railway stations and many other places. In many of these places an ordinary dirt road is in use, and teams are hauling over it loads not one-fourth as large as they could haul over a hard surface. In many other cases stone roads have been laid and are effecting a great saving over the old dirt roads, in cost of haulage, but are expensive to keep in repair under the heavy loads that pass over them. For such places as this the plan of using paving brick to take the heavy wear appears to be especially advantageous, and deserving of extended adoption.

It may be pointed out also in this connection that such a strip of brick pavement as is here proposed would make an admirable road for cycling, and the influence of that important body of agitators for road improvement might well be exerted in favor of this proposition.

LETTERS TO THE EDITOR.

Corrections for Vertical Curves.

Sir: In setting the type for the "Table of Corrections for Vertical Curves," given on page 346 of your issue of Nov. 26, the printer got the decimal point in the wrong place in column headed 250 for algebraic differences of grades of 1.1 to 1.8, inclusive. Instead of 0.2, 0.3, 0.4, etc., the types should have read .02, .03, .03, .03, .03, .03 and .04.

Yours truly, J. C. Nagle.

College Station, Tex., Dec. 2, 1896.

(A proof of the table referred to was sent to Prof. Nagle and returned without this error being noted. Accidents like this will happen in spite of all precaution, but are none the less annoying when they do occur.—Ed.)

◆

Concerning Skew Arches.

Sir: In Engineering News of Oct. 22, in a criticism upon my work on "Segmental and Elliptical Oblique and Skew Arches," I am astonished to find that your reviewer has completely overlooked the very things he says "is the only part that would warrant a new treatise on a rarely applied art; in this country at least."

If the reviewer will kindly look at Plate I. again, he will find the very templates he asks for, given in what some think profuse detail, with the mode of applying them clearly illustrated, and their construction fully described in chapter 3, page 7; and in chapter 5, page 12.

he will find full and complete instructions as to the use and application of every template given on Plate I.

Yours truly, George Joseph Bell,
County Surveyor & Bridge Master.
Carlisle, England, Nov. 13, 1896.

(In justice to Mr. Bell it is admitted that our reviewer did overlook the text and illustrations referred to; and the only excuse for so doing is the limited treatment of both. To an expert, familiar with the detail described, they are doubtless sufficient; but it is still contended that for use in this country, where few have any practical knowledge of skew arch construction, the author would have made a more useful book had he been fuller in this part of his text and given more detailed dimensions to his illustrations of templates. With this exception, however, it is undoubtedly the best, as it is the latest treatise on this art.—Ed.)

◆

Moment Tables for Cooper's Specifications.

Sir: The following is a table of moments and shears calculated for the locomotives given in the 1896 Specifications of Mr. Theodore Cooper. Their accuracy may be easily tested by noting that the moments, or shears, about corresponding concentrations of any two systems are in the same ratio as the numbers 27, 30, 35 or 40 of these systems.

Yours truly,
John H. Sayres.
Brooklyn, N. Y., Nov. 6, 1896.

The Accident to the Painter's Scaffold on the Brooklyn Bridge Station.

Sir: Your editorial in issue of November 19th with reference to a damage suit resulting from an accident in the erection of the New York terminal of the New York and Brooklyn Bridge, in that it supposes carelessness on the part of the contractors "taking things for granted," requires, in our opinion, an answer, and the further inference that this hook broke off short under a static load was not proved to be the case. In fact we think very few engineers could study the circumstances attending the case and arrive at that conclusion.

In the first place, similar cornice hooks, made of the same shape, from iron of the same size (1¼ ins. diameter), obtained from the same source, had been used on the building, having been tested previously to being put in use, and their continued use, as well as tests made after the accident on one of these hooks, "showed that the shape and dimensions of the hook were sufficient." The evidence produced in the trial of the case shows that when the scaffold fell to the roadway, one of the cornice hooks remained hung in the gutter at the eaves, but the falls by which it was secured to the scaffold over-reeved and the line ran entirely through the blocks. It was also shown that this end of the scaffold had been secured to the side of the building by a light hand line, fastened to an eye-screw, which had been screwed into the woodwork, to keep the scaffold from swaying, and that a corresponding hand line at the other end of the scaffold was in process of being so secured. The second cornice hook was lying in the street, broken in three pieces, with the falls intact. It was also shown in the trial that an eyewitness had seen the end of the scaffold at which the falls ran out, descend first, that the fall at a certain point was checked temporarily when the other end, at which the cornice hook was broken, fell, the whole scaffold then dropping to the street. This evidence points very conclusively to the fact that the workman who was killed had failed to properly secure the falls intended to be used for raising and lowering the scaffold at his end, and that after it had become loose and fallen a few feet, the hand line used to secure this end of the scaffold to the side of the building came into play, retarding the fall of this end, at the same time upsetting the scaffold laterally, and throwing the cornice hook at the other end out of the gutter, which hook, falling to the street, was broken in three pieces, as stated above.

No attempt is here made to deny the fact that the iron in this hook was either cold-short or had been overheated in its original manufacture, but we do deny that the use of double refined iron, 1¼ ins. in diameter, known to have been procured from a reputable firm, and carefully tested and inspected under a rigid specification for high test iron, was unduly "taking things for granted."

That the jury gave a verdict for the plaintiff shows simply that their sympathy was stronger than their ability to appreciate the facts which were originally responsible for the loss of life, but does not disprove them.

Yours respectfully, Levering & Garrigues.
552 and 554 West 23d St., New York, Dec. 1, 1896.

The Advantages of a Tunnel for the Newtown Creek Crossing.

Sir: The communication from Mr. Albert H. Scherzer, published in your issue of Dec. 3, 1896, calls attention once more to the problem which the authorities of Kings and Queens Counties have before them for solution; namely, how best to carry the highway traffic across Newtown Creek from Vernon avenue, in Long Island City, to Manhattan avenue in Williamsburgh. Mr. Scherzer points out very clearly the elements of the situation and the absurdity of bridging the river at the present level of the street, and his arguments if carried to their logical conclusion seem to the writer to indicate that a tunnel would be the only complete solution of the problem. With viaduct approaches and a bascule bridge which must be lifted for a portion of the river traffic any way, the problem is yet incompletely solved, but a tunnel under the Long Island R. R. tracks and the river would provide for continuous, safe and uninterrupted travel at all times, both by land and water.

On July 23, last, Mr. Frank Miller and the writer presented to the Newtown Creek Bridge Committee a design for such a tunnel and an approximate estimate of its cost, accompanied by a brief description of its main features and advantages, the substance of which you published in connection with various bridge designs in your issue of Nov. 5, 1896. We pointed out that a tunnel of ample capacity could be constructed without using prohibitory grades, that the railroad tracks would thereby be crossed below grade, that the cost of maintenance would be very small compared to the cost of maintaining and operating any kind of a bridge, that travel would be absolutely uninterrupted both by land and water, and that considerable dock space would be made available which is not so now.

Matters have progressed so far now that the Bridge Committee does not of course consider the question open for discussion. But to the citizens and taxpayers who are to foot the bills and suffer the consequences, the problem will always be open for discussion until actually solved. Suppose at the coming session of the Legislature a law should be passed abolishing all grade crossings in the State of New York; with a new bridge at the present street level, it would be rather awkward either to elevate or depress the highway sufficiently in a distance of 250 ft. to make a satisfactory crossing. On the other hand the expense of elevating or depressing the tracks would be a serious matter for the railroad company, involving a change of elevation of the yards and terminal. To avoid the former the municipal governments could increase their present bridge appropriation to an amount sufficient to build a tunnel under both river and railroad, now, once for all; to avoid the latter the railroad company could augment the present appropriation to an amount which would be sufficient to build the tunnel. The Long Island R. R. people would no doubt willingly contribute substantially to a scheme reducing their liability to accidents and relieving them from the running expense of guarding a dangerous crossing.

But this is not all. As Greater New York becomes greater and other East River bridges are completed, travel along the water front will increase with the natural increase of business, and will follow the line of least resistance. This route should be made the line of least resistance in the interest of property in the manufacturing district of Williamsburgh and in the business portion of Long Island City. The street railroad companies, whose cars now wait sometimes half or three-quarters of an hour at a time for the opening and closing of the drawbridge, and have an additional wait at the railway crossing, ought willingly to make a substantial contribution to a plan by which their traffic would be continuous and uninterrupted at all times. The situation is now and has been for some time, such that a man whose business requires him to make the trip from Long Island City to Williamsburgh within a limited time cannot depend upon this route at all. The 23d St. & Greenpoint Ferry carries considerable traffic which geographically belongs to the Long Island City & 34th St. Ferry, but does not take the shortest route on account of the uncertainty of this Vernon Ave. crossing to Williamsburgh. This state of affairs will not be materially improved by putting any kind of a new bridge in place of the old one. Besides this, the shipping interests ought to be considered, since the business of the locality is as much affected by the interruption of the water traffic as by that of the land traffic.

Taking it all in all, the writer ventures to say that a careful investigation and comparison of all the solutions of this problem thus far proposed, will show that a tunnel, if properly financed, offers the best and most satisfactory return in the long run for the capital invested.

Yours truly,
Wm. W. Crehore, Assoc. M. Am. Soc. C. E.
New York, Dec. 8, 1896.

Proposed Standard Specification for Portland Cement.

Sir: In view of the article by Mr. Lesley published in your issue of Sept. 24, which criticises the proposed specification for Portland cement advanced by the writer, it appears necessary that a few further facts be brought out to place this discussion in its proper light before the public and define the position assumed by me in advocating such a specification.

I again reiterate the assertion that the requirements of the American Society of Civil Engineers are indefinite and inadequate, and what engineer who has had experience in the testing of cements will not bear me out? What public testing laboratory follows all the requirements and is governed by the recommendations of the American Society of Civil Engineers? Take for instance the provision into which the personal equation of the operator enters so largely for filling the molds with mortar or cement. In this country we have no apparatus like Dr. Bohme's hammer which regulates the amount of pressure exerted in forcing the cement into the molds. It is a well-known fact that the results of cement testing are governed largely by the skill of the operator and the locality of making the tests. Laboratory tests are more accurate and show more nearly the true value of a cement than tests made on the work.

Could any of the distinguished engineers enumerated by Mr. Lesley answer the question he propounds, whether the construction of colossal bridges, buildings, reservoirs, aqueducts and tunnels, railways, etc., since June 21, 1895, has been done with cement of second grade?

Mr. Lesley seeks to draw the attention of these engineers to the assertion made by the writer that the American Society's specifications are indefinite and inadequate, by insinuating that the work was improperly done with second grade cements. In the first place, this question is most ridiculous on its face. What bearing can it have on the question at issue, Portland cement specifications? Surely no engineer would be rash enough to attempt an answer. Has all the above mentioned engineering work been done with Portland cement? Supposing it has, in order to support Mr. Lesley's question, has all the cement been tested? Here are two facts which should be known before any engineer could attempt an answer. Assuming that Portland cement was used and tested, it is a fact, even Mr. Lesley must admit, that "second grade" cement would pass if such a requirement as a neat tensile strength of "300 to 350 lbs." were used, which he says "will give good results." The second grade Portland cements made by other manufacturers besides Mr. Lesley are guaranteed to stand 300 lbs. neat in seven days. However, the absurdity of such a question is apparent when it is generally known that a large part of all the large engineering work done in this country in the past 11 years was constructed of so-called American cements (Rosendales and "Improved" cements) while a very small percentage of the Portland cement used was tested. Where specifications do exist, notably on railway work, the testing is not always carried out scientifically; the requirements may be there, but the cement is not systematically tested to see if it passes the limits. This is certainly the case with the railways cited by Mr. Lesley and whose requirements will be found about what he thinks give good results. On the other hand the higher requirements are those on municipal work where the testing is more thorough and exacting.

Now taking up in detail the 21 specifications, giving the requirements for tensile strength only, which he cites as from leading engineers in this country and wherein his last article says they are not refuted. The first, second, nineteenth and twentieth should be thrown out and not considered at all, for they give arbitrary values for the U. S. Govt. Lighthouse Engineers and Army Engineers, as though all offices had the same requirements. All of the railways come under the remarks made above and show low requirements, while the rest are those from cities and being used on municipal engineering, the testing is more rigid while the requirements are higher.

In first class cities, well equipped laboratories are to be found, either public or connected with the cities' departments of public works, which test and inspect cement to be used on work in their vicinity. On the other hand railways, especially those quoted by Mr. Lesley, have no laboratories where competent persons are employed to test cements. In the first case the requirements must be low or, with the inexperienced operator, the very best cements would not pass the tests; while on the other hand, tests made by laboratories obtain all there is in the cement and would allow a second grade cement to pass a low specification.

From the specifications quoted below, with the names of the engineers and architects and structures for which the cement was used in this city, it will be seen that the requirements advocated by me are not novel or excessively high, as Mr. Lesley would lead your readers to believe. These specifications are in use on all the structures lately erected and in process of erection by the engineers and architects quoted, and were not made for any one piece of work. The cement manufacturers or dealers bid on them knowing the requirements and that all the cement was to be tested at a laboratory.

Frank Miles Day & Bro., Philadelphia, Pa.

Buildings—Houston Hall (University of Pennsylvania), Horticulturel Hall, Medico-Chi College Amphitheatre, American Baptist Publication.

Specifications:

Chemical Composition—The Cement must show less than 2% of sulphuric acid, and less than 2½% of magnesia.

Fineness—95% shall pass a sieve of 4,900 meshes per sq. in.

90% shall pass a sieve of 10,000 meshes per sq. in.

68% shall pass a sieve of 40,000 meshes per sq. in.

Checking, Cracking and Color.—Three cakes of neat cement are to be molded on glass 2 or 3 ins. in diameter, and about ½ in. thick at the center, the edges being very thin. These cakes are to be made from a mixture of the cement and water to the consistency of a stiff plastic mortar.

Cake No. 1 is to be left in the air for the determination of color. The color must be uniform throughout, of a blueish or greenish gray for Portland, and the cake must be free from yellow blotches. The cake must show no signs of cracking or distortion after being kept indefinitely.

Cake No. 2 is to be put in cold water as soon as set stiff enough for the purpose, and to remain there two or three days, when it will be put in water at 200° F. and kept there for 24 or 48 hours. At the end of this time the cake should show no signs of cracking, swelling, blowing or distortion.

Cake No. 3, when hard enough, is to be placed in water and examined from day to day, to ascertain if it becomes contorted, or if cracks show themselves at the edge.

	7 days.	28 days.
Tensile strength—Neat cement......	500 lbs.	600 lbs.
Mortar, 3 to 1....	150 "	250 "

G. W. & W. D. Hewitt, Philadelphia, Pa.

Building—Philadelphia Bourse.

Specifications:

Fineness—85% shall pass a sieve of 10,000 meshes.

70% shall pass a sieve of 40,000 meshes.

Expansion and contraction—A pat of neat cement as soon as it is set, to be submitted to a moist heat and immersed in boiling water for at least 10 hours and must not show any signs of blowing.

	7 days.
Tensile strength—Neat cement................	400 lbs.
Mortar, 3 to 1.............	150 "

Westray Ladd, Philadelphia, Pa.

Building—Newsboys' Evening Home.

Specifications:

Fineness—90% shall pass a sieve of 10,000 meshes.

70% shall pass a sieve of 40,000 meshes.

Checking and Cracking—A pat of neat cement as soon as set hard to be placed in steam vapor for three hours and afterwards immersed in water at 200° F. for 10 hours, when it must show no signs of swelling or cracking.

	7 days.
Tensile strength—Neat cement................	500 lbs.
Mortar, 3 to 1.............	150 "

Jos. M. Houston. Philadelphia, Pa.

Building—Presbyterian.

Specifications:

Composition—All cement must show less than 2% of sulphuric acid, and less than 2.5% of magnesia.

Constancy of Volume—The cement must be mixed with pure water to obtain a stiff mortar and made into pats 3½ ins. in diameter, ⅜-in. thick at the center, and drawn to sharp edge at the circumference. The cement must show no signs of discoloration, cracks or distortions after an indefinite length of time, and after properly set to be placed in cold water for two days and then put in water at 200° F. for 24 hours, and must show no signs of cracking, swelling, blowing or distortion.

	7 days.	28 days.
Tensile strength—Neat cement......	500 lbs.	600 lbs.

P. W. Roos, New York, N. Y.

Building—Mutual Life of New York (10th and Chestnut Sts., Phila., Pa.)

Specifications:

24 hours.—Tensile strength...... ....7 days

300 lbs.—Neat cement.................. ....500 lbs.

3 sand to 1 cement..................150 "

Constancy of Volume—A pat of neat cement as soon as set hard to be placed in steam vapor for three hours and afterwards immersed in water 200° F. for 10 hours, when it must show no signs of swelling or cracking.

Wilson Eyre, Jr., Philadelphia, Pa.

Building.—City Trust & Safe Deposit Co.

Specifications.—Same in all requirements as those of F. M. Day & Bro.

Edgar V. Seeler, Philadelphia, Pa.

Building.—Dental Hall (University of Penna.)

Specifications.—Same in all requirements as those of F. M. Day & Bro.

F. M. Day & Bro., Cope & Stewartson, Wilson Eyre, Jr. (Asociated Architects).

Building.—Archaeological Museum (University of Penna.)

Specifications.—Same in all requirements as those of F. M. Day & Bro.

In all the above specifications the requirement for setting was omitted, as Mr. Lesley does not criticise that provision, while the other requirements are given in full. The general conditions governing the tests are the rules of the American Society of Civil Engineers.

Now from a summary of the foregoing specifications it will be seen that in the chemical composition the requirement for sulphuric acid is the same as advocated by me while the magnesia is ½% lower. The requirements for fineness are all slightly lower, while with one exception the tensile strengths are equal to those advocated by me. Now as to the requirements for checking and cracking, one requires a temperature of 212° F., while all the rest call for 200° F. Thus it will be seen that with the exception of the fineness and percentage of magnesia, which I shall discuss later on, the requirements are about the same as in the specifications he describes as "crude and ill digested." Would the gentlemen I have quoted, among the leading men in the profession in this city, feel flattered were they to realize that their specifications are "crude and ill digested?" Lastly, I think the following will totally disprove what Mr. Lesley would have your readers believe, that the tendency is towards lower requirements and that with such high requirements even the best imported cements would fail. The brands of cements going into each piece of work with the laboratories testing the same, which it is to be presumed passed the requirements, I now give in case Mr. Lesley has not heard of them.

Houston Hall Building; Atlas, Alsen & Heyne cement; Lathbury & Anderson laboratory.

Horticultural Hall Building; Mannheimer & Vorwohler cement; Lathbury & Anderson laboratory.

Medico-Chi College Building; Aalborg cement; Lathbury & Anderson laboratory.

American Baptist Building; Condor cement; Lathbury & Anderson laboratory.

Bourse Building; Alpha cements (foundations and brick work), Mannheimer & Dyckerhoff cement (pavements); Lathbury & Anderson, and Booth, Garrett & Blair laboratories.

Newsboys' Home Building; Alpha cement; Lathbury & Anderson laboratory.

Presbyterian Building; Alpha, Condor and Vulcanite cements; Booth, Garret & Blair laboratory.

Mutual Life of New York Building; Alpha cement; Lathbury & Anderson laboratory.

City Trust Building; Aalborg cement; Lathbury & Anderson laboratory.

Dental Hall (University of Pa.) Building; Condor, Atlas and Dyckerhoff cements; Lathbury & Anderson laboratory.

Archaelogical Museum Building; not selected; Lathbury & Anderson laboratory.

So much for specifications on private work, and with the following specifications for three large pieces of public work for the year 1896, it must be admitted that my specifications are not radically high in their requirements.

Department of Public Works, Brooklyn, N. Y., Wallabout Improvement.

Composition and Ingredients.—All the cement shall be composed of lime, silica and alumina in their proper proportions, be as free as posible from all other substances and contain no adulterant in injurious proportions. The ratio of the weight of silica and alumina to the weight of the lime in the cement shall not be less than 45-100. The cement shall not contain more than 3% of magnesia nor more than 1% of sulphuric acid.

Fineness.—99% shall pass through a sieve of 2,500 meshes; 90% shall pass through a sieve of 10,000 meshes; 70% shall pass through a sieve of 40,000 meshes.

Soundness.—All the cement must be sound in every respect and show no indications of distortion, change of volume or blowing when subjected in the form of pats to exposure in air and fresh and sea water of temperature from 60° to 212°, as follows:

The pats will be made of neat, unsifted cement, mixed with fresh water to the same consistency as stated for briquettes, and will be about 3 in. in diameter, having a thickness at the centre of about ½ in., tapering to about ⅛ in. at the edges. They will be molded on plates of glass and kept thereon during examination.

(a) One or more of these pats will when set "hard" be placed in fresh water of temperature between 60° and 70° for from 1 to 28 days.

(b) One or more of these pats will be allowed to set in moist air at a temperature of about 200° for about three hours. It will then be placed and kept in boiling water for a period of from 6 to 24 hours.

(c) One or more of these pats will be allowed to set in moist air at a temperature of about 100° for three hours; it will then be placed and kept in water of a temperature of 110° to 115° for a period of from 24 to 48 hours.

(d) One or more of these pats may be subjected to any or all of the above indicated tests (a, b and c), using sea water instead of fresh water.

(e) One pat will be kept in the air for 28 days and its color observed, which shall be uniform throughout, of a bluish gray and free from yellow blotches.

A failure to pass test "b" will not necessarily cause the rejection of the cement, provided it passes the other tests for soundness as noted in "a," "c," "d," and "e," and is satisfactory in other respects to the engineer.

Tensile Strength.—Mixed neat with about 25% of water by weight and worked to stiff plastic paste. Mixed with three parts sand by weight and about 12% of combined weight of sand and cement of water to stiff plastic paste.

	24 hours.	7 days.	28 days.
Neat	150 lbs.	400 lbs.	600 lbs.
Mortar, 3 to 1......		150 "	240 "

Board of Public Works, Reading, Pa.—Department of Sewers.

Composition.—Magnesia, not over 2½%; sulphuric acid, not over 2%.

Fineness. — 95% shall pass through a sieve of 10,000 meshes; 80% shall pass through a sieve of 40,000 meshes.

Checking and Cracking.—Two cakes of neat cement to be molded on glass. One to be immersed in cold water, after having set hard, and examined from day to day for surface checking and warping, the other after having been set hard to be immersed in water at 212° F, and allowed to remain in water of that temperature for 24 to 36 hours. Examination of the pat at the end of that time for constancy of volume and checking. Should the pats become contorted or show signs of warping or cracking, the cement will be rejected.

Tensile strength.	24 hours.	7 days.	28 days.
Neat	200 lbs.	500 lbs.	650 lbs.
Mortar, 3 to 1...		150 "	250 "

Department of Public Works, Philadelphia, Pa.—Bureau of Water.

Tensile strength.	24 hours.	7 days.	28 days.
Neat	200 lbs.	550 lbs.	650 lbs.
Mortar, 3 to 1...		200 "	300 "

Hot Water Tests.—All cement shall meet such other additional requirements as to hot water, set and chemical tests as the engineer may determine, the requirements for set may be modified where the conditions are such as to render this advisable.

The Portland cement furnished under the above specifications was used in large quantities for concrete work. In Brooklyn the work consisted in the improvement of the Wallabout Market lands under the direction of Mr. W. E. Belknap, engineer, Atlas cement being used. The Reading, Pa., work consisted of the entire concrete sewer system under the direction of Mr. E. Chamberlain, City Engineer, Atlas cement being used. The Philadelphia specifications embraced the large work on the Queen Lane reservoir, under the direction of Mr. Jno. C. Trautwine, Chief Engineer of the Water Bureau, Alpha cement was used on one section.

A careful study of the above specifications will show Mr. Belknap's to be the same in magnesia and sulphuric acid as I recommend; tests for fineness and tensile strength slightly lower, while the requirements for soundness are much more severe than I recommend. It is to be noted especially under the heading "Soundness," paragraph (b), Mr.Chamberlain's requirements are the same as mine, with the exception of magnesia, in which he is ½% lower. Mr. Trautwine's tensile requirements are higher in both neat and mortar tests for 7 and 28 days than those I recommend.

The above specifications will certainly show that Mr. Lesley in his aim to convince your readers that the tendency is towards lower requirements, has only picked out those specifications which support his criticisms. Now is this a scientific way of criticising this subject? The specifications I have exhibited show some lower and some higher than those I have advocated.

Another point that Mr. Lesley makes in his article of Sept. 21st: He states that "Not a single specification is refuted by Mr. Donaldson, nor its accuracy questioned."

Having assumed they were correct, I did not go over them carefully and consequently made no reference to them in my answer to his first criticism; but I would like now to correct the 7-day neat requirements of both Russia and Belgium from 255 lbs., as stated by Mr. Lesley, to 355 lbs.; to insert a 7-days sand test for France of 113 lbs. and to correct the 28-days sand test from 215 lbs., as stated by Mr. Lesley, to 213 lbs.

Under Mr. Lesley's list of the different countries, giving the requirements for fineness, Roumania is to be found. Now under the list giving the requirements for strength, Roumania is left out, while all the other countries appear. Why is this? It may be well to enlighten the "inexperienced engineers and architects." Under the same government specifications quoted by Mr. Lesley for fineness are the tensile requirements for sand test (3 sand to 1 cement) at 7 days of 142 lbs. and 28 days of 241 lbs.; no neat test being required. It might be well to mention the fact (Mr. Lesley having overlooked this also) that the government of the Roumanian railways requires a tensile strength for the 3 to 1 sand test of 213 lbs. at 7 days and 284 lbs at 28 days,without neat requirements; the latter being higher than any specification quoted by the writer and almost equal at 28 days to the neat requirement of 300 lbs. at 7 days, which Mr. Lesley "thinks will give good results." The requirement of Russia mentioned by Mr. Lesley as 142 lbs. for 28 days sand test, being the lowest of all the continental countries, would also bear an explanation. In all the countries, with the exception of Russia, the normal sand for making sand briquettes passes a sieve of one mesh and is caught on a sieve of another mesh the same as by the Am. Soc. C. E. rules. In Russia the normal sand consists of one part which passes a sieve of 64 meshes per sq.cm. and is caught on a sieve of 144 meshes per sq. cm., and one part which passes a sieve of 144 meshes per sq. cm. and is caught on a sieve of 225 meshes per sq. cm. Thus it will be seen that the normal sand consists of equal parts fine and coarse particles, hence the low requirement.

The facts above stated disprove entirely Mr. Lesley's attempt to convince your readers that the requirements advocated by me are abnormally high and above any others ever used on engineering work; and prove that the general tendency is not towards lower requirements; and that his specifications, as quoted, are inaccurate and misleading.

Mr. Lesley apparently loses sight of the main reason which influenced the writer in preparing the paper published in part in your issue of July 16. In the first place the prime object in writing that paper was to urge the adoption by the U. S. Government of a standard specification for Portland cement and a specified method of testing, which would be applicable to all departments alike. Such a standard, if adopted by this government, would prove beneficial to both users and producers alike; and at the same time would be used outside of government work. In presenting this subject, care was taken to collect specifications from as many offices in the several departments as could be obtained, in order to present the conditions as they now exist and argue from them the need of some such measure in this country. The majority of the European countries have their government specifications, while the United States has not and the defective system was explained in the paper accompanying the specifications prepared by me. The subject was not taken up before the conditions were carefully studied. It was not the purpose to antagonize either the United States Engineers on the one hand, or the cement industry, as championed by one man, on the other. In all some 30 odd specifications were collected, which it would have been impossible to have published in detail, but it is safe to say no two were alike. From some offices no specifications could be obtained, while others had none.

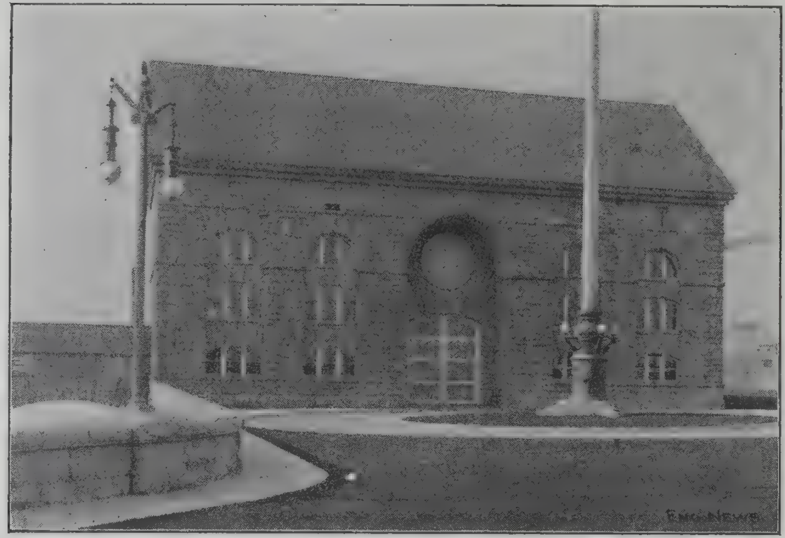

FIG. 1.—POWER HOUSE OF THE NIAGARA FALLS POWER CO.,—END VIEW.

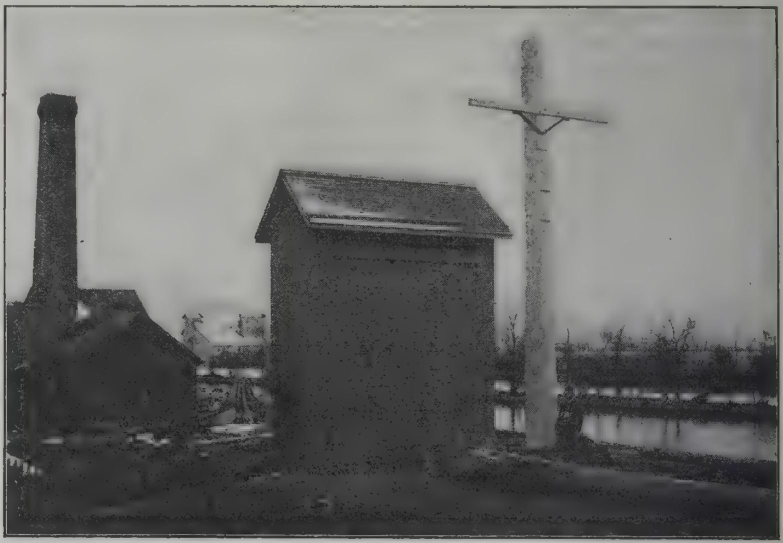

FIG. 6.—TERMINAL STATION AT CITY LIMITS OF BUFFALO, WHERE WIRES PASS FROM POLES TO UNDERGROUND CONDUITS.

In order to show the varied character of the specifications as respects requirements for fineness, checking and cracking and tensile strength, a few are given below. No specifications received contained chemical requirements. The requirements correspond to the order in which the offices are given.

Departments and Offices.

---

[1] In air. [2] Thirty days.

Note—Under the heading Tensile Strength, two specifications are quoted for No. 5, the first was dated July 23, 1896, while the second for the same piece of work was dated Oct. 15, 1896. The rules for the testing are based generally on the Am. Soc. C. E. rules, while notation is made above for air tests. Specification No. 8 requires transverse and compression tests.

A careful analysis of these specifications will bring out clearly these two facts: First—That Mr. Lesley is wrong when he quotes the U. S. Engineers in your issue of Sept. 10, as having one requirement; Second—That he is wrong in stating that the tendency is towards lower requirements. It is ridiculous for Mr. Lesley to assert that my requirement of 500 lbs. neat at 7 days "would lead to dangerous results in work," and equally as absurd to state that "there is a marked swing in the pendulum in favor of the elimination of the boiling test," when so many of the specifications cited by me require it.

Now, it is manifestly clear, from a study of the few specifications quoted above, wherein I have argued, in my "Proposed Standard Specification," for some uniformity among government engineers. It is likewise shown from the number of prominent specifications of government as well as civil engineers that the requirements advocated by me are not abnormally high or novel, as Mr. Lesley would have your readers believe.

In the matter of fineness, specifications certainly show that in the last five years this particular requirement has been raised, due to the gradual realization of its importance from the valuable results obtained, and why should it not be raised even higher? Perfect conditions can only be obtained by eliminating the coarser particles in a cement and thereby increasing the strength. All the advantages derived from fine grinding have been fully brought out in my previous papers, and writing as a manufacturer it is certainly within my province to judge of the capabilities of mills to meet such requirements as are advocated by me. Even Mr. Lesley is constrained to admit that "no careful manufacturer would hesitate to guarantee cement of the fineness he recommends." The whole question of fineness to a manufacturer hinges on the increased cost of production, and if such limits as these advocated by me were advanced by an engineer, Mr. Lesley would hardly raise objections. Certain it is, no consumer would be found among those who objected on the ground of an excessive requirement, for they would be the ones directly benefited. Should some prominent engineer, government or civil, specify limits as high as those advocated by me, it is certain that mills would soon grind fine enough to meet them. On this point also the objections of Mr. Lesley are to be read in two words "extra cost," and while it is admitted that the requirement in this respect is slightly higher than in the majority of specifications, it will not be very long before the requirements in many will equal them.

Taking up the remaining element criticised by Mr. Lesley, chemical composition, my authority for the percentage of magnesia, as explained in your issue of Sept. 10, remains unassailed by Mr. Lesley; while the percentage of sulphuric acid, notwithstanding his futile efforts to twist the meaning of the two requirements, is precisely the same as universally specified. Admitting that the limits for lime and silica are somewhat confined for low limed cements, the limits for iron and alumina combined are the same as those within which M. Le Chatelier says "Portland cements of good quality are to be found" and from the analyses of M. Candlot of the principal cements of France, England, Germany, Belgium and Russia (Ciments et Chaux Hydrauliques; Paris, 1891; pp. 71 and 76) the following number are within the limits advanced by me: French, 11 out of 12 cements; English, 12 out of 13 cements; German, 10 out of 14 cements; Belgium, 6 out of 6 cements; Russia, 4 out of 7 cements. This certainly shows that a majority come within the limits specified by me.

Having only answered Mr. Lesley on the four headings he criticises the proposed specifications on, it certainly will be admitted by the readers of your paper that I have not only "found scientific support," but have produced the same in defending the requirements of my specifications. As to whether they are "crude and ill digested" as Mr. Lesley states, I leave that to the judgment of those of your readers who will carefully go over the facts and proofs presented in this paper in support of my specification and in disputing the arguments of Mr. Lesley.

Before concluding, I would like to bring out clearly a point which has not been considered by Mr. Lesley. The requirements are high and in formulating them it was the purpose to make them high, but to meet this not only a specific manner and method of testing was provided, but it was stated that testing should be done in well equipped laboratories, by competent persons, thoroughly conversant with the subject of cement in both its chemical and physical properties. Testing thus conducted would obtain maximum physical results and the best Portland cements would easily pass the requirements.

Yours very truly,

Wm. J. Donaldson.

503 Betz Building, Philadelphia, Pa., Nov. 12, 1896.

(The demands on our space compel us to rule the discussion on this subject closed with the above letter. Without reference to the special matters in controversy, it may be remarked that each of the parties to the discussion have contributed a large amount of information respecting the specifications for Portland cement in use in a great variety of places, which will be studied with interest, we doubt not, by those of our readers who have cement specifications to formulate.

We may remark as an interesting fact in this connection that at the meeting of the American Society of Civil Engineers, on Nov. 4, a resolution was adopted recommending to the Board of Direction of the Society to take action looking to the preparation of a new standard code for cement testing to replace the one formulated by a committee of the Society in 1884.

Under the constitution the Board will make its report at the next annual meeting, and that meeting may order a letter ballot of the Society as to whether the proposed action shall be taken. Doubtless, the Society, if it takes action, will merely revise its code governing the method of making tests, and will not attempt anything in the way of a standard specification.

It appears to us that the most important point raised by Mr. Donaldson is the desirability and expediency of the adoption of a standard cement specification by the Government or by the Corps of Engineers. Concerning this, it appears plain enough that good results might follow, for example, if the Chief of Engineers were to create a Board to formulate a standard cement specification for use by the various officers of the corps. In the multitude of duties with which an engineer officer is charged, few have time to study all the ins and outs of the subject of cement tests and specifications, and it would be a great aid to good practice, undoubtedly, to have a standard specification at hand, prepared by some of the ablest men in the Department. Such a specification, of course, would need to be very elastic, and would need to contain many alternative provisions from which each officer could select those best suited to his especial work. Cement for use in sea-water, for example, should have certain special requirements, and the most economical grade of cement to use for a given work will vary widely in different localities.

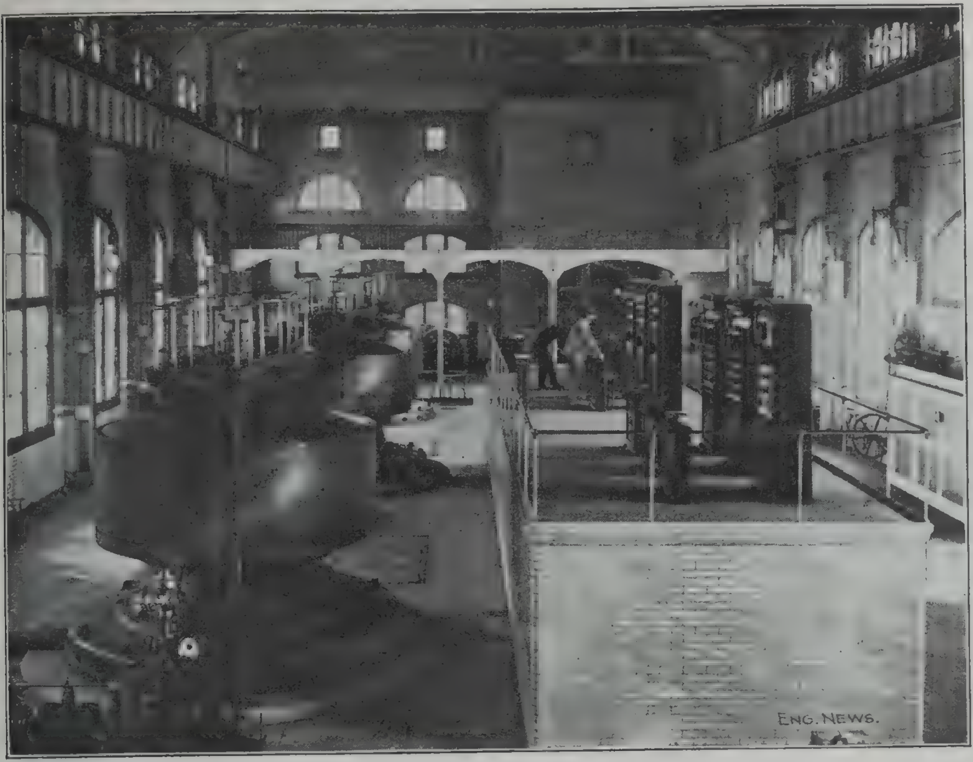

FIG. 2.—VIEW IN THE INTERIOR OF THE NIAGARA POWER HOUSE, SHOWING THE THREE 5,000-H. P. WESTINGHOUSE DYNAMOS NOW RUNNING.

But while we can readily see the benefit of such a standard specification, we would also urge strongly that no action should be taken that would make such a standard specification difficult to change.

May the day be long distant when Congress shall enact a standard cement specification for use in all Government departments! Experience with the old U. S. standard for testing boiler-plate is an excellent illustration of the evil in getting a Government standard adopted in such shape that it cannot be readily amended and kept up with the times. For this reason we should strongly oppose Mr. Donaldson's proposition to have a single standard specification control all Government work. That could not be brought about without Congressional action, which is at all costs to be avoided.

If, however, the present able Chief of Engineers should see fit to appoint a Board to formulate some standard specification, the use of which should be recommendatory, not compulsory, upon the various officers of the Corps of Engineers, we can see how the action might be very beneficial. —Ed.)

◆

Notes and Queries.

Frank A. Peirce, Greensboro, N. C., wishes to obtain the address of parties experienced in the construction of timber flumes for the transportation of timber. He also asks for any published data detailing the ordinary methods of construction.

THE NIAGARA FALLS AND BUFFALO ELECTRIC POWER TRANSMISSION.

Among the first corporations that contracted with the Niagara Falls Power Co. for electric current from the power house at the Falls was the Buffalo Street Ry. Co. In accordance with that contract there is now being delivered at Buffalo electric current sufficient to develop 1,000 HP. This current is sent over bare wires from the power house at Niagara Falls, a distance of 26 miles. The various power plants at Niagara Falls have been described from time to time in our columns, and are without doubt the most famous of all electric power installations by reason of the vast possibilities of future development.

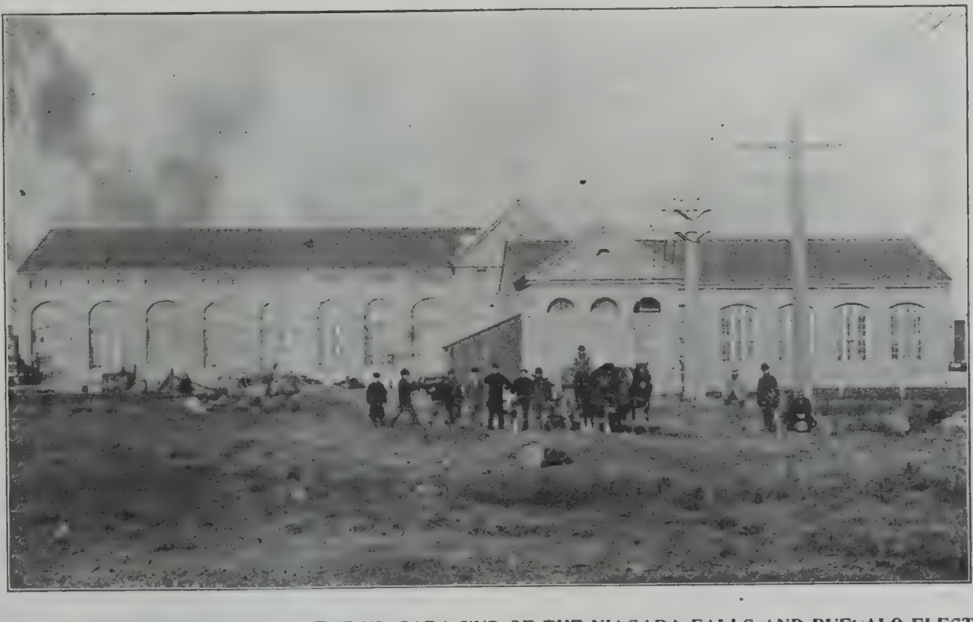

FIG. 3.—TRANSFORMER HOUSE AT THE NIAGARA END OF THE NIAGARA FALLS AND BUFFALO ELECTRIC POWER TRANSMISSION LINE. MAIN POWER HOUSE IN LEFT BACKGROUND.

The current from the Falls is generated by the Niagara Falls Power Co., which transmits the power as far as the city limits of Buffalo. All the construction work in connection with this installation was effected by the Cataract Construction Co., while the distribution, after it has reached the city limits, is in the hands of the Cataract Power & Conduit Co.

The first dynamo of the Niagara Falls Power Co. was started on April 5, 1895, and contracts for power have now accumulated sufficient to absorb the entire output of the three 5,000 HP. generators which were first installed. Work is now in progress on an extension of the wheel-pit and power house which will permit additional dynamos to be placed.

Work on the line for transmitting electric current from Niagara to Buffalo was begun last August by the White-Crossy Co., of 29 Broadway, New York city, which has spared no expense to construct the line in as substantial and durable a manner as possible. The pole line is not a straight one; owing to the objections of land owners to having their farms cut in two, it was necessary to deviate considerably from a direct route, and for a large part of the distance the line follows the property boundary between farms.

For the greater part of the distance the company owns the right of way, a strip 30 ft. wide; for five miles the line runs along the bank of the Erie Canal. There were 21,000 poles required for the work. They are of white cedar, shaved round, and are to be painted. The poles vary in height from 35 to 65 ft., and in diameter from 15 to 30 ins. They are set at distances varying from 60 to 75 ft. in order to eliminate any sympathetic vibrations of adjacent sections of the wires. The holes for the poles were dug from 6 to 8 ft. deep, and wherever the earth was soft concrete was used in setting. At sharp curves six poles were set in pairs (Fig. 5), each pole supporting one end of a double cross arm. The double cross arms are used to distribute the weight of the wire on two insulators instead of one, and to make the turn less abrupt.

Each pole carries three cross arms. The two upper ones are to support the power cables; they are yellow pine, 12 ft. long and 3¼ × 4¼ ins. in section. Each is trussed with an angle iron 1½ × ¼ ins. Each cross arm is designed to carry six cables. At either end of the top cross arm is a steel pin 18 ins. high; along these pins and also on top of the poles will be stretched three barbed iron wires; these will be grounded at frequent intervals and are expected to give protection against lightning. The pin holes in the cross arms are 4 ins. deep with drainage holes. All pins were boiled in linseed oil. The third cross arm is a small one for carrying a private telephone wire, which will be connected with 52 telephones located at intervals on the poles, to be used by linemen.

The insulators weigh 9 lbs. each; they are double petticoated, having two deep annular grooves around the bottom to prevent water or ice from forming an electric connection between the wire and the insulator pins. A groove at the apex carries the wire. The insulator is provided with a gutter running to a point on either side to prevent icicles hanging in such a way as to strike the cross arm.

These insulators were tested to withstand a pressure of 40,000 volts. The test was made by inverting the insulator and partly immersing it in brine contained in a metal vessel. The pin hole was also filled with brine. The terminals of the high pressure current were connected with the metal vessel and with the brine in the pin hole of the insulator. No calibrating instruments were used in circuit, the eye alone being relied upon to detect the passing of current through or across the insulator. The insulators are furnished by the Imperial Porcelain Works, Trenton, N. J.

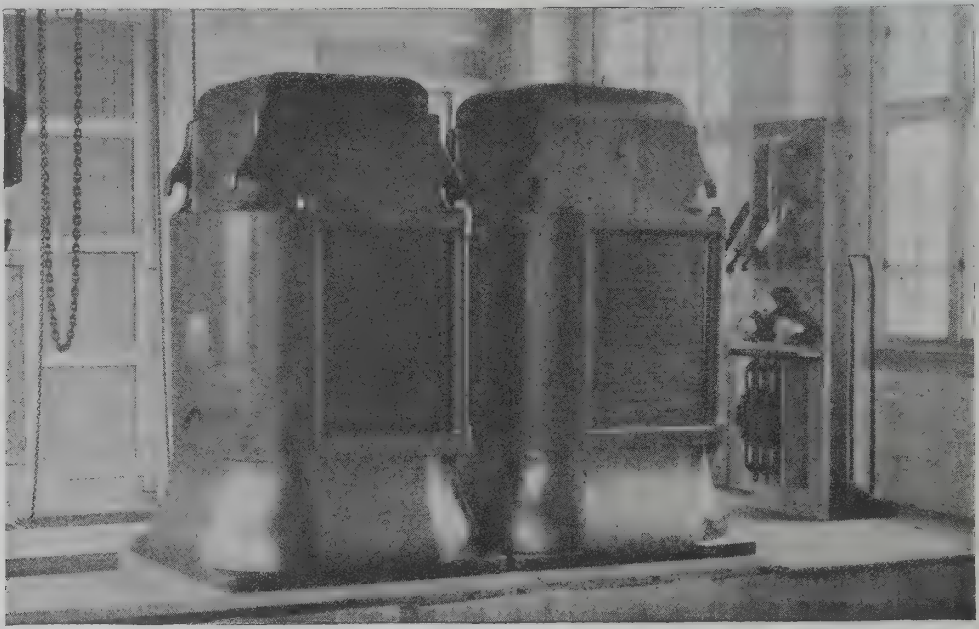

FIG. 4.—STEP-UP TRANSFORMERS, 1,250-H. P. CAPACITY EACH FOR NIAGARA FALLS AND BUFFALO ELECTRIC POWER TRANSMISSION.

General Electric Co., Schenectady, N. Y., Contractors.

In the rush of putting up the line some smaller size insulators were substituted and in several cases where this was done not only the pins but the cross arms have been burned off by the escaping current due to the insufficient insulation.

Looking from the Niagara end, the poles are set so that the outer ends of the cross arms are directly over the boundary line of the right of way; this leaves sufficient room for another pole line on the left. The three cables which are now in position are bare copper wire, each 350,000 circular mils in diameter, made up of 19 No. 10 wires. Each pole supports a weight of about 1,200 lbs. of copper.

The cables leave the generators in the Niagara power house and are conducted in a lead covering across the "Bridge of Sighs" to the transformer house. The step-up transformers are the largest in the world; each of 1,250 HP. capacity, 7 ft. 10 ins. high, with a base 64 × 56 ins. Each transformer weighs 25,000 lbs. The 2,200-volt alternating current from the generators is here raised to 11,000 volts, and changed from a two-phase to a three-phase current. Provision is made in these transformers, as well as in the ones at the Buffalo end, for raising the voltage to 22,000 volts whenever it is wished to increase the capacity of the line. The transformers are cooled by an air blast from a fan driven by a 5 HP. motor. From the transformers three cables pass to the high tension switchboard standing beside them. This switchboard is of marble, and carries three high tension switches, each switch being separated by a marble barrier about 1 in. thick. This partition prevents arcing from switch to switch. The switchboard also carries current indicators and three special fuse carriers. From the transformer house the wires pass through lightning arresters to the first pole of the pole line standing immediately in the rear of the building.

At Buffalo the cables pass from the last pole into a small brick terminal station (Fig. 6), where connection is made through lightning arresters with the underground cables. The lightning arresters are of the Wirt type, especially designed for heavy voltage transmission work, and are single pole. They consist of strips of marble, upon which are mounted eleven cylinders, giving one air gap space 1-32 in. for each one thousand volts, with an allowance of 25% rise in the potential. In the action of the arrester, the large metal cylinders serve to chill the arc, so that, on reversal of the current, the arc is extinguished, no dependence being placed upon any non-arcing property of the metal to put out the arc. In order to limit the current on short circuit, and thus the heating effect, a special solid graphite rod of low non-inductive resistance is used. The arresters are similar to those used on the Big Cottonwood transmission line at Salt Lake City, Utah, which have effectually protected the machinery in many severe storms. The underground wires are rubber covered, taped and sheathed with lead; the insulation was tested to withstand 80,000 volts. The vitrified clay conduit has 12 holes or ducts, each 3 ins. in diameter; but three of these ducts are in present use. The conduit is laid 18 ins. under ground and surrounded on all sides by a bed of concrete 4 ins. thick.

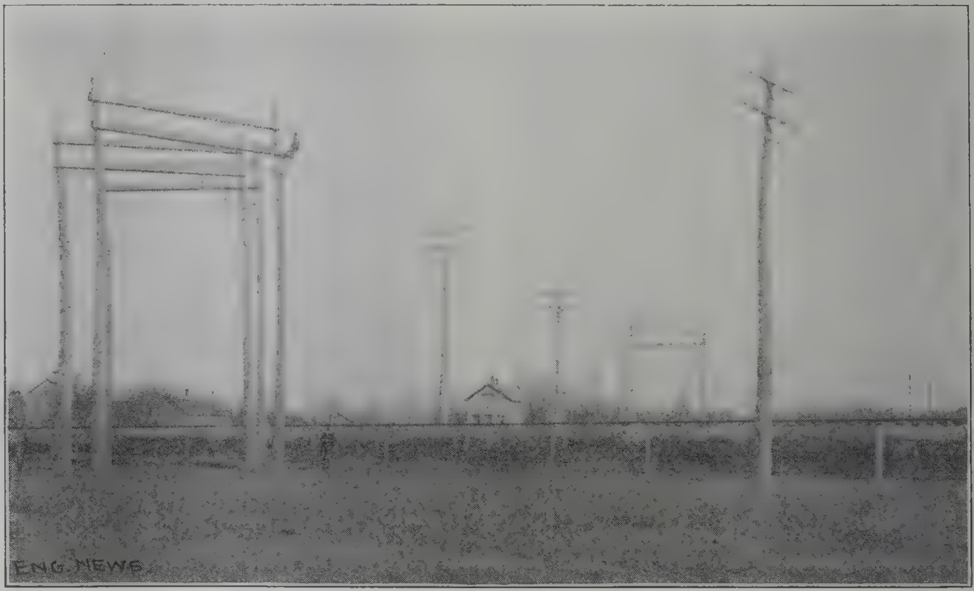

FIG. 5.—A PORTION OF THE POLE LINE FROM NIAGARA FALLS TO BUFFALO.

The White-Crosby Co., 29 Broadway, New York City, Contractors.

The step-down transformers (Fig. 7) are located in a small building adjoining the Buffalo Street Ry. power station. These transformers reduce the pressure from 10,700 to 370 volts; they are similar to the ones at the Niagara end, and, like them, are cooled by an air blast. The 370 volt current is conducted to three rotary transformers in the power house. Two of these are in use, and the third is held in reserve. These transformers are six-pole machines; they convert the 370-volt alternating current into a 500-volt direct current, in which form it is used on the Buffalo Street Ry. The rotary transformers are each 6 ft. 10 ins. high, with a base 36 × 47 ins., and weigh 7,000 lbs. The electrical apparatus has all been furnished by the General Electric Co.

We are indebted to the White-Crosby Co. and to the General Electric Co. for the information from which this article was prepared, and for our illustrations.

THE LATEST CAPE COD SHIP CANAL PROJECT has reached the time limit for depositing its $200,000 with the State Treasurer, as provided by the Massachusetts legislature. The law also provides that plans of location must be filed within six months from June 9, 1896. The preliminary plans have been prepared and approved by the joint board of railway and harbor and land commissioners, but they await the deposit with the State Treasurer before being presented to the Barnstable County Commissioners.

THE ERIE CANAL was closed to navigation on Dec. 1, and preparation is being actually made to enter upon the execution of the plans for the improvement of the State Canals, for which contracts have already been let, aggregating $4,000,000.

THE BOSTON PNEUMATIC TRANSIT CO., on Nov. 30, again received from the Board of Aldermen permission to lay and operate suitable underground pipes for transmitting mail matter, merchandise, etc., through certain streets of that city. Mayor Josiah Quincy, on Oct. 2, returned without his approval a similar order, stating that he believed that no such franchise should be granted without provision in it for a pecuniary return to the city. The present order is based upon an agreement of the company to the following effect: One year after the completion of any line of tubes the company is to pay one-half of one per cent. of the total gross revenue of the company for that year. For each year thereafter the company shall add one-quarter of one per cent., until at the end of the ninth year of its operation it shall pay to the city 2½% of the total gross receipts and continue to pay this sum so long as the tubes are operated. The contract provides that the conduits must be completed by Jan. 4, 1898, under the general supervision of the Superintendent of Streets. As this order conforms generally with the recommendations of the Mayor it will doubtless be approved.

A STEEL RAIL PLANT is projected for Japan. Five Japanese commissioners who are making a tour of the United States and Europe in search of information concerning steel making were in Pittsburg last week visiting the principal works in that city and vicinity. It is said to be their intention to purchase an 8-ton converter and modern machinery for a small steel plant. The commissioners expect to sail from New York for Liverpool on Dec. 12.

THE BRONX PARK BOTANICAL GARDEN PLANS, for New York, are not yet made public, but Prof. Britton, who is to be in charge, says that the general committee on plans has decided that the greater part of the $250,000 to be first raised for the improvement of the 250 acres, set apart in Bronx Park for the garden, will be expended upon the museum building, which is to be built upon elevated ground about 1,000 ft. east of the Bedford Park station of the Harlem Railway. This building will have a front of 304 ft., with two wings each 200 ft. long and 50 ft. deep. Houses for the director-in-chief and head and second gardener will be built east of the Bronx River, and there will also be propagating houses and rain-shelters. The plans provide for a second glass-house, larger than the one above described, to be located south of the Southern Boulevard. These plans are now being completed, and as soon as they have been passed upon by the Park Commission and the Building Department they will be published.

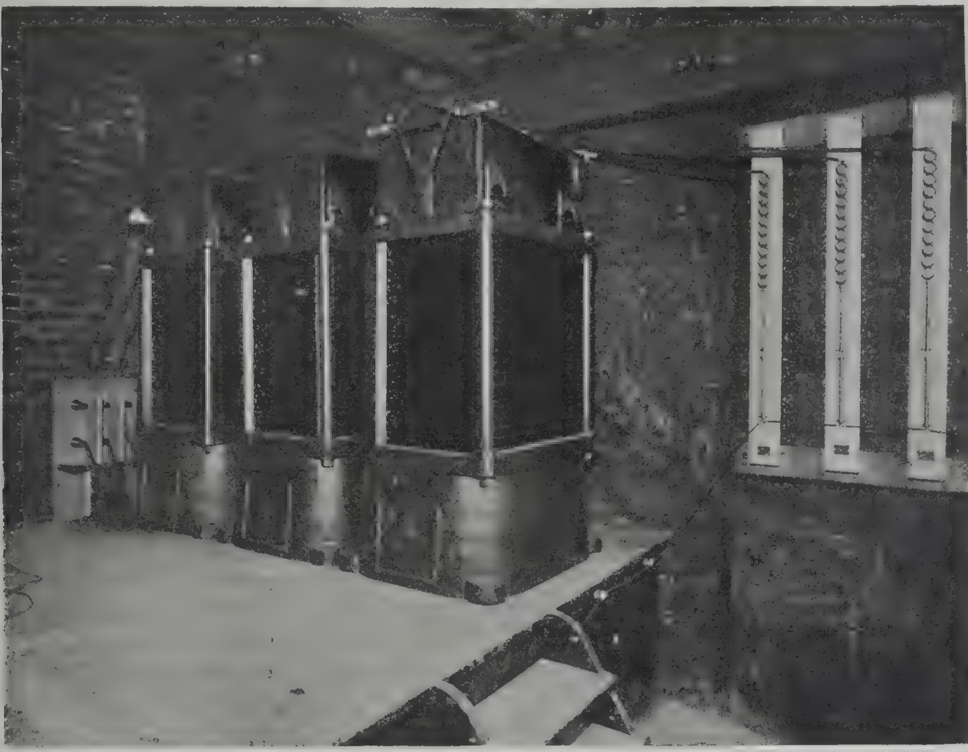

FIG. 7.—STEP-DOWN TRANSFORMERS AT BUFFALO FOR THE NIAGARA FALLS AND BUFFALO TRANSMISSION.
General Electric Co., Schenectady, N. Y., Contractors.

◆

THE U. S. GUNBOATS "VICKSBURG" AND "NEWPORT" were launched at Bath, Me., on Dec. 5. These are composite boats with steel frames planked below the water line and plated above. Each boat is barkentine rig, with three full decks. The lengths are 168 and 174 ft. on load water line, the extreme beam is 34 and 36 ft., the mean draft is 12 ft., displacement 1,000 tons, and speed 12 knots. The engines are twin-screw vertical triple expansion, with 800 I. HP. and 16, 22 and 36-in. cylinders and 24-in. stroke. The armament includes six 4-in. rapid-fire guns, and four 6-pdr. and two 1-pdr. rapid-fire guns. The crew will include 11 officers and 135 men for each.

◆

THE BOARD OF INSPECTORS OF STEAM VESSELS at New York city is being investigated by a special board of inquiry appointed by Secretary Carlisle. It is charged that the inspectors of the local board have accepted bribes to pass vessels needing repairs.

◆

VITRIFIED SEWER PIPE 36-INS. IN DIAMETER, to the extent of 3,000 ft., will be laid in Montpelier, Ind., in place of brick sewer usual for so large a sewer. The pipe will be made by the Blackmer & Post Pipe Co., of St. Louis, of which Mr. L. W. Post is Vice-President and General Manager.

◆

THE POSTAL TELEGRAPH CABLE COMPANY, says the "Journal of Commerce," is to be purchased by the Commercial Cable Company, with the view of establishing a great foreign and domestic organization. The Commercial is to issue $20,000,000 in 500-year bonds and to exchange $15,000,000 of this, dollar for dollar, for the stock of the Postal Cable Company, with a guarantee of 4%; the balance will remain in the treasury of the Commercial Company and be added to its $10,000,000 of capital stock. The Commercial Cable Company is popularly known as the Mackay-Bennett Cable Co., and it owns three cables between Nova Scotia and Ireland, one from Ireland to Havre, and one from Ireland to Bristol, England; also one from Nova Scotia to New York and one to Brockport, Mass. The third cable to Ireland was completed in August, 1894. The president of the company is J. W. Mackay, and operations commenced in December, 1884. The gross earnings of 1895 were $2,009,738; with $1,215,298 net earnings.

◆

A THIRD ST. LOUIS BRIDGE is being discussed for North St. Louis by the North St. Louis Improvement Association. Some railway officials are said to be interested, but as yet the project is talk only.

◆

THE U. S. PATENT OFFICE, in the fiscal year ending June 30, 1896, received 41,660 applications for patents, 1,641 applications for designs, 2,460 caveats and 2,064 applications for trademarks. The patents granted numbered 22,791, and 11,466 patents expired in the year. The total receipts of the office amounted to $1,307,090, and $209,721 represented receipts over expenditures. The total balance to the credit of the Patent Office, in the U. S. Treasury, is $4,776,479.

◆

THE VACANT PUBLIC LANDS of the United States, says Mr. Francis, Secretary of the Interior, in his annual report, amount to 600,000,000 acres not including Alaska. The actual public domain now amounts to 1,849,072,537 acres. The General Land Office has disposed of 946,000,000 acres up to 1896, with 326,000,000 acres of this granted since June 30, 1883. Since 1862, 162,892,132 acres have been entered under the Homestead Act of 1862. To land-grant railways 83,784,705 acres have been distributed and 1,945,045 acres have been patented to wagon roads. The total area of the four National parks is 3,272,960 acres, and the estimated area of all Indian reservations on the public domain is 84,418,562 acres, with 1,397,691 acers in military reservations. Mr. Francis thinks that 100,000,000 acres of the arid lands could be reclaimed by irrigation.

◆

THE EXPORTS of manufactured goods from the United States for October surpass even the remarkable record for September of this year. The exports of this character advanced from $16,352,356, in September, 1895, to $21,684,734, in September, 1896. The figures for October show an advance from $18,778,817, in 1895, to $23,479,279 in 1896, the highest total for any month in the present fiscal year. The total for the four months, including October, is more than $87,500,000, and if the rate is continued the total of manufacturing exports for the fiscal year will be $263,000,000; the actual total will not fall below $250,000,000 for the year. At the latter rate the exports of this character will be $22,000,000 in excess of the total for any fiscal year on record, and $49,000,000 more than the record for any calender year. The manufacturing exports for 1896 will be 26.47% of the total exports, the highest proportion on record, that of 1895, being 23.14%. The total exports for all kinds for 1896 will be about $882,520,000, only exceeded by the $1,015,732,011 exports of 1892. For the ten months ending Oct. 31, the value of copper ingots exported was $22,094,000, and that of refined oil, $47,979,000, the gain in those two items for the ten months, over 1895, was a little more than $16,000,000. The actual gain in the export of manufactured articles for the same ten months was $60,000,000. The exports of electrical and scientific apparatus advanced from $1,351,460, in the corresponding ten months of 1894, to $2,234,664 in the ten months of 1896. The value of colored cotton exports, for the same period, advanced from $3,120,791, in 1894, to $3,441,670 in 1896; but the export of uncolored cottons advanced from $6,486,299 to $10,322,833 in 1896, and was nearly double that of 1895.

◆

THE PACIFIC COMPANY is the name of a company organized in New York City and incorporated in Virginia with $20,000,000 capital, with the alleged purpose of developing coal mines and building railways in Peru. The officers and directors are as follows President, Harry Keene; Secretary, R. W. Hawkesworth; Treasurer, Jacob Bertschmann. The directors are the three above named and Charles F. Dieterich, Charles Coudert, E. J. Jerzmanowski, Isaac Alzamora, John C. Barron, David S. Walton, Henry T. Scott, Jose M. Yrigoyen, Charles W. Mayer and Appleton D. Palmer. The company's New York offices are in the American Surety Building at No. 100 Broadway. Mr. Keene is President of the Equitable Gaslight Company.

◆

A KITE CARRYING A TELEPHONE WIRE over obstructions was successfully experimented with by Mr. Wm. A. Eddy, of Bayonne, N. J., on Dec. 6. The wire was sustained by three large kites. A lantern was attached to the outer end of the wire, and when it reached a height of 500 ft. was lowered by being paid out through a pulley suspended from one of the kites. When it reached the earth ground connections were established at each end of the wire and both telephone and telegraph messages were sent through it. The obstructions which the wire passed over included three lines of trees, two roadways, a line of telegraph and one of telephone wires and a house. Signals were exchanged for over an hour, and the kites and wire were then drawn in.

◆

DOORS OPENED BY ELECTRICITY when a person steps upon the wire door mat have been placed at the entrance of the new city market, at Springfield, Mass. An electric motor using a 110-volt current furnishes the power for winding up a coil spring and closing the door, and the circuit is broken by stepping upon the mat, releasing the spring which opens the door. The inventors are Oliver H. Hicks and Robertus F. Troy, of Chicago.

◆

A BOILER COMPOUND or water purifier for locomotive and other boilers, which has thus far shown very favorable results in actual use, has been tested on the Cleveland, Cincinnati, Chicago & St. Louis and the Wisconsin & Michigan railways. The chemicals which enter into its composition are given as follows: $Ba\ C_3\ H_6\ O_3$, $Ca\ C_3\ H_6\ O_3$, $Ba\ Cl_2$, and $Ca\ O\ H_2\ O$, but the relative proportions of each in the mixture are secret. As marketed the mixture is in the form of powder and is to be added to the water, either hot or cold, in the proportion of about ¼-lb. per 1,000 gallons. It is claimed to be non-corrosive and to have no injurious effects upon the packing, and, of course, to prevent scale and rust. The makers are Engle & Co., of Chicago, Ill.

ANNUAL MEETING OF THE AMERICAN SOCIETY OF MECHANICAL ENGINEERS.

In our last week's issue we gave a report of this meeting down to Wednesday afternoon, Dec. 2. The list of members and guests present increased until the adjournment on Friday afternoon, when it numbered 538, making the meeting the largest probably that has ever been held by any engineering society in this country. On Wednesday evening a reception and conversazione was held at Sherry's. This was the only distinctively social event of the meeting. Thursday morning's session was devoted to the reading and discussion of papers. The first was entitled "Experimental Investigation of the Cutting of Bevel Gears with Rotary Cutters," by F. R. Jones and A. L. Goddard. The authors describe the operations required in cutting bevel gears with rotary cutters in a milling machine. The only uncertainty in these operations is that of revolving the blank from its original or central position through such an angle that the cutter shall pass through the pitch point of the larger end of a tooth, and at the same time cut just enough off the smaller end to allow the gear to mesh with its mates without further dressing of the teeth.

By a series of experiments with an apparatus which they designed for the purpose they determined the amount which the blank should be revolved for a number of different sizes and shapes of gears. The results are given in the paper and will be of interest to machinists and others concerned in the production of bevel gears.

The next paper was presented by Mr. J. A. Laird, and was entitled

"The Calibration of a Worthington Water Meter."

The meter tested was a Worthington made entirely of brass, for hot water, and bought for testing purposes. It was used to measure the feed water during the two 30-day duty tests on the Allis engines at the Chain of Rocks pumping station, St. Louis.

The method of making the tests is described and illustrated. It consisted in delivering the water passing through the meter into two tanks supported on platform scales, each holding about 1,000 lbs. The errors of the meter for each day are as follows:

"The Contraction and Deflection of Iron Castings," was the next paper read, and was by Mr. Francis Schumann, of the Tacony Iron & Metal Co. He described a method of calculating approximately the deflection of castings of different shapes which is caused by the unequal contraction of its several parts. We shall shortly publish an abstract of this paper. It is, as far as we know, the first attempt to predict by calculation based upon the known shrinkage of a test piece what will be the shrinkage of a large casting, and what will be the extent of the deformation produced by such shrinkage. The paper led to considerable discussion, some of the members taking exception to some of the author's statements. The discussion covered a wider range than that of the problems presented in the paper, and showed that the whole subject of cast iron and its vagaries is one of great interest to many members of the society. It is proposed to make "The Physics of Cast Iron" a special subject for papers and discussions at the meeting to be held in Hartford next spring. The following papers were then read and discussed briefly: "A 200-ft. Gantry Crane," by John W. Seaver; "Friction Horse Power in Factories," by C. H. Benjamin; "Washing of Bituminous Coal by the Luhrig Process," by J. V. Schaeffer. We print the second of these papers in this issue and the other two will be printed at an early date.

Thursday afternoon was left free to the members to visit industrial works or to otherwise employ their time as they saw fit. Many of them remained at the rooms "for social and professional chat," as it was expressed in the programme. On Thursday evening another session was held for the reading and discussion of papers. The first was by Mr. F. A. Halsey, on

"Some Special Forms of Mechanical Computers."

This paper described several forms of the special circular slide rules invented by Mr. Wm. Cox, of New York, several of which have been illustrated and described in Engineering News. We quote the following extract from the paper:

> These computers are simple mechanical devices in the nature of special circular slide rules, designed for the solution of certain more or less complicated formulas, each computer solving but the one formula (or in some special cases two) to which it is adapted. They are in this respect unlike the ordinary slide rule, which is, in a sense, a universal instrument. On the other hand, the slide rule covers only operations involving multiplication, division, squares, and square roots and their combinations, while these instruments can be made to handle any powers or roots or trigonometrical functions. Problems involving more than four factors, when solved by the slide rule, must be attacked piecemeal, whereas the computers may be made to solve at once problems containing any number of factors.
>
> They are provided with different logarithmic scales, similar to those on the slide rule, but with the important difference that each scale represents one definite factor in the formula, and is made sufficiently long to cover all probable values of that factor, so that positive quantities as 8, 80, 800, etc., are read off without chance of error, thus overcoming the slide rule difficulty of locating the decimal point.

The next paper was presented by Mr. M. P. Wood, of New York city, and was entitled

"Rustless Coatings for Iron and Steel."

This is the fourth paper which he has presented to the society on the same subject. The following is an abstract:

> The reported case of the corrosion of the floor beams in the old New York "Times" building, occurring, as it were, almost under one's feet in the short interval of 35 years, and in the hereinafter reported case of one of six days appear to be an unanswerable argument of the dangers of using the oxide of iron in any form for the protection of metallic structure from corrosion.
>
> This argument may be reinforced by the query, What is or what will be occurring to the metallic portions of the many sky-scrapers that are in process of erection in our own and other cities at the present time, under great dissimilarity as regards temperature, humidity and other climatic conditions, but of one characteristic sameness—viz., being sealed in solid masonry or other coverings beyond the ken of inspection?
>
> Inspection of these buildings now in progress, as well as those lately erected, reveals possibly a slight improvement in general over the conditions apparent two years ago; but the improvement is a hollow mockery, and will bear fruit for repentance ere many years have passed. These structures, though more carefuly painted than those erected before, with more and heavier coatings of some kind of stuff called paint, do not appear in a single case to have received any attention or consideration as to the condition of the metallic surfaces before applying the protective coating beyond a possible sweep with a dirty broom to get rid of the rough dirt from the workshop yard, and a possible wipe with a piece of old sacking to remove the grease due to machining processes. Anything like a washing down of the parts with soda-ash or lye-water to remove the grease, and then pickling with weak acid to remove the mill scale, and a subsequent washing with lime water to neutralize the acid bath, warming the work before painting it, and care to apply the paint only on clear, bright days, when no sweating can occur, or applying the paint in warm paint-rooms; it is safe to say that not in a single case out of the many skeleton structures of our modern sky-scrapers can this be found to have been the procedure. Not only this, but in the minor parts of the structure, where the light grillage and ornamental partitions should at least claim these precautionary measures to be used, and where the question of weight and complexity of parts could not arise to cause a decision on the side of Cheap-John methods.
>
> In previous papers on "Rustless Coatings" read before this society, attention has been called to a few of the many cases of destructive corrosion that are apparent to the most casual observer, viz.: The Niagara Falls and Brooklyn Suspension Bridges (Transactions A. S. M. E., Volume XV., pp. 1044-1046); the Victoria Tubular Bridge across the St. Lawrence River at Montreal, Can. (Volume XVI., p. 410), and the Firth of Forth Cantilever Bridge, Scotland (Volume XVI., p. 407); the elevated railway and viaduct constructions of the Metropolitan Railway lines in the city of New York, and the evidently wrong conception from the beginning of what was necessary for the protection from corrosion of these costly structures, so that their life could be measured by the lapse of centuries instead of decades.
>
> "Engineering," July 31, 1896, pp. 157-158, reports from a paper read by Mr. Hector Macoll, of Belfast, before the Institute of Mechanical Engineers (before referred to) an interesting case of the Unusual Corrosion of Marine Machinery due to the presence of oxide of iron pigment.
>
> On Dec. 24, 1895, the steamer, "Glenarm," carrying a cargo of about 650 tons of "burnt ore," struck on a rock in the Sound of Mull, and was at once beached in Scallaster Bay, where the sea stood a little over her after-deck, at low water, and close up to her bridge deck at high water. After having been submerged six days, she was pumped out and raised. On examination the machinery was found to present an extraordinary appearance; all wrought-iron work was deeply and roughly corroded, and planed cast-iron work rendered so soft as to be easily cut with a knife. These unusual effects were undoubtedly caused by the cargo of "burnt ore." Every 100 tons of cargo contained as much sulphate of copper as would, if available, dissolve nearly 32 cwt. of metallic iron. The burnt ore might also contain a small quantity of free sulphuric acid, which would combine with the soda of common salt in the sea-water and set free hydrochloric acid, and the latter would rapidly act upon copper or brass.
>
> On the condition of affairs being discovered, the engines and boilers as well as the hull were at once opened up for survey. The general condition of the engines was that wrought-iron work had been penetrated by corrosion to a depth of about 3 32-in., and planed cast-iron so softened that ⅛ in. had to be taken off before a hard surface was regained. Surfaces in bearing contact, or with oil between them, and all painted surfaces, were completely preserved.
>
> The condition of both boilers looked serious. The front end plate of the main boiler was considerably wasted; the furnaces, which are of the spiral, corrugated type, had corrosive scores running in the direction of the corrugations; and the tubes were covered with a deposit of what appeared to be pure metallic copper. In the end, however, after careful drilling and gaging, it was found that an unexhausted margin remained in all except the tubes. These were all found to be seriously corroded in both boilers, and every tube was therefore cut out and renewed; after which the boilers were satisfactorily tested.
>
> The cause and effect are so closely related that all doubts as to the cause are set at rest. As stated in previous papers read before this society, the corrosive agent is found in the oxide of iron pigment as usually prepared for the market, and claiming great superiority as to quality by reason of its bright attractive color and purity over other forms of oxide pigments ground from hematite ores, whose dirty brown purplish color indicates the presence of more or less clay and earthy matters, wholly unreliable as a pigment even when mixed with good linseed oil, and whose varying qualities are readily detected in the separate consignments from the same manufacturer or compared with each other. Of the samples from the many concerns turning out this Cheap John material, none are good, all are bad and comparatively useless for the protection of metal, however admirably adapted by virtue of their cheapness to wooden structures, and are a poor investment for them if the merits of a better paint is considered.
>
> How much damage is done to the internal parts of a marine vessel by the use of iron oxide paints with which those portions below water-mark in the holds are usually coated it is hard to realize. Bilge-water is a very corrosive fluid, composed as it is of sea-water mixed with the leakage from fluid cargoes soured by the heat of the hold, the sulphur-water from the furnace, ashes and pyrites in the coal bunkers, mill-scale and paint oxides of copper and iron thrown down in the course of repairs to boilers and hull and seldom if ever removed, continually agitated and washed over the exposed metallic surfaces, and aided by the presence of carbonic acid generated from the conglomerate mass in the confined air of the hold. It is scarcely to be wondered at that the vessel when in the dry dock for the too often extended yearly examination is found in such an advanced stage of corrosion that it is necessary to cut out and renew frames, bulkheads, and other parts so corroded as to endanger the safety of the ship in seaway.

In the discussion which followed the paper some of the speakers showed that their opinions differed from that of the author concerning the value of oxide of iron as a pigment. It was also shown that iron wires taken from suspension bridges after 40 years' service had shown no corrosion if they were properly protected. Dr. C. E. Emery related cases of protection of the inner shells of steamships from corrosion by bilge water for more than 30 years. His remedy is paint, plenty of it, and often repeated. The best painting of the inside of the hull of a vessel is done by a laborer who thinks nothing of the economy of paint, but "daubs it on," and the worst by a skilled painter, whose training has been in the direction of making a can of paint go as far as possible.

The next paper was "A Method of Shop Accounting to Determine Cost," by Mr. H. M. Lane. We shall print this paper in full in an early issue.

It was followed by a lecture by Mr. Harry de B. Parsons, member of the society's committee on Tests of Fire-Proofing Material, on the tests which have been made to date by the committee. It was illustrated by a number of lantern slides. The lecture covered the results given in the committee's preliminary report, which was printed in full in our issue of Aug. 6.

The closing session was held on Friday morning, and was devoted to the reading and discussion of papers. The first was by W. W. Christie, on

"The Efficiency of the Boiler Grate."

The author compiled the result of 108 boiler tests, selected from various sources, and by plotting the relation of the economy to the rate of combustion per square foot of grate surface, arrived at the conclusion that the rate of combustion which gave the highest economy was 13 lbs. per sq. ft. of grate per hour for anthracite, and 23.8 lbs. for bituminous coal. This conclusion was disputed by those who took part in the discussion, and one member showed that a correct plotting of the data given in the paper led to the conclusion that within the limits of 5 and 37 lbs. per sq. ft. of grate the economy was entirely independent of the rate of combustion. This corresponds with what was stated in our editorial on Sept. 24, 1896, showing that in locomotive boilers, between the limits of 60 and 240 lbs. per sq. ft. of grate per hour, the efficiency is independent of the rate of combustion, providing the area of grate is cut down in proportion to the increase of grate, except in so far as at the higher rates of combustion a greater quantity of unburned coal is discharged out of the stack.

The next paper was by Mr. R. S. Hale, of Boston, entitled

"Efficiency of Boiler-Heating Surface."

It was a study of formulas given by Rankine, Isherwood, Clark, Emery and Carpenter, to express the relation between the extent of heating surface and the economy of a boiler, the rate of combustion being taken as constant. By plotting these several formulas, the pounds of water evaporated per pound of combustible being taken as ordinates and pounds of water evaporated per square foot of heating surface per hour as abscissas, it was shown that wide differences existed in the formulas. The author then discussed the effect of radiation upon the economy and plotted a series of curves showing this effect. The results of Mr. Barrus's tests with anthracite coal, taken from his book on "Boiler Tests," were then plotted, and it was shown that while a curve could be drawn representing an average relation of the economy to the rate of evaporation, yet results of the individual tests were very far from this average. The discussion which followed the paper was quite lively, and when printed together with the paper as finally revised for the "Transactions," will probably prove an important contribution to our knowledge on the subject of the paper, or at least it will show how great is our ignorance of the subject and how much remains to be learned concerning it.

The next papers on the list were: "Paper Friction Wheels," by Prof. W. F. M. Goss, and "Steam Engine Governors," by Mr. Frank H. Ball. The first of these papers will be printed in our columns in full, and the second in abstract, at an early date.

These papers were followed by a brief presentation in abstract of a paper of 96 pages entitled "The Metric versus the Duodecimal System," by Mr. George W. Colles. The paper is the most extended and vigorous attack upon the metric system of weights and measures which has appeared in many years. It is divided into two parts: 1, Historical; 2, Argumentative. The title is rather unfortunate, as the author uses the word Duodecimal as meaning the ordinary English system of measures in which the foot and inch are the primary units, while the same word is used by other writers to mean the proposed new system of numerical notation, based upon twelve digits instead of ten. The discussion which followed the presentation of the paper was nearly all in its favor, but a few members pointed out what they considered errors in some its minor statements. The sentiment of the members of the society in general is strongly against the metric system, and especially against compulsory legislation for its introduction. The sentiment of the Council has been shown, as was stated in our last week's issue, by its appointment of a committee to prepare material to be used in opposition to the proposed Congressional legislation to make the metric system compulsory.

The next and last paper was entitled "Aluminum Bronze Seamless Tubing," by Mr. Leonard Waldo. This tubing is an entirely new production of the Pope Tube Co. Samples of various sizes were shown. We shall print an abstract of this paper at an early date.

A MOTOR CARRIAGE COMPETITION has been arranged for by the proprietors of "The Engineer," London, England, entries for which must be made by the end of March, 1897. The vehicles are to be delivered at the Crystal Palace, Sydenham (near London) in May, for the preliminary trials and examinations by the judges. The competitive run is for a course of 100 miles out and 100 miles back, and will probably be made on May 31. A wise provision made in the rules is to the effect that as the attainment of high speed is not one of the objects sought, no credit will be given for speeds exceeding 10 miles per hour. The points on which the awards will be made are as follows: 1, Distance run without renewing supplies, and freedom from stoppages for repairs, oiling, etc.; 2, Design and workmanship of machinery and carriage; 3, Safety; 4, Simplicity, durability, accessibility, and freedom from smell and vibration; 5, Time of setting to work and ease of starting; 6, Speed (up to 10 miles per hour) and hill climbing; 7, Steering gear and brakes; 8, Weight; 9, First cost and (to a limited extent), cost of working; 10, General efficiency. The prizes offered are as follows: $1,825 for carriage weighing two tons and carrying four or more passengers; $1,750 for carriage weighing one ton and carying one, two or three passengers; $1,750 for carriage weighing two tons and carrying one ton of freight; $780 for carriage weighing one ton and carrying 560 lbs. of freight; $600 for a carriage operated by the vapor of oil or spirit, having a specific gravity lower than 0.8%, or a flashing point lower than 73° F. The full conditions of the competition can be obtained on application to "The Engineer," London, England.

◆

THE BOARD OF TRUSTEES OF THE SANITARY District of Chicago, which has in charge the construction of the great Drainage Canal from Chicago to Lockport, Ill., effected a pretty complete reorganization at the annual meeting, held Dec. 8, 1896. This board consists of nine members, five of whom are Republicans in politics, and four Democrats. The president of the board, who is elected by ballot of the nine members, has for the past year been Mr. B. A. Eckhart, a Republican, and the chairmen of the most important committees, who are appointed by the President, have been Republicans. Previous to December, 1895, these same offices had been held by Democrats, the followers of that party being in the majority. The change in the political affiliations of the members which took place at the general election held in 1895, resulted at the annual meeting in the officers being voted to Republicans as above noted. This action aroused considerable partisan animosity, which has continued in a more or less suppressed state during the past year, and at the annual meeting, held Dec. 8, last, the Democrats of the board, with the aid of one of the Republican members, elected a Democrat, Mr. Thos. Kelley, to the office of President, and affected a complete turnover in the chairmanships of the most important committees. This action has increased the intensity of the partisan feeling between the Republican and Democratic members of the board, and in the Chicago press mutual charges of vicious intent and the administration of affairs to further partisan ends, have been flying broadcast. As far as the officially expressed intentions of the majority now in control of the board go, however, the only radical change of policy thus far voiced is the advocacy in the inaugural address of President Kelley of more attention to securing and promoting the waterway features of the canal. To this end Mr. Kelley advocates that all arrangements made for crossing of the canal by bridges shall provide for the present construction, or, at least, the substitution at will, of swing bridges for fixed bridges, and for the planning of all other work with a view to the use of the canal as a waterway. In this connection it may be noted that a convention of delegates from the Illinois River valley towns through which the discharge of the canal will flow was held at Peoria, Ill., Dec. 10, to effect an organization to prevent any change in the law under which the Drainage Canal is being built, and to check any intention of the Board of Trustees to violate or evade the provisions of the law.

◆

THE CHICAGO DRAINAGE CANAL'S engineering force is to be cut down from 142 to 65 men, the work being so far advanced that their services are no longer needed. The new President of the Board of Trustees, Mr. Thomas Kelly, in his inaugural address, referred to the work yet unfinished, a strip 5½ miles long, from Joliet westward, and also the work remaining to be done on the Chicago River, from the lake to Robey St., where the river connects with the main channel. He said that although the government had signified a willingness to deepen the river by drainage and otherwise, the sanitary trustees would probably have to buy or condemn property wherever necessary to bring about the required flow of 300,000 cu. ft., as provided by law. He strongly urged that a plan be immediately adopted to proceed to this work, which should be started as soon as possible.

◆

THE BOSTON SUBWAY has been leased by the Boston Transit Commission, of Boston, Mass., to the West End Street Ry. Co., for 20 years. The rental is 4⅞% on the cost of construction, which will suffice to pay the interest on the bonds and create a sinking fund to pay on the principal in 40 years. In addition to this, the company is to pay quarterly a sum not less than 5 cts. for each car using the subway in either direction. The track, fans, pumps, electric lights, etc., are to be put in by the company and the entire work of maintenance also done by the company.

◆

ELECTRIC LIGHTING FOR SIGNALS, stations, etc., is said to be in contemplation by the New York, New Haven & Hartford R. R. The plan, as reported, is to have power plants at intervals, furnishing light for stations, yards, signal towers, and signals.

◆

AN AIR COMPRESSOR PLANT for shop work has been put in at the Union Pacific Ry. shops at Cheyenne, Wyo. It will be used for operating machine tools, yard derricks, car cleaning, etc. Similar plants will be put in at the other principal divisional points.

◆

THE USE OF DUMMY COUPLERS for hanging up airbrake hose on freight cars has been abandoned by the Southern Pacific Ry. The company will hereafter receive freight cars at interchange points without "dummy couplings," and will decline on and after Jan. 1, 1897, to receive bills for replacing or repairing such couplings.

◆

TRAFFIC ON THE BROOKLYN BRIDGE has been steadily decreasing since 1893, according to the annual report of the trustees, and the reason given for this is the discomfort due to the work of making the changes in the terminals. The total number of passengers for the year ending Nov. 30, 1896, was 43,996,459, as against 44,564,329 in 1895, the financial decrease being $22,514. The changes are now practically completed, however, and an increase in train service is promised.

◆

A RAILWAY CROSSING FIGHT occurred recently at Kingston, N. Y., in which the officers of both roads set their men an example of argument by force, as is too often the case. A few months ago the Common Council granted the Ulster & Delaware R. R. the right to cross the Strand, and on Sunday morning early the track was laid, crossing the Colonial Electric Ry. tracks. Early Monday morning the latter tore out the crossing, and on Tuesday the Ulster & Delaware R. R. put the crossing back. The electric railway had a car running over its track loaded with employees, and the Chief of Police ordered the motorman to stop by order of the Mayor. He refused and was arrested. The Colonial Co. again tried to tear up the tracks, but the Ulster & Delaware R. R. ran a flat car loaded with bluestone over on the crossing and the workmen were obliged to stop. A mob of about 2,000 people gathered and a riot was narrowly averted.

◆

A FIGHT FOR A RAILWAY FRANCHISE is in progress at New Brighton, Staten Island, N. Y. The Staten Island Electric Ry. Co. got hold of an old franchise for a line on Castleton Ave., and started to build the line without a permit, gangs of men being continuously arrested by the police and replaced by the company. The village trustees have rescinded the franchise and given it to the Midland Ry. Co., and trouble is expected in addition to the inevitable litigation.

THE MOST SERIOUS RAILWAY ACCIDENT of the week was a head collision of freight trains Dec. 12 at Welder, Tex., on the Southern Pacific Ry. The eastbound train had orders to wait on the siding to let three sections of a westbound train pass, but the second section was mistaken for the last section owing to a fog which prevailed at the time. There were five men killed, and both engines and several cars were wrecked.

◆

A LOCOMOTIVE BOILER EXPLOSION occurred Dec. 4 near Eagleville, Conn., on the New London Northern R. R. The engine was hauling a freight train at the time, and was derailed by the explosion and went down the embankment. Three men were killed.

◆

A BOILER EXPLOSION in the Wilcox Lumber Co.'s mill at Seville, Tex., wrecked the plant and killed six men.

◆

THE LOSS OF THE S. S. "SALIER," of the North-German Lloyds Line occurred off the coast of Spain, Dec. 7. The vessel struck on sunken rocks near the shore in a fog, and went down with all on board, the number of persons drowned being given as about 300, including passengers and crew.

◆

RECENT EXPLOSIONS OF ACETYLENE GAS serve to call attention to the dangerous nature of this much advertised illuminant. The latest is reported in a press dispatch from Berlin, Dec. 14, which states that an explosion occurred in the workshop of an inventor named Geo. Isaacs who was experimenting with processes of making the gas, and four persons were killed. The explosion on Oct. 17 of a cylinder filled with the liquefied gas in the laboratory of M. Raoul Pictet, the well-known chemist and engineer, has been carefully investigated, and the gist of recent reports from abroad is that acetylene is liable to contamination with certain impurities which render it liable to spontaneous explosion. Acetylene appears to be as dangerous from the physical side as from the financial.

◆

THE QUEEN LANE RESERVOIR SUIT, in Philadelphia, has been decided against the city and in favor of the contractors, Filbert, Porter & Co. The suit was brought by the contractors to secure the payment of $137,071, being the 10% of the contract price usually withheld until work is accepted. The reservoir having proved defective the city refused to pay over the balance, claiming that the contractors had done poor work. The defence seems to have been that the contractors followed the specifications, except where ordered or authorized by the city authorities to depart from them.

◆

THE $3,000,000 PHILADELPHIA FILTRATION ordinance has been indorsed by the director of public works and signed by the Mayor. Before anything will be done in the way of construction a decision from the State Supreme Court will be awaited, to learn whether the proposed loan can be legally made. When this is satisfactorily settled and bonds are issued and sold, the council must pass upon the final disposition of the money, so, altogether, the filtration scheme in Philadelphia is by no means past all dangers.

◆

THE PURCHASE OF THE WATER-WORKS OF DULUTH by the city has been postponed, at least, by a decision in a lower court, throwing out a large number of votes, and thus giving the majority to the opponents of the project. The city is developing a supply from a new source, and proposed, as we understand it, to buy the distribution system now owned by a company.

◆

AN IRRIGATION POLICY for Colorado has recently been outlined in an open letter by Mr. J. S. Greene, ex-State Engineer of Colorado, and now practicing law Pueblo. In brief, he proposes that the state be divided into natural drainage districts. The people of any of these districts might at any time vote to incorporate their district, the corporation so formed having control of the water and land within the district. The plan is in part dependent on the cession of the arid lands to the several states. Grazing lands would be leased for the benefit of the district, and mineral lands would pay royalties, the sale of such lands being prohibited.

◆

A WATER POWER PROJECT for Portage la Prairie, Manitoba, has been proposed. The plan being to build a dam across the Assiniboine River, south of the city. A favorable report has been made by Mr. Geo. H. Webster, C. E., of that city, but no definite steps have yet been taken.

◆

DIVERS FOR FOUNDATION WORK have been employed at the site of the new building on the north side of Liberty St., near Church St., New York city, owing to the amount of water met with.

◆

ELECTRIC POWER FOR DRAWBRIDGES is to be adopted for all the bridges over the Chicago River at Chicago, Ill., replacing the steam plants now required for each bridge.

A TOWER DERRICK FOR ERECTING STRUCTURAL IRONWORK.

The special conditions under which the erection of ironwork has to be done in the construction of the modern type of steel skeleton building have led to the devising of various improvements in detail adapted to this class of work, and we illustrate herewith a somewhat novel form of erecting derrick which has been used on two or three buildings. The general view, Fig. 1, shows the general arrangement of the derrick, which is simply a four-post tower carrying four booms whose range covers the whole area of the building. The fourth boom had not been put in place when the photograph was taken from which our illustration is reproduced. This view shows the derrick as used on the foundations and the two lower stories of the Woodbridge Building, in William St., New York city, and the tower was extended upward as the work progressed, the full height of the derrrick being shown in Fig. 2. The booms are all 60 ft. long, 12 ins. diameter at the upper end, 10 ins. at the lower end and 14 ins. at the middle. They can be lowered to a horizontal position, each boom having thus a reach of 60 ft. and a sweep or range of 270°. The tower was designed to hoist 5 tons on each boom. The contractors for the ironwork of this building were Levering & Garrigues, engineers and contractors, of New York city, to whom we are indebted for photographs and blue prints of the derrick.

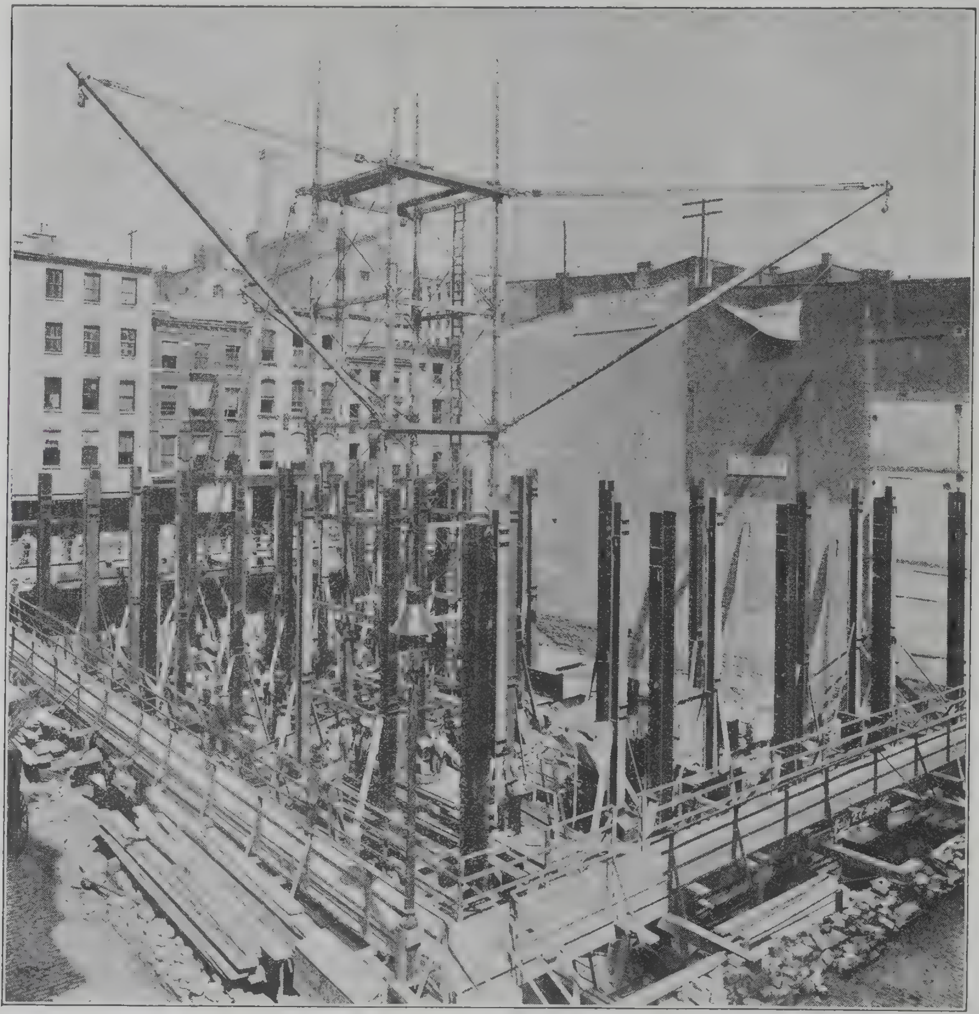

FIG. 1.—TOWER DERRICK FOR ERECTING IRONWORK, WOODBRIDGE BUILDING, NEW YORK CITY.
Levering & Garrígues, Contractors.

BRITISH RAILWAY STATISTICS FOR 1895.

From the general report of the railway companies of the United Kingdom, dated Aug. 10, 1896, and officially presented to Parliament through the Board of Trade, we obtain the following statement relating to the capital, traffic, working expenditure and profits for the year 1895:

The total mileage of British railways at the date of the report was 21,174 miles, of which 9,738 miles were single track; the gain in mileage over 1894 was 266 miles, or 1.3%. The total railway capital, in dollars, was $5,005,551,105, or $236,400 per mile of line operated; the ordinary or common share capital is $1,820,187,025. The total receipts for 1895 were $429,613,510, divided as follows: Passenger receipts, $186,805,810; from goods, $220,174,425; from miscellaneous sources, $22,633.275. The total expenditures for 1895 were $239,383,185, leaving net earnings equal to $190,230,325, a gain of 2.5% over the net earnings of 1894. The receipts per train-mile from traffic were $1.15 30-100, a gain of 0.2% over 1894, and the expenditures per train-mile, exclusive of harbors, etc., were $0.64 64-100; leaving a net earning per train-mile of $0.50 66-100, and a decrease in expenditures of 0.2% per train-mile. The percentage of net earnings on capital was 3.80% as compared with 3.77% for 1894.

The Board considers this showing as satisfactory from every point of view, especially as the small improvement in revenue and net earnings is upon totals which were already the largest on record. In regard to dividends the highest average rate paid, during the last ten years, was 4.32% in 1889; after this date the rate gradually declined to 3.74% in 1893, a rate partly due to the great coal strikes of that year.

From an analysis of the passenger traffic for 1894 and 1895, the following table is prepared:

No. of passengers.	1894.	1895.
First-class	29,821,000	29,990,000
Second-class	60,162,000	58,568,000
Third-class	821,430,000	841,213,000
Total	911,413,000	929,771,000
Receipts from Passenger Traffic.		
First-class	$14,830,000	$15,175,000
Second-class	9,860,000	9,675,000
Third-class	116,380,000	118,980,000
Season tickets	13,240,000	13,800,000
Excess luggage, mails, etc.	28,165,000	29,175,000
Total	$182,475,000	$186,805,000

In recent years the second-class has been abolished on several important lines, and the total decline in this class of receipts has been nearly 27% since 1890. The increase in season-ticket receipts was about 19%. The third-class passenger receipts show an unbroken record of increase for the last 9 years. In 1886 the $90,000,000-mark was just passed, and since that time the actual increase has been equal to 32%. The revenue from third-class passengers now amounts to about three-fifths of the total revenue from passenger traffic.

The receipts from freight, for 1895, were divided as follows: Mineral traffic, $90,880,000; general merchandise, $122,255,000; live stock, $7,040,000; total, $220,175,000. There was a gain over 1894 in these classes of freight of 0.3% in the mineral traffic and 2.7% in merchandise, but a decrease of 3.5% in live stock carried. These sums were earned on the carriage of 240,400,000 tons of minerals and 93,900,000 tons of general merchandise, or a total of 334,300,000 tons, showing a general gain of 3% in volume over 1894. As being of interest in connection with these figures the Board gives the following figures for coal and pig-iron production for the two years:

Item.	1894.	1895.
Coal raised, tons	188,278,000	189,661,000
Pig iron produced, tons	7,427,000	7,703,000
Coal shipped coastwise	17,357,000	16,524,000
Coal exported abroad	31,756,000	31,715,000

The pig-iron production includes that made from foreign ores, and the coal exported excludes that used by steamers engaged in the foreign trade.

The total train-mileage of passenger trains, in 1895, was 184,200,000 miles; for freight trains it was 150,400,000 miles, and the total mileage, including mixed trains, was 338,900,000 miles. The proportion of working expenditure to total revenue, in 1895, was 56%, practically the same as for the preceding year. For many years prior to 1890 this rate remained comparatively stationary at 52 to 53%. In 1890 it rose to 54%, and gradually increased each year until it was 57% in 1893. From an analysis of expenditures for all the railways, in 1895, it is found that these were divided as follows: Maintenance of way, works and stations, $38,300,000; locomotive power, $62,650,000; repairing and renewing rolling stock, $20,100,000; traffic expenses, $74,800,000, making a total of $195,850,000 for the principal items connected with the absolute operation of the railways. The average expenditure per train-mile for all the companies is thus divided:

Item.	1895.
Maintenance of way	10.84 cts.
Locomotive power	17.78 "
Rolling stock	5.72 "
Traffic expenses	21.16 "
General charges	2.96 "
Rates and taxes	4.26 "
Government duty	.38 "
Compensations	
Personal injuries	.18 "
Damage to goods	.32 "
Legal and parliamentary	.36 "
Miscellaneous	.68 "
Total	64.64 cts.

In this connection there is an average decrease of cost of 0.16 cts. per train-mile over 1894. The approximate average cost of coal at the mines, in 1895, was $1.45 per ton, as compared with $1.90 in 1890. The average export price of iron and steel rails, as computed from the quantity and declared value of exports in 1895, was $19.15 per ton, as compared with $27.35 in 1890.

In the analysis of dividends paid in 1895 on $1,820,000,000 of ordinary share capital, it appears that stock to the value of $240,000,000, or 13.2% of the total, paid no dividend. Of the remainder, 29% paid between 5 and 6%; 15.5% paid between 6 and 7%; 11.5% paid between 2 and 3%, and only 0.3% of the total paid between 7 and 8% dividends.

From the general report of the Board of Trade upon railway accidents in the United Kingdom, for 1895, we obtain the following: The total killed by railway accidents was 1,024 and 4,021 people were injured. Of the killed 442 were railway employes and 285 were trespassers; only 83 passengers were killed and 1,109 injured from all causes connected with railways. Of employes 2,654 were injured. The proportion of passengers killed during the year was 1 in 11,202,059, and 1 in 838,387 were injured. In 1894 the proportion was 1 in 7,789,854 killed, and 1 in 780,319 injured. The report details 69 train accidents during the year, four of which were attended with fatal results.

Among employees 16 were killed and 331 injured while employed in coupling and uncoupling trains; 94 were killed and 1,127 were injured in various shunting operations; 86 were killed and 95 injured while working on the permanent way, and 93 were killed and 148 injured while walking on or crossing the tracks. The total number of men employed on the railways of the United Kingdom, in 1895, was 465,112, divided as follows:

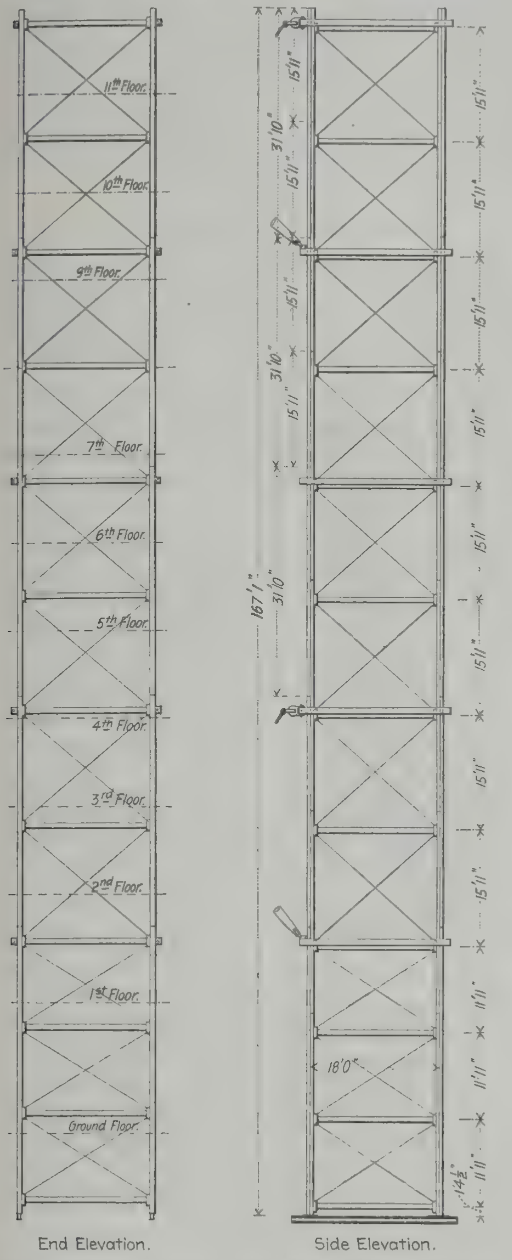

Fig. 2.—Details of Tower Derrick For Erecting Structural Ironwork.

Station masters	7,410
Brakemen and goods-guards	11,881
Permanent-way men	58,781
Gatekeepers	3,292
Engine-drivers	19,281
Porters	45,696
Shunters	7,092
Firemen	19,264
Inspectors	6,805
Passenger guards	6,357
Pointsmen and signalmen	24,381
Laborers	45,882
Ticket collectors	2,795
Mechanics	69,227
Other classes	136,968
Total	465,112

The progress made in the adoption of the absolute block and interlocking system is thus stated in the reports made annually to Parliament. The proportion in which the signal and switch levers had been interlocked on railways was 99.7% in England, 99% in Scotland and 97.7 in Ireland, or 99% for the United Kingdom. The mileage in these several divisions is given as follows:

	Miles	
	Double.	Single.
England and Wales	'9,325	4,472
Scotland	1,314	1,768
Ireland	613	2,534
United Kingdom	11,252	8,774

By a report dated Dec. 31, 1895, it appears that 94% of all passenger vehicles were fitted with continuous brakes complying with some or all of the requirements of the Board of Trade; and the number of passenger vehicles fitted with pipes and connections only was 5%.

THE WASHING OF BITUMINOUS COAL BY THE LUHRIG PROCESS.*

By J. V. Schaefer, Jun. M. Am. Soc. M. E.**

The composition of fuel is a matter so vitally connected with all commercial and manufacturing industries, that the removal of the impurities in coal has been made a subject of much study and experimental work. Before giving a detailed description of the latest plant built on the Luhrig system the writer desires to consider briefly the nature of these impurities, the means to be employed to remove them, and the advantages of the cleaned coal.

The principal impurities in coal which it is desired to remove are ash in the form of slate, and bone coal and sulphur in the form of pyrites. The larger pieces of slate, bone, and pyrites can be removed by hand picking. Fortunately, all these materials have a specific gravity greater that that of pure coal. It is therefore possible to remove these elements from the small coal by using water in such a way as to float off the coal, which is lighter, leaving the slate, bone, and pyrites to settle. This is the process called washing.

The incombustible matter in coal generally consists of silicate of aluminum and oxide of iron. In blast furnaces the oxide of iron is reduced, but when present in fuel used for generating steam it forms into clinkers on the bars of the furnace grate, resulting in great loss.

Coal ashes often contain about 90% of silicate of alumina. The proportion of silica to alumina is generally ¾ to 2. The latter proportion generally exists in coal with a high percentage of ash. This silicate is almost infusible, and in order to flux it for good working of the furnace it requires an addition of lime.

In blast furnaces on Bessemer iron the slags are generally of the following composition:

Lime, 47%; silica, 38%; alumina, 15%.

The proportion between alumina and lime is about 1 to 3, but if lime be added in the same proportion to the alumina of the ashes of the fuel, the proportion of the bases to the silica will be much greater than in the Bessemer slag. However, to prevent an exaggerated estimate of loss, the lime (in the following calculation) will be only added in sufficient quantity to make the ashes of the fuel as basic as the remainder of the slag produced in the furnace.

Let it be assumed that 22 cwt. of coke, containing:

Carbon, 92%; ash, 5%; moisture, 3%, will produce one ton of Bessemer iron.

The following will show, with this data, what amount of coke will be required when the coke contains:

Carbon, 82%; ash, 15%; moisture, 3%.

The principal elements of the ash being:

Silica, 49%; alumina, 25%; lime, etc., 8%; 22 cwt. of coke with 92% carbon gives 20.24 cwt. of carbon per ton of iron.

Again, 20.24 cwt. of carbon represents 24.7 cwt. of coke when there is 82% of carbon; i.e., with 15% of ash.

The 10% of additional ash in the dirtier coke equals 2.5 cwt., consisting of 1.23 cwt. silica, 0.82 cwt. bases, 0.45 cwt. oxide of iron. The bases take up 0.5 cwt. of silica, leaving 0.73 cwt. to be fluxed by adding lime to the extent of 1.2 cwt., which is equal to 2.2 cwt. of limestone. The total slag due to the extra 10% of ash in the coke will therefore be 3.7 cwt., consisting of 2.5 cwt. ashes plus 1.2 cwt. lime.

	Cwt. Units.
The fusion of 3.7 cwt. of slag requires, according to Bell, 3.7 × 550 =	2,035
To expel the carbonic acid from 2.2 cwt. of limestone requires 2.2 × 370 =	814
To decompose 0.264 cwt. of carbonic acid of the limestone requires 0.264 × 3,200 =	845
Total cwt. heat units	3,694

Taking 4,400 as the number of units developed by 1 cwt. of carbon in the blast furnace, the above will represent 3694 ÷ 4400 = 0.84 cwt. of carbon.

The carbon, therefore, in the inferior coke must be 20.24 + 0.84 = 21.08, instead of 20.24 cwt. Consequently, the coke required with 15% of ash will be 82 : 100 : : 21.08 : 25.7 cwt., or 3.7 cwt. coke for every ton of iron produced, more than coke with only 5% of ash, or about 17% of coke extra.

To this loss must be added the cost of 2¼ cwt. of limestone, which would of itself more than cover the cost of washing. It is evident, therefore, that a great saving can be effected by washing coal to be used for metallurgical purposes.

Connelsville coal contains 0.53% of sulphur. It is considered that any coal which contains in the coke made from it more than 1% of sulphur is not fitted for blast-furnace use. As many coking coals do contain more than 1% of sulphur, it is in these cases absolutely necessary to wash them carefully if they are to be made into coke for blast-furnace use.

The table here given shows a few results which have been obtained by washing coals from different sections of this country, and is interesting in that it shows to what extent ash and sulphur may be removed from coal:

Location.	Ash.		Sulphur.	
	%Unwashed.	%Washed.	%Unwashed.	%Washed.
Sloss, Birmingham, Ala.	10.00	5.80	2.65	1.92
Sopris, Sopris, Col.	22.48	7.20	0.95	....
Big Muddy, Carterville, Ill.	14.25	4.50	1.14	0.97
Blossburg, Birmingham, Ala.	7.68	4.60	2.29	1.48
Mary Lee, Birmingham, Ala.	10.32	6.14	0.89	0.71
Belt, Montana	29.69	7.35	4.32	2.40
Toluca, Toluca, Ill.	18.61	4.92	4.02	2.49
Brazil, Brazil, Ind.	24.32	5.67	....	....
Rogers, Lisbon, O.	12.78	4.90	3.14	1.27
Alexandria, Greensburg, Pa.	10.60	5.00	1.14	0.62
Cherry Valley No. 3, Leetonia, O.	9.88	5.00	3.83	1.72
Comox, Union Bay, B. C.	35.50	8.50	2.15	1.30
Sand Coulee, Montana	25.59	7.25	4.24	1.87
Cokedale, Montana	31.00	5.40	....	....
Crabtree, Greensburg, Pa.	10.60	6.21	1.13	0.617
Athens, Ohio	14.28	6.33	....	....

In a properly conducted washing operation as practised under the Luhrig system, nothing essential to coking is lost. In some of the less thorough systems—if indeed they may at all be called systems—a considerable amount of bituminous matter and pure coal is lost. These losses, however, are inexcusable, and should not be charged to coal washing in general.

Again, the cost of manufacture of coke from dirty coal is greater that that of coke from clean coal. Let us assume that the coal contains 10% of removable ash. As the price of the coke is proportionate inversely to its percentage of ash, it is necessary in this case to maintain a coking plant one-tenth larger than if the coal was washed, in order to produce the same money equivalent.

All that has been stated above applies with almost equal force to coal used under a boiler for generating steam. In the process of burning, the iron, sulphur, etc., in the removable dirt, together with the fixed incombustible matter in the coal, melt together and form a vitrified mass on the grate bars, called clinker. This greatly impedes the passage of air between the bars and causes imperfect combustion. Moreover, when the bars are covered with a firmly adherent mass of clinker they are no longer cooled by a current of cold air, and so become heated, and "burn out." To compensate for these losses an extra amount of fuel must be provided, the cost of which and the cost of removing the ash and repairing grate bars, are items that make the desirability of washing very apparent.

The cost of transportation on a dirty coal is also an element well worth considering In a coal having 18% ash there is probably 10% that might have been left at the mine by a process of washing. In many cases as high as 70% of the price a consumer pays for coal goes for railroad transportation; 7%, therefore, of the price the consumer pays goes for transporting the very thing he doesn't want—a product worse than useless, as it spoils his fire, burns out his grate bars, and costs money to haul away from his ash pit. As this 10% of removable ash can be washed out at the mine at a cost of two to five cents per ton, the transportation charges on it alone will pay for the cost of washing and the shrinkage in volume due to washing. As this washed coal will have 11% greater calorific power the consumer can pay such a price for it as will leave a liberal margin of profit for both consumer and producer. This readily accounts for the fact that wherever it has been introduced washed coal has found a ready market. Parties who once try it are nearly always converted to its continued use.

A thorough system of washing involves the careful separation of the coal into different sizes—No. 1 and No. 2 nut, No. 3 and No. 4 pea, and sludge. It is a universally accepted fact that the best results are obtained by using coal of a uniform size. Therefore the smaller sizes of washed coal often make a much better fire than the run-of-mine or lump coal that has previously been used at a higher price. The much higher efficiency of an evenly graded nut coal over lump coal and the increasing use of mechanical stokers are facts which, in the writer's opinion, will soon compel the coal producer to prepare his steam coal for the demand of the market by crushing and washing. By using the sludge or intermediate product (this term will be fully explained later) it is often possible for a mine operator to use under his own boilers the product for which he has no market, and sell or coke all the remainder.

Freight charges and low prices for small coal often combine to produce conditions where the slack coal becomes a very troublesome affair. It cannot be sold, so it must be hauled to the dump at a cost of considerable money, and often it becomes even there an intolerable nuisance by its firing and clogging streams. In many cases where these conditions exist, a washing plant will convert this expensive slack pile into a marketable product which will make a showing on the other side of the ledger.

---

*From a paper presented at the New York meeting of the American Society of Mechanical Engineers.

**The Link Belt Machinery Co., Chicago, Ill.

Again, much small coal is often left in the mine because it does not pay to hoist it. This, of course, means just so much of the coal territory made unproductive. It has been found profitable to hoist this and, by washing, make of it a marketable coal.

The washing of coal is, properly speaking, a process, not a single operation. There is involved in it such an arrangement of various elevators, conveyors, jigs, etc., etc., with respect to their individual and related uses and to their environment that they will work in harmony with each other and handle coal and water to the best advantage.

For fuel purposes, coal must not be broken into fine pieces more than is unavoidable. To this end bar screens and all dumps which tend to break the coal should be avoided, and in their places should be used shaking screens and rotary dumps. The pit cars should be dumped into a hopper at the head of the screen in such a manner as to allow the coal to flow gently on to the upper end of the shaking screen. On this screen the hand picking can be done.

For coking coal it is usually necessary to put in crushers and disintegrators. This is especially true of those coals that are low in volatile matter. When the coal must be reduced to a fine state before coking it should be washed first and disintegrated afterward. If all the product of the mine is coked, and the slate and pyrites occur in large pieces in the lump and egg-coal sizes, these sizes should be hand-picked before going to the breaker, where they are broken to nut-coal size before going to the washer.

All water that has been used should be clarified so as to be used over again. As it takes about a ton of water to wash a ton of coal, there are few localities where it is possible to obtain a sufficient quantity of water to allow it to flow away after being used. Indeed, when it is possible to do this it is not desirable, for the reason that much coal is thus lost, and the damage done to streams by the deposits of fine coal and refuse are apt to cause expensive litigation. The water carrying fine coal should be allowed to settle, the clarified water being used over again, and the fine coal or sludge being saved for coking or for use under the boilers. The water carrying refuse should be treated in the same way, and the refuse, drained of its water, dumped on a pile on the mine property. When these precautions are observed a very small stream of fresh water, usually not over 2½-in. pipe, suffices for washing purposes.

The perfection of the process of coal washing is due almost entirely to the efforts made in this direction by Mr. Carl Luhrig, of Germany; but others have labored in this line, and it will be of value in getting an understanding of the perfection of the Luhrig system to review in a cursory manner some of these other efforts before passing on to the description of a Luhrig washery.

Among mechanical appliances for the washing of coal probably the most primitive consists of a long wooden trough divided by low cross dams at intervals. This sluice is given such an inclination that the water has sufficient force to float the coal over the dams, while the heavier pieces of slate and pyrites are retained and removed at intervals with a rake.

Another appliance consists of an inverted cone-shaped receptacle. Water is forced into this tub near the apex at the bottom, and flowing out at the top it floats over the coal, allowing the slate and pyrites to settle and be removed at intervals by means of valves. In order to facilitate the separation, stirring-arms are put in the tub to keep the water and coal agitated, and so aid the separation.

A percussion table has been used with some success. It consists of a shallow wooden chute or table about 8 ft. long and 3 ft. wide, with sides 6 ins. high. This is made slightly concave upward and suspended by rods in an almost horizontal position. The bottom consists of a sheet of galvanized iron; above this, about 1 in. clear, is a false bottom made of wooden riffles. These riffles are placed close together, with a space of 1-32-in. between, and have their upper edges, pointing toward the higher end of the table, sharpened by the insertion of a piece of sheet metal. This table is allowed to fall forward, and then is thrown back violently against a bumping post. As the coal and water in a mixed stream flow on to the higher end of this table, the upward bumping action throws the heavier particles, which settle down so the riffles can act on them, up and off the higher end of the table, while the clean coal and water flow off the lower end. The receptacle between bottom and false bottom being filled with water, aids the separation and allows the removal of the finer refuse.

All of these appliances have been used with some success, but they are all wasteful of coal and water, their results on different coals cannot be assured in advance, with any reasonable degree of certainty, and they have never been developed into any complete system. Nothing but a running stream will supply the trough washer with water. The inverted cone is tolerably effective with the larger sizes of coal, but inefficient in dealing with smaller sizes and dust. The percussion table requires such careful watching to keep the supplies of coal and water balanced that it is very difficult to keep regulated. The form of the table also requires changing to suit different coals, and as this can only be determined by actual experiment the installation of such a plant proves very troublesome.

By far the best results that have been obtained have been reached by means of various forms of the old Hartz ore jig. The jig consists in general of a box divided vertically into two compartments from the top to a point below the water line. In one of these compartments a plunger plays up and down. The other compartment is closed near its bottom by a screen. Coal is placed continuously on the screen near the partition and water is forced into the back of the other compartment below the plunger. The action of the plunger imparts a pulsating motion to the water, which, acting upward through the meshes of the screen, lifts the lighter parts, allowing the coal to flow out of the front of this compartment near the top, while the slates pass out at a point lower down.

Mr. Luhrig conceived the idea of using pieces of broken feldspar on the screen when fine coal is to be washed. This has proven very successful on fine coal. The refuse which in this case passes out of the bottom of the jig has to pass through the interstices of the feldspar in a tortuous way, and the pulsating water has thus abundant opportunity to act on the mass and lift out the lighter particles of coal.

These jigs have been made in various ways, represented in this country by the so-called Deischer, Stutz, and Stein washers, all the same in principle, but differing in essential details from the Luhrig jigs. It must be kept in mind, however, that success in coal washing does not depend so much on individual machines and appliances which can be made in any good machine shop as it does on the process and the system upon which the whole plant has been built and is operated. The nature of the coal must in every case be taken into account, the purposes for which it is to be used, and the plant designed accordingly. It follows that every plant is different, and imitation of previously carried out plans is generally faulty and disappointing. It is therefore advisable to place the design of washing plants into the hands of an expert who, by training and experience in this particular line of work, is qualified to so systematize and arrange the plant to meet existing conditions as to produce the best results.

The perfection of the Luhrig system of coal washing was the life work of Mr. Luhrig among some of the most dirty and difficult coals of Europe. The system, after being perfected in Germany and covered in its essential details by letters patent, was introduced into England and Scotland, by the Messrs. Merry & Cuninghame at their collieries. Its work at these places was so effective and so far in advance of the results obtained by other processes of washing that it is now almost exclusively used in Great Britain.

Messrs. Cuninghame & Co., controlling the Luhrig patents in the United States and Canada, have introduced the system into this country, and have built successful Luhrig washeries at Carterville and De Soto, Illinois; Belt, Montana; and Union Bay, Vancouver Island. A six-hundred ton plant for coking coal is now building at Greensburg, Pa., for the Alexandria Coal Co.'s Crabtree mine. (Here follows a detailed description of this plant.)

Special attention is called to the following features of this plant: First, the extreme and careful grading into eleven different sizes, and washing each size in a jig especially made and adjusted for it. Second, the washing of the nut coals before crushing to take out the intermediate product. Third, the arrangement of the whole plant with a view to minimizing labor, three men only being required to run it. Fourth, the effective arrangement for settling the water, and the automatic and continuous removal therefrom of sludge and refuse, clarifying the water, and saving all the fine coal dust. Fifth, the effective arrangements for drying the washed coal.

When the matter of washing the Crabtree coal came up for consideration a sample of the coal was selected by the representative of Cuninghame & Co., great care being taken to have the sample represent as nearly as possible the average run of the coal. Part of this was hand-washed, and analyses made of both the washed and unwashed portions. The following results were obtained:

No of sample.	Size.	Kind.	Ash, %	Sulph., %	Phos., %
1	⅛-in. to ⅜-in.	Unwashed	10.35	1.098	0.032
2	" " "	Washed	6.88	0.604	0.025
3	1-16-in. to ⅛-in.	Unwashed	10.60	1.139	0.027
4	" " "	Washed	6.213	0.617	0.025
5	Under 1-16-in.	Unwashed	12.400	1.606	0.033

Specific gravity of bone coal...... .... 1.39%
Specific gravity of pure selected coal.............1.27%
Fixed ash in pure selected coal.................. 2.54%

A previous ultimate analysis of a sample of this coal gave the following results:

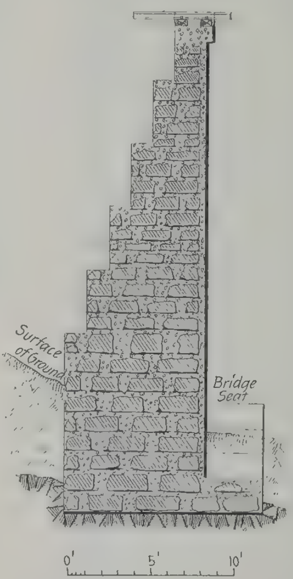
	Bone %.	Pyrites %.	Slate %.
Moisture	1.150	....	....
Vol. matter................	26.900	....	....
Ash......	21.080	....	....
Sulphur..	0.549	28.28	1.098
Fixed carbon..	50.321	....	....
Phosphorus	0.072	0.05	0.017
Sp. gravity	1.552	....	....

It is expected that the washing of the coal at this place will be so thoroughly done that the ash in the coke made from the washed coal will be below 10%, and the sulphur below 1%. That this may be confidently expected will be readily apparent when we consider the wonderful results achieved at Union Bay, B. C., where the ash is reduced from 35.5% to 8.5%. The fixed ash in this Comox coal is 7.8%, thus showing that the coal washed to within 1% of the fixed ash in the coal.

The Luhrig system, though comparatively new in this country, is no new thing. Over 200 plants are in daily use in England, Germany, Austria, and other parts of the world, all doing good work. Several of these plants have capacities of 175 tons per hour each. Such is the control which an expert operator has over the results that the Messrs. Cuninghame & Co. are enabled to fully guarantee beforehand the exact results which will be obtained in washing any coal by this process.

STONE FILLED CONCRETE PIER.

The construction of the Cascade bridge, at Burlington, Iowa, was ordered on June 15, 1896, and the work was completed on Sept. 15, 1896, in 92 days. The plans were made in the City Engineer's office, with Mr. Emmet Steece, Assistant City Engineer, in direct charge, and from Mr. Steece are obtained the following details concerning this work.



Section of Concrete Pier for Cascade Bridge, Burlington, Ia.

The piers and abutments were to be built entirely of concrete, and this was done after ordinary methods, except for the last abutment alone. All except this abutment were finished by Aug. 15 and work was commenced on this abutment on Aug. 17. But as it was desired that all work should present the same appearance and the time for placing the metal work was near at hand, it became necessary, for this particular abutment, to devise some means of hastening the work of construction. The previous plan of operation was too slow, as depositing and tamping concrete in 6 to 8-in. layers consumed time; and to attempt to increase the depth of the layers was to endanger the good character of the work. In this emergency Mr. Steece suggested the method here illustrated, and the abutment was completed in 7 days.

The method adopted was as follows: Concrete, made of 1 part cement to 2½ parts of sand and 4½ parts of broken stone, was first deposited in a 4-in. layer. Upon this bed were laid, in a full bed of mortar, wetted rough stone, with the points and projections alone broken off; the spaces between these stones were not less than 6 ins. wide nor less in width than two-thirds the thickness of the thickest stone at the joint. The concrete was then rammed into these spaces and the whole was covered with another layer of concrete not less than 4 ins. thick. In this manner from 40 to 50 cu. yds. of concrete were deposited in a working day of ten hours by a force of 28 men.

The cost of this masonry per cubic yard was as follows:

Item	Quantity	Cost
Saylor's Portland cement, ...	0.82 bbl. at $2.60	$2.14
Sand	0.22 cu. yd. at $1.00	.22
Broken stone	0.52 cu. yd. at 94 cts.	.49
Water		.07
Labor	$1.50 per day of 10 hours	1.19
Large stone	0.38 cu. yd. at 63 cts.	.24
Foreman		.09
Total cost per cubic yard		$4.44

The total cost of the 278.2 cu. yds. of masonry was $1,235.21, though this cost does not include the excavation nor the lumber used in the forms; the latter were employed again in the construction of sidewalks and box drains in the immediate vicinity. The broken stone had to be hauled two miles, and the charge for hauling alone is given. The city owns a quarry near the bridge site; but as there was no crusher near it would have cost $2 per cu. yd. to quarry the stone and break it by hand. With a more reasonable cost for the materials Mr. Steece believes this work could have been done for about $4 per yard. The work looked well, though the labor was unskilled; a competent foreman alone being necessary.

This method of reducing the cost of concrete work by imbedding in it large stone, is, of course, not novel; as it is often employed in the construction of dams and other large concrete structures. it was done to a large extent in the building of the Vyrnwy dam for the Liverpool water-works. From the thickness given to this retaining wall, by Mr. Steece, it must be assumed that it is intended to well ram and consolidate the back filling. Even then the thickness is less than a good masonry wall would call for.

◆

GANTRY CRANE OF 200-FT. SPAN AT THE STRUCTURAL IRON YARD OF THE CAMBRIA IRON CO.*

By John W. Seaver, M. Am. Soc. M. E.**

In the latter part of the year 1895, the Cambria Iron Co., of Johnstown, Pa., decided to construct a storage and loading yard for their proposed new structural mill at Johnstown, Pa., and invited several engineering firms to submit estimates and designs for a plant to handle the material that it was intended to store and load in this yard.

Among the firms invited to submit proposals, that with which the writer is connected took up the matter at once, and gave it a great deal of very careful study. The yard it was designed to cover—400 by 800 ft.—was so large that it was evident from the beginning that unless some very economical form of construction should be proposed, the expense of covering the area would be very great. There are several methods by which the desired object can be attained, and each plan was carefully considered and its objections and advantages compared.

A very simple way of covering any area is by the use of stationary derricks with swinging jibs. This, while probably the cheapest construction, is at the same time the most objectionable, on account of its requiring a large number of derricks to cover the surface. In fact, swinging derricks cannot be arranged so as to cover the whole yard, as there is necessarily a considerable area around the foot of the derrick that is unavailable. These objections caused this plan to be dismissed.

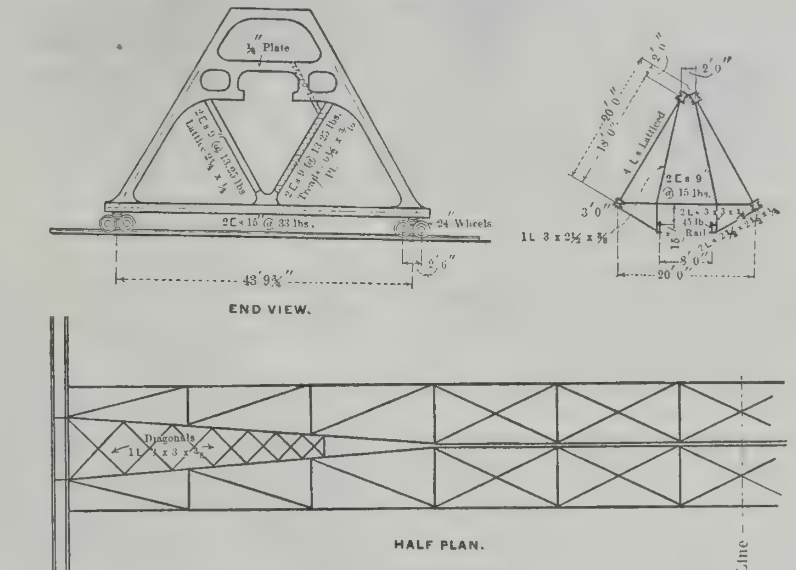
The next plan that was considered was a system of surface tracks, between which the material to be stored would be piled, and on these tracks a number of locomotive cranes could be placed. Two of the objections against the plan of the stationary derrick system could very properly be raised against the second plan with even greater force, as the tracks upon which the locomotive cranes would travel would occupy a very large portion of the yard. The locomotive cranes would be very expensive, and their range of length of jib is quite limited.

A third form of construction, and one that seemed to offer several advantages over the first two plans, consisted in a series of overhead tracks, running parallel to the length of the yard, and mounted on these tracks were to be a number of overhead traveling cranes of the ordinary type. Against this plan could be urged the fact that the supports themselves would take up more or less room, and the foundations, columns and stringers for these supports would be very expensive, and it was proposed to make the cranes of exceptionally long span (100 ft. centers of supports). This span would make the overhead ties or bracing very expensive. Dispensing with the overhead bracing would necessitate the columns supporting the overhead tracks to be sufficiently rigid in themselves to maintain the tracks in perfect alinement, and, in addition to this, they would require exceptionally heavy and good foundations and anchorages. The cranes themselves would be expensive, and, should the surface of the whole yard be covered, which would necessitate four cranes, each 100 ft. span, it would mean the employment of four operators—one for each crane. These were the principal objections to the overhead crane system, but they were deemed sufficient to cause the rejection of this plan in favor of the "gantry" crane system.

This plan contemplates the use of two traveling cranes, each 200 ft. span, running upon tracks on the surface of the ground, parallel to the length of the yard, so that the two cranes cover the whole surface, with the exception of three spaces, one 5 ft. wide down each outside edge of the yard, and one 10 ft. wide down the center. There is one line of track down each outside edge and two lines of track down the center. It was proposed to mount the cranes upon end frames or legs, making them what are commonly called "Gantry Cranes," and to make the legs or end supports of sufficient height to allow a train of cars, with men on top of same, to pass freely underneath. For this purpose the clear height from the top of the rail to the underside of the stringer that the crane trolley traverses was fixed at 20 ft., and as the height from the surface of the yard to the top of the rail is 14½ ins., a clear height from the surface of the ground to the underside of the crane of 21 ft. 2½ ins. is obtained.

The magnitude of these proposed gantries caused the matter to be most carefuly considered, both by the Cambria Iron Co. and the Wellman Seaver Engineering Co. After a thorough examination of the plan proposed by the latter they were awarded the contract.

The firm, before submitting their proposal for this crane, very carefully considered all the various forms of cranes, both of the regular traveling and the gantry types that are at present in use, and, after a thorough investigation of the different types, decided upon a form of construction that they believe to be entirely original. It consists of two main girders of the Pratt type, with vertical posts and diagonal tension braces, the bottom chord being straight, and the top chord parallel to the bottom chord for about one-half its length, and then inclining to the end posts of such an angle that the depth of truss at the ends is one-half that at the center. These two main trusses are framed together at an angle of 60°. The top chords have their parallel portions connected with splice and tie plates. The bottom chords are parallel to each other, and separated a distance of 20 ft. The main trusses are 18 ft. deep at center and 9 ft. deep at the ends.



MAKE-UP OF STRUCTURAL FRAMEWORK OF 200-FT. GANTRY CRANE.

This peculiar form of construction gives the arrangement of the main trusses the appearance of a steep-hipped roof, very long in proportion to its height. A cross section at the center is that of an equilateral triangle, and the cross section of any point between the end posts and where the top chords join each other is that of a trapezoid. Suspended beneath the bracing that separates the bottom chords is a runway for the crane trolley to travel on. This runway consists of riveted I-beams, with T-rails secured to their upper flanges.

The stringers are very rigidly braced to the chords of the main trusses, not only at the panel points, where they were suspended, but also at the middle of each panel.

The horizontal bracing between the trusses consists of a series of floor beams, firmly riveted to the posts of the trusses, and forming the struts of the lateral system.

The diagonal members consist of angle irons riveted to wing plates secured to the trusses and floor beams, these wing plates being bent to conform to the angles of the floor system and the trusses. To prevent any cross strains of the struts resulting from the live load (the weight of the stringers and trolley), it is taken directly from the stringers suspenders up to the top of the posts of the main trusses by means of diagonal suspender angles. These angles also form posts for the attachment of a line of hand railing.

Resting on top of the floor beams are two lines of channel irons parallel to the main trusses. These channel irons form stringers for the foot walk, which extends the full length of the crane. The walk is made of two thicknesses of pine plank with tar paper between. The floor beams also carry the pillow blocks for the main shafting. At the ends of the crane, and in the plane of the trusses, are carried down riveted legs, or supports of box form. These legs are firmly braced to the bottom chords of the main trusses, with large plate iron brackets, well stiffened with angle iron flanges. The legs are also braced to each other crosswise of the crane, with a system of horizontal and diagonal braces, with a stiff tie-beam at the foot of the legs.

The width c. to c. of the trucks supporting the crane is 43 ft. 9¾ ins., forming a wheel base for the crane of a little more than one-fifth of the span, which is sufficient to square the crane on the tracks.

The end frames are formed of plates and angles, arranged so as to present a smooth end surface, the corners of the openings being filled in with curves of large radii.

The top chords are made of two channel irons with a cover plate on top, and latticing on the bottom. The bottom chords are made of two channel irons, latticed on top and bottom, so as to afford no room for lodgment of moisture; this point being carefully kept in view throughout the construction.

The vertical posts of the trusses each consist of four angle irons latticed together. The diagonal members of the trusses are each formed of two angle irons riveted at their intersection. Particular care was paid to the connections of all members.

The loads and strains adopted for this crane were as follows: A live load for trolley equal to 20,000 lbs. To this was added, for impact, 25%, or 5,000 lbs. The weight of the trolley was estimated at 23,000 lbs.—making a total of 48,000 lbs. distributed on four wheels, spaced about 9 ft. centers, bringing a reaction upon each stringer support of 18,000 lbs.

To still further provide for any sudden application of a live load, it was assumed to be equal to 22,000 lbs. applied at any panel point of bottom chord of each truss.

This is largely in excess of any load that will come upon the crane; but it was considered advisable to use it, in view of the fact that the load might catch, thereby bringing a greatly increased weight upon the trolley.

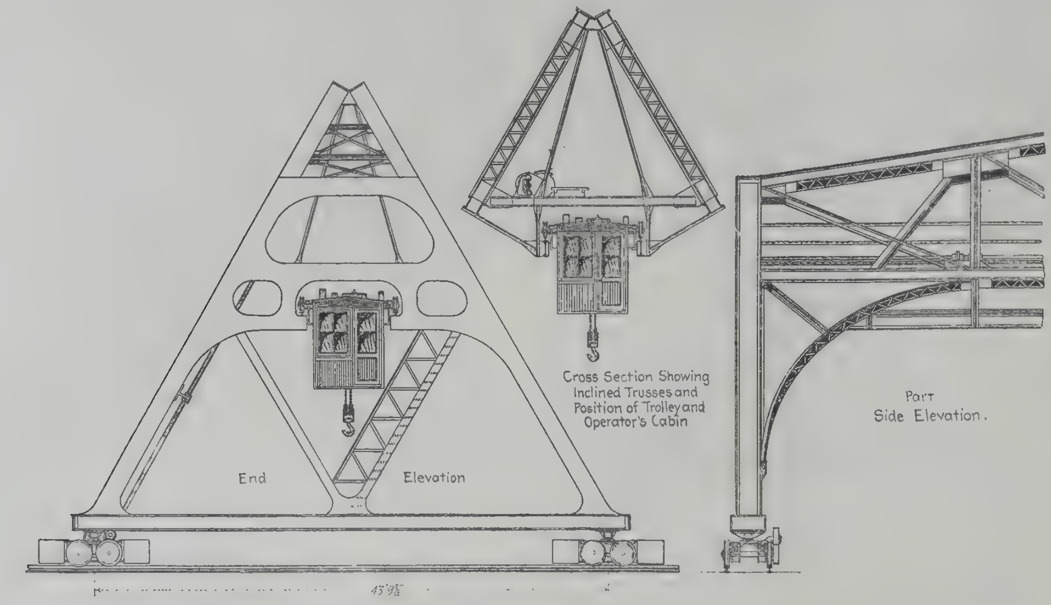
**The Wellman-Seaver Engineering Co., Cleveland, O.

*A paper presented at the New York meeting of the American Society of Mechanical Engineers.

The dead load, weight of trusses and floor, was assumed at 88,000 lbs. per truss, or 8,000 at every point of bottom chord of each truss.

In order to provide for a very large factor of safety in the bottom lateral system, a wind pressure of 20 lbs. per sq. ft. was assumed, or a load of 5,000 lbs. at each panel point of bottom chord. To resist these combined loads, the following limitations of strains were adopted:

For live loads: Tension	12,000	lbs. per sq. in. net section
Shear	6,000	" " " " " "
Compression	10,000	" of gross section
Bearing, rivets and bolts	12,000	" per sq. in.
For dead load: Tension	15,000	" " " " net section
Shearing	10,000	" " " " " "
Compression	12,000	" " " " gross sec.
Bearings, rivets and bolts	15,000	" " " "



Cross Section Showing Inclined Trusses and Position of Trolley and Operator's Cabin
Part Side Elevation.
End Elevation
45'9½"

END ELEVATION AND PART SIDE ELEVATION OF FOOT OF CRANE.

In all the compression members a proper reduction of the strains was made in all long members, so as to insure the same general factor of safety throughout, and the strains in the bottom lateral system were still further reduced to 10,000 lbs. per sq. in. in tension and 8,000 lbs. per sq. in. in compression. All of these strains are largely in excess of what the writer would recommend for an ordinary crane construction; but the ratio of dead load to live load is so great that it was necessary to observe the greatest possible economy of material to avoid the crane being so heavy that it would be impracticable.

The truss members were not all proportioned to comply exactly with the areas that the above limitations of strains called for. They were never made of less sections, and in several cases the section was increased in order to obtain the necessary stiffness. This will account for the seemingly largely increased area of some of the members over that required by theory.

The minimum speeds of the various motions of the crane are as follows: Traverse of main bridge, 200 ft. per min.; traverse of trolley, 400 ft. per min.; hoist with full load, 20 ft. per min.

The crane rests upon four trucks; each having four steel tired double flanged wheels, 24 ins. in diameter. The wheels are keyed to steel axles, 5 ins. in diameter. The gage of the track is 3 ft. 6 ins. centers of rails. The journals are 5 ins. in diameter, 7 ins. long, fitted with bronze bearings carried in cast-steel oil-boxes, with ample provision for lubrication. The wheels on one truck at each end are connected by means of a system of shafts and bevelled gear wheels. The gear wheels are steel castings, and are of extra heavy design throughout. The shafting from one truck to the other is 4 ins. in diameter. The couplings are all rigid flanged couplings, tightly keyed to the shafts, and fitted with turned bolts of a tight driving fit. The main shaft, extending the length of the crane, is carried in universal bearing pillow-blocks of very heavy design. These pillow-blocks are bolted to the cross-beams of the floor system, with packing pieces between them and the beams, and are lined up perfectly true and level. The thickness of the packing pieces vary to suit the requirements of each individual pillow-block.

The end bearings, where the main shaft is geared to the diagonal shafts that connect it to the trucks at each end, are carried by compound boxes, so that it is impossible for the main and angular shafts to get out of line.

Special care has been taken with all the bearings to provide ample facilities not only for the lubrication, but for the inspection and removal of any part. For most of the bearings compression grease-cups have been supplied, in addition to the usual lubricating holes and reservoirs.

The top of each truck carries a steel socket or cup, and in this socket is placed a hard steel ball, 6 ins. in diameter.

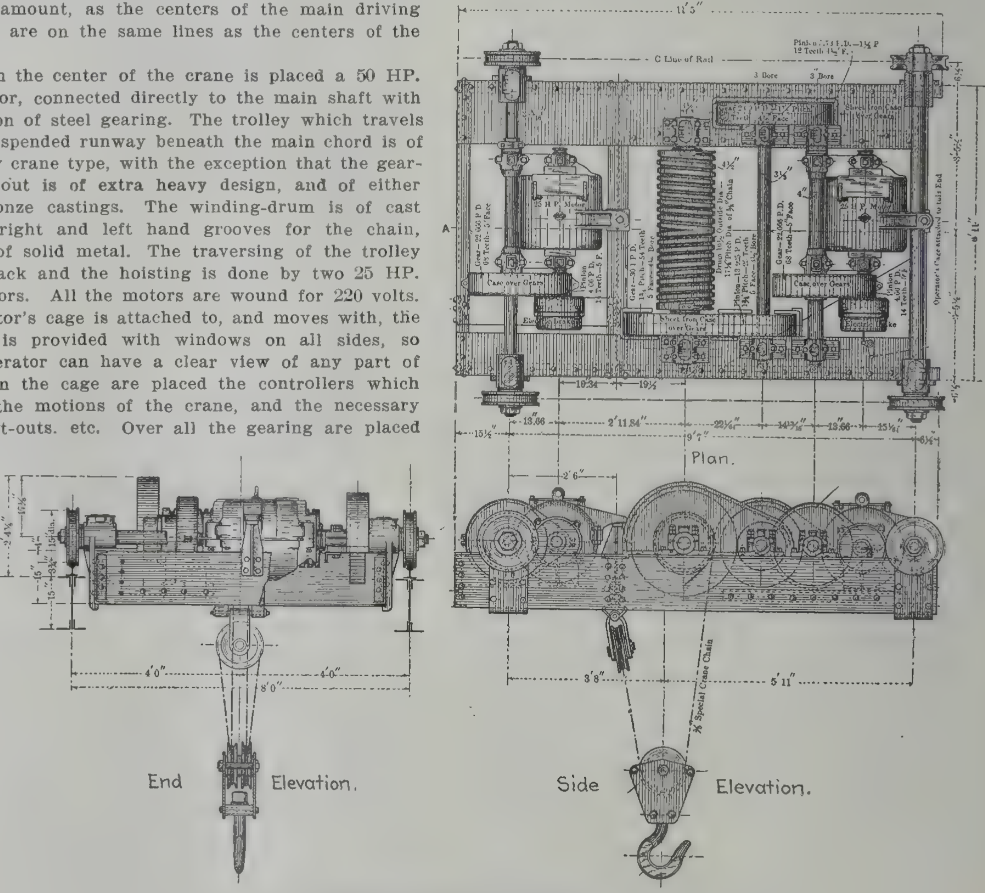
The bottom of the end supports are also provided with corresponding cupped sockets. The ball rests in a slightly elongated groove; the major diameter of the groove being crosswise to the center line of the truck, and the minor diameter being parallel to the track on which the truck rests. By means of this elongation of the groove, the ball is allowed a slight motion at right angles to the center line of the track on which the truck travels, and this permits of the expansion and contraction of the main girders of the crane. It also allows the trucks upon which the crane travels to be slightly out of alinement, as the balls form universal joints between the trucks and the crane. The arrangement of the gearing connecting the driving shafts to the trucks is such that the vibrations of the trucks around the centers of the balls do not disturb the alinement of the gearing to an appreciable amount, as the centers of the main driving spur wheels are on the same lines as the centers of the balls.

Directly in the center of the crane is placed a 50 HP. electric motor, connected directly to the main shaft with one reduction of steel gearing. The trolley which travels upon the suspended runway beneath the main chord is of the ordinary crane type, with the exception that the gearing throughout is of extra heavy design, and of either steel or bronze castings. The winding-drum is of cast iron, with right and left hand grooves for the chain, milled out of solid metal. The traversing of the trolley upon the track and the hoisting is done by two 25 HP. electric motors. All the motors are wound for 220 volts.

The operator's cage is attached to, and moves with, the trolley. It is provided with windows on all sides, so that the operator can have a clear view of any part of the yard. In the cage are placed the controllers which govern all the motions of the crane, and the necessary switches, cut-outs. etc. Over all the gearing are placed coverings or housings that are readily removable, the coverings being arranged to exclude all moisture or dust. The motors are also encased.

Attached to each truck are two snow-plows, or guards, made of plate stiffened with angle irons. These snow-plows are easily removable, so that access can be had to any part of the trucks.

The end frames are so arranged that should it be desired to transfer a load from one side of the yard to the other, both cranes can be brought in line with each other by means of removable stops on the trucks, and the trolley from either crane run directly through the end supports and on to the track on the other crane.



DETAILS OF CRANE TROLLEY.

THE BUSINESS WISDOM AND RESPONSIBILITIES OF THE ENGINEER.*

About twenty years ago a railway in Illinois became insolvent and a receiver was appointed to take charge of its affairs. To reduce expenses the receiver began by reducing the number of employees, and the first to go, as usual in such cases, was the engineer and all his tribe. For a number of years the road was operated in a cheap, hap-hazard sort of way, when it was sold to an Eastern syndicate, who took immediate steps for reorganization. and I was appointed engineer in charge to rebuild the road. My first work was to thoroughly inspect the entire property and determine what was immediately necessary to make it safe for traffic and also remunerative. I found that the roadbed, bridges, buildings, etc., had deteriorated beyond redemption, that the whole line must be rebuilt. At this time the road had been for about five years in the hands of a receiver, a lawyer.

I labored hard and faithfully for six years, putting the entire road and its branches into first-class condition, and under its excellent management it has so remained to this day. For my services I received about $12,000.

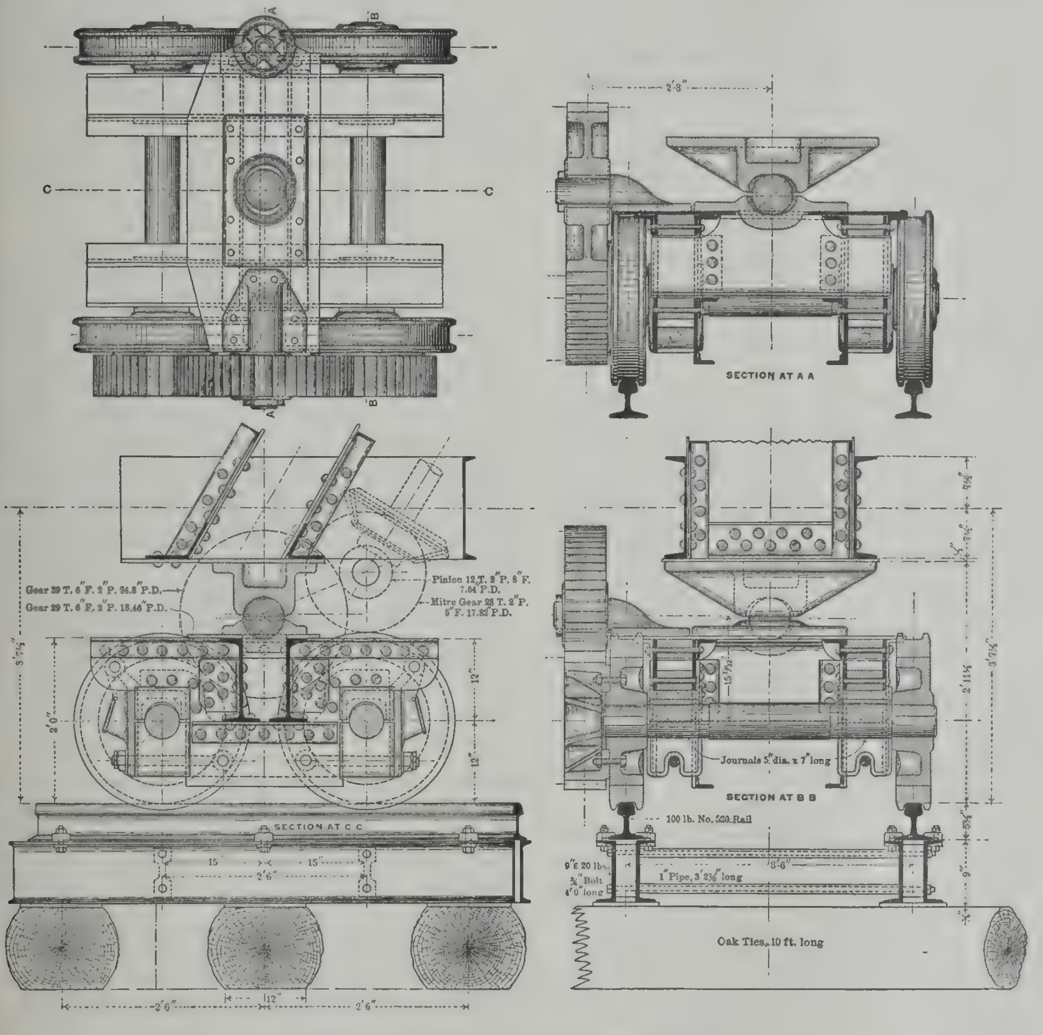
The lawyer remained with the road some years longer than I did. When it passed out of the hands of the master-in-chancery, by which act the office of receiver was abolished, the court ordered that the lawyer be paid from the proceeds of the sale of the road the sum of $125,000.

Now, I do not cite this as a disparagement to lawyers, but as an example of the generally recognized value of a lawyer's services, and it also demonstrates the tenacious grasp with which a lawyer holds upon all properties which he is called upon to control and manage.

This railway property deteriorated under his management. He placed few betterments upon it. Had he employed a competent engineer, much of the deterioration could have been prevented and expensive repairs avoided, besides the traffic would have been heavier and the earnings thereby increased. There were many engineers in the country (most of them out of employment at that time, for it was shortly after the great panic of 1873) who were thoroughly competent to handle the property in a very economical and remunerative manner, making it far more valuable than it proved to be when sold to the Eastern syndicate, and none of them, had the position been offered them, would have refused it at a salary of $2,500 annually. Yet, for all this, the lawyer was paid ten times more

---

*Extract from an address by Mr. W. F. Goodhue, before the Purdue Society of Civil Engineering.



TRUCKS AND TRACK FOR GANTRY CRANE.

than was the engineer who repaired his wasteful management.

I see no reasòn why the engineer should not hold positions of equal responsibility and value with the lawyer. Lawyers hold these positions without becoming engineers, then why should not engineers attain them without becoming lawyers? If both are liberally and broadly educated their chances should be equal. I do not consider the question of natural ability at all. Bright men are not possessed exclusively by any one vocation of this busy world.

I have reasons of my own, born of a long acquaintance and daily contact with the individual, why the engineer has in so large a measure failed to hold his own in the business world, and I give them as follows: Because he is too often the slave to details. He is not always a student of human nature, and thereby fails to manage and understand men. He is too often deficient in business training, the keeping of accounts, etc., and disclaiming all egotism, he is withal a modest, diffident man, too much so for his own good. So many engineers in charge of work want to see and do everything themselves. They have a great horror of errors and mistakes, and are willing to trust nobody. Their heads are full of measurements, weights, elevations, designs, and all the ins and outs of the work in hand. They are a sort of monomaniacs on the rules of construction, and for the time being live and exist upon their work and have no thought or care for anything else. Timid themselves, they teach it to their assistants. The pent-up Utica of their daily life is the limited area of their workshop. They are seldom in the cabinet and always in the field. The lawyer is always in the cabinet and seldom in the field.

Now, a man should be commended for paying strict attention to business—it is almost the only rule of success—but should a man bury himself so deeply in its meshes that he is lost sight of? How would the battle go if the commanding general took a musket and lost himself in the ranks of his army? What would become of the ship if the admiral went below while engaged with the enemy? Victory in either case would be won by the subordinates in command. So it should be with the engineer in charge of work; let him divide the care of details with his subordinates; they will carry them out under the watchful, careful eye of the master, and he will thereby have more time to devote to the general management of the whole business. If the engineer is deeply absorbed in one set of details, he must of course neglect others, and that is what he sometimes does; he will hold firmly to all the details of construction and neglect the accounts belonging to it, which are, in the eyes of nearly all men, the essential elements of business. Some of our greatest engineers have been able business men. Captain James Eads was of this type, and so was the younger Roebling.

The engineer of to-day should be a practical business man, and it is well if he acquire his business training, partially at least, by actual contact with business methods. He should be as well versed in business as the lawyer, the contractor and the makers and dealers in materials, as he is brought daily in contact with one or more of these persons.

Municipal methods of voting and issuing improvement bonds of various kinds are well worth studying, because nearly all consulting engineers depend upon the issuance of bonds for employement, and it is not pleasant to be thrown out of remunerative work because of a faulty issue of the bonds which are necessary to provide the funds to carry it on. By giving attention to such matters the engineer soon becomes not only proficient in the details of issue and form of bond, but is a very competent judge of what constitutes a legal, solvent bond, and oftentimes can serve his own interests well by pointing out defects, which if allowed to pass unnoticed would defeat their legal issue, and a defective bond issue is quite a common occurrence among our smaller towns and cities. There is not a business or legislative body in the world that can equal the average common council for making serious blunders, and when they do blunder it is generally an expensive affair. Everybody connected therewith suffers more or less either in pocket, or in disappointment because of the resulting delay occasioned, excepting the members of the council, who have no responsibility in the matter at all and cannot be held accountable. They, perhaps, voted as best they knew, and there seems to be no legal form of indictment which can arraign such a condition of mind.

Nowadays wherever you find the common council there you will also find the city engineer, and I must say that I do not always find that sweet harmony which should prevail between them, and it is not to be expected. The rock upon which they most generally split is the difference between good and cheap work. The engineer has perhaps prepared his plans with great care, and when submitted to the council the first thing it wishes to do is to cheapen the cost, and if the engineer won't submit to the pruning process his plans are rejected. The aldermanic line of reasoning seems to be that if the work is not just as strong and durable after the cheapening process, then the plans are defective and the engineer is incompetent.

Upon one occasion I well remember sitting in a council chamber and witnessing a common council voting a form of sewer assessment of doubtful legality, directly against the advice of the city attorney and engineer, and had not the act been subsequently vetoed by the mayor, not one cent of the large assessment could have been collected by the city. Later one of the aldermen said to me: "We voted that assessment act simply to show the city attorney and engineer that they could not run this council." Yet the attorney and engineer both were advising in good faith, and without prejudice, but the minds of that council were not sufficiently elevated to appreciate a firm, disinterested opinion from those who had thoroughly investigated the matter and were well qualified to give their opinions.

This is a fair instance of the stubborn prejudice and ignorance combined which will confront the engineer in his life work. If he is a sensitive, timid man, he will bow before it; if he is brave and resolute, he will hold his own to the end, but will in the meantime receive many knock-downs of humiliation and discouragement. He will find that all bodies of men banded together to build and develop a great property are very much alike, whether it be a board of railway directors, the stockholders of a manufacturing concern, or the common council of a city. These men are not of his kind, they do not comprehend his work, his knowledge nor his methods of reasoning; they are impatient for results, paying results, and will not submit kindly to delays which affect such results, therefore the engineer must be patient with them; he should explain little and offer few apologies, but do all that he can to push the work along to completion; let his actions speak for himself, and these ebullitions of unreasonable impatience will soon pass away. To lose his temper and leave the work upon such occasions is to acknowledge defeat and would be a foolish act, for the next work he may engage would be perhaps quite similar and under the same sort of direction, thus he would be no better off than before.

The engineer must remember that the men, the capitalists who furnish the money and who are directors of many of the great works built and operated in this country are not technically educated men; they are mostly merchants who have acquired fortunes and are seeking investments for their surplus wealth. They are generally first-class business men themselves and it frets and annoys them when they learn that the engineer that they employ is not also a business man. It is a condition they cannot quite understand, because they are unused to such men. Therefore it is quite necessary that the young engineer should go to his life work fully prepared and equipped to meet these men on their own ground; by doing so he will avoid much that is disagreeable and he will also be more successful than have the engineers of this generation who are notoriously unbusinesslike.

LEGAL DECISIONS OF INTEREST TO ENGINEERS.

Mining: The Right of Support.

Where the mineral estate in land is severed from the surface by a conveyance, the owner of the former is bound to leave enough of the mineral in place to support the surface, unless the owner of the latter has released his right of support. The release must be by express words or by necessary implication.—Robertson v. Youghiogheny River Coal Co. (Supr. Ct. of Penn.) 33 At. Rep., 706.

Right of Gas Company to Make Reasonable Charges.

When a corporation is chartered with the right to manufacture and sell gas, the right to charge a reasonable rate for all gas furnished is implied, and forms a part of its contract with the state, which cannot be impaired by legislation.—Cleveland Gaslight & Coke Co. v. City of Cleveland (U. S. Cir. Ct. of Ohio), 71 Fed. Rep., 1610.

Negligent Construction of Water-Works.

A water-works company is liable for the damages resulting from the fall of a water tower negligently constructed on its own premises; and where the tower fell and the water therefrom rushed upon a house, overturning a burning lamp, whereby a party was fatally burned, the damages sustained are not too remote in an action brought by the surviving wife and child.—Rigdon v. Temple Water-Works Co. (Ct. Civ. App. of Tex.) 32 S. W. Rep., 828.

Rights of Elevated Road in Streets of City.

An elevated railway company has such a property right in its structure lawfully erected in a street as cannot be damaged by a city without compensation. The construction of a viaduct along a street for the purpose of relieving the traffic along such street is not a mere change in the grade of a street, and an elevated railway company whose structure is interfered with by the viaduct is entitled to compensation.—Manhattan El. Ry. Co. v. City of New York, 35 N. Y. Sup. Rep., 505.

Change of Street Grade: Damages.

Where a city has by ordinance established a new grade of a street, but has done nothing towards raising the street surface to conform to it, a street railway company, which is granted the right to construct a track through the street, is liable to abutting property owners for damages resulting from laying the track at the latter grade, in the absence of an express provision authorizing the act. Stritesky v. Cedar Rapids (Supr. Ct. of Ia.) 67 N. W. Rep., 271.

SUBSCRIPTION RATES: United States, Canada and Mexico, One Year, $5.00; *6 months,* $2.50; *2 months,* $1.00; *Single copies,* 15 *cents. To all other countries in the Postal Union, add* $2.08 *per annum* (4 *cents per number*) *to above prices for postage. No club rates allowed. Mailing addresses may be changed at will by sending both old and new address. We shall be obliged if subscribers who fail to receive their papers promptly will notify us without delay. The number on the address label of each paper indicates when subscription expires, the last figure indicating the year and the one or two preceding figures the week of that year; for instance, the number* 326 *means that subscription is paid to the* 32*d week* (*that is the issue of Aug* 6) *of the year* 1896; *the change of these figures is the only receipt sent, unless by special request.*

ADVERTISING RATES: 20 *cents per line agate measure. Want notices, special rates, see page* 22. *Rates for standing advertisements sent on request. Changes to standing advertisements must be in hand on Monday afternoon; new advertisements, Tuesday afternoon; transient advertisements by Wednesday noon.*

Since the publication of our issue of Dec. 3, in which some further reference was made to the work of the Baltimore topographical survey, we have received several letters continuing the controversy upon this subject, which space does not permit us to publish. We are also in receipt, however, of a letter from the Mayor of Baltimore, who is the head of the commission in charge of this work, in which he says:

> The so-called investigation was not authorized, nor have its findings been considered by the commission. The gentleman against whom the charges have been made is still in the position, and at present we have no disposition to remove him for alleged imperfect work.

It appears from the information now before us that the investigation (on which the comments in our issue of Nov. 12 were based) was conducted by a committee of the city councils, which has, as we now understand, no authority whatever over the work. This fact was unknown to us when we made our original study of and comments upon this investigation. Had we been aware of it, we should not have printed its conclusions or based our editorial opinions upon it. The only proper authority to investigate the Baltimore survey, it appears to us, is the commission in charge of the work or the authority which created that commission.

In view of these circumstances we desire to formally withdraw our comments on this survey made in our issue of Nov. 12, and to express our regrets that we were misled as to the non-authoritative nature of the investigation.

◆

A correspondent asks us to suggest topics for college theses in the field of bridge and structural engineering on which investigations would be interesting or useful to the profession. The request is rather a difficult one to fulfil. There are plenty of subjects in this field on which more knowledge is desirable; but in most cases investigations of the results of actual practice, extending over a long series of years, are needed rather than theoretical studies or investigations which can be made in the short time available for a thesis investigation.

Bridge structures of the standard types have been so exhaustively studied that a college student with the time and means at his disposal can hardly hope to add anything valuable to professional knowledge in that field. There is more opportunity, it appears to us, in investigating the applications of iron and steel in building construction. No one who has witnessed the enormous growth which the past few years has seen in the use of iron and steel in buildings can doubt that in the near future we are to see a very large proportion of our stores, mills, and even the better class of residences constructed with steel framework, and the solution of the problems in connection with this new use of steel shapes is likely to have practical value.

For example, there are already a great number of shops and factory buildings constructed with steel framework, and with no attempt at fireproofing. If the reader will turn to page 5 of our current volume, he will find that such a structure may collapse under even a very small fire. Instead of being a good construction to resist fire, as has been supposed, these structures are apparently even more easily injured by an interior fire than if they were built with wooden in place of iron columns.

The question is, what can be done to such structures to render them reasonably fireproof. The expense of ordinary fireproofing systems makes them out of the question; but may it not be possible to apply to the principal members of such structures something in the shape of a non-conductor or fire retardent which should effect the desired end? There are on the market a number of fireproofing paints, and fireproofing solutions. Descriptions of a great number of others can be found in the patent office records. Experiments with samples of these substances obtained from the makers or made up in the college laboratory might be exceedingly valuable in indicating the probabilities of success with constructions of this type.

Again, recent experiments have shown remarkable fire-resisting qualities in concrete. It would be a very useful task to investigate the effect of different cements, different aggregates, and different proportions upon the fire-resisting qualities of concrete. It may be that a thin coat of cement plaster, spread on a very cheap and light wire lathing could be made a fairly effective fireproofing for the frames of iron shop buildings.

We mention the above merely as suggestions; other topics in this field will doubtless occur to many of our readers. For subjects for investigation in bridge engineering, a fruitful topic might be found in some of the types of bascule bridge, and a comparison of the weight of their metal work and machinery with the weights of swing bridges of similar span.

◆

In a note in our "Construction News" supplement in our issue of Dec. 3, the fall of a bridge near Ensley City, Ala., was noted, and the name of Mr. P. S. Milner was given as County Surveyor, not with the idea that he was in any way responsible for the disaster, but merely in accordance with our usual rule to give the name of some official whom contractors and others in search of business may address. As a matter of fact we learn that Mr. Milner had nothing whatever to do with the structure which failed. It was under the charge of the County Superintendent of Public Improvement, an office entirely separate and distinct from that of County Surveyor.

In another item, which recently appeared in our "Construction News" columns, the defeat of bonds for sewer construction in a Massachusetts town was noted and the item concluded with the name of the chairman of the town committee on sewer construction, merely for the convenience of those who might desire to write for further particulars. The gentleman whose name was given, however, in a personal letter to us expressed the fear that the item might be construed as meaning that he was in some manner responsible for the defeat of the proposition. To guard against any mistakes of this sort by those who follow our "Construction News" items, we may say explicitly that the giving of names in connection with these items is done simply as a guide and for the convenience of those who use these items for business purposes; and no other significance whatever attaches to them.

SOME PLAIN WORDS ABOUT CITY GAS SUPPLIES.

In three great cities at the present time the question of gas supply is a subject of public discussion, and in each of them the fruits of a bad system of managing this important business are being made manifest. These three cities are Boston, Brooklyn and New York.

In each of these cities the policy has long been followed of giving franchises to a number of different gas companies in the expectation that competition between them would reduce the price of gas to a figure as low as it could be economically made and sold. Many times has the absurdity of this policy been shown. Many times has it been pointed out that it was bound to result in great injury to every city pursuing it, and that the only parties who would benefit from it would be promoters, stock speculators, and in some cases dishonest city officials. It has been shown time and again that the ultimate result of the chartering of a number of independent gas companies to operate in the same territory will be the consolidation of these companies into one organization; or if actual consolidation be prevented by court or statute, some practical form of co-operation will be devised by which the competition which was to work such benefits to the public will be stopped, and the same end will be attained.

Boston has made two separate and distinct attempts to inaugurate competition in the gas business, the history of which has recently been told in the Boston "Herald," as follows:

> When, years ago, Mr. J. Edward Addicks first made his appearance in the Boston field, and announced his intention of greatly benefiting the people of this city by the introduction of better and cheaper gas, we pointed out that the conclusion would be the union of the competing gas interests, with the subsequent exaction from the people of Boston of the money needed to pay interest upon needless, because duplicate, plants. It is doubtful if Mr. Addicks and his Bay State company would have been permitted to enter Boston if recourse had not been had to influences in securing official approval which were thoroughly reprehensible. But once in the field, and once in control of the old company, the promises made were not complied with. There was not that general reduction in the price of gas, neither was there any marked improvement in its quality. When, afterward, the Brookline Gas Co. came in as a competitor in Boston, again a demand was made calling for the spending of millions of dollars in unnecessary work, upon which expenditure the citizens would later on be called by consolidation to pay interest.
>
> In the case of the Brookline Gas Co. the competition that was permitted had the immediate effect of reducing the price of gas, a change which the Bay State company could much better have made before the Brookline company entered its field than after it was compelled to divide quite a part of its business with the newcomer.

As newspaper readers know, a consolidation has recently been effected of the Boston gas lighting companies and the capitalization has been increased to an enormous figure.

Brooklyn is another city which has tried competition in gas supply. Two years ago no less than five gas companies were doing business in that city. Since that time all these companies have been consolidated into one, and the attorney-general of New York has decided (doubtless correctly) that the state law against trusts is powerless to prevent such a consolidation.

In New York city four great corporations have for many years furnished a gas supply—the Equitable, the Standard, the Mutual and the Consolidated. No competition, at least as respects the price of gas, has existed between these companies for many years; apparently, there has been some private agreement between the several companies by which they have worked in harmony—such perfect harmony, indeed, that the price of gas was kept up by them to the enormously exorbitant figure of $1.75 per M. until it was reduced to $1.25 by an act of the legislature in 1885.

One would have supposed that the experience of the city with competing gas companies which did not compete would have taught the public something; but a half-dozen years ago a new concern came along, the East River Gas Co., and secured a franchise without difficulty, under which it has proceeded to tear up many miles of city streets, many of them newly paved, for the purpose of laying its mains. It has, we believe, sold gas at prices slightly below those charged by the other companies, and as a result a formal union of all the New York gas companies has recently been announced in the newspapers. The course of the stock market bore witness to the correctness of the announcement.

Here was another object lesson to the people of New York city and to those who are responsible for the public interests. Let us see how much effect it had. For several months past there has been before the Aldermen of New York an application for a franchise by a fuel-gas company. In the very week in which this consolidation was announced the Aldermen granted a franchise to this company by a vote of 26 to 4, and the committee which recommended the passage of the ordinance had the sublime assurance to present as a reason for the grant of the franchise that "If competition will force prices down, by all means let us have it."

The childish folly of such a remark in view of the actual circumstances is apparent enough. That the aldermen themselves are perhaps not so ignorant of the elements of municipal business principles as the above quotation would indicate is shown by the fact that at the same meeting a resolution was adopted authorizing an inquiry into the feasibility of the city owning its gas works, and in the preamble to this resolution the following occurs:

> Whereas, The recent combination between the old gas companies and the new best illustrates the futility of expecting reductions in the price of gas from the establishment of competing companies; and
>
> Whereas, This municipality has itself failed to secure cheap street lighting, because, in advertising for competitive bids for that purpose, it has been the invariable experience that there is not real competition, but that the different companies apportion among themselves the different districts of the city, and offer non-competitive bids for the respective districts.

Query: If the aldermen understand the "futility of expecting reductions in the price of gas from the establishment of competing companies," why did they proceed to grant a franchise to a fuel-gas company on terms which in several features run counter to well-settled principles that should govern the granting of all such franchises?

Fortunately, there has been during the past ten years an enormous advance in the public appreciation and understanding of the value of municipal franchises. In the case of the present proposition to give away another gas franchise in New York city, the press of the city is a unit in condemning it, the Mayor and the city's law officers are certain to use every effort to defeat it, and as it is only by a legal quibble that the aldermen can claim the right to grant such a franchise, anyway, there is a good prospect that the aldermen's action may be of no effect.

Since the above was in type the aldermen themselves have recalled the franchise above referred to from the Mayor and have referred it to the special committee on the establishment of a municipal gas supply, whose appointment was noted above. The aldermen, of course, deny that their action in granting the franchise was influenced by any motives but anxiety for the city's welfare; but they offer no explanation of the fact that a motion to make the franchise limited in duration instead of perpetual was voted down by the same vote by which the franchise was passed, and another motion to sell the franchise to the highest bidder (other companies having, in fact, already made better offers than the company to which the franchise was given) was defeated by the same vote.

Turning again to the general question, the three cities we have named have each pursued for many years the policy of competition in the gas business. What has been the result? Millions of dollars expended in laying duplicate lines of mains in the streets and building unnecessary and badly located gas works; millions of dollars expended in tearing up and relaying pavements for laying needless mains and making needless connections. Millions of dollars worth of damage done to street pavements for which the city taxpayers had to pay. Millions of dollars worth of gas lost by leakage from the badly laid mains of companies organized not to do an honest business, but to float shares on the stock market and make their promoters wealthy; and finally unnumbered millions of dollars paid by gas consumers in excessive gas rates above the price at which gas could be made and sold for under a single honest and efficient administration. Such is the net result of a half century of bad management of the gas industry in American cities.

What are the correct principles on which the gas supply of a city should be managed? Experience has developed one principle at least which can be stated without fear of contradiction, and that is that the gas supply of a city is of necessity a monopoly. Every attempt ever made to establish competition in it has resulted finally in failure, and because this plain fact has been so commonly and persistently ignored in American cities, the dwellers in them have to bear an enormous and wholly needless burden.

The cities of Great Britain and of the Continent have been far wiser in their administration of their gas supplies. There the essential monopoly of a municipal gas supply has long been recognized, and as a result the inhabitants of nearly all the principal European cities are furnished with gas at a cost of 50 to 75 cts. per M. ft., whereas, the average cost of gas to the consumer in American cities of similar size will average nearly or quite double this.

There are two general systems of controlling a city's gas supply when the monopoly principle is recognized, either of which can give admirable results. In the one, the city owns and operates its gas supply just as it does its water supply. In the other the city grants an exclusive franchise to a corporation for a limited term of years, and fixes in the franchise the quality of the gas, the prices at which it will be furnished to public and private users and the tax (preferably a percentage of its gross earnings) which shall be paid to the city. At the end of the term of the franchise the city has the option of taking the plant at an appraised valuation, and can either undertake the supply itself or make a contract with some company, either the old one or a new competitor for a new term of years.

Each of the plans above described has advantages; local circumstances may make sometimes one, sometimes the other preferable; but either is vastly better than the system which has been commonly pursued by American cities, and which is based on a false and obsolete political economy.

Unfortunately the problem before American cities at the present day is not the simple one of building anew on a correct basis. The mistakes and errors of two generations cannot be wiped out at once. The law does not annul the existing franchises because they were given away or sold for a song by an ignorant or dishonest board of aldermen a score of years ago. What each city should do, therefore, will depend on the circumstances in which it finds itself. In some cities faithful city attorneys or other public spirited officials have seen to it that no perpetual franchises were granted, and in these cities the introduction of a correct system will be a comparatively simple matter. In other cities grants have been thoughtlessly made by which companies have acquired perpetual rights to use city streets, often as a free gift. To undo this manifest wrong is a difficult task, but that it will be permitted to exist unremedied to the end of time seems too preposterous to be believed.

The experience of American cities has abundantly shown the folly of granting perpetual franchises. If the way is not yet open by which they may be annulled, we can at least prevent further folly of this sort. The organic law of every state should prohibit the grant of any public franchise for any longer period than a quarter-century. Such a provision would not interfere with any legitimate enterprise and it would save millions of dollars of "unearned increment" to the public purse.

LETTERS TO THE EDITOR.

Coal Consumption of a Gas Engine.

Sir: In your issue of Dec. 3 different opinions are expressed regarding the quantity of anthracite coal consumed per I. HP. per hour with a Dowson gas engine. In this connection I would mention the result of a test made by the City Engineer in Copenhagen, Mr. Ch. Ambh, on a Dowson gas engine manufactured by the Tuxen & Hammerick Co., Copenhagen.

The test lasted eight hours, with variable load, the engine developing from 38 to 47 I. HP.

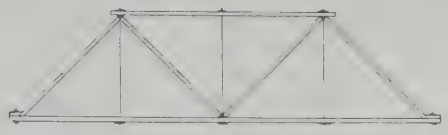
The average consumption of anthracite coal was 0.855 American lbs. per I. HP. per hour, measured in the generator.

Yours very truly,
K. Moller-Holst, C. E.

138 East 29th St., New York city, Dec. 9, 1896.

A Curiosity in Bridge Designs.

Sir: An item in your paper recently reminds me of a case where a large railway company a few years ago absorbed a small one on which "practical" men were employed rather than engineers. The resident engineer of the larger road reported that several of the bridges on the absorbed line wabbled excessively (in a vertical plane) under the passage of the trains of the large road, and a sketch of one of the bridges in question was sent to headquarters, with the report of the "engineer"—that it seemed as if the stringers had all the carrying capacity that there was in the bridge, and it was undoubtedly getting too weak to be in service. The sketch herewith shows that an engineer may be about as "practical" as the practical man.

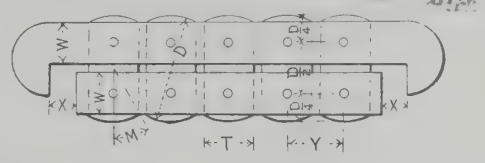


H. V. Hinckley, M. Am. Soc. C. E.

Topeka, Kan., Dec. 3, 1896.

The Design of Segmental Rollers for Expansion End of Bridge Spans.

Sir: In drawing segmental rollers for the expansion ends of bridges the dimensions indicated by W, X and Y on the accompanying sketch, must be made such that the bridge may expand or contract the required amount. I have worked out the following formulas which give values of W, X and Y, such that when the bridge expands or contracts A inches the rollers will bind in each of the three following ways:



$$Y = \frac{I}{\cos\theta}; \quad X = \frac{D}{2}\,\text{sine}\,\theta; \quad W = \frac{D}{2}\cos\theta;$$

$$\theta = \frac{A}{2}\cdot\frac{360}{D\pi}.$$

M must be equal to at least $\frac{A}{2}$ ins.

I have made tables for 6-in., 8-in., 10-in. and 12-in. rollers for necessary values of A.

Yours very truly,
F. P. McKibben.

Mass. Inst. of Tech., Boston, Dec. 9, 1896.

The Electrical Conductivity of Aluminum.

Sir: In your issue of Nov. 26 you make calculation upon the electrical conductivity of aluminum rods used by the Pittsburg Reduction Co. for transmitting the current from its generators in the power-house on the lower bank of the Niagara River to the pot-room on the upper bank of the Niagara River. These conductors are of ⅜-in. diameter, and in lengths of 350 ft. In your calculations as to the relative cost of aluminum to copper, you make the cost per pound of aluminum 1.8 times that of copper rods. This is somewhat in error, as you base your calculations upon the eleectrical conductivity of aluminum at 54.2% that of pure copper, while, as a matter of fact, we are furnishing aluminum in large quantities for electrical conductors with guaranteed electrical conductivity of 63% of copper. The actual test of the electrical conductors used by us at Niagara for our line shows this conductivity, and with our purest aluminum we have obtained results of 64% of pure copper; tests having been made by Mr. Chas. F. Scott at the electrical testing laboratory of the Westinghouse Electric Co., East Pittsburg. As a matter of fact, aluminum is as cheap as copper when at two times the cost of copper per pound.

The tensile strength of the rods used for our Niagara line was something over 21,000 lbs. per sq. in., with an elongation of 27% in 2 ins. and 16% in 8 ins. Similar rods of copper ordinarily would have a tensile strength of 40,000 lbs. per sq. in.

The relative longer distance which will be allowed between supports with the aluminum conductors as compared with copper conductors, makes the use of aluminum a special matter of advantage in many cases.

For further data regarding aluminum electrical conductors which we are using at our Lower Niagara Works, we have to inform you that the current is carried at 280 volts pressure, and that there are over 500 of these ⅜-in.

rods of 350 ft. length. The rods are painted with an insulating varnish and are strung in a wire tower which is attached to the penstock carrying the water to the turbine.

Very respectfully,
The Pittsburg Reduction Co.
Alfred E. Hunt, President.
Pittsburg, Pa., Nov. 30, 1896.

(On receipt of the above letter we wrote Mr. Hunt stating that the figure 54.2 for conductivity of aluminum was given on the authority of Mr. Lazare Weiler, who is considered good authority. Mr. Hunt's reply is given as follows:—Ed.)

Sir: Weiler's tables on the conductivity of aluminum are in error. The results were probably obtained with samples of impure metal. With all alloys, the conductivity is materially reduced. Any aluminum over 98% pure will have over 54% electrical conductivity, so far as our experience goes.

We have had a good many electrical conductivity tests made, and with our purest aluminum the results run over 64½%.

Very respectfully,
The Pittsburg Reduction Co.
Alfred E. Hunt, President.

◆

The New York Railroad Commission's Decision Concerning the Catskill, Cairo & Windham Electric Ry.

Sir: I would like to take exception to your note in your issue of Nov. 26 upon the recent refusal of the New York Railroad Commission to grant a permit for construction to the Catskill, Cairo & Windham Electric Street Ry. Co. In the first place, it is a street railway, and would be for the accommodation of the people living along the Catskill and Cairo turnpike, along which it is proposed to run, while the Catskill Mountain R. R., being a steam road, cannot, even if it attempted to do so, accommodate the people, except at stated stations along its route. The proposed road would not parallel the Catskill Mountain R. R. in the general meaning of the term for at least one-third of its length. They would both start from Catskill Point on the Hudson, but the steam road follows the Catskill Creek, while the electric road is intended to be a street railway, and would follow the main street of Catskill through that village and, continuing on through, would follow the turnpike, passing through three villages of considerable size and passing through Cairo at a distance of about eleven miles from its starting place would go on to Windham at the summit of the Catskills. The Catskill Mountain road passes through neither of the villages, and has no stations for them, with the exception of South Cairo and Cairo, where one branch ends, but the main line extends to Palmville, which is entirely off the line of the proposed road. The present road is not self-supporting, both because it is at arm's length from the villages and because it charges exorbitant freight rates and passenger fares; for the latter the charge is 10 cts. per mile, thus barring almost all but summer boarder travel. The local travel at present goes by stages, of which there are several all the year and in summer hundreds every day for the summer boarder traffic. The freight is now also carried by wagons. Without taking away any of the present traffic of the Catskill Mountain road an electric road would be a profitable investment. I write the above from a knowledge gained by living on the proposed route for a number of years, and knowing every foot of the ground of both the present steam road and the proposed electric road. I enclose a clipping showing the Catskill opinion.

I am, yours respectfully,
Lewis B. Sebring, C. E., Cy. Engr., Schenectady, N. Y.

(The clipping enclosed is from the Catskill "Examiner" of Nov. 21, and is as follows:—Ed.)

> The proposed road manifestly is not parallel to the C. M. Ry., which does not go to Jefferson, Leeds and South Cairo villages, has no stations at Leeds or Jefferson, and only at a distance from South Cairo. It does not and cannot, under the prohibitory rates for fare and freight, accommodate the public during the portion of the year it is in operation, and there is no doubt that the traffic thus tabooed would make an electric railroad a profitable venture. That it would be a great convenience and is practically a necessity nearly every business man in the village and residents along the proposed road attest. No evidence was before the commissioners to show that the road would not pay, except that given by persons either directly or indirectly interested in the Catskill Mountain Ry. That the commissioners should make such an outrageous decision in favor of monopoly is bringing anathemas from the general public upon them.

◆

The Ownership and Control of Water in the Irrigable West.

Sir: You are entitled to the thanks of Western irrigators for your timely discussion of our unsatisfactory conditions. The attention of the East is what is needed, and a proper appreciation of our situation is greatly to be desired. To this end I wish to call attention to one or two features of our water laws not generally understood, and not dealt with in your editorial of December 3.

(1) Transfers of lands to the arid states will not add to or take away from the control over streams already exercised by these states.

The act of Congress of July 26, 1866, recognized the validity of local laws and customs in the control of streams and in the appropriation of their waters, as is shown by the following extract (Sec. 2,329, Rev. Stat. U. S., 2d ed., 1878):

> Whenever, by priority of possession, rights to the use of water for mining, agricultural, manufacturing, or other purposes, have vested and accrued, and the same are recognized and acknowledged by the local customs, laws, and the decisions of the courts, the possessors and owners of such vested rights shall be maintained and protected in the same (Act of July 26th, 1866).

Under this sanction, rights have been acquired under state and territorial laws by virtue of which important streams have, for all practical purposes, passed from public to private control. The rights thus acquired have been upheld in both state and national courts of appeal, so that the right of Congress to reassume control of the water supply of these states is gravely questioned.

In Wyoming state ownership of streams is not a matter of implication. Congress conferred such ownership by specific grant and in the following manner:

The state constitution of Wyoming was framed, adopted by the people of the territory and submitted to Congress for the examination, and ratification or rejection, of that body. The approval of that instrument by Congress made Wyoming a state without Presidential proclamation or further action by the people of the territory. Whatever powers or authority that instrument asserted were thus absolutely ratified and confirmed by Congress. Sec. 1, of Art. 8, of the State Constitution reads as follows:

> The water of all natural streams, springs, lakes or other collections of still water within the boundaries of the state are hereby declared to be the property of the state.

Every legal authority whom I have heard discuss this question has agreed that by the ratification of this article by Congress the title of the state to the waters of its rivers became as complete as it is to the Capitol building at Cheyenne, and that Congress can now no more legislate about the management of one than it can of the other.

The state owns the streams, the nation owns the land; neither one is of value without the other, and without some concert in their management and disposal there can be no satisfactory development of our agricultural resources.

There is no such concert of action at present. Our land laws were framed for the humid East. They ignore the grazing lands; they make no provision for communal or concerted action in the reclamation or management of the irrigable land; they fail to protect capital in the construction of irrigation works, and by increasing the risk add to the cost thereof, and, in the end, to the burdens of water users. State laws for the management of water are impotent. State ownership of streams is of no consequence so long as the state has no land on which to apply them.

This situation is full of menace for the future. Having no land on which to apply the water there is a lack of local appreciation of its ultimate value, which makes it easier for individuals looking to the future to secure the passage of laws permitting the transfer of these streams to private ownership.

It is worth considering that the state which has most complete control of its streams is most carefully guarding its property. In no other of the arid states are the limitations on water rights as clearly drawn or public control as rigorously exercised as in Wyoming.

(2) Your statement that the act granting one million acres to each of the arid states requires that water rights should be inalienable therefrom, requires amendment. No such condition is contained in the national act. The Wyoming law accepting the donation makes land and water inseparable in this state.

(3) So long as separate ownership of land and water continues there can be no application of the principle of the Wright District Law to the reclamation of public land. The success of this act, or the liability to reclaim lands through any district or communal organization, depends on authority to pledge the land for the money required for its improvement, and in the right to subject all the lands in the district to the regulations which the district or community may find necessary. Present land laws permit neither of these things.

If human experience has any value it has certainly sufficed to show the evils and abuses of our present land system. The history of every irrigated country in Europe shows the necessity for uniting with land the right to the water which reclaims it. Under our system the control of these two joint agents of production is divorced at the outset. We have tried this system long enough to know that its results are in many cases pernicious, and in all insufferably inadequate.

The state of Wyoming has within its borders the headwaters of four of the great rivers of the arid region. It is situated in the path of the old emigrant trail and for 50 years home seekers have been exploring its valleys and fording its rivers, yet in all that time less than one million acres of agricultural land have passed into the hands of private individuals through the operation of our public land laws. During much of that time the laws providing for the requirement of title to land were much more liberal than they are at present. The best locations for reclaiming land have all been utilized. The streams which could be diverted at small cost are nearly all fully appropriated or over appropriated. If such inadequate results have characterized the favorable conditions of the last half century what can we expect under the same laws for the future?

I ascertained after the publication of the paper, from which you have quoted, that the table giving acreage of taxable lands is in one particular incorrect. I gave the area of patented land as the taxable area, but since its publication I have learned that railway land grants are taxed whether patented or not. At the time the paper was prepared I believed that these lands stood on exactly the same footing as land filings under other laws and were not taxable until patents has issued, but by legislation in 1886 this was changed. The taxable area in the land grant states is, therefore, as much greater than my table as the difference between the railroad lands which have been patented and the total grant. In several of the states it does not materially affect the percentages and does not at all affect the conclusion as to the adequacy of the land laws, but rather emphasizes it.

Respectfully, Elwood Mead.
Cheyenne, Wyo., Dec. 7, 1896.

◆

A CONVENIENT METRIC CONVERSION TABLE.

The following metric conversion table has been compiled by Mr. C. W. Hunt, M. Am. Soc. M. E., president of the C. W. Hunt Co., of New York city, and is the most labor-saving tool in the dealing with metric weights and measures which we have anywhere seen. We advise our readers to paste this convenient and compact table in their notebooks. For the benefit of those of our readers who preserve their copies for binding, we would add that Mr. Hunt has had copies of this convenient table printed on a slip with a gummed back, and will, we presume, mail one of these to any of our readers on request.

Millimeters × .03937 = inches.
Millimeters ÷ 25.4 = inches.
Centimeters × .3937 = inches.
Centimeters ÷ 2.54 = inches.
Meters × 39.37 = inches. (Act of Congress.)
Meters × 3.281 = feet.

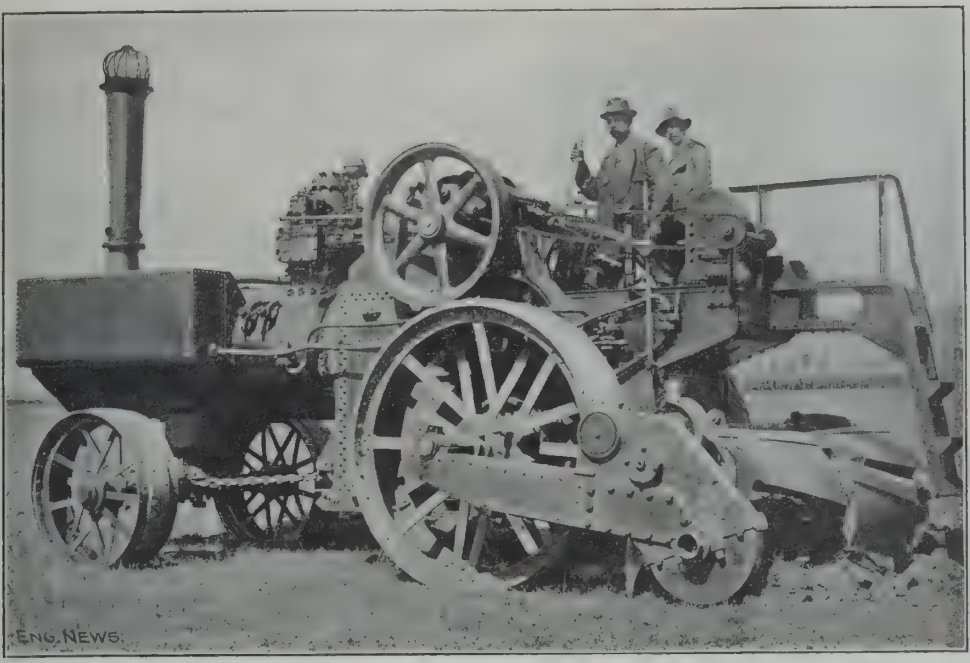
Francs × .193 = dollars.
Gravity, Paris = 980.94 centimeters per second.

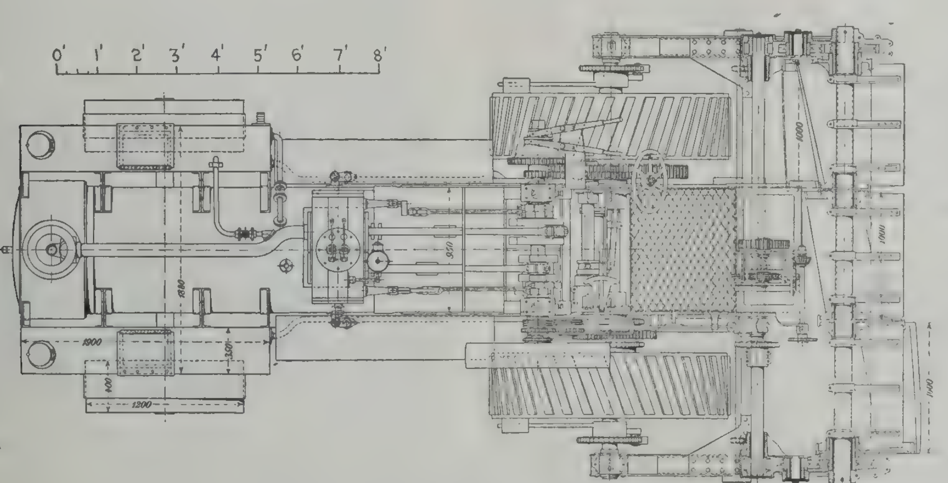
THE MECHWART ROTARY PLOWING MACHINES WITH STEAM AND PETROLEUM MOTORS.

The first steam plow was patented in England in 1846, and since that date machine plowing has been attempted, with more or less success, in every country where the importance of agricultural methods and the areas to be cultivated would warrant the necessary outlay. The first so-called steam plows were nothing more than a system of ordinary gang-plows hauled backward and forward across a field by ropes operated by stationary engines placed on each side of the field. Owing to the practical difficulties encountered this method has been very generally abandoned, and a traction engine was next used to haul after it a series of gang-plows. Many other plowing devices have been since patented, including so-called digging and spading devices, some of these being hauled by rope or by horses, and others being mounted directly in the rear of a traction engine and forming part of the engine. But mechanical defects, the softness and unevenness of the ground, the lack of uniformity in the depth of the cut made, and the usually high cost of these machines, coupled with unsatisfactory results, have prevented them from coming into general use.



MECHWART ROTARY PLOW.
Operated by 50 H. P. Steam Engine.

The requirements for a direct-acting rotary steam plow may be generally stated as follows: The machine must be strong, compact, easily repaired and not too expensive in first cost or daily operation; the plow must cut out a clean, compact mold, lift this out of the ground without disturbing the subsoil, and deposit this mold to the rear of the machine in a thoroughly loosened and inverted condition; the gage of the traction engine must be less than the width of the cut made so that the main wheels may always travel upon firm ground, and the depth of the cut made must be capable of adjustment, to suit the ground, and this depth must be automatically controlled by the ground surface itself.



PLAN OF 50 H. P. MECHWART ROTARY PLOW.

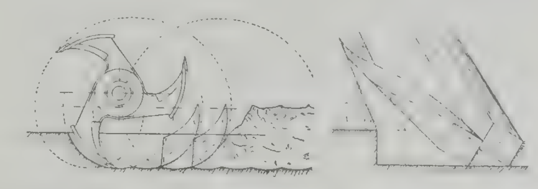
Rotary steam plows have been heretofore made; but these generally operated a series of narrow spades, upon a drum, which simply loosened the soil and scattered it about unevenly. To meet each and every one of the above requirements the rotary steam plow here illustrated has been invented and patented by Mr. Andreas Mechwart, the general manager of Ganz & Co., an important manufacturing concern of Budapest, Hungary. The practical needs of a machine of this character have been so carefully studied that this plow promises to revolutionize present practice in this connection.

As shown in the illustrations, the rotary plows are directly connected with the engine operating it and also supplying the motive power. The frame supporting the plows is pivoted to the main axle of the locomotive, and by special devices is made to automatically adjust the depth of cutting to the inequalities of the surface. To prevent one falling mold from interfering with the cutting of the next mold, by the following share, and to make the cutting without shock, the cutting edge of the share is given a shearing action by setting it at an angle to the axis of the drum, this angle approximating 30°, but varied to suit the soil. The peculiar form and angle given these shares enables them to lift the cut molds bodily and to deposit them rearward in an inverted position; and the claim is made that no other rotary plow accomplishes this important result. As the plows rotate in the same direction as the main running wheels, the pushing action of the plows in the ground practically assists the forward motion of the locomotive and to that extent decreases the tractive force required.

At the Budapest Exposition of 1896 the Mechwart plow was exhibited under running conditions. This plow, shown in the half-tone illustrations, was operated by a 50 HP. steam engine used to propel the plow and to rotate the cutting or plowing device. The plow, or cutter-drum, was 12 ft. long, with an outside diameter of 3 ft., and the cut made was from 6 to 14 ins. deep, according to the adjustment of the apparatus. Many previous tests made with this same machine, and in different soils, show that the action of the plows is similar in effect to the spading operation in garden work. Crops of wheat, barley, oats and corn, raised on soil thus treated, are claimed to have yielded from 5 to 15% heavier weight of product than similar crops raised from ground worked by the ordinary gang plow. This plowing machine has also been worked in combination with a harrow and cultivator hauled after it with no added expense.

The Mechwart plowing machine is made in three sizes of 30, 40 and 50 HP., plowing over a space 8, 10 and 12 ft. wide and having a working capacity, in 14 hours, of 14, 18 and 21½ acres. The weight of a 50 HP. machine is 10 tons, and the selling price of this class of machine is $4,000. An elaborate estimate puts the total cost of operating a 50 HP. plow at $16.80 per day; in this estimate the day is 14 hours long, coal costs $2.50 per ton, the engineer and fireman are paid $2.50 and $1.50 per day and the fuel consumed is 275 lbs. per hour. With an average of 21½ acres per day plowed 14 ins. deep the average cost of plowing per acre is 78 cts.

Cuts on the next page show a similar but smaller rotary steam plow operated by a 12 HP. petroleum motor, as exhibited at the Budapest Exposition. This motor was especially designed to work automatically and to be safe from explosion, smell or smoke. The petroleum vapor is carried automatically from a tank on the machine, without the use of a supply pump, and the ignition is brought about without the use of an electric spark or burning flame. An engineer is not needed, as any man or boy can soon be taught to operate the motor.



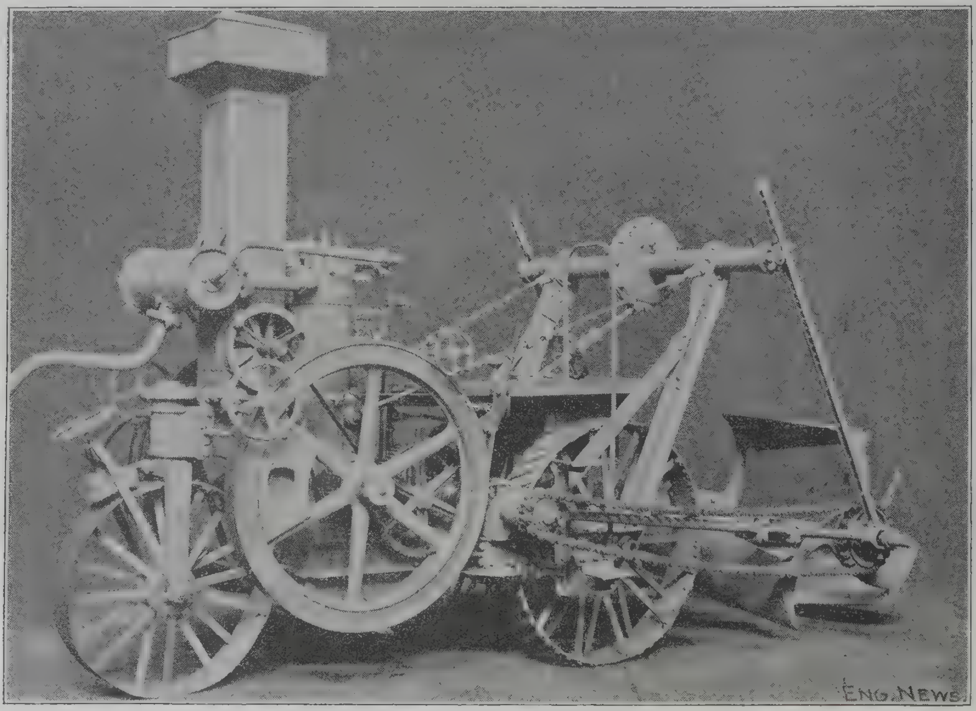
Sections Showing Principle of Cut Made by the Mechwart Rotary Plow.

In this petroleum plowing machine the circular cutter is 4 ft. wide and 3 ft. in diameter; but provision is made to insert a 5 or 6 ft. cutter when this is deemed necessary. The plow will cut from 6 to 12 ins. deep, as the soil may require, and it may be worked in a train with a harrow and cultivator. This machine has plowed an average of 8 acres, 12 ins. deep, in 14 hours. The machine is sold for $800, and the average daily cost of operation, including the investment, is put down at $3.78. In this estimate 1½ gallons of petroleum are used per hour and two farm laborers are included at $1 per day. On the above basis of 8 acres plowed 12 ins. deep in 14 hours, the average cost per acre is only 47 cts. Both machines are patented in the United States, and for further information the reader is referred to the American representative, M. Neumayer, M. E., C. E., 68 East 114th St., New York city.

THE NEW NORTHWEST WATER-WORKS TUNNEL for Chicago, Ill., is progressing quite satisfactorily, according to recent reports. Of the total 72,600 ft. of land tunnel, 5,600 ft. of the 10-ft. tunnel and 11,435 ft. of the 8-ft. tunnel have been completed. Of the lake tunnel, 10-ft. in diameter, about 800 ft. are completed.

STANDARD CEMENT SPECIFICATIONS OF THE SOUTH AUSTRALIAN GOVERMENT.

We are indebted to Alexander B. Moncrieff, M. Inst. C. E. and Engineer-in-Chief of the South Australian Government, for a copy of the standard specifications for Portland cement supplied to that government for use on its public works, under which he states satisfactory material has been received for some time past. These specifications are interesting in themselves, and show recent engineering practice in Australia in regard to cement.

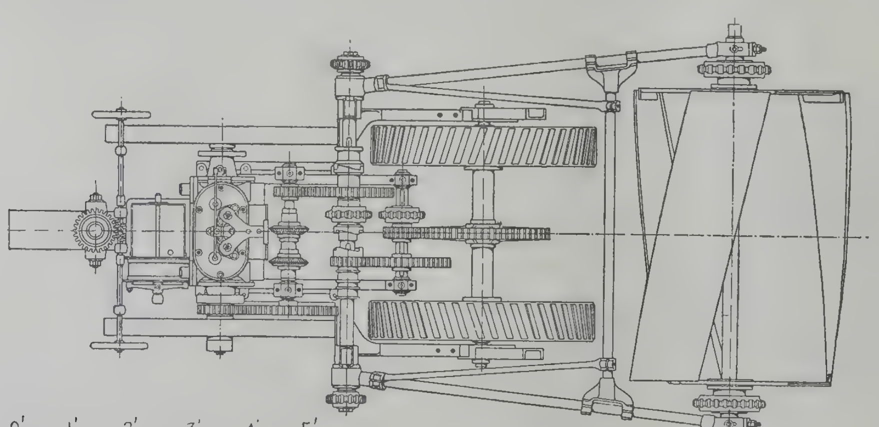


MECHWART ROTARY PLOW.
Operated by 12 H. P. Petroleum Motor.

The part of the specifications relating to weight, residue, sand, mixing and tests is as follows:

Weight—ascertained by filling a cylindrical, imperial bushel measure from a fixed hopper which will deliver the cement at a height of 2 ft. above the bottom of the measure. The measure, which is 13 ins. high, will be set upon a solid floor, and shall be filled in two minutes. No shaking or other means will be allowed to cause the cement to settle. The weight of the "striked" bushel shall be not less than 100 lbs.; and the specific gravity of the cement not less than 3.10. The tests for weight and specific gravity shall be made not earlier than 28 days after the cement has left the contractor's works.

Residue—ascertained by sifting 10 lbs. through a sieve of 5,806 meshes per sq. in., made of wire No. 45 I. S. W. G., shall not be more than 1 lb., and all this residue shall pass through a sieve of 2,500 meshes per sq. in., made of wire No. 39, I. S. W. G.



PLAN OF 12 H. P. MECHWART ROTARY PLOW.

Sand—used for the tests shall be River Torrens sand, thoroughly washed and dried, all passed through a sieve of 400 meshes per sq. in. and caught on a sieve of 900 meshes per sq. in.

Mixing—will be effected in a Faija's mixer, the proportions of cement, sand and water being determined by weight and all the water being added at once.

Test blocks—or briquettes will be made by filling the material, mixed as above, into metal molds of the form shown in the margin,* and resting on non-absorbent beds, and pressing it uniformly so as to exclude the air and make the briquette compact.

The pressure shall be applied by hand to each briquette for not more than 2 minutes for neat cement, and 3 minutes for cement and sand, and the pressure shall not exceed 56 lbs. upon a tool similar to that shown below.

The blocks shall be kept in the molds exposed to the air for 24 hours, and then in water for the balance of the specified periods, when they shall be taken out and immediately tested.

Testing of the blocks will be done in a testing machine approved by the Engineer-in-Chief. The strain on each block commencing from 0 lbs. and increasing at the uniform rate of 400 lbs. per minute until the block is broken.

Tensile strength per sq. in. of neat cement, 7 days after mixing, shall not be less than 400 lbs.

Tensile strength of neat cement, 28 days after mixing, shall not be less than 550 lbs. per sq. in.

Tensile strength per sq. in. of a mixture of 1 part of cement to 3 parts of sand, 28 days after mixing, shall not be less than 200 lbs.

Setting and Cracking Test.—Pats of neat cement, about 3 ins. in diameter and ½-in. thick, with thin edges, will be mixed on glass with sufficient water to form a stiff paste, and the times of setting hard enough to support ¼-lb. on a wire 1-12-in. diameter, and 1 lb. on a wire 1-24-in. diameter shall not be less than 1 hour and 3 hours, nor more than 4 hours and 12 hours respectively. One-half of the pats, when set, will be kept in water for a period of 7 days and the other half will be exposed to the air, and if distortion or cracking of edges develops in them, the cement from which they were taken will be rejected.

In addition to the above tests the Engineer-in-Chief may order such chemical tests and analyses as he may think necessary to demonstrate whether or not the article supplied contains the requisite constituents of Portland cement.

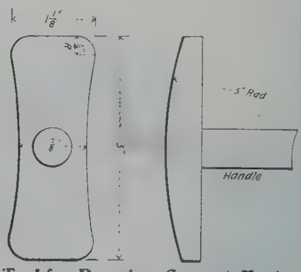
Four samples at least for each test shall be obtained from every 400 bushels for the purpose of testing.

In the event of a sample failing to stand any of the required tests, the Engineer-in-Chief shall have the option of ordering fresh tests at the expense of the contractor, or of rejecting the whole of the parcel from which such sample was obtained.

All costs of testing shall be borne by the contractor. The charge for testing the samples representing each 400 bushels shall be one guinea.

Should the contractor request in writing any further tests, the charge for making each such additional test shall also be one guinea.

It is not intended that there shall be any departure from the established departmental mode of testing, but if any test be objected to by the contractor on the alleged ground of insufficient pressure being used in filling the mold, and he request that a further test be made the pressure shall in such further test be applied by a machine rolling a tool, similar to that shown herewith, over the surface of the mixture, under a direct dead-weight of 56 lbs. The time occupied in filling each mold in such case shall not exceed 3 minutes for neat cement and 4 minutes for cement and sand.



Tool for Pressing Cement Mortar into Briquette Molds.

In further clauses it is specified that while the tests shall be made at such place and in such manner as the Engineer-in-Chief may direct, the contractor has the option of being represented at the testing. No cement will be received that has not been properly cooled and aerated before delivery; and the contractor must stack the cement in separate lots of 400 bushels each, estimating about 4 bushels of cement to each barrel or 2 bushels to each sack. From each lot so stacked at least four samples will be taken by boring with an auger into several packages, or by other approved means. No delivery will be considered complete without the certificate of the Engineer-in-Chief that the cement is of the required standard; nor will any payment be made on account of cement delivered without the production of this certificate. Tenderers must give the schedule price per imperial "striked" bushel of Portland cement as measured upon completion of 28 days' test. This price must include all patent rights and royalties, packages, carriage, testing, and "any claims whatsoever arising from the making, conveyance, stacking and delivery of the cement, in accordance with the terms of this specification."

◆

THE CYCLE INDUSTRY IN THE UNITED States, says an interesting and lengthly article on this subject in the London "Times," has grown from 6 factories, in 1885, with a total output of 11,000 machines, to 500 factories in 1895, counting only those which turn out not less than 1,000 machines annually, and having a total production of 600,000 cycles of various grades. The capital invested in these 500 factories is placed at $90,000,000, and the lowest estimate of the output of completed machines for 1896 is one million valued at $60,000,000. If the manufacture of tubing, bells, lamps, and other bicycle paraphernalia is included it is estimated that the total capital invested would amount to $125,000,000. The export of American bicycles practically commenced in 1895, and for the last half of that year the value of those exported only amounted to $243,721, according to the reports of the Treasury Department. But for the first six months of 1893 the same report puts the value of exported machines at $1,654,291. Nearly one-half of this export goes to England, incompleted machines or parts of machines, and Germany and France are the next best customers. The success of the American machine, says the "Times," is the attention paid to the development of strength with lightness and the finish and high quality of the product. Bicycles are made weighing only 26 lbs., which will safely carry 300 lbs. over any road. The price of the best bicycles has been reduced from $140 in 1893, to $100 in 1896, for the same quality of machine or even better. The "Times" estimates the number of bicycles in use in the United States at not less than 3,000,000. Mr. George F. Parker, American Consul at Birmingham, says that in 1895 about 750,000 bicycles were made in England, valued at about $58,392,000. The export value of English bicycles for the first 9 months of 1896 amounted to $6,452,691; but the trade in cycle material with the United States has declined to $62,787, and Mr. Parker says it will practically cease by the end of the season of 1897.

AUTOMATIC BUCKET FOR COAL HOISTING; SOUTHERN PACIFIC RY. DOCKS, OAKLAND, CAL.

In a paper in a recent number of the "Journal of the Association of Engineering Societies," Mr. John D. Isaacs, of the Technical Society of the Pacific Coast, described certain apparatus designed by him for handling coal for the Southern Pacific Ry. Co. at Port Costa and Oakland Wharf. The bucket used is particularly interesting, and it was devised to meet peculiar conditions existing at that point. These conditions required that most of the coal should be landed from ships into receiving bunkers and then transported by rail to the place of consumption. The high cost of coal, the high rate of wages paid to stevedores, and the importance of quickly unloading the vessels made it very desirable that waste and breaking should be diminished as far as possible, that manual labor be minimized in handling the coal and that the ship be discharged quickly.

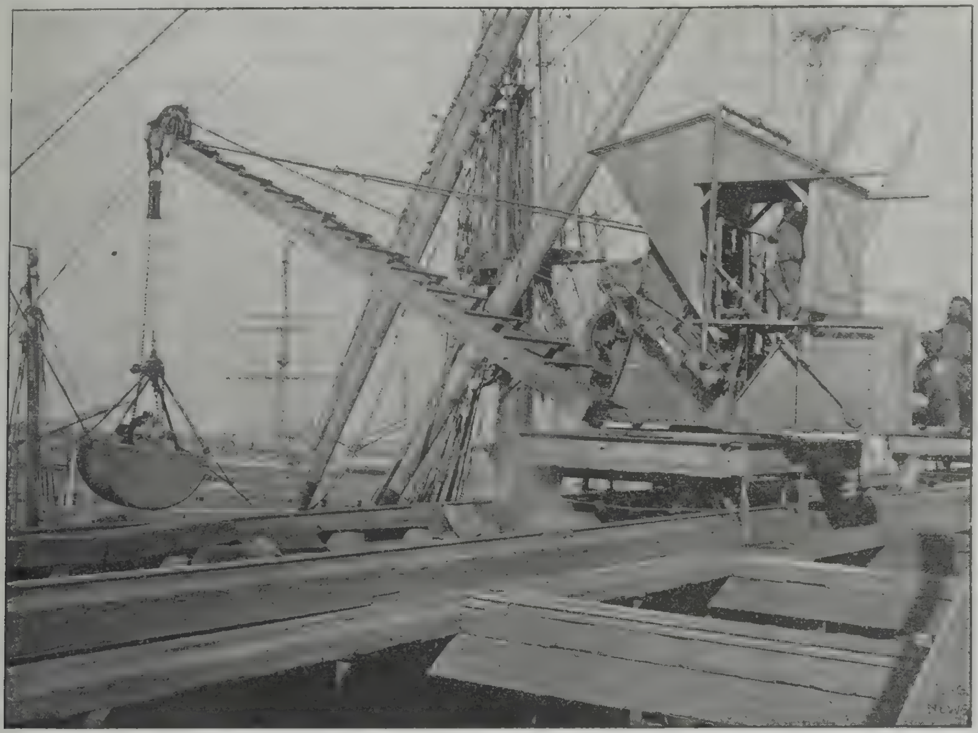

FIG. 1. -COAL UNLOADING PLANT AT SOUTHERN PACIFIC RY. DOCKS; OAKLAND, CAL.
Designed by John D. Isaacs, M. Am. Soc. C. E.

The mechanical digging conveyor, supplemented by a fore-and-aft conveyor in the ship bringing coal to the main buckets, is the ideal method of landing coal from vessels and in some form is in common use in the Eastern and Middle States for unloading barges. But on the Pacific Coast there are complications which make this system practically impossible. The coal ranges in size from dust to pieces measuring several cubic feet in volume; it is sometimes very wet and at other times very dry; the range of tide, the variation in the draft of ships and in the size and position of the hatches, and the interference of rigging and special bulkheads would all interfere with the proper working of the conveyor system. The only practical method of general application is the hoist of a bucket by means of a derrick of some form; and it was to the improvement of this latter method that Mr. Isaacs directed his attention.

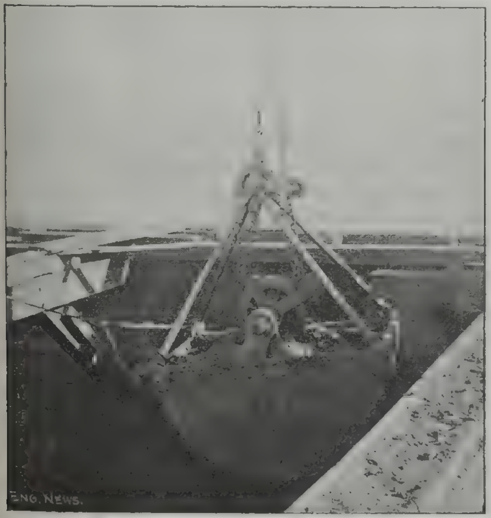

Fig. 2.—View of Automatic Coal Bucket, Closed.

The ordinary "tipper" bucket involves much manual labor and a high dump for the coal; consequently many varieties of clam-shell dredger, or "grab-buckets" as they are there called, have been devised. These buckets should be simple, with few parts and these easily replaced; they should be moderate in cost, with a low repair account; they should be geared to bite lumps of coal in two when these are caught between the lips; they should bury themselves in the coal and come up full; have a low dump and be handled entirely by the derrick engineer. The buckets which conformed most nearly to the conditions of low dump, automatic action and applicability to various states of the coal, says Mr. Isaacs, were very complicated in their gears, springs, pawls, etc., and caused constant delay and expense in repairs.

The grab-bucket designed by him and here illustrated, is only limited in size by the dimensions of the hatches and the capacity of the derrick. Three sizes have been made, of 3,000, 3,800 and 5,000 lbs. capacity, level full; but the medium size meets the conditions and is now the only size in use. It weighs 3,775 lbs., with a ratio of dead weight to useful load, of about 1 to 1, and has a capacity of 64.4 cu. ft. The maximum speed of lift is about 400 ft. per minute, and the average fall of coal is 8 ft., as compared with 21 ft. from the tipped bucket. In operating it, only one stevedore is required at the hatch, instead of six as with the tipper. Five of these grab-buckets have been in almost constant use at the Oakland Wharf since November, 1894; and to this time there has been absolutely no delay by disarrangement and there have been no charges against them for repairs.

This bucket is operated as follows: It is lowered into the hold, both lines being paid out together. When the bucket has nearly reached the coal, the running line is let go, and the weight of the lower sheaves, hinges, etc., throws the bucket wide open by the time it rests upon the coal. The hanging line is now slacked and the running line hauled in, and the bucket buries itself in the coal, up to the lower sheave-shaft, and closes. Both lines are now hauled in together, but the lift is kept entirely on the runner. As soon as the bucket clears the hatch it begins to swing and hoisting is stopped as it clears the top of the bunker and it then passes to the point of discharge. At this latter point the hanging line is held and the runner released, opening the bucket and dumping the coal; and with this latter operation a reverse motion towards the ship begins.

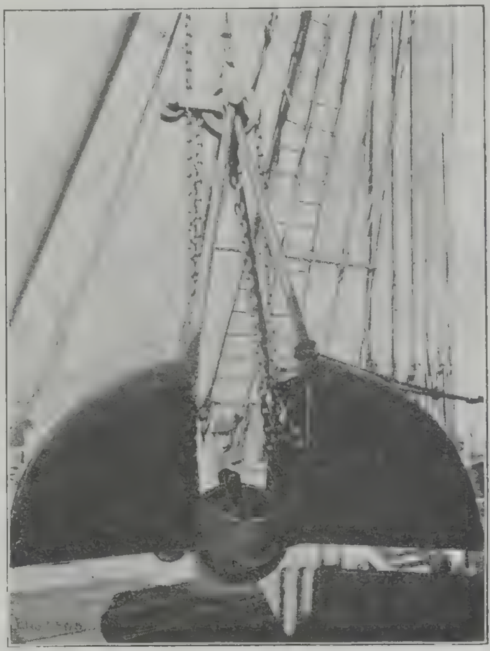

Fig. 3.—View of Automatic Coal Bucket, Open.

The derricks employed in handling these buckets are of the ordinary type, with double independent drums, friction brakes and the usual appliances. The reach of the boom is 32 ft. The derrick car runs on a track of 8 ft. gage, and is hooked down to the track stringers when in use. All lowering is done by the brakes. In the same paper Mr. Isaacs describes and illustrates the receiving and distributing bunkers built at Oakland and at other points. These bunkers have each a capacity of 10 tons per foot run, level full. They contain an average of 1,266 ft. B. M. of timber per foot run and cost by contract about $36.60 per foot. The trestle approach contains 266 ft. B. M. and it cost $6.60 per lineal foot. The track on the top of the bunker is 46 ft. above the coaling track, which is outside of the bunkers, as giving the greatest capacity for a given height and width.

◆

COMPARATIVE VALUES OF GAS AND ELECTRICITY FOR HEAT, LIGHT AND POWER IN GERMANY.

At the last meeting of the German Union of Gas Manufacturers, says "Le Genie Civil," Mr. W. G. Oechehauser gave some comparative figures relating to the cost of gas and electricity for lighting, heating and power purposes. These figures, which are based solely upon German practice, are as follows:

In gas lighting, under ordinary pressure one cubic meter of gas ordinarily furnishes 560 Hefner units. In using the incandescent electric light, with lights of 16 candle-power, it is usual to rate one kilo-watt hour as giving about 280 Hefner units. On this basis one cubic meter of gas is equivalent to two kilo-watt hours. With the arc light compared with gas, one cubic meter of gas, under a pressure of one meter, furnishes 1,000 Hefner units; and one kilo-watt also gives 1,000 Hefner units. In this case one cubic meter of gas is about equivalent to one kilo-watt hour. For lighting purposes one cubic meter of gas, in Germany, costs from 3½ to 5 cts., while the cost of a kilo-watt hour is from 15 to 20 cts.

For power purposes, one effective horse-power hour, according to the power of the motor, requires an expenditure of gas varying from 600 to 800 litres; one cubic meter of gas can thus be rated as furnishing from 1.25 to 1.66 horse-power hours.

In electric power, one effective horse-power hour is equal to 736 watts; and in the actual electric motor the mean useful effect varies from 80 to 90%, according to their power. They absorb then from 820 to 920 watts per horse-power hour produced,and one kilo-watt produces from 1.08 to 1.22 horse-power hours. In this case again, one cubic meter of gas is approximately equivalent to a kilo-watt.

For heating purposes, the experiments of Messrs. M. J. Hasse and F. Goly show that the combustion of one cubic meter of gas furnishing 2,400 to 2,600 effective calories in gas-cooking appliances; 3,840 calories in heating water for baths, and from 3,628 to 4,080 calories in general gas heating apparatus. For heating by electricity, Messrs. F. H. Haasse and A. Herzberg figure that we can utilize from 80 to 95% of the product. On this basis one kilo-watt will only produce from 700 to 800 effective calories.

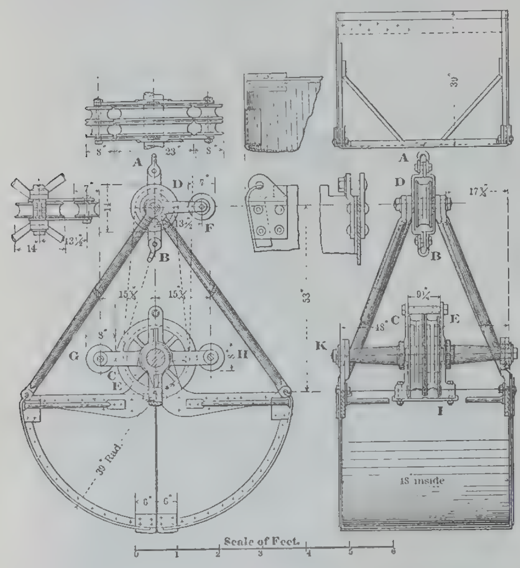

Fig. 4.—Details of Automatic Coal Bucket.

The ordinary German price for gas supplied for heating and power purposes varies from 2 to 3 cts. per cubic meter; under similar conditions the cost of a kilo-watt varies from 5 to 7½ cts.

THE MANAOS TELEGRAPHIC CABLE, laid in the Amazon River, to connect Para and Manaos, cost $1,000,000 and failed to work within 31 days after being laid. It was guaranteed for only 30 days by the contractor. No messages have been transmitted over it since last February; but it is being inspected for breaks and it is hoped that it may be in operation again before long. This cable was supposed to supplant the overland telegraph line to the center of the rubber trade; a line continually interrupted by the rapid growth of tropical vegetations and the antics of Brazilian monkeys.

A FRENCH-SOUDAN RAILWAY, or, rather, the completion of a railway commenced in 1881, is being considered by the Colonial Minister of France. Up to 1896 $2,600,000 had been expended on a line extending from Kayes to Bafoulabe, with a proposed extension to the Niger, with the practical result that about 56 miles of rails have been laid down on ties spaced about 16 ft. apart, with the rails held by single bolts. Surveys have now been completed to the Niger, and a project for finishing the road has been favorably reported upon by the Minister. The two towns mentioned are on the Senegal River, emptying on the West Coast of Africa at St. Louis, and between Bafoulabe and the Niger, emptying into the Gulf of Guinea, lies high and difficult ground. The opinion is advanced that the proposed line is a simple waste of human energy and the hard-earned money of too sanguine investors.

DOUBLE DECK HIGHWAY AND RAILWAY BRIDGE ROCK ISLAND, ILL.

(With inset.)

The Rock Island Bridge, whose principal structural features are illustrated in the accompanying engravings and on our inset sheet this week, is one of the most important bridge structures constructed in the United States during the past year. Briefly described it is a combination railway and highway bridge 1,850 ft. long over all, with seven fixed spans and one swing span; the highway being carried on the main floor at the bottom chord line and the two-track railway line upon a second floor 12½ ft. in the clear above the highway. The bridge crosses the Mississippi River, between Rock Island, Ill., and Davenport, Ia., and has been built at the joint expense of the United States Government and the Chicago, Rock Island & Pacific Ry., the railway company paying 60% of the cost. Accurately speaking, the bridge has been constructed by the United States Government and 60% of its cost, by agreement, charged to the railway company. A. R. Buffington, Colonel of Ordnance, U. S. A., Commanding Officer, Rock Island Arsenal, was the Government representative having the work in charge, and he appointed Mr. Ralph Modjeski, Assoc. M. Am. Soc. C. E., Chicago, Ill., as Chief Engineer, to design and construct the bridge.

History.—Historically, the Rock Island bridge is unusually interesting, it being the lineal descendant of the first bridge constructed across the Mississippi River. According to the records the first Rock Island bridge was built under a charter granted Jan. 17, 1853, by the Legislature of the State of Illinois. The purpose of its construction was to connect by spanning the Mississippi River the Chicago & Rock Island R. R. terminating at Rock Island, Ill., with the Mississippi & Missouri R. R. in Iowa. It was the first bridge to be built over the Father of Waters and the opposition by the so-called "river interests" to its construction and maintenance was most bitter and prolonged. However, the bridge was finally built—a single track, wooden, Howe truss structure—and served its purpose until on May 6, 1856, when the first span, east of the swing span, 250 ft. long, was destroyed by fire, communicated by the steamboat "Effie Afton," which collided with and burned at one of the piers. In the litigation which followed, and which was brought by the owners of the burned boat, it is of interest to note that Abraham Lincoln, of Springfield, Ill., was one of the counsel for the railway company.

This did not end the troubles of the bridge, however, for in 1860, a suit was brought by James Ward, a citizen of St. Louis, Mo., which resulted in Judge Love, of the District Court of the United States for the District of Iowa, declaring the bridge a "nuisance" and ordering "all the piers within the state of Iowa, together with the superstructure thereon, removed on or before the 1st day of October next." As denoting the opinion of those days regarding the comparative importance of the railway and the navigation interests, it is interesting to note, among other things in Judge Love's decree, the statement that, "if the bridge were to remain, we would probably in no great period of time have railway bridges upon the Mississippi River at every 40 or 50 miles of its course;" also, "that the loss involved in the removal of this bridge would be but trifling compared with the great mischief which must inevitably flow (to the commerce of the river) from the precedent of maintaining it." In one respect the prediction of Judge Love has been in a great measure realized, for at this time there are at least 35 railway and highway bridges over the Mississippi River between Minneapolis, Minn., and St. Louis, Mo., a distance of 800 miles. However, to return to the subject, the Supreme Court of the United States reversed the decision of Judge Love, principally on the ground that the jurisdiction of the District Court extended only to the middle channel of the river, and the removal of the three piers in the State of Iowa would not remedy the obstruction, while it would destroy the bridge.

This decision seems to have settled the trouble from litigation, and in 1866 and 1867 two acts were passed by Congress authorizing the construction of a new bridge to replace the old one. Before work was begun, however, the bridge had suffered serious accidents. In March, 1868, the first pier on the Iowa shore was pushed bodily some 20 ft. or 30 ft. downstream by the ice, and in April of the same year, during a severe wind storm, the swing span was lifted from its masonry and blown over on its side upstream, so that it hung supported by the pier with both ends free in midair. In June, 1869, the contract for the masonry for the new bridge was let, and the structure was completed in October, 1872. Mr. C. Shaler Smith, M. Am. Soc. C. E., was Chief Engineer, and the Phoenix Bridge Co., of Phoenixville, Pa., the contractors for the superstructure. Nineteen years after the completion of the new bridge it was found necessary to strengthen the upper or railway floor, and in 1891 the wooden system then in use was replaced by iron construction. Despite these repairs, however, the bridge was inadequate to the traffic, particularly to the railway traffic, there being but one line of track and no great surplus of strength for the heavier and more frequent trains. In 1894-95, therefore, Congress authorized an entirely new superstructure and partly new substructure, and appropriated the sum of $490,000 for the work. It is this last structure with which this article is immediately concerned, and to which the remaining description will apply.

General Description.—The general plan and elevation of the new bridge are shown by Fig. 1, and, as will be seen, it consists of seven fixed spans and one swing span of the following dimensions and weights:

	Length, ft.	Length, ins.	Weight, lbs.
One swing span, A............	365	7	2,466,271
Two fixed spens, B............	258	0	3,298,955
Three fixed spans, C..........	216	6¾	3,690,815
One fixed span, D............	193	3	789,142
One fixed span, E............	98	9	337,779

Spans A, B, C and D are 29 ft. wide, c. to c., of trusses, and span A is 62 ft. high at the centre and 50 ft. high at the ends. Spans B and C are 50 ft. high at the centres; span D, 30 ft. high, and span E, 25 ft. 4½ ins. high, but only 28 ft. wide, c. to c., of trusses. All spans carry a roadway at the lower chord line 226 ft. wide, with two 6 ft. sidewalks, and a two-track railway line on an upper deck. The styles of truss and lateral bracing, with one exception, which will be noted further on, are shown by the drawings as is also the location of the piers and other general features.

Substructure.—It having been determined to utilize the old piers for the new bridge, and this structure being considerably wider than the old one, it became necessary to remodel the masonry to suit new conditions. This was done in the manner shown by Fig. 2, that is the coping and top part of the old pier was removed down to a point where by interrupting the batter of the old cutwater and extending it upward vertically the increased width obtained would be sufficient for the new conditions. For the old piers Joliet limestone had been used, but the new masonry was composed of Kettle River sandstone for the facing and coping and of Anamosa stone backing, laid in Alsen's Portland cement mortar, of two parts sand and one part cement, for the facing, and three parts sand and one part cement for the backing. The specifications for the masonry required tests of the stone and were rigidly drawn to secure the best workmanship, but need not be given in detail here. As general contractors for the bridge the Phoenix Bridge Co. sublet the masonry work to Sooysmith & Co., of New York.

Truss and Floor Construction.—To understand the metal work details, drawings of the swing span only need be considered, since they are typical of the whole work. These are shown in Figs. 3 and 4, and as far as the general composition of the various truss members and connections, portal and lateral bracing, characteristic strains, etc., are concerned, they are self-explanatory. Some of the minor requirements in the metal work construction will be noted in the abstracts of the specifications given further on. In the roadway floor construction no unusual design is found, it being a simple floor beam and girder construction, with the necessary flooring and paving for wagon traffic, and with two lines of street railway track. The railway deck floor and track construction, however, demand further notice. Transverse girder floor beams carry four lines of grider stringers, one stringer under each rail, and these stringers carry a solid floor of trough sections of the form shown in detail in Fig. 5. The Phoenix Iron Co., of Phoenixville, Pa., made special rolls for this trough section. A detail of the connections of the floor troughs, stringers and floor beams at each floor beam is shown by Fig. 6. The floor troughs are, of course, riveted to the stringers in the manner indicated by Fig. 5. On top of the floor troughs and under each rail is a 20 × ⅜-in.

plate continuous the whole length of the bridge and, of course, riveted to the floor troughs. The object of the continuity of these plates was that in connection with the floor troughs they might form a lateral bracing against wind pressure. The troughs take the shear and the continuous plates act as chords to take the bending moment. On the top of these plates at each trough top there is an 8½ × 8 × ⅜-in. steel blocking plate to support the rail, and to their inner edges, that is between rails, a guard angle is riveted as shown by Fig. 3. Altogether this floor weighs 940 lbs. per lin. ft. It is also water-tight to protect the roadway floor below.

In calculating the various members the following loads were used: Dead load, span A, 7,380 lbs. per lin. ft. of bridge; span B, 7,220 lbs.; span C, 6,700 lbs.; span D, 4,000 lbs.; span E, 3,400 lbs. Live load for trusses, 80 lbs. per sq. ft. or 3,050 lbs. per lin. ft. for roadway and 4,000 lbs. per lin. ft. per track for railway deck; live load for roadway floor, Cooper's road roller and electric car, each 12 tons in 7½ ft., or 100 lbs. per sq. ft., and for railway floor the locomotive and car load shown by Fig. 7. The wind load was placed at 650 lbs. per lin. ft. at the railway deck, 300 lbs. at bottom chord, and 200 lbs. at top chord.

DOUBLE DECK RAILWAY AND HIGHWAY BRIDGE, ROCK ISLAND, ILL.
Ralph Modjeski, Assoc. M. Am. Soc. C. E., Chief Engineer.

Turntable.—The general dimensions and construction of the turntable and drum are shown by Figs. 3 and 4. The track-bed plates are of tough gray cast iron, and are planed top and bottom to a uniform thickness. The tread segments are of forged steel, and planed to uniform thickness and bevel. The wheels are of cast steel.

Material.—Generally all structural plate and shape work is of medium open hearth steel and all rivets are of soft open hearth steel, except the trough floor, which was made of soft steel. Cast steel is used for end bearings, turntable wheels and other parts of the machinery; cast iron for bed plates and certain portions of the machinery, and wrought iron for the spider rods of the turntable and minor parts. The specifications were in abstract as follows:

Steel shall be made by the open hearth process. The amount of phosphorus shall never exceed 0.08% in acid steel and 0.04% in basic steel. The variation in cross section or weight of rolled material shall never be more than 2½% from the specified dimensions and weights. Steel pins over 4 ins. in diameter shall be hammered. In tests the following requirements shall be met:

	Med. steel, lbs.	Pin. steel, lbs.	Soft steel, lbs.
Minimum ultimate strength	63,000	63,000	54,000
Maximum ultimate strength	71,000	71,000	62,000
Minimum elastic limit	38,000	38,000	32,000
P. C. elongation in 8 ins.........	22	18	28
P. C. reduction of area...........	44	36	52

(A somewhat higher elastic limit, it will be observed, was adopted.—Ed.)

All material must be perfectly straightened—mill straightening will not be considered as sufficient—and the templets shall not be applied to any material unless it is perfectly straight. They must lay flat without distortion while the marking is being made. The diameter of the punch shall be at least 3-16-in. smaller than the finished hole in all material ¾-in. or less. It shall be ¼-in. smaller than the diameter of the finished hole in material ¾-in. to 1 in. in thickness. No punching will be allowed in material thicker than 1 in. The diameter of the die shall, in no case, be more than 1-32-in. in excess of the diameter of the punch. After the pieces have been punched or drilled, they shall be assembled and the holes reamed or drilled to the required size. The punching must be sufficiently accurate to permit 1-16-in. of metal to be taken out all around the hole by reaming. Otherwise a smaller punch shall be used. No drifting shall be allowed which would cause initial strains in any of the assembled pieces. The reaming shall be done in a neat manner, taking out 1-16-in. of metal all around the hole. While the reaming is being done the different pieces shall be held firmly together by bolts and clamps. After the pieces are reamed, every hole shall be gone over with a counter-sinking tool, cutting off the sharp edge of the hole, and making a fillet of about 1-16-in. under each rivet head. The members shall then be taken apart and cleaned, the surfaces in contact painted, and the members carefully reassembled and riveted up before the paint is dry. The diameter of the rivets will be such as to require, when heated, a slight pressure to force it into the hole. The size of the rivets shall be adjusted to fill this condition. Whenever possible the riveting shall be done by power. The manufacturer shall procure special riveting machines to meet special positions. All rivets shall have hemispherical heads of neat and workmanlike appearance concentric with the axis of the rivet hole. They shall be well up against the metal. The rivets shall fill the holes and be absolutely tight. No calking or recupping will be allowed. Counter-sunk rivets shall be so driven as to fill the counter-sunk holes completely, and in such a manner as to dispense with chipping when possible. All chipping, whether of rivets or other parts, shall be done in a neat and workmanlike manner without breaking out of metal. Each chipped surface shall be finished off with a file. Where metal is chipped or planed out of a plate or shape, all sharp or concave corners shall be rounded off to at least a 2-in. radius. (This requirement is unusually novel. To understand its application reference may be made to Fig. 4, where the plate X has its corner chipped and rounded according to this clause.—Ed.) No chipping shall be done with a sledge hammer.

Forged Work.—All steel heated for the purpose of forging, bending, or up-setting, shall be subsequently annealed by heating to a dark red heat and allowing to cool slowly. The heads of eye-bars and screw-ends shall be up-set by a process acceptable to the commanding officer. No welds will be allowed except in wrought iron. The design of the heads of eye-bars may be determined by the contractor, provided this design is uniform throughout for each width of bar, and provided the head is strong enough to break the body of the bar. The head will never be more than 1-16-in. thicker than the body of the bar.

Machine Work.—All sheared edges or ends of plates or shapes shall be planed or faced so as to take off at least ⅛-in. of metal. No sheared or punched surface shall be left in the work. Curved edges may be chipped and filed unless specified to the contrary. The ends of riveted chords shall be faced after they are riveted up complete, excepting the projecting splice plates. The lengths shall be measured with iron standards. The chords shall be provided with suitable spacing blocks and clamps, especially near each end, to hold the plates and angles firmly in their proper relative positions while the ends are being faced. The chord sections shall be fitted together at the shops in lengths of at least 120 ft. When so fitted together there shall be no perceptible wind in this length. The reaming of the splices, as well as all other field connections, shall be done with the different parts assembled. When this is impracticable, the connections shall be reamed through iron templets at least 1½ ins. thick. The parts which have been reamed together shall be stamped with stencils, and marked with white paint in such a manner as to be easily put together in the field in the same relative position. Diagrams for marking shall be furnished by the commanding officer or by the inspector. The angles for cross frames, portals and laterals may be reamed from iron templets, provided that one cross frame of each kind, one portal of each kind, and one panel of lateral angles of each kind is fitted up in the shop complete. When so fitted the rivet holes must come truly opposite each other; otherwise the different pieces must be assembled for reaming. All pin holes shall be bored with a sharp tool. A finishing cut shall always be taken. The finished pin hole shall be perfectly smooth and polished. Roughness in a pin hole shall be sufficient reason for rejecting a whole member. The distance between pin holes shall be measured with an iron standard of the same temperature as the member. The plans show the distance between the centers of pin holes; shop measurements shall be made between the bearing surfaces of tension of compression members, with a proper allowance for the diameter of the pin. Pin holes shall be bored exactly square with the member and absolutely parallel with each other. The play of the pins in the pin holes shall never exceed 1-50-in. This applies to all pin holes in the structure, and must be strictly adhered to. Machine fitted bolts must fill the holes with a driving fit. All pins shall be accurately turned to a gage and shall be full size throughout. Pins above 5 ins. in diameter shall be bored through center as shown on plans. The ends of stringers and floor beams shall be squared in the facer. The end angles must be so fitted that facing does not reduce the thickness of the angles by more than ⅛ of their original thickness. The cut will extend over the whole surface of the angles. The stringers shall be measured with an iron standard and must be absolutely true. All bearing surfaces shall be truly faced. All machine-finished surfaces shall be covered with a thick coat of white lead and tallow before leaving the shop. All machine work shall be performed in the best possible manner and according to plans, whether specified here or not.

Eye-bars.—Eye-bars, after being annealed, shall be bored with a sharp tool at exact distances. The pin holes shall be perfectly square with the face, and exactly on the axis of the body of the bar. Roughness in the pin hole shall be sufficient reason for rejecting a bar. The distance between pin holes of each bar shall be tried with an iron standard of the same temperature as the bar. There shall be no perceptible difference in the length of the bars in the same billed length. The play of the pins in the pin holes shall never exceed 1-50-in.

Full-sized Tests.—There shall be 12 full-size eye-bars tested to destruction. The sizes of test bars shall be determined by the engineer in charge. The 12 tests shall be divided into four groups of three tests each. When a full set of eye-bars of the same dimensions as one of the test bars has been manufactured and annealed, the inspector shall select a test bar from that set. When three test bars have been selected in this manner, they shall be tested without delay. The three tests will then constitute a group. No bars known to be defective in any way shall be taken for test bars. Such defective bars shall be rejected. If tested by the manufacturer the results shall in no way influence the acceptance or rejection of other bars. The tests of full-size bars shall be made at such place as the commanding officer of Rock Island Arsenal may direct. They shall meet the following requirements:

Minimum ultimate strength..................	60,000 lbs.
Minimum elastic limit.............	33,000 "
Minimum elongation for each bar............	10%
Average elongation for a group of three tests..	12%

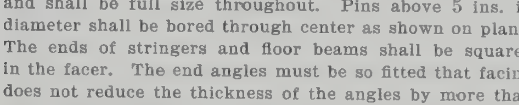

Fig. 7.—Locomotive Diagram for Live Load, Rock Island Bridge.

The elongation shall be measured in 20 ft., including the fracture. The bars will be required to break in the body. When a bar breaks in the head, but develops 10% elongation, another bar of the same size and lot shall be tested, the two tests being counted as one. If the average elongation of these two tests attains 12%, the test will be considered as satisfactory; provided, however, that no more than one bar of each group of three tests breaks in the head. In case of an unsuccessful group of tests, the engineer in charge, under direction of the commanding officer, shall examine the cause of the failure and determine which bars shall be rejected. If the bars fail in the ultimate strength, elastic limit, or elongation, the engineer in charge may reject all bars of the same melt as the defective test bar, whether already manufactured or not, or he may reject the whole bill of eye-bars. The commanding officer of the Rock Island Arsenal may, however, order additional tests. If, in a group of three tests, more than one bar breaks in the head, all bars presented by this group of tests shall be rejected. If a test bar is too long for the machine, it shall be cut in two and both halves reheaded, annealed and tested; the two tests, however, to count as one. If the cross-section of a test bar is too great for the capacity of the machine, it shall be planed down on a length of 10 ft. to a section equal to the capacity of the machine in pounds divided by 75,000, and then tested to destruction, care being taken to have all corners and angles at the places of change of section carefully rounded off. The elongation shall then be measured in 8 ft. One clevis and one sleeve nut of each size shall be tested coupled to corresponding bars. They will be required to break the bar. The bars used for these tests shall be of steel accepted for this work.

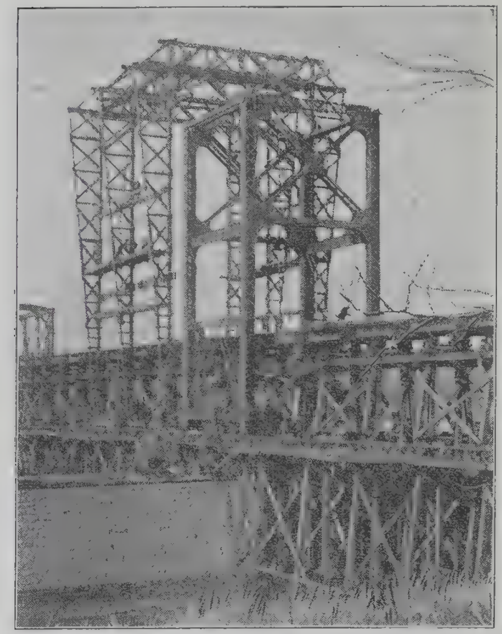

Fig. 8.—View of Falsework and Traveler Used in Erection.

The specifications have been quoted thus fully because they indicate more clearly than could be easily done in any other way the quality of workmanship and material, which are among the notable features of the bridge. In their rigidness and regard to detail they are worthy of careful study, and are characteristic of the best character of government work.

Operating Machinery.—It is not possible at the present time to give detail drawings of the operating machinery, which is in many respects novel, but the following general description in connection with the details shown by Figs. 3 and 4 will give a very fair understanding of its salient features. The contractors for this machinery were the well known firm of Geo. P. Nichols & Bro., Chicago, Ill. For the present purpose the operating machinery may be considered under five different headings, as follows:

(1) The Swinging Machinery Proper.—The rack attached to the tread on the center pier is made of cast steel, and instead of having teeth of the usual form, is made wih sprockets. On each side of the drum are two vertical shafts, supported by brackets, on the lower end of which shafts are cast steel sprocket wheels corresponding in pitch with that of the rack, which is 12 ins. These sprocket wheels carry an endless chain, with links of 12 ins. pitch, which engage the sprockets on the rack. On the upper end of these vertical shafts are sprocket wheels, which are connected by a chain to a vertical driving shaft midway between them, which rises to the floor of the machinery room. This is duplicated on the opposite side of the bridge. An interesting feature of this part is that all these vertical shafts are run on ball step bearings. On the upper end of these main vertical shafts above the machinery floor are bevel gears, one looking up and the other looking down, the two being connected through bevel pinions to a horizontal cross shaft, divided in the center where an equalizing gear is attached. By means of a train of gears a 50 HP. electric motor is connected with the shaft, thereby transmitting the power to the rack below. All the machinery in the room is mounted on one common bedplate.

(2) Rail Locks.—On each of the four ends of the tracks on the bridge are a system of rail locks consisting of heavy steel slides fitted to the outside of the rails and held in position by guides, so that they may be slid into position or withdrawn, thereby connecting the ends of the rails on the bridge with those on the fixed span, so that the wheels of the train will pass over the intervening gap on these slides without any jar, a continuous line being presented on which the wheels pass. These slides are operated by means of a pneumatic cylinder located in the center of the bridge at each end, through a system of connecting rods so arranged that all four slides at each end move simultaneously.

(3) The End Jacks.—The jacks are of the semi-toggle type, consisting of two parallel pairs of bars attached to the end beams directly under the chords by pins so as to turn freely, while on the lower end are rollers which rest on bearing plates on the shore abutment. By means of a pneumatic cylinder, a center crank and struts connected to the roller pins, these jacks are forced to a vertical position when the bridge is closed, and drawn in to release the bridge when it is to be opened.

(4) The Interlocking and Controlling System.—A Hall signal is placed on each of the fixed spans within a few feet of the ends of the draw, standing normally at danger. Connected to each of the jacks and rail locks are electric switch boxes, from which wires run through insulated pipes to an indicator in the machinery room. When any one or all of the jacks or rail locks are in a closed position, a red lamp is lighted in the indicator, one lamp for each jack or pair of rails, and when they are released for the bridge to swing, a corresponding white lamp is lighted, replacing the red. By a combination of electric connections, the man in charge of the bridge can set the signal to safety only when the end jacks and rail locks are set. Should for any reason the bridge not be properly locked, the engineer cannot receive his signal to enter upon the draw.

At the front end of the machinery room, in a bay window from which the operator can have a clear view of the tracks and river, is placed an interlocking controlling stand, having four levers, the first one to the right operating a hand brake. The second lever controls the rail locks through an air valve, and can be moved at will; this being thrown forward, the end jack lever which previously has been locked is released, the movement unlocking the motor controller lever, which now can be moved for operating the bridge. This system makes it impossible for the operator to swing the bridge until first the rail locks and then the end jacks have been released, the indicator above referred to announcing to the operator that these various devices have properly responded to the movement of his levers.

In the machinery house is also an air compressor, driven by an electric motor, and in the attic above the machinery room are two steel reservoirs of a combined capacity of 200 cu. ft., from which air is drawn to operate the various cylinders. A uniform pressure of 120 lbs. is maintained by an automatic device whereby the pump is started automatically when the pressure falls below 110 lbs. and stops when it reaches 120 lbs.

Electric current for swinging the bridge is furnished from the power station of the Tri City Ry. Co., whose wires pass directly over a support on the bridge; also from the Peoples' Power Co. of Moline, Ill., whose wires are brought up to the same support on the bridge. By means of a system of rings and brushes, current is taken from these wires are brought to the switch board in the machinery room, where a double throw-switch is placed so that the motor may be connected either with the railway wires or those of the People's Power Co. at will.

(5) Emergency Hand Devices.—To guard against any possibility of the bridge being made inoperative through any cause, a supplementary hand connection has been made for each separate device. To swing the bridge a capstan is placed underneath the roadway deck at each end and attached to the floor beams. Eye bolts are fastened in the masonry at the abutment, and at the ends of the stone protection. A heavy hawser stored on a platform near the capstan is attached to these eye bolts in case of emergency and the rope reeved around the capstan. By means of a lever this capstan can be operated by hand and the bridge opened and closed. Connected with the center crank which operates the end jacks at each end is a worm gear, to which the same lever which is used to work the capstan can be attached and the jacks may thus be raised and lowered in case of necessity. On the railway deck the rail lock system is also provided with levers so as to work independently of the air, should occasion arise.

Erection.—The principal difficulty arising in connection with the erection of the bridge was that the old structure had to be kept open to the railway traffic until the new bridge was ready for use. The method adopted to accomplish this was as follows: Underneath the roadway floor of the old bridge was built a falsework, and on top of this falsework were placed trestle bents inside the trusses and carrying the upper or railway deck. This allowed every part of the old structure except the railway floor to be removed. Since the new bridge was double tracked and the old bridge single tracked, the new trusses came outside of the old trusses. Outside of the new trusses came the traveler tracks. Obviously the falsework was made much wider than the old bridge. The photograph, Fig. 9, indicates the construction just described. The method of procedure was to remove span by span the old structure, except the railway floor, and to replace it by the new structure, the railway floor of the new structure being the last part to go into place.

End View of Swing Span, Rock Island Bridge.

Engineers and Contractors.—The Rock Island bridge was built after the designs and under the supervision of Mr. Ralph Modjeski, Assoc. M. Am. Soc. C. E., of Chicago, Ill., as Chief Engineer. Col. A. R. Buffington, Ordnance Corps, U. S. A., was the representative of the United States Government. Mr. E. H. Connor was Resident Engineer, and Byron B. Carter, Mechanical Engineer. The general contractors for the bridge were the Phoenix Bridge Co., of Phoenixville, Pa., John Sterling Deans, M. Am. Soc. C. E., Chief Engineer. The subcontractors for the substructure were Sooysmith & Co., of New York. The contractors for the operating machinery for the swing span were Geo. P. Nicholas & Bro., Chicago, Ill.

The Development of Structural Ironwork Design..417

LETTERS TO THE EDITOR.

Wanted a Test for Tin Plate—Sewage Disposal at Meriden, Conn 418

THE WORCESTER-MILLBURY SEWAGE POLLUTION suit has resulted in a decision by the court that a nuisance exists in the Blackstone River, in Millbury; that the city must take steps to remove objectionable matter from the sewage before discharging it into the River; that the city report within three months what steps it has taken to abate the nuisance; and that the city pay the costs of the litigation. We understand that the city some months ago began exhaustive investigations looking towards important changes in its sewerage system, especially the separation of the storm water and sewage proper.

BIDS FOR GARBAGE DISPOSAL, and for a garbage disposal plant, at Milwaukee, will be received until Jan. 15, as stated in detail in our advertising columns. The garbage of the city is treated by the Merz process, described in detail in our issue of Nov. 1, 1894.

THE PROHIBITION OF WOOD PAVEMENTS in Milwaukee and the requiring of concrete foundations for all pavements, is effected by an ordinance signed by the Mayor a few days ago. The general features of the ordinance are in accordance with recommendations by Mr. Geo. H. Benzenberg, M. Am. Soc. C. E., City Engineer.

COBBLESTONE PAVEMENTS IN BALTIMORE are prohibited for the future by an ordinance just introduced in the city council. The ordinance provides that where the cost of paving is met by abutting property owners, they may choose from sheet or block asphalt, vitrified brick, Belgian blocks, mosaic blocks, or such other improved material as may be approved by the mayor and city commissioner. In case property owners do not make a selection within the specified time, it will be made by the commissioner, subject to the approval of the mayor.

SUBMERGED GAS AND WATER MAINS have been laid beneath the Quinnipiac River at New Haven, Conn. The gas main is 16 ins. and the water main 24 ins. in diameter, both being about 700 ft. long. Pile foundations were used where the bottom is soft, and Falcon flexible joints were placed about 50 ft. apart. The greatest depth of water was 25 ft., at mean high tide. The mains were tested to 150 lbs. pressure from time to time during the work, and at 80 lbs. on completion. The final test showed the gas main to be absolutely tight, while the water main leaked very slightly. The work was carried out for the water and gas companies by Mr. Jos. G. Falcon, of Evanston, Ill., as contractor, and with Mr. A. B. Hill, M. Am. Soc. C. E., of New Haven, as consulting engineer. Mr. Chas. A. Ferry was in direct charge of the work as Mr. Hill's assistant.

THE ELEVATION OF TRACKS at Allegheny, Pa., is to be carried into effect, and it is said that work will be commenced in the spring. The Pennsylvania R. R. will pay the cost of the work, but the city will pay for any damages resulting to property-owners. Mr. F. J. Torrence is chairman of the council committee on grade crossings.

THE PARK AVE. VIADUCT and its four-track drawbridge over the Harlem River, will be put in use for train service by the New York Central R. R. in January. The present low-level tracks under the viaduct will be abandoned, and the open cut filled in to the street level. The viaduct and drawbridge have been very fully described and illustrated in our columns.

THE BOSTON TERMINAL CO., of Boston, Mass., has been authorized by the Railroad Commissioners to issue additional bonds to the extent of $2,000,000. The $6,000,000 of bonds authorized last July have all been taken, and, with necessities arising to $4,115,000 in excess of that amount, the terminal company is again asking for more. It is, however, buying land for the city of Boston for streets, as well as for its great station, and out of the $10,000,000 required for expenditure the terminal company expects from the city about $1,000,000. This gives the maximum cost of the new station and approaches, roughly estimated, at between $9,000,000 and $10,000,000.

ELECTRIC AND STEAM TRACTION over the same railway tracks is briefly discussed in the report of the Railroad Commissioners of Connecticut. It is said that the New York, New Haven & Hartford R. R., with its ownership of the Meriden electric and the Stamford street roads, is admirably situated to introduce this system of operation, and that when the power-house at Berlin is finished and the electric cars are running over the New Britain branch, and over the New England R. R., between Hartford and New Britain, further developments may be expected in this direction, and, should there be sufficient travel to warrant it, the street cars of Meriden may be run into Hartford and New Haven with like connections elsewhere.

AN UNDERGROUND CABLE RAILWAY, called the Glasgow District Subway, has recently been put in operation at Glasgow, Scotland. It is a continuous belt line, 6½ miles long, partly in two single-track brick tunnels 11 ft. wide and 9 ft 6 ins. high above rail level; and partly in two circular iron-lined tunnels 11 ft. diameter. The 15 stations are in brick archwork, 28 ft. span, with an island platform at each station. In each tunnel is a 1½-in. steel cable, running at 15 miles per hour and driven by a simple non-condensing engine with one cylinder 42 × 72 ins. Messrs. Alexander Simpson, W. S. Wilson and Robert Simpson were the engineers.

THE HARDIE COMPRESSED AIR LOCOMOTIVE for trial on the New York elevated railways has been completed at the works of the New York Locomotive Co., Rome, N. Y. According to report it resembles the present steam locomotives, except that it has no smokestack, and a two-wheel instead of a four-wheel truck. The four driving wheels are under the reservoir which takes the place of the boiler, and the cylinders are under the cab. A compressor plant is being established at Greenwich St.

FOUR-CENT STREET CAR FARES IN CHICAGO are made compulsory by a bill passed by the common council by a vote of 63 to 3. The bill must still be approved by the mayor. It provides that six tickets must be sold for 25 cts., 12 for 50 cts., and 25 for $1.

THE UNDERGROUND TROLLEY SYSTEM, which is employed in the street railways in Lenox and upper Lexington Avenues in New York city, was stopped by the heavy snow storm on Dec. 16. The cause of the stoppage and the plan proposed for preventing it in future, was thus explained by Mr. F. S. Pierson, Chief Engineer of the Metropolitan Traction Co.:

> A sudden drop in the temperature caused a thin coating of ice to form on the underground rails that carry the electric current. The shoes that slide along these rails and carry the current through the motor slid over the ice until the cars stopped. The ice acting as an insulator shut off the current from the car entirely. It took us some time to find out what the trouble was, and then we spent several hours equipping a car with knife-like scrapers that would take this ice off. By the time we got this car in working order the slots had filled up with snow and slush to such an extent that the tracks were so covered with snow that it took many hours to get the roads open. The loss of electricity through the slush and snow was comparatively small. Pure snow is not a conductor, but an insulator. It is the slush that runs into the slots from the street that causes the "grounding" of the current, as we call it. Now that we know that ice may form on the underground rails, we will be prepared with plows to scrape it off.
>
> During the time that the Lexington and Lenox Avenue lines have been running they have never been blocked until yesterday. It is because of the success of these lines that the traction company has decided to put the underground electric system on the Sixth and Fourth Avenue lines. The system will work better on the downtown lines, because the cars will be run so often that they will keep the conduit cleaner. With plants to supply plenty of extra power when it is wanted, and cars equipped to scrape away the ice and snow from the electric rails, the electric system is just as reliable as the cable.

THE MOST SERIOUS RAILWAY ACCIDENT of the week was a glancing collision on the Erie R. R., near Rutherford, N. J., Dec. 22. As an eastbound freight train was approaching a westbound passenger train one of the freight cars jumped the track and fouled the other track so that it was struck by the passenger train. The engine was upset and the engineman and fireman were killed, but none of the passengers were hurt. As far as the officers of the road have been able to ascertain, the freight car was thrown from the track in front of the passenger train on account of a brakebeam falling upon the track.——A derailment at Danville Junction, Me., on the Grand Trunk Ry., was caused Dec. 21 by a broken rail. The engine and three passenger cars went down a 30-ft bank and 12 persons were injured, but none very seriously.

THE POWERHOUSE of the Lookout Mountain & Lula Lake incline railway, at Chattanooga, Tenn., was destroyed by fire Dec. 12. The car at the top was released by the burning in two of the cable, and ran down the incline until it left the track at a curve.

A WIRE SUSPENSION BRIDGE over Fish Creek, Wheeling, W. Va., gave way under a crowd Dec. 21, throwing about 40 persons into the creek. Two persons were killed.——The White Rock Creek bridge, near Boulder, Colo., gave way under a traction engine and reaping machine Dec. 14.

A BOILER EXPLOSION at a mine near Mingo Church, Pa., Dec. 14, resulted in the death of the engineman. The boiler was being started up to pump out the mine.——One of the boilers of the Kent Woolen Co.'s mill at Centreville, R. I., exploded Dec. 19, killing four persons. The boiler is said to have been of the Allen return tubular type, and to have been inspected only a few weeks before the accident.

A BROKEN HOISTING CABLE at the Virginius mine, Ouray, Colo., caused the cage to drop 1,400 ft. The five men in the cage were killed.

A GRADE-CROSSING COLLISION between an electric car and a locomotive occurred Dec. 16 at Dighton, Mass., on the New York, New Haven & Hartford R. R. The car ran away on the hill aproaching the crossing and knocked the locomotive off the track. Nobody was hurt.

THE BURNING OF THE SCHENLEY PARK CASINO in Pittsburg on Dec. 16, which caused the total destruction of the building and a loss of $400,000, was due to a most unusual cause. The building contained an ammonia refrigerating plant. The cylinder of one of the ammonia pumps burst, and the ammonia gas escaping came in contact with the fire in the boilers, and at once set the building on fire.

LAND-SLIDES CAUSED BY IRRIGATION have occurred on the line of the Canadian Pacific Ry. in British Columbia, and Col. Robert B. Stanton, M. Am. Soc. C. E., and Mr. James D. Schuyler, M. Am. Soc. C. E., were lately appointed a board of experts to examine into the matter for the railway company The San Diego "Union" speaks as follows of their experience:

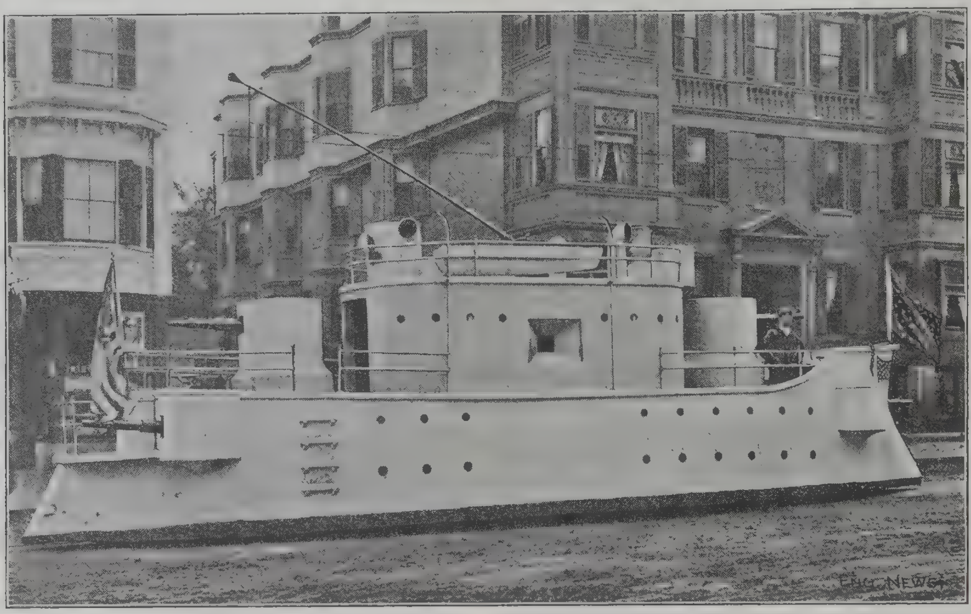
> An action has been brought by the Canadian Pacific Ry. Co. to secure an injunction against the farmers on Thompson River to prevent them from further irrigating lands contiguous to the railways, this irrigation having already caused land-slides which have swept down upon the tracks of the company. Along this river the land rises in benches extending from 50 to 500 ft. above the river. The soil is gravelly, with a clay sub-soil. The farmers irrigate their lands by water from creeks back in the mountains, and the land is sliding downward apparently on the slippery clay sub-soil. In one place 66 acres have slid down in a mass, and the experts estimate the volume of one of these slides at 32,000,000 tons. At times the railway track has been shoved 5 ft. out of line in one night, causing great outlay in reconstruction. The jury has found in favor of the railway company, ascribing the slides to the irrigation.

THE CORROSION OF STEEL BOILERS by surface feed waters is being studied by the Steam Users' Association, and a circular has been issued to the members by Mr. Geo. Atkinson, Secy., 87 Milk St., Boston, asking for information concerning such corrosion and for samples of the feed water. An investigation of this corrosive action is about to be made by the Department of Water Analysis of the Massachusetts Institute of Technology, in charge of Mrs. Ellen H. Richards, to whom will be furnished samples of the water collected by the Steam Users' Association.

A SUBMARINE BOAT FOR WRECKING AND EXploring purposes is about to be built by the Columbian Iron Works, of Baltimore, after the plans of Mr. Simon Lake, a Baltimore inventor. The practicability of the design, it is stated, has been proved by experience upon a small boat. The boat will be capable of rising to the surface and submerging at will, and it may be propelled in any desired direction when on the bottom. A door may be opened, through which the occupants, by donning a diving suit, may pass from the interior to the outside and back again. The boat will be used principally for searching the bed of the ocean adjacent to coast lines and in locating and recovering sunken vessels and their cargoes. It will be about 54 tons displacement and will carry a crew of six men. It will be propelled while on the surface by an engine and screw of the ordinary type, and while under water the screw will be driven by an electric motor, taking current from storage batteries. A searchlight will light up the pathway of the vessel as she moves along the bottom.

A WARSHIP ON A STREET RAILWAY.

The novel sight of a make-believe warship moving through the streets was a feature of many parades in Fitchburg, Mass., and neighboring towns during the recent election campaign. This singular craft is shown in the accompanying view, taken from a photograph sent us by Mr. W. W. Sargent, Superintendent of the Fitchburg & Leominster Street Ry. Co. The vessel was 37 ft. long, and was built on a construction car 26 ft. long, with a wheel base of 6 ft. 6 ins., equipped with two 30-HP. Westinghouse motors. It was constructed of sheathing and timber, the whole being covered with canvas painted and varnished. The hull, turrets and boats were painted white; superstructure, yellow; iron work, bronze; guns, anchor and anchor chain, black. It was lighted with 25 incandescent lamps, and red fire was burned in the smokestack. It made all its trips without a breakdown or accident of any kind. At one time it carried 104 men, this being the entire crew of officers and men. The car was designed to run slowly through the street during a procession, with its crew marching in front, on both sides and in the rear, while many of the officers would ride; then during a long trip from town to town officers and men would ride together. It has now been dismantled and will be erected on a raft at the pleasure park of the railway company in the early spring. The boat was designed by Mr. W. W. Lapointe, naval architect, and was constructed at the car house of the railway company under the direct supervision of Mr. Sargent.



A WARSHIP ON THE FITCHBURG & LEOMINSTER ELECTRIC RAILWAY.

MATHEMATICAL THEORY OF THE LIPPINCOTT PLANIMETER.

By Townsend Wolcott.

The accompanying engravings represent a new form of planimeter, which has been designed to obviate the defects which exist in other instruments of this class.

The wheel has a knife-edge, and is free to move on its shaft, so that there can be no slipping on the surface upon which it travels, giving the same results upon the roughest table as when used upon the finest paper.

In other instruments, in tracing some lines of the diagram, the wheel travels at right angles to its shaft, so that it can roll freely; at other points, the direction of its motion is changed until it is compelled to move in a line with its axis, so that the edge simply scrapes over the paper. For this reason the accuracy of these instruments is largely dependent on the texture of the surface upon which the wheel moves. This feature also causes a variable resistance, which makes it difficult to closely follow the lines. With the Lippincott planimeter the sliding is done entirely upon the shaft, and not on the paper, and as this shaft is made of glass, it is practically frictionless.

Inside of this glass shaft is placed the scale, which is printed upon specially prepared paper, so that the greatest contrast and legibility may be ensured. The ends of the shaft are then hermetically sealed under a partial vacuum, so that the scale can never become discolored, or affected by the atmosphere.

Three of these tubes are provided with the instrument, each containing two scales, so that the mean effective pressure can be read directly for the following springs: 8, 10, 12, 16, 20, 24, 30, 32, 40, 50, 60 and 80, or other graduations can be substituted. The legibility of these scales can be seen by referring to Fig. 2, which shows the scale and tube full size.

By pressing the small knob found on the top of the instrument, as in Fig. 3, a steel point, P, is protruded through the pivot screw, thus providing a convenient method of setting the instrument to the length of the diagram to be measured.

With this construction, no bending of the tracer point can affect the reading, which is not the case where separate points are provided on the top for setting to the card length. This improvement is of vital importance where absolute correctness is demanded.

To use the instrument, select a tube containing the scale corresponding to spring used in taking the card, and insert the same in the clamp, as in Fig. 1, after which the clamp screw C is to be tightened sufficiently to prevent the tube from being easily moved.

Loosen the set screw and adjust the points P and T to the exact length of card, holding the instrument as in Fig. 3. The set screw is then firmly tightened.

Having fastened the card upon the table by thumb tacks, place the instrument as shown in Fig. 1, but with the tracer-point T at the upper left hand corner of the diagram. The wheel may be readily set to zero by moving the point R to the right or left before finally pressing it into the surface.

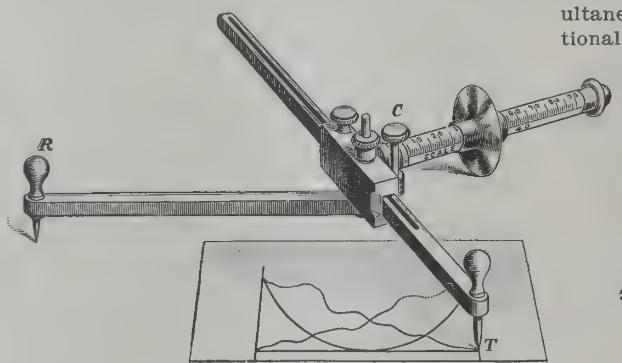


Fig. 1.

In tracing the right-hand diagram of Fig. 1, the starting point should be made somewhere in the steam line, so that the wheel will not strike the clamp before it moves to the right.

If the diagram is very short, the points may be set twice the card length. By tracing the diagram twice, the reading will be the M. E. P.

If a reading is desired in square inches, use a 40 scale, and set the points 4 ins. apart, without regard to length of figure. The points may also be set 5 ins. apart, and a 50 scale used, or 6 ins., and a 60 scale. The latter is preferable, when the figure is large.

As the operation of this planimeter is so different from that of other instruments of its class, it is thought that an explanation of its theory may interest the readers of Engineering News.

The essential peculiarity of the Lippincott planimeter is, that the quantity directly measured is not the rotation of a wheel, as in most other planimeters, but the axial motion of the wheel upon its shaft. As the rotation of the wheel is not measured, its amount is immaterial; and consequently the wheel may have any convenient diameter, and if the diameter becomes reduced by wear, no harm is done. In order that the wheel may register accurately, it is only necessary that it should be able to revolve upon its own axis, and upon a vertical axis through its point of contact with the surface on which it rolls, without skidding or slipping sidewise.

Like other planimeters it measures areas, but by selecting the proper scale and properly adjusting the tracing arm, the reading of the scale will give the area in the required units multiplied or divided by any required constant. The instrument is intended chiefly for measuring indicator cards where the required quantity is not the area but the mean effective pressure, which is obtained by dividing the area by the length. This is the quantity that the instrument gives when the scale used in the instrument is the scale of the spring with which the card was taken, and the length of the tracing arm is the same as the length of the card.

In the diagram, Fig. 4, we will first suppose the polar arm P stationary. As the tracing arm T revolves about the center O, the short arm t describes an equal angle in the same time, and the axis of the scale tube does the same. The axis of the scale tube therefore remains at all times tangent to the circle c. As the point of tangency is advanced through an elementary distance $t\,d\,\theta$, (θ being the angular motion of the tracing point in circular measure), it is evident that the rest of the scale tube must be pulled through the same linear distance, and that it also swings through the same angle $d\,\theta$. The angular motion is allowed for by the rotation of the integrating wheel, and the linear motion by the scale tube sliding through the hub of the wheel. The scale therefore registers the elementary arc $t\,d\,\theta$, and t being constant, the integral $\int t\,d\,\theta = t\,\theta$. The point of contact of the integrating wheel therefore moves in an involute to the circle c.

The sliding of the wheel upon the scale, due to the angular motion of T, is not affected by a simultaneous motion of P, for it is simply proportional to the angular motion of T in all positions of P. In carrying the tracing point around a closed figure, and back to the starting point it is evident that the arm T makes equal excursions in both directions. Therefore whatever the shape of the figure, for every positive element $t\,d\,\theta$, there is at some other part of the perimeter a corresponding negative element, $-\,t\,d\,\theta$,

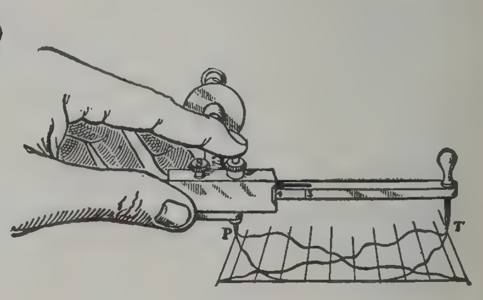

Fig. 3.

and t being a constant these two elements cancel and the integral $\int t\, d\, \theta$ taken clear around any closed path equals zero. As in practical use, the tracing point is always moved clear around a closed path, this motion of T or t does not in any way affect the final scale reading.

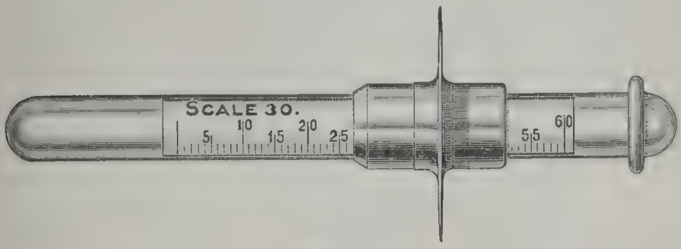

Fig. 2.

The only other motion in the instrument is the angular motion of the polar arm P. Suppose for the moment that these arms t and P are fixed at the angle ψ. The scale tube axis produced, is tangent to the circle e, and by a chain of reasoning similar to that before employed, it may be shown that the angular motion $d\, \varphi$ of the arm P causes an axial motion of the integrating wheel through a distance equal to the corresponding arc of the circle e. This is true also for the instantaneous motion $d\, \varphi$ when ψ is variable. In any given figure, ψ is a function of φ. The triangles O f h and R g h, are similar, and right-angled; therefore $\frac{t}{\cos \psi} = \overline{O\, h}$, and $\overline{O\, h} : \overline{h\, R} :: t : \overline{g\, R}$. That is $\frac{t}{\cos \psi} : P - \frac{t}{\cos \psi} :: t : g\, R$, or $P \cos \psi - t = \overline{g\, R}$, and the axial motion of the integrating wheel is $\int (P \cos \psi - t)\, d\, \varphi$. The integral $-\int t\, d\, \varphi$ disappears for a closed path, just as does the integral $\int t\, d\, \theta$, so that all that remains is the integral $\int P \cos \psi\, d\, \varphi$.

This does not in general disappear for a closed path, for ψ being variable the corresponding elements $P \cos \psi\, d\, \varphi$ and $- P \cos \psi\, d\, \varphi$ are not necessarily numerically equal, and do not necessarily cancel.

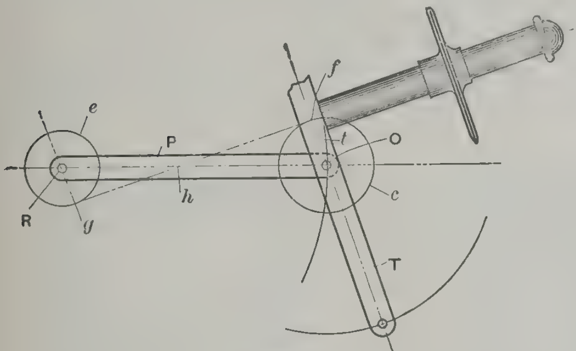

Fig. 4.

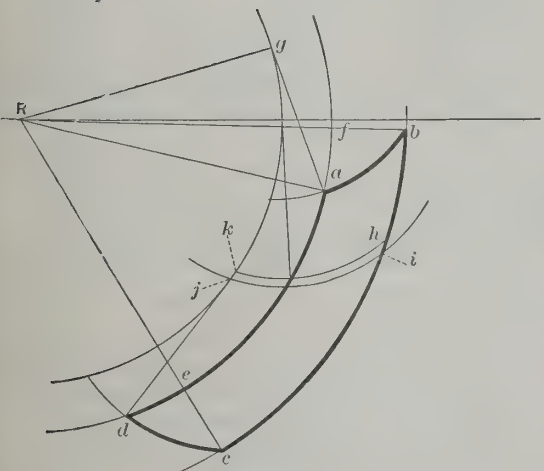

Fig. 5.

To show that the integral $\int P \cos \psi\, d\, \varphi$, is proportional to the area actually described by the tracing point, we will first take the area a, b, c, d, e, in Fig. 5. In this figure $\overline{R\, g} = P$, $\overline{g\, a} = T$, and g is a right angle. That is $\psi = \frac{\pi}{2}$ and $\cos \psi = 0$, and therefore $\int P \cos \psi\, d\, \varphi = 0$, from d to a. From a to b, φ is constant, and also from c to d, leaving only the arc from b to c, where the integral is finite. Now for this portion of the path ψ being constant $\int P \cos \psi\, d\, \varphi = P \cos \psi .\, \varphi$. As the figure c, d, e equals the figure b, a, f, the figure a, b, c, d, e equals the figure b, c, e, a, f. The area of this by the rule for circular sectors, is

$$\frac{\overline{R,\, b}^2 - \overline{R,\, a}^2}{2}\, \varphi.$$

The radius $\overline{R,\, b}$ is the third and longest side of a triangle, the other (given) sides being P and T, and the included angle the supplement of ψ. In Fig. 6, erect the perpendicular $\overline{p,\, q}$; this is evidently equal to $T \sin \psi$, and $O,\, p = T \cos \psi$. Then $\overline{R,\, b}^2 = (P + T \cos \psi)^2 + (T \sin \psi)^2 = P^2 + 2\, P\, T \cos \psi + T^2 (\cos \psi)^2 + T^2 (\sin \psi)^2 = P^2 + T^2 + 2\, P\, T \cos \psi$. The square of the radius $\overline{R,\, a}^2 = P^2 + T^2$, therefore,

$$\frac{\overline{R,\, b}^2 - \overline{R,\, a}^2}{2}\, \varphi = P\, T \cos \psi .\, \varphi.$$

which differs from the scale reading only by the constant coefficient T.

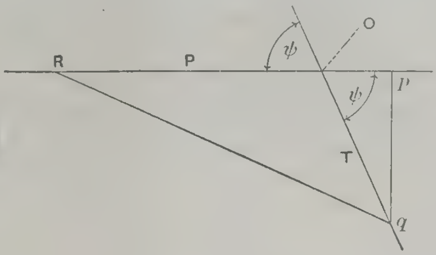

Fig. 6.

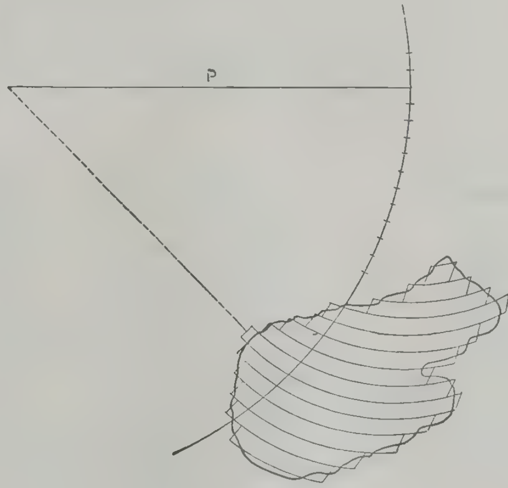

Fig. 7.

For any radius smaller than $\overline{R\, .\, a} = \sqrt{P^2 + T^2}$, ψ is obtuse and therefore $\cos \psi$ is negative. But if the tracing motion be reversed φ becomes negative, and $\cos \psi .\, \varphi$ positive. This is what it should be, for if the tracing point move from b to c to register positively, giving the correct area (or known fraction thereof) it must move in the opposite direction to add an area lying within the zero circle d, e, a, f, otherwise the combined area could not be evaluated by a single continuous motion of the tracing point around the figure.

Having shown that the planimeter correctly evaluates a figure of the form of Fig. 6, it remains to show that it will do the same for any other figure. In the elementary area h, i, j, k, Fig. 5, the ends $\overline{h\, .\, i}$ and $\overline{j\, .\, k}$ are the only parts that contribute anything to the scale movement, $P \cos \psi\, d\, \varphi$., Therefore, if any number of these elements be placed side by side, their combined perimeter will be less than the sums of their separate perimeters by twice the length of the coalescing sides, yet as these coalescing sides take nothing from the scale reading the combined area is correctly evaluated. By taking these elementary areas of different lengths a finite area of any form may be built up, as in Fig. 7, and its area will evidently be correctly evaluated by following its perimeter with the tracing point.

In an indicator card, the area of the diagram divided by its length gives the mean ordinate. Therefore, if in this planimeter the length of the arm T be made equal to the length of the diagram, the scale reading will give the mean ordinate, for the scale reading is $\int P \cos \psi\, d\, \varphi$, and the area $\int T\, P \cos \psi\, d\, \varphi$. If this movement is measured with the scale of the spring with which the card was taken, the scale reading is the mean effective pressure.

The Lippincott planimeter is sold by the Hine & Robertson Co., 68 Cortlandt St., New York city. Its price is $15.

WATER DEVELOPMENT BY TUNNELING AT ONTARIO CAL.

By Jas. T. Taylor, M. Am. Soc. C. E.

The Ontario Tunnel, commonly known as the Bodenhammer Tunnel, is located on Mountain Ave., about one mile west of the famous Euclid Ave. of the Ontario Colony lands, San Bernardino Co., Cal., and about 5½ miles northwesterly from the growing and prosperous city of Ontario.

The mouth of the tunnel is very near the San Bernardino base line, at an elevation of some 1,700 ft. above sea level, and commanding a large area of land which has been demonstrated to be first class for the successful growth of citrus fruits.

Mountain Ave. runs north and south and at right angles to the general slope of the upper portion of the valley, or mesa, and has an average fall of about 200 ft. per mile.

The object of the tunnel was to intercept the underflow from the mountain range known as the Sierra Madre, and divert the waters so developed by gravity into the present system for an increased supply of the Ontario lands, and possibly other lands in the immediate vicinity.

Prior to the commencement of the tunnel proper several shafts were sunk to a considerable depth and tests of the water supply made by pumping. These tests, as reported, seemed to indicate a considerable volume of water available, and to support in a measure the theory advanced by the promoters, and concurred in by the "water witch enthusiasts," that a stream af water exceeding 1,000 ins. was running to waste, and only required tapping to secure and control the precious fluid.

The glowing accounts and reports of the hidden treasures, coupled with the growing necessity for a more ample supply of water for the Ontario lands, led to the making of the contract by the San Antonio Water Co., on the part of the property owners, with Mr. Bodenhammer, et al., the promoters, for the development and delivery of a water supply, on a basis of $500 per in., measured at the mouth of the tunnel, the company to furnish the capital for the development under the management of the promoters.

The tunnel is timbered throughout with 6 × 6-in. redwood, and 2 × 6-in. redwood for lugging. The bottom width is 4 ft. in the clear, the top width 3½ ft., and the height is 6 ft. The bottom of the tunnel and the sides to a height of 1 ft. are lined with concrete. The total length of tunnel is about a mile, and there is about one-fourth mile more of shafts along the line of the tunnel.

Nothing of particular interest occurred in the cutting of the tunnel until the water stratum was entered at the face of the tunnel, causing a cave. After abandoning further development in the main tunnel, considerable water flowed into the tunnel for a time, until, about Jan. 1, 1896, it reached its normal flow, discharging at the mouth of the tunnel 4 miners' ins.

At this time the promoters of the enterprise decided to connect the tunnel with a shaft about 210 ft. deep, at a point about 20 ft. back from the face, and run side drifts or tunnels into the water-bearing stratum above the main tunnel, first by pipes and afterwards by shaft. Some four wells were driven before a connection was made to be of any benefit in increasing the supply of water in the tunnel below. The first well was started with pipe 14 ins. in diameter, and reducing to 12, 10, 8 and 6 ins. The second well was bored to a depth of 165 ft., where some tools were lost and this well abandoned. Well No. 3 met with the same fate at about 175 ft., and well No. 4 was finally driven to the tunnel and a connection made. On cutting the pipe at the water stratum, some considerable water was obtained for a time, diminishing, however, until the normal flow was reached, which resulted in about 30 miners' ins. The pipe also filled with debris, and it was found necessary to excavate the shaft the full depth to allow the water to enter the tunnel.

The sinking of the shaft was a very tedious and expensive operation, as the several pipes had to be cut out in pieces as the work progressed.

The expense of the work, including tunnel, shafts and accessories, has exceeded $75,000, and the additional tunnel must be necessarily expensive.

In consequence of the existing conditions, and the enormous outlay and resultant limited supply of water, sealed proposals were called for, to be received on Monday, Sept. 13, at Ontario, Cal., by the San Antonio Water Co., for the construction of certain proposed extensions of the tunnel, resulting in the awarding of a small contract to a local contractor. Work is still progressing on the tunnel, with some success in increasing the water supply.

This tunnel is one of the sources of water supply of the Model Colony, of Ontario. The total supply for the present season is now approximately as follows:

	Miners' ins.
San Antonio Creek	165
San Antonio Tunnel	81
Frankish & Staur Tunnel	18
Bodenhammer Tunnel	25
Total	289

The direct effect of the light rainfall for the winter of 1895 is shown by the unusually small surface flow of the San Antonio Creek.

THE STRUCTURAL FRAMEWORK OF THE ASTOR HOTEL, NEW YORK CITY.

(With inset.)

We illustrate this week the principal details of the structural work of the new Astor Hotel, now being erected at Fifth Ave. and 34th St., New York city, for Mr. John Jacob Astor. Mr. H. J. Hardenbergh is the architect, and the steel structural skeleton has been designed by and built under the supervision of Messrs. Purdy & Henderson, of New York city. Mr. John Downey is the general contractor, and the steel work has been built and erected by J. B. & J. M. Cornell, of New York. We are indebted to Messrs. Purdy & Henderson and to Mr. Hardenbergh, for the material used in the preparation of this article.

The Astor Hotel adjoins the famous Waldorf Hotel, on the northwest corner of Fifth Ave. and 33d St. The architectural design of the new building has been made to harmonize with that of the older one. The main dining-room in the new building will connect directly with that of the Waldorf, making practically one room extending across the entire length of the Fifth Ave. front of the ground floor of the two buildings. This room, 50 × 200 ft., will be practically unobstructed by columns, having only a row of columns along each side, about 6 ft. from the wall. The great ballroom, 85 × 96 ft., on the first floor, will also be free from columns, so that special truss designs have had to be introduced to carry the columns of the upper floors. On the 34th St. side of the first floor there will also be a banquet room, 40 × 72 ft., occupying the space between two rows of columns, 40 ft. apart, this space being spanned by heavy plate girders. The site occupied by the building is 98 ft. 9 ins. × 335 ft., with the shorter side fronting on Fifth Ave., and the rear will be broken by four light courts. The 34th St. front will be opened so that at the main entrance carriages can be driven across the sidewalk directly into the building. The steel columns on the front of the building are covered with cement grouting, brickwork, and a sandstone finish. The exterior of the building is of red brick, with red sandstone trimmings.

The foundations are all on solid rock, 35 ft. below the street level, or deeper where required. The rock surface was found about 3 ft. below the level of the street, at the Fifth Ave. end, and then at increasing depths to a maximum of 65 ft. under the western end of the building. Foundations extending below the 35 ft. level were opened for the required area, and built up with concrete. The carrying load was 29,000 lbs. per sq. ft. at the top of the concrete piers thus formed. Upon the rock or the concrete piers (as the case may be) are brick piers, with granite caps for the column shoes.

Fig. 1 is a diagram plan showing the arrangement of the columns, but its more important purpose is to show the position of the several trusses, to which reference will be made later. The three trusses, D, E, F, on the east side of the building are to support the columns above the first floor, leaving the ground floor clear for the great dining-room, which occupies the space between columns 1, 16, 17 and 21. The trusses at the west end of the building are to carry the columns above the fourth floor, leaving that part of the fourth floor clear of columns for the great ballroom, which will be 85 × 96 ft., occupying the space between columns 162, 167, 219 and 226.

FIG. 1.—PLAN SHOWING COLUMNS AND TRUSSES IN THE ASTOR HOTEL, NEW YORK CITY.

Fig. 2 shows a part of the floor framing of the eighth floor, and is a typical example of the framing system adopted, which is composed of I-beams and plate girders, there being some 1,600 tons of the latter in the building.

Fig. 3 is a portion of one of the architect's plans of the interior arrangement, and represents the general arrangement of rooms, etc., on the eighth floor. This is shown merely as an example of the design, since the arrangement varies, of course, on nearly every floor, and it is this irregularity in floor plan which, as already noted, has caused so much unusual study in the design of the structural arrangement, this structural design having been subordinated to the architectural design regardless of expense.

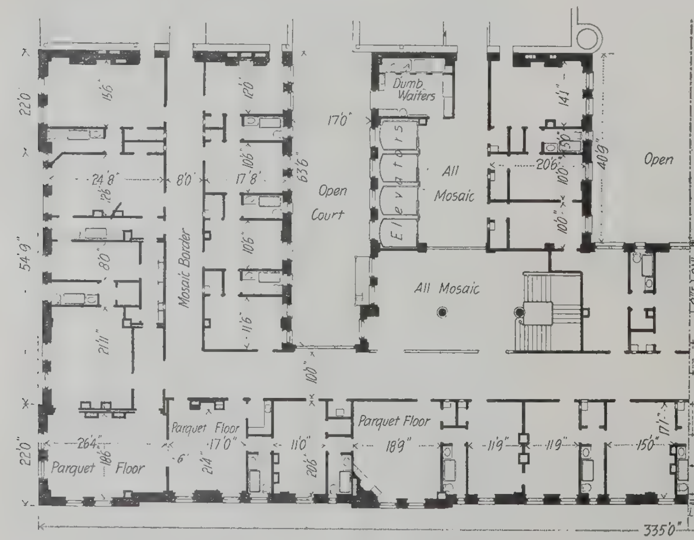

FIG. 3.—PART PLAN OF INTERIOR ARRANGEMENT (EIGHTH FLOOR).

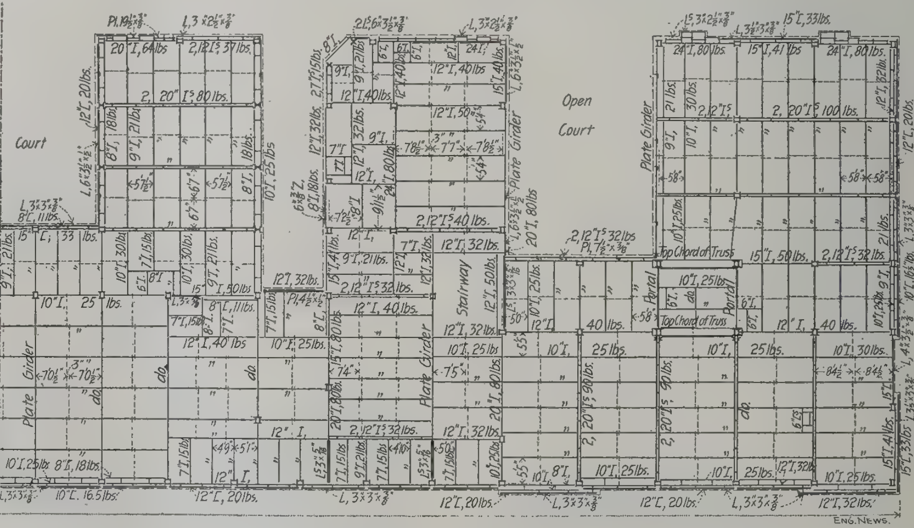

FIG. 2.—PART PLAN OF FLOOR FRAMING (EIGHTH FLOOR).

This eighth floor is one of the floors devoted entirely to living rooms, and it will be noted that the suites of rooms on the Fifth Ave. front have a private hallway inside of the main public corridor. All the rooms have either gas-log hearths or open fireplaces, and the number of flues required by the latter proved to be one of the disturbing elements in the structural design, it being necessary to arrange the framing and connections so as to leave room for the flues and the necessary clothing to protect the metal work.

An interesting detail to which attention may be called is the arrangement of the small spaces for "shoe boxes," one to each room. In every large hotel, the management is constantly troubled by the loss or theft of boots and shoes left to be cleaned, and as this not only causes much annoyance but also considerable expense in providing new shoes to replace those which have been stolen, steps have been taken to put a check upon this in the Astor Hotel. In the corridor partition of each room is an aperture just above the floor, and on the inside of the room is a shoe box, having a glass door flush with the partition and another door opening into the room. The occupant of the room puts his shoes in the box at night and latches the door. The porter making

his rounds can see through the glass door whether there are any shoes; if so, he unlocks this door and takes the shoes out. When they have been cleaned they are put back and the door again locked.

Fig. 4 shows the lower section of column 280 (supporting the trusses), which is the heaviest column of the entire building, and carries the greatest load, namely, 5,400,000 lbs. This enormous column has 10 web plates, 4 cover plates and 12 angle irons. Its length is 30 ft. 4 ins. and its weight is 46,980 lbs. A view of the column is given in Fig. 5. Some of the standard column sections are shown in Fig. 6, and these need little explanation. In some cases a column of small size but with a great mass of metal became desirable, the dimensions being limited by reason of the enclosing of the column in a circular shell of polished stone, and for this particular purpose the column sections shown in Fig. 7 were devised by the engineers, the form comprising a heavy concentration of metal in a section well adapted to receive a circular clothing, as shown. Fig. 8 also shows a column of this type, with the variations in its construction for the several floors which it carries.

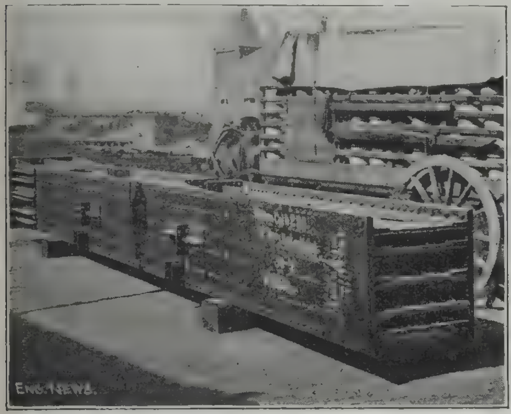

Fig. 5.—View of Large Column, No. 280.

The construction as thus far described does not present any exceptional features of design, except in matters of dimensions and details, but we come now to the consideration of the solution of a difficult problem. The great ballroom is on the first floor, with its ceiling at the level of the fourth floor, and it was required that this room should be kept free from obstructing columns. Had this been an upper floor, the design of a truss roof would have been easy enough, but it must be remembered that there are 16 floors, and that the ballroom trusses must carry the supporting columns of the floors above. It must also be remembered that the trusses had to be designed so as not to interfere materially with the arrangement of the rooms above the fourth floor or to diminish the value of the space for hotel purposes. These considerations greatly complicated the actual design of the trusses.

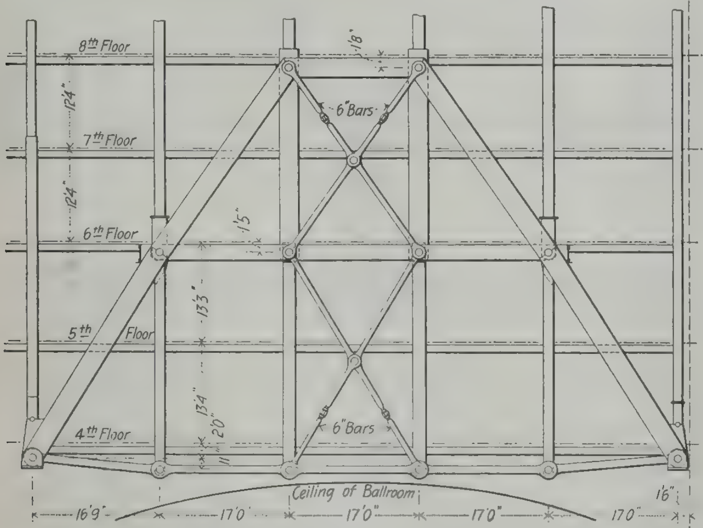

FIG. 9.—GENERAL DESIGN OF BALLROOM TRUSSES.

Fig. 9 shows the solution of this problem, which was eventually adopted. Each of the two trusses is triangular in form, 51 ft. 3 ins. deep, its lower chord being built into the fourth floor and its upper chord built into the eighth floor. The top chord is 17 ft. and the bottom chord 84 ft. 9 ins. long, c. to c. of pins. The lower chord is of unusually large eyebars, 12 ins. deep, with 12-in. pins. The truss is of the double-deck type, having a horizontal member at mid-height (sixth floor) while the two intermediate floors (fifth and seventh floors) are carried mainly by brackets on the truss posts and columns. The middle panels have diagonal bracing, as shown. It was at first planned to have the two upper diagonal pieces of the upper panel and the two lower diagonal pieces of the lower panel formed by square rods 3 × 3 ins. with welded loop ends. In the manufacture of these rods, however, it was found to be difficult to obtain satisfactory and reliable welded joints in bars of this size, and eyebars 6 × 1½ ins. were therefore substituted, these bars having upset threaded ends and turnbuckle connections, as shown, and as originally planned for the square bars.

The use of trusses under such conditions is, of course, not new. They were employed as long ago as 1887, by Wilson Bros. & Co., of Philadelphia, in the Drexel Building, where two trusses were used, as shown in our issue of March 19, 1896. These had clear spans of 48 ft. 10½ ins. and 58 ft. 3½ ins., and each extended through four floors, one being from the fourth to the eighth floor, and the other from the fifth to the ninth floor. One of these carried eight and the other seven floors, including that of the bottom chord.

Again, in the construction of the extension of the Waldorf Hotel in New York city, it was required to leave a ballroom on one floor unobstructed by columns, and for this purpose a truss arrangement was designed by Mr. Purdy, the consulting engineer for the ironwork. This truss, which was fully described and illustrated in our issue of March 5, 1896, is 82 ft. 6 ins. long and 28 ft. 4 ins. deep, its bottom chord being at the second floor level and its top chord at the fourth floor level, while the first floor is carried by columns which extend below the truss and act now as suspenders. When the new Astor Hotel is completed the ballroom in the Waldorf extension will be given up, and columns will then be put in between the ground and first floors, as was described in our former article.

The detailed construction of one of the two great ballroom trusses in the Astor Hotel is shown in Fig. 10. The lower chord is composed of four parallel sets of eyebars 12 × 2 1-16 ins., with 10-in. pins except at the endpost shoes, where 12-in. pins are used. These shoes are steel castings with ribbed top surfaces to fit the webs of the posts. In the lower half of the truss the end posts have an immense amount of metal, there being no less than 10 web plates (in five pairs), ¾ × 29½ ins., two cover plates ½ × 36 ins., and 12 angle irons ½ × 4 × 6 ins. The cross-section of the member, on Fig. 10, gives an idea of the great amount of metal used. At the base of the end post is a column connecting with the column seated on a 6-in. pin, as shown on the right of Fig. 10, and also in Fig. 11. In the upper half of the truss each end post consists of 6 web plates ¾ × 29½ ins.; 2 cover plates, ½ × 38 ins.; 4 angle irons, ¾ × 4 × 6 ins., and 4 angle irons, ½ × 4 × 6 ins. The top chord is composed as follows:

1 Web plate	½ × 29½ ins.
2 Web plates	¾ × 29½ ins.
2 Cover plates	½ × 41 ins.
8 Angle irons	½ × 4 × 6 ins.

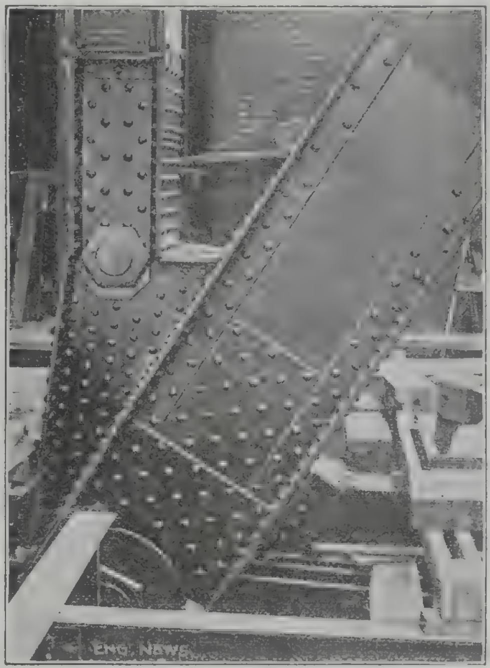

Fig. 11.—View of Base of End Post of Ballroom Truss.

The middle chord, at the sixth floor level has two channel-shaped sides, each composed of a web plate 7-16 × 23½ ins., and two angle irons ½ × 3½ × 4 ins., these sides being connected by horizontal lattice bars ⅜ × 4½ ins. The chord connects with each end post by a 12-in. pin, which also forms the seat for a column rising above it.

The two trusses, A and B, are practically alike. They are spaced 14 ft. 9 ins. apart, c. to c., and the middle posts are connected on each floor by arched portal bracing, as shown in Figs. 10 and 12. Two general views of these trusses are shown in Figs. 13 and 14. These trusses were built by the Keystone Bridge Co., of Pittsburg.

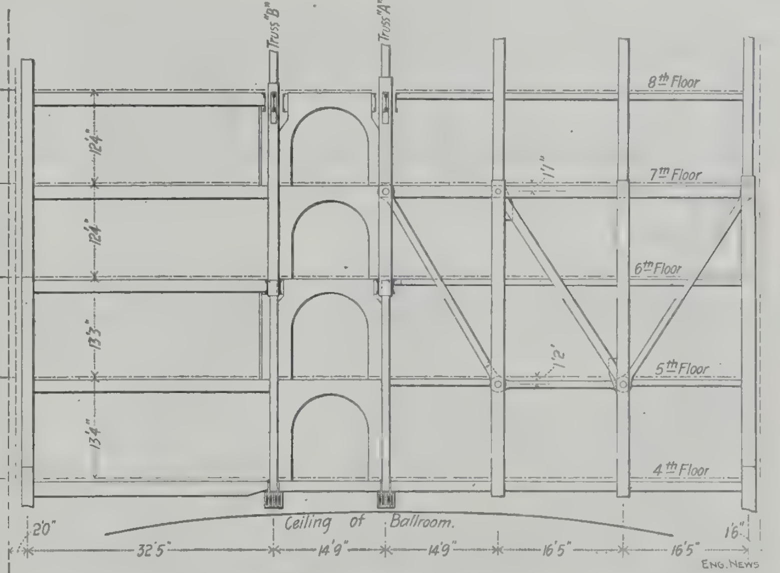

FIG. 12.—ELEVATION SHOWING POSITION OF TRUSS C.

It will be seen on reference to Fig. 1 that truss A carries one end of another truss which is at right angles to A and B, this being marked truss C. This carries the weight of the floors over the end of the ballroom. One end of the truss is carried by a 10-in. pin in the post of truss A, while the other is carried by a 10-in. pin in the wall or abutment column No. 209. The truss connection makes a somewhat complicated arrangement necessary, since it causes a double reversal of the strains in the post, the bearing on the 10 in. pin of truss C being at right angles to the top and bottom pins of truss A. The details of this truss are shown in Fig. 15.

Similar conditions exist at the dining-room on the ground floor of the Fifth Ave. front. Here it was stipulated that the position of the side columns should conform to that of the columns in the dining-room of the Waldorf Hotel, so that when the party wall is opened there will be one large room practically unobstructed by columns, as already noted. In order to meet these requirements and to carry the columns of the 14 floors above the dining-room it was necessary to devise a truss arrangement, and this is shown in Fig. 16, which is truss D, one of the three which span the dining-room. The posts of this truss are practically inclined columns connecting the vertical columns above and below, the truss being two stories in depth. In consequence of the arrangement of the corridors and rooms, no diagonals could be placed in the center panel of the truss, and the somewhat singular arrangement of counters in the end panels had therefore to be introduced. It was at first proposed to make these counters or diagonals of 3-in. square rods with welded loop ends, but for reasons already stated eyebars 1½ × 6 ins. were substituted, having the ends upset and threaded for the turnbuckle connections. The posts are of box section, having 6 web plates, 2 cover plates, and 8 angle irons. The chords are each composed of 2 plate girders 28 ins. deep, 20½ ins. apart, having the flanges connected by lattice bars. The truss is 26 ft. 8 ins. deep, c. to c. of pins, and its length is 51 ft. 7 ins. At the bottom, the center panel is 35 ft. 10 ins., while one side panel is 7 ft. 7 ins., and the other 8 ft. 2 ins. At the top, the center panel is 17 ft. 3 ins., and the two side panels are 17 ft. 2 ins., all c. to c. of pins. Brackets on the columns and truss posts carry the beams of the fourth floor, which crosses the truss at its mid-height.

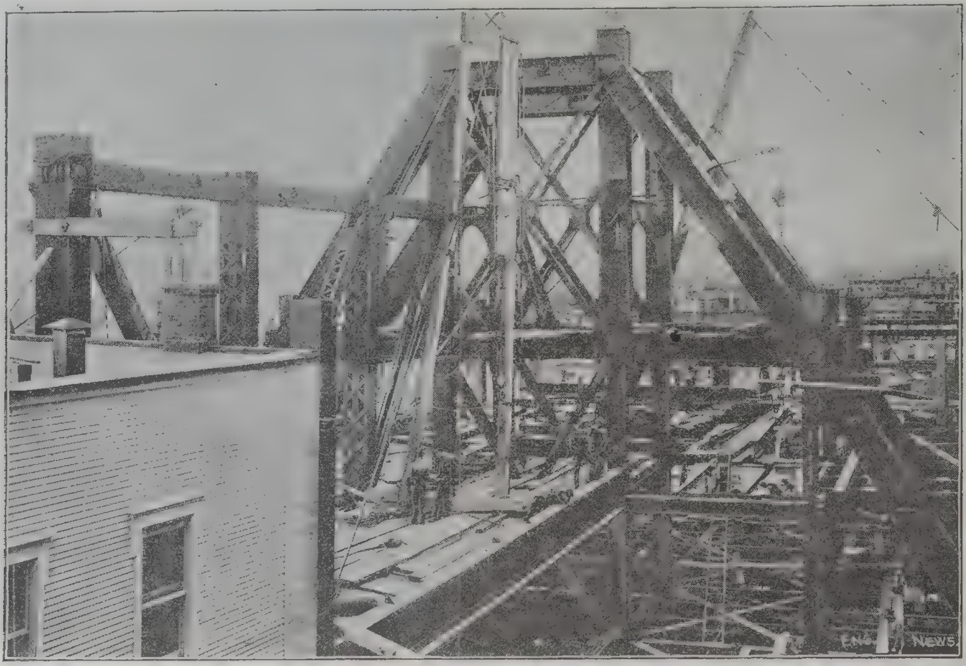

FIG. 13.—VIEW OF STRUCTURAL WORK, SHOWING THE BALLROOM TRUSSES, A, B AND C.

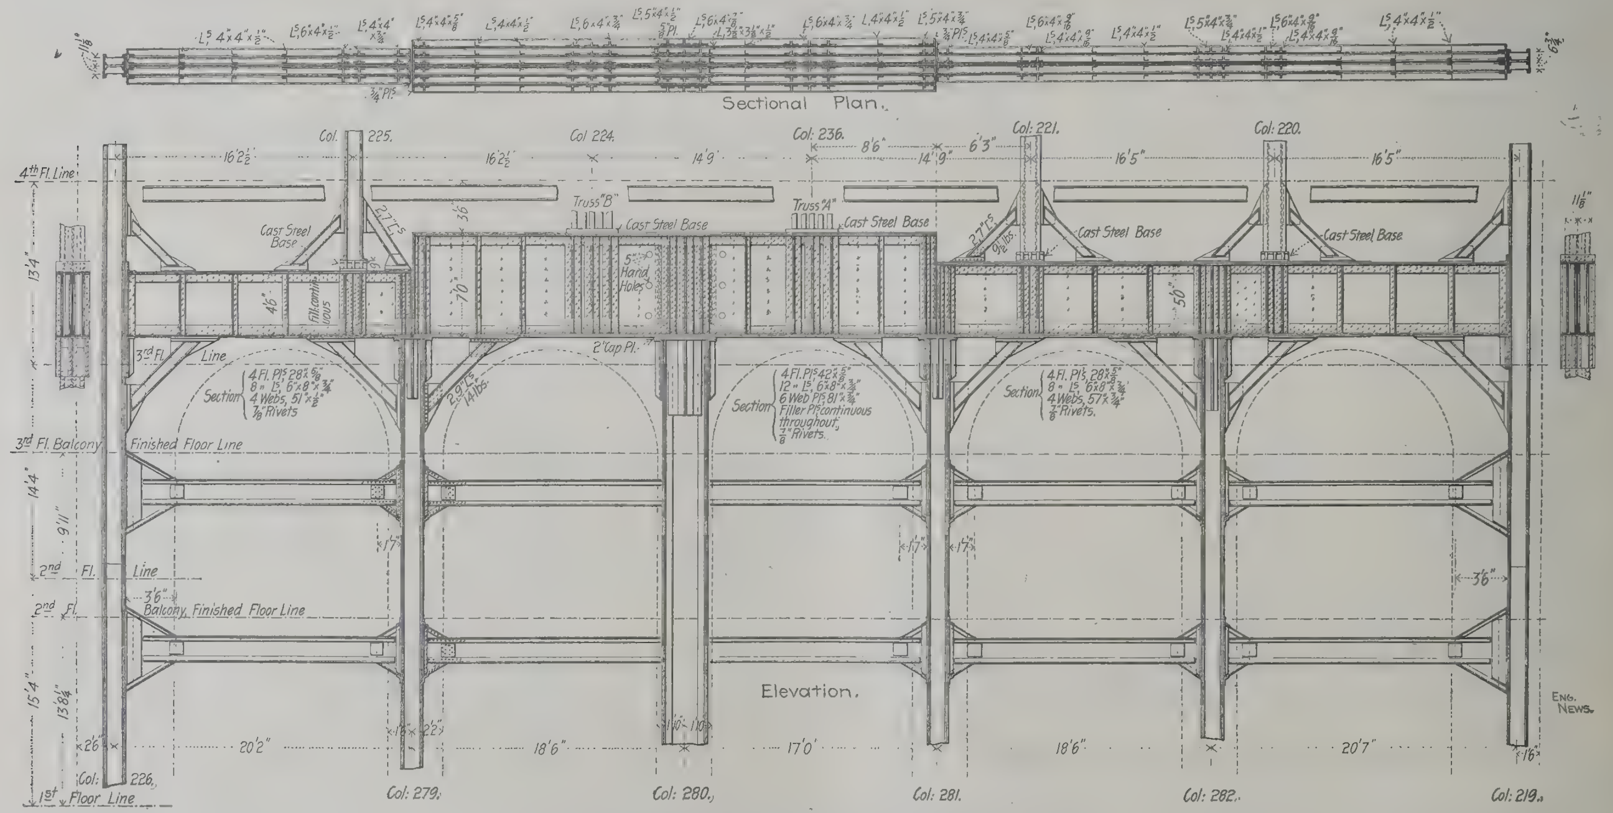

FIG. 17. GIRDER SUPPORTS FOR THE BALLROOM TRUSSES.

Another interesting feature in the structural design is the method of supporting the great ballroom trusses A and B, for, as will be seen on reference to Fig. 1, they are not seated upon columns. The spacing of the columns in the western end of the building is entirely changed at the fourth floor level, and to provide for this a line of heavy plate-girders was introduced, and the trusses rest on one of these girders instead of directly upon the columns. It should be explained that this complicated arrangement was necessitated by requirements of the owner of the building in order to facilitate the use of the lower stories, and to satisfy architectural ends.

This peculiar arrangement is shown in Fig. 17, the lower part of which shows in dotted lines the finished outline of the architectural work in the spaces between the columns, and shows also the knee-braces or stiffeners connecting the columns and girders. The trusses and columns above are not in line with the columns below, but eccentrically on either side of column 280, which is the heaviest column in the building, as already described. The continuous plate girder resting on columns 279, 280 and 281, is of very massive construction; the total length is only 35 ft. 6 ins., but the depth is 7 ft., and the makeup is as follows:

6 Web plates	¾ × 81 ins.
4 Flange plates	⅝ × 42 ins.
12 Angle irons	¾ × 6 × 8 ins.
Filler plates continuous throughout.	

As the steel skeleton up to the second floor forms practically the foundation for the trusses and the superstructure which they carry, it is essential that this lower part of the work should be absolutely stiff and rigid, for which purpose a very complete system of knee-bracing and gusset-plate connection has been introduced, as shown diagrammatically in Fig. 18, which represents the portion immediately below that shown in Fig. 17. The steel foundation work is also tied together rigidly by horizontal diagonal bracing of flat bars riveted to the top of the floor beams for the floor which forms the ballroom ceiling, and in some of the upper floors.

The wind bracing is of a very substantial character, consisting of heavy diagonal bracing of channel irons, with vertical bars from the intersection of the diagonals to the floor beams below. An example of this is given in Fig. 19, showing the bracing between columns No. 163 and No. 164, extending from the sub-basement level (or the feet of the columns) to the fourth floor.

All the main structural work is of mild steel, and members are given one coat of paint at the shops and two coats after erection. A graphite paint is used, supplied by the Detroit Graphite Mfg. Co., containing 33% of graphite and 20% of iron oxide. The columns are enclosed with brick masonry in cement, laid close in contact with the metal work.

The building will contain about 10,000 tons of structural steel work, the cost of which represents about one-tenth of the total cost of the building. This proportion is said to be unusually low, particularly when the great spans between the columns (and the consequent heavy construction) are taken into consideration.

◆

THE REPORTED FAILURE OF THE STEEL PLATES intended for use in the hulls of the battle ships now under construction at Newport News is causing a good deal of newspaper comment, but the whole facts in the case will not be known until the report of the investigating board is made public. The "American Manufacturer" of Dec. 18 has an editorial on the subject, probably based on statements it has received from the manufacturers of the plates. It says:

> Sufficient is known to show that the fault did not lie with the makers of the plate. It seems that there was an error, and that error was such as could easily be made by any one not thoroughly posted on the manufacture of steel. Among engineers nowadays it is the rule to require great tensile strength in steel material. Years ago 50,000 lbs. tensile strain was considered a very satisfactory test, and steel of that composition could be bent and twisted in any way. But now specifications will call for a tensile strength of 70,000 lbs., forgetful of the fact that to get this, more carbon must be added, and that tensile strength is secured at the expense of ductility. This was exactly the case in the plates about which so much has been published. Each and every one of those plates were made according to specifications, and all stood the government test.

This statement does not harmonize with statements made in a press despatch from Norfolk published in the New York "Herald" of Dec. 20, which says:

> In the bending test more than 64% of the specimens failed to come up to the letter of the contract, and in the quenching test the failures amounted to exactly 50%. In the pulling test 10.7% fell below the contract requirements for tensile strength, and 18% showed deficient elongation.

◆

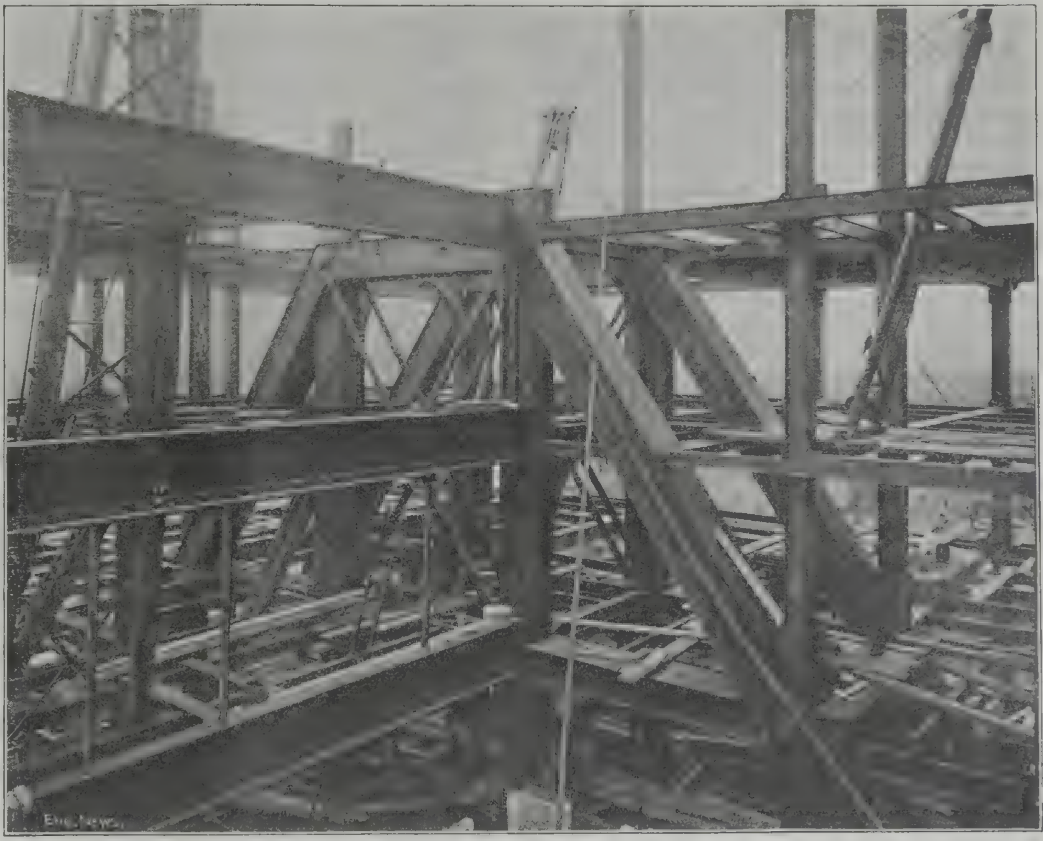

FIG. 14.—VIEW OF BALLROOM TRUSSES.

THE INTERSTATE COMMERCE COMMISSION has presented its tenth annual report to Congress. From advance abstracts issued to the press, it appears that a large part of the report is devoted to a discussion of the effect upon the work of the commission of recent decisions of the United States Courts. The amendments to the law which are recommended by the commission are as follows:

1. To confine the procedure of the courts for enforcement of orders of the commission to the record made before the commission, and to provide that the order of the commission shall be enforced unless the court shall find in the proceeding some material error which furnishes sufficient reason for refusing to enforce it.
2. To so amend section 15 as to make it expressly provide that the commission may, after due procedure and investigation, issue an order requiring the rates, facilities or practices complained of to be changed, modified or corrected as in the order specified.
3. To make railroad corporations liable to indictment for offenses against the statute, as well as their officers, agents and employees.
4. To require the carriers to adopt a uniform freight classification.
5. To make the rate sheets, reports and contracts of carriers on file with the commission, by express provision in the statute, competent testimony and prima facie evidence of what they purport to be in all proceedings before the commission or in the courts.
6. To permit the commission to appoint special agents with the authority to inquire into the business management of carriers.
7. To provide for the interchange of traffic between connecting roads and the continuous carriage of freights from point of shipment to place of destination, as contemplated by sections 3 and 7 of the act.
8. To require carriers to file reports with the commission for each year ending June 30, on or before Sept. 15 next following, and to enforce obedience to this requirement by a cumulative money penalty for non-compliance; to make the provisions authorizing the commission to prescribe a uniform system of railway accounts more specific, and failure to conform to such a uniform system prescribed by the commission a misdemeanor; to require the carriers to file monthly reports with the commission covering earnings and expenses.
9. To require that joint tariffs shall specify the names of the carriers parties thereto, and that each of said carriers, other than the one filing the tariff, shall file with the commission such evidence of concurrence or acceptance as may be required by the commission; to authorize the commission to prescribe and from time to time change the form, contents, and arrangement of the schedules and joint tariffs required to be published and filed.

Changes to standing advertisements must be in hand on Monday afternoon; new advertisements, Tuesday afternoon; transient advertisements by Wednesday noon.*

With the reassembling of Congress, the possibility or probability of legislation respecting the Nicaragua Canal is again a theme of public discussion. Most of the journals which are really friendly to the enterprise recognize the fact that the only sensible course for the government to pursue, if it takes any action at all, is to provide for the making of a thorough survey of the route, as was recommended by the commission of engineers last year. A few newspapers, however, still adhere to the absurd idea that the government should guarantee the bonds of the enterprise in its present position. One of these journals, the New York "Mail and Express," in advocating this view, bestows the following gratuitous insult upon the able commission of engineers who reported on the enterprise last year:

> The commission appointed by the President to investigate as to the practicability of the project made a predetermined adverse report, but it was subsequently proved that they did not visit the canal territory, and that their so-called tour of inspection was a mere junketing trip at the expense of the government. All of the objections urged against the canal by this ex-parte commission were shown to be groundless and worthless.

It is needless to inform our readers that the statements made in the above quotation are absolutely without foundation. It has not only never been "proved" that the commission of engineers did not visit the canal territory, but we are not aware that any such claim has ever been made. The "Mail and Express" may condemn the report of these engineers, if it chooses, and may claim that their professional judgment was mistaken; but it goes beyond the limits of fair debate when it charges that the character of these engineers' report was determined in advance of their investigation, and further, that they did not visit the canal territory at all, and their report was, in consequence, necessarily a pure fabrication. The statement made by the "Mail and Express" is a gratuitous insult, not only to the able engineers whom it so wantonly condemns, but to the engineering profession of which they are honored members.

As our readers know, Mr. Alfred Noble, the civilian member of that commission, is a member of the American Society of Civil Engineers, and is Vice-President of the Western Society of Engineers. Major Ludlow and Mr. Endicott are connected with government engineering departments, in which the sense of professional honor and esprit de corps is quite as high as it is among civilian engineers. The average newspaper reader, who believes what he reads, will naturally form the conclusion that engineers, even of the highest rank, know no such thing as professional integrity, when he reads such an item as that which we have quoted above. It is for this reason that we have deemed it worth while to call attention to the matter.

We sincerely hope that the "Mail and Express" may see fit to make such amends as in its power for its unwarranted insult, by publishing a retraction of its wholly unfounded statement.

The advisability of securing for a large electric lighting or power station a location on a water front, where an abundant supply of water may be had for condensing purposes and where coal may be received and ashes shipped away on boats, has once more been brought to notice by the announcement of an extensive project by the Edison Electric Illuminating Co., of Brooklyn. It has recently purchased a shore front property at 66th St., Brooklyn, measuring 260 ft. on the water front and 1,150 ft. in depth, of which 550 ft. is under water. It is the intention of the company to construct there an electric central station, which will be one of the largest and most economically operated plants of its kind in the world. On the land under water two piers, 60 × 550 ft. each, will be built for handling and storing coal. From the bulkhead line back, a one-story brick building will be erected, which will contain boiler and engine rooms. The engine room will also contain the dynamos and other electric apparatus. The new station will be put in connection with the other stations of the Edison company, and, in addition, will run connections into each sub-district of the city and to surrounding suburban towns as far as Babylon, Roslyn, Garden City and Hempstead. Underground conduits will be used for transmission.

The economies resulting from the location of a large central plant on tide water, as compared with a number of small plants scattered throughout the city and away from the water, are manifold. Probably the largest saving is that due to the use of condensing, instead of non-condensing, engines, by means of which a saving of from one-fourth to one-third the fuel may be made. Receiving coal by water instead of by rail usually results in considerable advantage to the purchaser, giving him a choice of coal companies to purchase from, and a chance of low transportation charges. The comparison is still stronger if we compare water transportation with the haulage of coal and ashes by horses and carts through the streets to and from the power station, which is common in Brooklyn and other large cities. In the boiler plant also a large plant offers more chances for saving than a small one, in the use of machinery for conveying and firing coal, and for removing ashes. The cost for installation, interest, depreciation, repairs, insurance, superintendence and labor, per unit of power developed, may also, by proper management, be made considerably smaller in a large plant than in a small one.

The very high temperatures in the fire and engine rooms and dynamo compartments of our new warships stands out prominently in the report of the Surgeon-General of the United States Navy, just presented. On the "Cincinnati," for example, there is a record of 204° Fahr., in the forward fire-room, and the average for the year in this room is 145.8°. The subject of better ventilation on board these ships is forcing itself upon the designers on shore, and the engineering staff at sea; but much evidently remains to be done to remedy matters. The chief trouble lies in the fact that a modern warship is cut up into a series of small compartments by tight bulkheads demanded for purposes of strength and security. This arrangement in itself interferes with the circulation of natural air-currents and renders the work of artificial ventilation very difficult and intricate. But when to these unfavorable structural conditions are added the heat from enormous boilers and from auxiliary engines in close compartments and the steam-pipes which run almost everywhere, the sufferings of the men who have to live and work in these places become well-nigh unbearable.

On the "Detroit" the two passageways on either side of the ship have iron floors directly over the boilers, covering a superficial area of 492 sq. ft. in all. When the ship is under steam the temperature of the floor plates is 135°, and this great radiating surface raises the temperatures of the passageways to 125°. The only escape for this extreme heat is through the end-doors and seven deck ventilators. So far all attempts made to improve upon this condition of affairs have only succeeded in reducing the average temperature to 110°, under the most favorable circumstances.

Of course, much has been done in the way of forced ventilation, nearly all the ships are now provided with Sturtevant blowers, fitted for either exhaust or supply and having a capacity of 10,000 cu. ft. of air per minute. The main ducts from these blowers are sometimes as large as 27 × 15 ins., tapering to 4 to 6-in. terminals, and in addition to these appliances there are in use electrical fans, 12-in. and 14-in. deck and lateral ports, wind-sails, etc. The U. S. S. "Maine" has in each engine room a steam driven blower of 10,000 cu. ft. capacity, with other blowers of varying capacity in the ammunition room, dynamo rooms and steam-steering room; but each of the two fire-rooms depend for ventilation upon three 20-in. cowled pipes leading from above the ship's superstructure and expanded below into large flares.

Aside from questions of personal discomfort, or the dictates of common humanity, the abnormal conditions now surrounding some of the most important working men aboard ship have a serious bearing upon the general efficiency of the ship as a fighting machine. The surgeons, in reporting upon the physical condition of the engineer's force, say that the exhaustion apparent is not due to the work but to the excessive temperature endured while at work; to the motionless impure air in the coal-bunkers, and to the constant clogging of the sweat-glands by the coal dust. The surgeon of the U. S. S. "Detroit" says that in one trip it was only possible to keep the firemen and coal-passers at work by giving to each of these men two ounces of whiskey at the end of each four-hours' watch, and even then the men were almost collapsed, streaming with perspiration, accompanied with stertorous breathing, rapid pulse and trembling limbs. It is a fact worth noting in this connection that in the summary of deaths in the U. S. Navy, in 1895, pneumonia and heart disease rank as the most common causes of death. The deaths are not reported according to occupations of the crew; but it is fair to presume that they are most common among the men engaged in the engine and fire-rooms.

What further remedies can be added to those already in practice, in the way of non-conducting covering for boilers and pipes, non-conducting floors over boilers and more extensive systems of artificial ventilation, it is for naval engineers and architects to decide. But it is evident to all that if the efficiency of the engineer's force, especially, is to be maintained, some scheme must be devised for overcoming this excessive temperature in the vitals of the ship. The difficulties presented are the natural sequence of the transition from wooden sailing ships, with roomy open decks pierced with portholes of liberal dimensions, to the floating iron-clad fortress of the present day. But have not our naval architects paid too much attention to the development of an engine of destruction, and too little to the prevailing conditions in which the men must live who work and man this modern warship? Modern conditions of naval warfare are bad enough under the most favorable conditions for fighting, without adding to these the misery and physical wreck of men engaged in peaceful cruising. The general good health of the men in the engine-room and before the boilers is essential at all times; but in an emergency their powers of endurance may decide a battle, and it is not expedient to overstrain these powers.

The recent successful experiments with compressed air, as a substitute for steam or hydraulic power in operating the auxiliary engines of the coast-defense monitor "Terror," may yet have an important bearing upon this question of better ventilation. Compressed air is one of the best agents for this purpose, and as it has proved its advantages over steam and hydraulic power in turning the turrets, loading and elevating the guns and steering the ship, its further use as a ventilator of the ship would seem a natural sequence.

◆

The strain upon the physical powers of the workers aboard ship, here referred to, may be better appreciated by noting the number of deaths and prostrations that in any large city follow a heated term of only 100° temperature. Contrast this record, and the conditions of open space and quiet labor with the actual suffering of men who are engaged at the hardest of manual labor in a confined engine or fire-room, with an average temperature of say 150° and a maximum reaching 200°. The only wonder is that they can endure it at all and live to tell the tale; and, in this connection, it may be said that a surgeon's report has nothing to say of the men who part company with the ship after one cruise, physical wrecks, and leave no official record behind them of their later illnesses or deaths.

◆

An extraordinary state of affairs exists in the iron and steel trade. The steel billet pool, which was organized in April last, and raised the price of billets $3 to $5 per ton, remains intact as to its organization, but a single concern (the Bellaire Steel Co.) has withdrawn, and the market is an open one, with cutting of prices the rule. The nail trust collapsed a few weeks ago, and the selling price of nails has dropped 50% as the result. Thus far everything is in the consumer's favor, and to encourage him still further to believe that the era of low prices was at hand, a rumor has been going the rounds of the press to the effect that Mr. Rockefeller, the Standard Oil magnate, who owns some of the largest ore mines in the Lake Superior region, and also the new fleet of steel steam vessels for carrying ore on the lakes, was about to build a great iron and steel works near Chicago, which would compete with the Carnegie works. This report has proved false, and, instead, it is now announced that an arrangement has been concluded between the Carnegie Steel Co. and Mr. Rockefeller by which the steel company acquires control of several properties on the Mesaba range, the ore from which will be carried to Conneaut, on Lake Erie, by the Rockefeller steamers, and thence by Mr. Carnegie's new railway line, the Pittsburg, Bessemer & Lake Erie, to the furnaces and steel works of the Carnegie company at Bessemer, Duquesne and Homestead. The Carnegie Steel Co. some years ago acquired the control of the Frick Coke Co., whose plant was by far the largest in the Connellsville region. Hence it now has in its own control all the raw materials necessary for producing steel, and also all the transportation lines required for assembling them at its works. It has also by far the largest iron and steel manufacturing plant in the world, when its works at different places are taken together, and is reported to be building 16 additional basic open-hearth steel furnaces, which will give it a total of 36 basic furnaces, in which it can utilize the product of mines below the Bessemer grade. The great reduction in the cost of transportation which will follow from the use of steam vessels of great tonnage on the lakes and from the new railway with roadbed and rolling stock especially adapted for carrying ore, together with its unequaled facilities for manufacturing, puts the Carnegie Steel Co. in a position where it will probably be able to produce steel in any shape, from billets to structural material, far cheaper than any other concern in the country, and either to undersell its competitors or to dictate terms to them concerning prices and "allotments." Whether it will use its power to put up or to put down prices is a matter which no one outside of the company may predict.

◆

We congratulate the English engineering journals on the vigor on which they are attacking the schemes of those unscrupulous speculators who are taking advantage of the public interest in motor carriages to sell stock at ridiculous prices in "Horseless Carriage companies." The wholesale manner in which the class of men who a few years ago engineered the boom in worthless South African mining shares a now booming motor carriage companies leads the London "Electrician" to suggest that the most appropriate name for the new vehicle is "Promoter car."

◆

THE DEVELOPMENT OF STRUCTURAL IRONWORK DESIGN.

The construction of the exceptionally high buildings with steel framework, which now form such a notable feature of the larger American cities, has led not only to the development of a new and large market for structural steel and iron work, but also to new problems in structural design. The introduction of this type of construction dates back only a few years. Previous to that time ironwork design had been limited mainly to bridges, roofs and the framework of factory or mill buildings, none of which cases called for the solution of the problem of superimposed masses of material to form a high, narrow and rigid structure.

We have from time to time published drawings of buildings of this class, with drawings also of the members and the details of construction, and any of our readers who have had occasion to study these critically must have been struck by the many peculiarities in design and the many new governing conditions under which the general and detail designs have had to be prepared. In bridge design the engineer is, as a rule, limited only by the required span and loads to be provided for, and has a free hand to design the structure and arrange the material according to his ideas of what will be most satisfactory. In structural design for tall buildings, however, the engineer is limited by the general plan arbitrarily set for him by the architect. He must so plan his columns and braces as not to interfere with the arrangement of rooms, corridors, etc. This may involve a very unsymmetrical structure, and necessitate the use of heavy beams, girders or even trusses for the floor systems. In a building intended for ordinary office purposes, as are the majority of these tall structures, this general column plan, when once laid out, is carried up through the whole height of the structure, the architectural, or room plan, being practically identical on all the floors. If the structure is intended for other purposes, however, it may be that variations in the room plans will necessitate breaking the continuity of the columns, and this, of course, will very considerably complicate the problem of the structural design of the building. A notable example of this is afforded by the new Astor Hotel, in New York City, which is illustrated on our inset sheet this week. This building will have 15 floors, and on some of the lower floors are a dining room, a ball room and a banqueting room, in which great areas are required to be kept free from columns. The problem was, therefore, to devise some means for carrying the several tiers of floors above these open spaces, and for supporting the columns of these floors, and, at the same time, to provide the necessary rigidity of the structure. In the first two cases this has been done by the construction of great trusses, as described in detail elsewhere, while for the banquet room, where a clear space of 40 ft. between columns was demanded, heavy box girders span this space and support the intermediate columns of the floors above.

Another difficulty which is encountered is in so arranging the floor systems, connections, etc., as to avoid interference with the multiplicity of passages required for flues, plumbing, electric wires, water pipes, etc., and in a large building this is no small matter. Then, again, it is necessary to provide a means of support and attachment for the masonry of the exterior walls, the weight of this masonry being usually carried by a string course of beams or girders at each floor, or at certain intervals. The wind bracing is another special feature in the design, and in many cases diagonal bracing cannot be introduced for this purpose, on account of its interference with corridors, doorways, etc. In such cases a very successful solution of this particular problem has been effected by the use of arched portal bracing, which is, in fact, a modified and improved form of knee bracing, which latter is also sometimes used. In order to ensure absolute rigidity, and freedom from vibration of the floors, horizontal diagonal bracings of flat bars, riveted to the floor beams, is also sometimes employed.

The requirements for wide spacing of the columns may result in very exceptional loads upon certain columns. A column load of 3,000,000 lbs. will be reached in the 30-story Park Row Building illustrated in our issue of October 8, and a load of 5,000,000 lbs. is carried by one column in the Astor Hotel. It will be obvious that very massive construction is necessary to carry such enormous loads; in the latter case we have a mammoth column built up with no less than 10 web plates, 4 cover plates and 12 angles. The weight of this column is 46,980 lbs. in a length of 30 ft. 4 ins.

Another difficulty met with in this hotel building was that the arrangement of trusses and columns could not be harmonized. In one case the truss posts are practically inclined columns, connecting the wider-spaced columns below with the closer-spaced columns above. In another case the outer ends of two great trusses could not be supported by the wall or abutment columns; or by the intermediate columns and it was necessary to provide a line of immense plate girders which spanned the intermediate columns and supported the trusses. While speaking of columns, reference may be made to one special feature calling for special design. Some of the columns in the Astor Hotel, which carry heavy loads, occurred in places where they would not be built into the walls or partitions, but would be isolated, and would be enclosed in shells, or cases, of polished stone. In order to avoid clumsiness in the appearance of the column as thus clothed, it became important to keep the actual metal column as small as possible, and this was effected by the use of column sections specially designed for such locations.

An examination of the drawings of such structural work as we are here considering will show an immense number of cases were specialization in members, details and connections has been required, all of which, of course, add greatly to the trouble of estimating, and the cost of construction, to say nothing of the brain work involved in the solution of the innumerable problems, small and great, but all having an important bearing upon the technical success of the design and the expenditure involved in the building as a whole. These difficulties are probably appreciated not at all by the owner, and only to a limited extent by the architect (unless he is himself an engineer experienced in structural work), and the designing engineer can expect but little credit for the successful results of his labors, since the work is all built in and enclosed as soon as erected, so that the casual observer never gives it a thought, and even if anyone were interested in it, it is hidden from examination.

Few of those who occupy buildings of this class ever realize or think of the enormous amount of metal work involved in the construction. They notice and admire the high facade, the handsome stone pillars, the noble masonry and the expensive and beautiful interior ornamentation; but they see nothing of the great steel skeleton which forms the framework of the whole structure and of which the visible walls and interior finish are but the clothing and decoration. In the Astor Hotel the structural iron work will aggregate about 10,000 tons, as against about 60,000 tons for the completed structure (exclusive of the load), and its cost will be about one-tenth of the cost of the whole building. In the Park Row Building (for office purposes), the structural iron work will aggregate 9,000 tons, or nearly one-seventh of the total weight of the completed building, while its cost will be about one-fifth ($500,000 against $2,500,000) of that of the completed building. The cost of the steel construction is exclusive of elevators, elevator enclosures, stairs, or any work of an ornamental character, while the cost of the building does not include that of the site. In a large warehouse building several stories high, recently erected on Broadway, the cost of the structural work amounts to one-fourth of that of the completed building. This difference in cost is, of course, due to the difference in the character of the "clothing" of the skeleton. In the Astor Hotel a maximum of elegance, profusion and cost will probably be reached, while in the warehouse building (with plain brick and fireproof clothing and little architectural treatment) the proportion of cost will approximate to the minimum. The office building forms a mean between these extremes, having a handsome and expensive finish, but much less costly decoration than will be found in the magnificent hotel. In ordinary types of buildings it has often been the practice to estimate a cost per cubic foot of the entire structure for different kinds of buildings. While this method has probably little application to such special structures we have been considering, it may be of interest to note that the cost of office buildings of this type figures out at from 20 to 25 cts. per cu. ft.

LETTERS TO THE EDITOR.

Wanted, a Test for Tin-Plate.

Sir: There is a well-founded belief that tin-plate is not so good as it used to be, the reason probably being that in modern methods of making it the coating of tin which is put on the iron or steel is carefully brushed off except just enough to make a bare coating without appreciable thickness, while in former times most of the tin which stuck to the iron when it came from the melting pot was allowed to stay on. Tin-plate as now made consists of two things, a sheet of low-priced steel and a coating of high-priced tin. The object of the maker is to sell for so much a pound as much steel and as little tin as possible. The object of the buyer is generally to buy a tin at the market price which will last the longest without having holes rust through it. If he builds a house the architect specifies the best X Y Z's I. C. charcoal tin, but how can he know that the tin he receives is the best or is even of a fairly good quality? Can any of your readers give me a standard of quality of tin-plate for roofing and other purposes, and a method of testing to determine quality? I have a rough idea of a kind of test which might be applied, but before it could be adopted a little chemical research would be needed to establish the details. It is to take a piece of plate, say 2½ ins. square, and by bending the edges ¼-in. wide at right angles, to form a small tray 2 ins. square and ¼-in. deep. Put in this tray a measured quantity of nitric acid of a certain dilution and note the time it takes to eat a hole through the tray. The chemical research needed would be to procure samples of as many different brands and quantities of tin-plate as possible, to expose small samples of each to a number of different corrosive influences, such as salt and water, sea air, distilled water, rain water, dilute acids, etc., and to determine from the results what was the endurance of each under the different circumstances, which samples should be called respectively good, medium and poor, and then to determine just what kind of test could be conveniently applied to any specimen which would infallibly prove whether it should be placed in the good, medium, or poor class. Tester.

New York, Dec. 21, 1896.

Sewage Filtration at Meriden, Conn.

Sir: In the Engineering News of July 18, 1895, a history of the Meriden sewage disposal ground, from the time investigations for the system were commenced up to that date, was given. Thinking you may like to continue the history up to the present time I send you the following facts: The ten new filtration beds referred to in your article were completed about Dec. 15, 1895, at a cost of $9,483. Since that date the sewage has been confined entirely to the beds, as the filtration system appeared to give better satisfaction to the general public than did the irrigation area.

The sewage is allowed to run on a bed 24 hours at a time, and the beds are thoroughly cleaned before being used again. The inlets to all the beds have been provided with wire screens, which are placed about 20 ft. from the inlet pipe. These screens stop most of the paper and solid matter, and greatly facilitate cleaning the beds.

The solid material removed from the beds is composted and covered with sand, so that we have no trouble from odor.

Up to within the last few months two of the large beds were used at a time; since that date two of the large beds and one of the small ones have usually been used together. The beds were graded level, and with the six inlets at no time has sufficient water accumulated to cover the entire bed, and no water has appeared at the underdrains at any time. As was stated in your article, no underdrains were laid in the new beds. Under the treatment described above, the beds are working as well to-day as they were a year ago, and have not given us the slightest trouble. The following letter accompanied Dr. Herbert E. Smith's report on the beds:

> Yale Medical School, New Haven, Conn.,
> Nov. 9, 1896.
>
> Mr. E. B. Moss, City Engineer, Meriden, Conn.
>
> My dear Sir: Enclosed I send a statement of the results of my examination of the samples of water. I included in the series the examination of the sample sent me by Mr. Schleiter and taken the day before we took our samples. I found out from him exactly where he took the specimen, and find that it is another of the outbreaks of the effluent from the bed, and it seems to me that it adds strength to the case to include that analysis.
>
> The analysis of Nos. 2 and 3 show conclusively that the purification effected at the beds is remarkably good, the organic matter being reduced to a point very close to that which we find in the best spring waters. That the water coming out at the bottom of the ledge is chiefly the effluent from the beds is seen in a study of the amount of chlorine. The average of the composite samples of the Meriden sewage gives 46.3 parts of chlorine per 1,000,000. Assuming this average as about the amount of chlorine in the sewage, it is easy to calculate that the effluent which contains about 33.5 parts must consist of about three-fourths sewage; of course there is some ground water coming from rain in these springs.
>
> The examination, then, is very satisfactory in showing that the effluent is chiefly composed of the sewage water and that it is highly purified. The results from No. 4, which is the sample taken from the small stream just before it enters the river, seems to show that the bulk of that water comes from the sewage beds after purification. It would be interesting to have that flow measured with a view of ascertaining how much of the purified sewage is accounted for at that point. Comparing the two samples from the Quinnipiac River, it is seen at once that the addition of the purified sewage does not in any way increase the objectionable contamination in the stream, but on the contrary it slightly improves the water, as far as its organic contents goes, adding nothing to it except the mineral matter, which of course is not objectionable.
>
> The samples from the little stream flowing into the Quinnipiac above the filter beds gave only 3.8 parts of chlorine per 1,000,000, showing conclusively that none of the sewage effluent shows in that direction. I think the examination must be accepted as satisfactorily proving that the discharge of the water from the filter beds is not a source of contamination to the river, and that also the beds are working in a very efficient manner. If there are any points concerning the examination which requires further explanation from me I shall be pleased to hear from you. Very truly yours,
> Herbert E. Smith.

The effluent referred to in Dr. Smith's report comes out of the ground 21 ft. lower than the grade of the lowest bed. The following will give you some idea of the amount of sewage disposed of: May 23, 1895, 9 a. m., 68,460 gallons per hour; Oct. 31, 1895, Friday, at 2 p. m., 99,276 gallons per hour; July 20, 1896, at 4 p. m., Monday, 70,988 gallons per hour; Oct. 15, 1896, Thursday, at 2 p. m., 81,360 gallons per hour.

It was planned to keep all surface water out of the sewers, but the difference between the amount of sewage in dry and wet weather shows conclusively that a large amount of ground water finds it way into the pipes. Nearly all the factories and large blocks in the city have been connected. Five men and a one-horse dump cart are constantly employed at the disposal area.

Yours truly,
E. B. Moss, City Engineer.

Meriden, Conn., Dec. 7, 1896.

NOTES OF A TRANSCONTINENTAL TRIP.

VI.

San Francisco to Portland; Southern Pacific Ry.

In going from San Francisco to Portland the railway crosses the Siskiyou Mountains. At Chico, 186 miles from San Francisco, the railway is at an elevation of only 193 ft. above sea level. From thence there is an almost continuous up-grade to Siskiyou, where an elevation of 4,130 ft. is attained, 414 miles from San Francisco. From Siskiyou the grade falls to 1,898 ft. at Ashland, Ore., 17 miles further, and continues to fall all the way to Portland, which is only 53 ft. above sea level. The total distance is 772 miles, and the time occupied by the trip is 37 hours 10 minutes. The steepest part of the grade going north is from Red Bluff to Sissons, 113 miles, in which distance the line rises 3,245 ft. The line follows the valley of the Sacramento River on the south side of the range, crossing the river 18 times in 80 miles, and passing through about twelve tunnels through the rocky spurs, while there are numerous loops giving the necessary development to keep within the permissible rate of grade. In one place, near McCloud, the line has a course of five miles to gain an advance of half a mile, but ascending nearly 600 ft. in this distance. All trains stop at Soda Springs to allow passengers to get out and taste the natural soda water which springs up here.

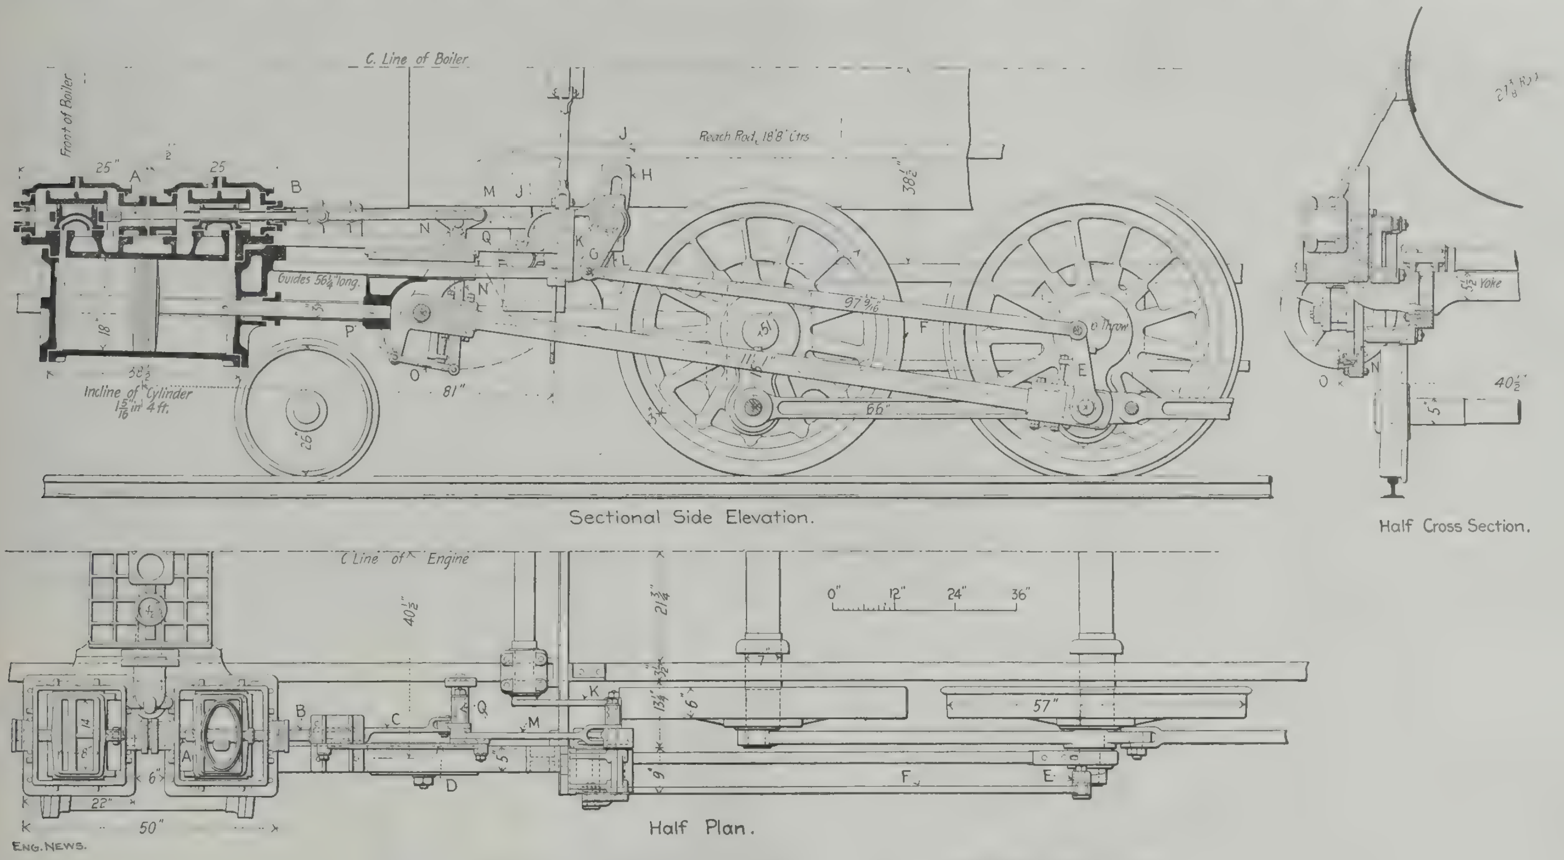
The line presents some very interesting engineering features in crossing the Siskiyou range, and affords some wonderful views of mountain scenery. At Ashland, at the foot of the eastern slope, the last spike of this part of the Southern Pacific Ry. was driven by Mr. Charles Crocker, on Dec. 17, 1887. From here the line follows the Rogue River valley, taking nearly every curve and turn of the river, the railway being for a great part of its length on an embankment right at the side of the river or benched out of the side-hill slopes.

The Oregon division of the Southern Pacific Ry. was completed in 1887, connecting with the Oregon & California Ry. to form a through route to Portland. On the first part of the line the track is fairly good and easy riding, though it is laid with rather light rails and the square suspended joints are spliced by 18-in. angle bars inside the rails and 18-in. fish-plates outside. There are four bolts, 4½ ins., c. to c., with nuts on the outside. Square sawed ties are used, the joint ties being placed quite close together. The ballast is largely of broken stone, shaped to the section usually employed for gravel, and neatly dressed to slope, the toes being lined up with larger stones. In some places, however, the joints are notably defective, and even in the heavy Pullman cars, with their easy springs, the sharp, sudden shocks are felt, which are an indication of particularly bad joints. The superelevation of the track seems to be too high, at least for the speed of the northbound trains. It is interesting to note the great extent to which the Southern Pacific Ry. is using tie-plates. On the Atlantic system it uses 32 plates to a rail (or on every tie) in renewing rails; while on the Pacific system, with fir ties and broken joints, the plates are used on all joint or shoulder ties. In applying the plates, the ties are turned upside down instead of having seats for the plates adzed out of the worn face of the tie.

All bridges and openings are numbered from the mile posts, as "501 A," etc. Iron guard rails are used on trestles, placed about 8 ins. inside the track rails, and they are extended about 200 ft. on the approaches, being brought to a point at the end. Some of the trestles have the mudsills laid in sheathed trenches, open to the air and to inspection; while some of the large wooden bridges are having the piers and trusses sheathed with planking. There is practically no longitudinal diagonal bracing on the trestles of the Southern Pacific Ry., all reliance for longitudinal rigidity being placed upon the track stringers and the stringers or waling pieces at panel heights, There are several tunnels on this route, most of them having a timber lining. On the Shasta division wood burning engines are used, and it was curious to see the immense balloon smokestacks and the cord wood piled high up on the tenders. Wood fuel is used only on this division and the lines in Oregon. The diamond stack is not used, as all wood burning engines have balloon stacks, and on coal burning divisions the engines have straight cast-iron stacks and extension smokeboxes. The Oregon Express, a train of nine to ten cars, is hauled over the heavy grades of the Shasta division by two powerful ten-wheel engines built at the shops of the Southern Pacific Ry. at Sacramento, Cal.

A noticeable feature of these locomotives was a peculiar valve gear, which is shown on the accompanying cut, Fig. 1. This is known among the enginemen as the "monkey gear," and was designed by Mr. A. J. Stevens, formerly General Master Mechanic of this road. There are about 60 engines equipped with the gear, but it is not being applied to any other engines. While it was undoubtedly a step in the right direction for fuel saving, the valve is very severe on the running parts of the locomotive, owing to the very rapid admission of steam to the cylinders. The effect of this is to very soon pound out the driving boxes, resulting in heavy maintenance expenses. A report on this valve, by Mr. H. J. Small, Superintendent of Motive Power, is given in the Proceedings of the American Master Mechanics' Association for 1890. It will be seen that there are two separate balanced slide valves to each cylinder, the stem of the rear valve A passing through the hollow stem of the forward valve B. The stems are operated respectively by the valve rods C and D. The valves are driven by a return crank E on the main driving crank-pin. This return crank is set at 90° with the main crank, and from it extends the rod F to the arm G, by which motion is imparted to the link H which has a curved slot in which works the slide-block. The position of this slide-block is regulated from the reach-rod by the vertical arm J, the curved arm K, and the lifting link, L. To the slide-block is attached the radius rod M, the opposite end of which is connected to the vertical lever N. The upper end of this lever has arms to which are attached the valve rods C and D, while the lower end is connected by the rod O to the crosshead P.

The lever is supported by the link Q. The cost of this gear is about 25% greater than that of the ordinary gear, and the cost for maintenance and repairs is also considerably higher, apart from the increase in cost for the general maintenance and repair of the engine. In a comparison of eight ten-wheel engines (cylinders 18 × 30 ins.), fitted with the Stevens gear, and eight ten-wheel engines (18 × 24 ins.), with the ordinary link motion, the former showed a decrease of 18% in fuel consumption and an increase of 41% in cost of repairs. The engines with the Stevens gear made 33.93 miles per ton of coal, as against 27.92 miles by the other engines. At 23 cts. per engine-mile for fuel, the former engines showed a gain of 4.14 cts. per mile; while at 6 cts. per mile for engine repairs the latter showed a gain of 2.46 cts., leaving a final gain of 1.68 cts. per mile run in favor of the Stevens gear.



Sectional Side Elevation.

Half Cross Section.

Half Plan.

FIG. 1.—STEVENS VALVE GEAR AND DUPLEX VALVES; SOUTHERN PACIFIC RY.

Portland, Ore.

This city is one of the largest and busiest of the Pacific northwest, and has a population of about 82,000. It is situated on the west bank of the Willamette River, about 12 miles south of its junction with the great Columbia River, and is 115 miles from the ocean, having good terminals and navigation facilities for river and ocean steamers. The city is about 53 ft. above sea level. It is an important railway center, the Southern Pacific and Northern Pacific railways meet here, and the Union Pacific Ry. has an entrance over the line of the Oregon Railway & Navigation Co. (formerly a part of the U. P. Ry. system) which follows the course of the Columbia River. A railway is now being built to connect Portland with Astoria, at the mouth of the Columbia River, a distance of about 110 miles. The contractors are Honeyman, De Hart & Glenn, and their contract calls for the completion of the road by May, 1897. At the mouth of the Columbia River are the celebrated pile and rock Columbia River jetties (now practically completed), while up the river (above the Willamette) are the Cascade locks (also practically completed) and the site of the Dalles ship railway, which is to give a through route for river navigation. The U. S. Engineer Office, at Portland, is now at work on the drawings for this ship railway or boat railway, and land is being secured for the right of way.

There is a good system of water-works, supplied by an excellent quality of water from Bull Run River. The headworks consist of a canal 400 ft. long, terminating in a funnel-shaped chamber 9 ft. long, which tapers from 60 ins. to 42 ins. in diameter, the latter being that of the discharge pipe. From this chamber extends a riveted steel discharge main, 42, 35 and 33 ins. diameter, 24 miles long, ending in the Mt. Tabor reservoir on the east side of the Willamette River. From this reservoir a 32-in. main leads to the upper of the two City Park reservoirs on the west side of the river, crossing the river by a 28-in. submerged pipe 2,006 ft. long. This was laid in lengths of about 17 ft. by means of a curved apron behind the pipe-laying boat or scow. The Wolff & Zwicker Iron Works (which are briefly described below) made the steel pipe and the Oregon Iron & Steel Co. made the cast-iron pipe. A plan and profile of the pipe line are given in Fig. 2, and the following tabular statement of the bends was taken from a paper on "Flow of Water in Wrought and Cast-Iron Pipes from 28 to 42 ins. Diameter," by Mr. Isaac W. Smith, M. Am. Soc. C. E., which was presented at the San Francisco convention of the American Society of Civil Engineers in June. Mr. Smith is Chief Engineer and General Superintendent of the Water-Works, and Mr. D. D. Clark, M. Am. Soc. C. E., is Principal Assistant Engineer.

The two reservoirs in City Park are not now used for storage, partly on account of the trouble with the creeping of the asphalt lining, and partly on account of some fears for the stability of the ground upon which the reservoirs are built. This matter is now the subject of investigation.* At present, the water from the pipe line flows over a weir and through screens into a vertical cylindrical distributing tank, whence it flows to the gate-house of the lower reservoir. A similar arrangement is provided at the other reservoirs, the water flowing from the distributing tank to the mains. The flow from the upper to the lower reservoir, with a head of 62 ft., drives Pelton water wheels which operate two Fraser & Chalmers pumps of 500,000 and 1,000,000 gallons capacity, these supplying the high-service system at an elevation of 600 to 650 ft. above the reservoir level.

Monolithic concrete is used for the head gate-house of the upper reservoir, for part of the reservoir wall, etc. It is finished off and pointed to resemble masonry, and gives a very good-looking rock-faced surface. The Mt. Tabor reservoir has a fountain with a 5-in. nozzle discharging a stream of water to a height of 125 ft.

There are several cable and electric railways, and in some cases electric traction has superseded cable traction. The Portland Traction Co. has a cable line with a grade of 21½% on a viaduct of considerable length. The cars on this particular line have track brakes with wooden blocks, a slot-wedge brake, and independent wheel brakes on the front and back trucks. Turntables are used for turning cars at some of the terminals, but they are considered objectionable on account of the cost of repair and the time occupied in turning the cars. Watering cars are run on the electric lines, resembling large double-truck cars, but without windows. The East Side Ry. has some of the Lovejoy convertible summer and winter cars, the sides of which are formed of panels hinged at the eaves line, these panels being folded up against the inside of the roof during the summer. On the cable line of the Portland Traction Co. the yokes are 4 ft. 6 ins. apart, and for rail joints coming between the yokes, a special joint with a support formed by a piece of reversed rail 4 ft. long, has been designed by the general manager, Mr. F. I. Fuller, M. Am. Soc. C. E.

There is no official with the title of City Engineer, but the Superintendent of Streets (Mr. Chase) is practically the city engineer, being in charge of the design and construction of streets, sewers and general municipal work. He is elected by popular vote, as is also the City Surveyor, who is practically a subordinate of the Superintendent of Streets.

On Fourth St. a wood pavement has recently been laid on a 6-in. concrete foundation, with concrete curb. The blocks are 4¼ × 3¾ × 8 ins., made from fir stumps, laid close together on a 1-in. bed of gray sand, and grouted with pitch. There are 8-in. planks laid longitudinally between and outside the rails, upon these being laid cross-planks beveled at the ends to form a flangeway. The track is laid with T-rails, having square joints, spliced with four bolts, the longitudinal timbers being notched or boxed out to allow of access to the nuts. Honeyman, De Hart & Co., of Portland, are the contractors. Some streets are paved with transverse timbers 6 × 6 ins. or 5 × 5 ins., resting on mudsills; such a pavement will last about seven years, and with traffic that will wear it out in that time it is cheaper than brick, asphalt, etc. Square sticks are used, so that they can be laid with the grain edge up, in which position they give much better wear. California bituminous rock has been tried, but it does not give good service, even on concrete or macadam foundation. The material wears in holes, and it is to be stripped off the concrete and Trinidad asphalt laid in its place.

---

*The reservoirs and the evidences of movement have been described in Engineering News, Jan. 10, 1895, Feb. 7 and 21, 1895, and June 11, 1896.

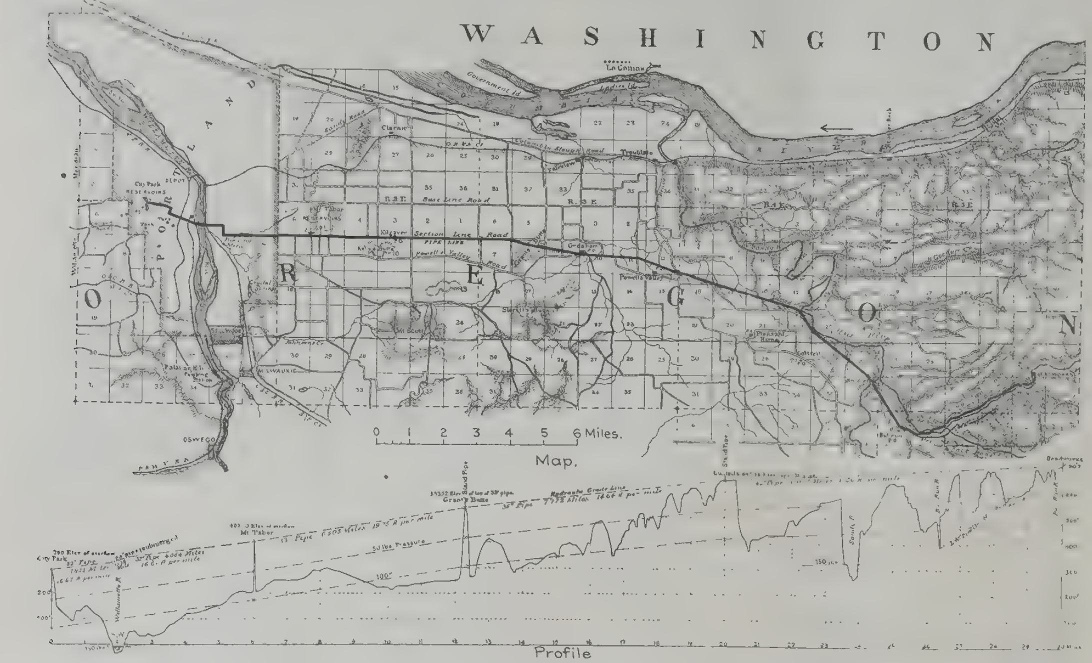

FIG. 2.—PLAN AND PROFILE OF THE BULL RUN PIPE LINE FOR THE WATER SUPPLY OF PORTLAND, ORE.

The city has a garbage crematory, which was built by a local firm. It works well, destroying even carcasses of horses satisfactorily, but repairs are required frequently. This furnace was described in Engineering News of Aug. 20, 1896, and there is talk now of replacing it with an Engle furnace.

About twelve miles south from Portland is the town of Oregon City (reached by an electric railway), at which place the power of the falls of the Willamette River, with a head of 40 ft., is utilized by a water-power plant generating electricity which is transmitted to Portland and used for railway, lighting and power purposes. The power house is to be built in sections, and the part thus far completed is equipped with three pair of Victor turbines, a 42-in. and a 60-in. turbine to each pair for high and low-water service. The vertical shafts of the turbines drive three 600 HP. generators, the armatures of which (7 ft. diameter and 2 ft. high) revolve in a horizontal plane. The oil bearings on the vertical shafts are filled with oil at 175 lbs. pressure. A large amount of machinery is on hand for extensions to the plant, and contracts are to be let for the concrete superstructure of the new part of the building and for new cribwork along the boat canal which passes the falls. This plant is similar to that at Niagara Falls, and antedates the latter, but while at Oregon City the armatures of the generators revolve, at Niagara Falls the fields revolve. The plant was put in by the Portland General Electric Co., of which Mr. Sullivan is the engineer, and was described in Engineering News of Oct. 10, 1895.

Portland has a very fine union station of recent construction, but there is no trainshed, though it is said that one is to be built when times are better. The station was built by the Portland Terminal Co., of which Mr. E. Lyons is Manager.

The Wolff & Zwicker Iron Works, of Portland, have a very complete plant for the manufacture of riveted steel pipe. The special tools for this work include two automatic feed punch machines, capable of handling 60 tons of material per day. From the punches, the plates are lifted and carried by a hydraulic crane to the vertical rollers. After being rolled, the pipe is bolted and rounded up, and the longitudinal seams are riveted by bull riveting machines, of which there are eight, all operated by hydraulic power. The courses are then pressed together with hydraulic presses and carried forward by the trolleys to the round-seam riveting machines. After being riveted they are calked with pneumatic calking tools, and then rolled to dipping tanks to be coated with asphaltum. Their largest contract was the pipe for the Bull Run water supply for the city of Portland, of which there were 24 miles, from 33 to 42 ins. diameter, and made from plate from No. 6 gage to ⅜-in. in thickness. They have, however, manufactured within the past four years, over 65 miles of pipe of all diameters and gages for mining and water-works purposes.

Portland to Tacoma and Seattle.

At 5 p. m. I went from Portland northward by the through transcontinental train of the Northern Pacific R. R., which is a solid train for the entire run of 2,056 miles between Portland, Ore., and St. Paul, Minn. The train was hauled by a fine Baldwin ten-wheel engine (187,980 lbs., with tender) and was made up as follows: Mail car, baggage car, express car (60,666 lbs. each), colonist sleeping car (63,650 lbs.), two day cars (64,900 lbs.), dining car (90,110 lbs.), and sleeping car (98,310 lbs.), or eight cars in all (weighing 564,168 lbs). In connection with the remarks on dining-car service, in the first part of these "Notes" (Engineering News, Sept. 3) it may be stated that the Northern Pacific R. R. follows the practice of running through dining cars on all its transcontinental trains, an arrangement which conduces largely to the comfort of passengers, ensuring them against the unpleasant delays in getting meals due to trains being late or detained. The sleeping-car service on this line is also worthy of note in that three classes of cars are run. Ordinary sleeping cars are available only for persons holding first-class or "regular" tickets, but this road also runs Pullman "tourist" sleepers for the use of holders of second-class or cheap-rate tickets, these cars being fully as comfortable as and but little plainer than the ordinary sleeping cars, while a uniformed porter looks after the comfort of the passengers. For the use of colonists, etc., the train has, on three days in the week, a free colonist sleeping car, the arrangement of which is similar to that of the other cars, but having a very much plainer finish, with no upholstering or bedding, these materials being supplied by the passengers, who can purchase them at the principal railway stations. A second-class sleeping car is frequently engaged for a tourist or prospecting party, and the car porters find this service more remunerative in the way of "tips" than the more aristocratic first-class car with its more exclusive passengers.

At Kalama the railway reaches the great Columbia River, and here the train is run onto a large steam transfer boat and ferried across the river.

This boat resembles the larger steamer of the Southern Pacific Ry., described in Engineering News, Nov. 5, 1896. The length of the trip is 1.1 miles, and the boat has a speed of twelve miles per hour. The total time occupied, from stop to start of train at the landing stages, is about 30 minutes. The boat was put in service in August, 1884, and has been running regularly ever since without an accident. There are three tracks, united at each end of the boat, to connect with the single track on the landing stage apron, and these tracks can accomodate 27 freight cars (33 ft. long), 15 Pullman cars or 18 ordinary cars. The boat was built by the Harlan & Hollingsworth Co., of Wilmington, Del., in 1883, and Capt. J. A. Gore, who is now in charge, states that it was sent round Cape Horn in sections on the "Tillie Starbuck," being put together by Smith Bros. & Watson, of Portland. It was originally named the "Kalama," but this was changed to the "Tacoma" before the boat was put in service. For the particulars as to this interesting vessel I am indebted to Mr. Charles S. Fee, General Passenger Agent; Mr. Joseph McCabe, Division Superintendent, and Capt. J. A. Gore, who is in charge of the vessel; and also to the Harlan & Hollingsworth Co. There are two horizontal jet-condensing engines, each having a cylinder 36 × 108 ins. The Sickles valve gear is used, with half-stroke poppet valves. Steam is supplied by two boilers of the locomotive type, having an aggregate heating surface of 3,210 sq. ft., and a grate area of 100 sq. ft. The boiler pressure is 65 lbs. There is a single rudder at each end, and the steering gear is operated by hand. The general dimensions are as follows:

DESIGN FOR A COMBINED SURFACE AND EXPRESS SUBWAY RAPID TRANSIT SYSTEM WITH ELECTRIC TRACTION RY. W. I. AIMS, C. E.

Length of deck	340 ft.
Length between perpendiculars	300 "
Beam of hull	42 "
Width of deck over guards	76 "
Depth of hull, below deck	13 ft. 6 ins.
Height of superstructure, above deck	12 ft.
Draft, light	7 "
Draft, loaded	9 "
Tonnage, gross	1,362 gross tons.
Engine cylinders	36 × 108 ins.
Boilers, number	2
Boilers, capacity of each boiler	300 HP.
Heating surface of each boiler	1,605 sq. ft.
Grate area of each boiler	50 " "
Boiler pressure	65 lbs.
Wheels, diameter	28 ft.
Wheels, width	8 "

A PROPOSED PLAN FOR RAPID TRANSIT SERVICE IN CITY STREETS.

We illustrate in the accompanying cut a proposal for a system of rapid transit in city streets which has been submitted to us by Mr. Walton I. Aims, C. E., of 35 Broadway, New York city. It consists of a double-track tunnel just beneath the street surface, and with the track centers directly below the centers of surface tracks in the street above. The plan is to operate express trains upon the tunnel tracks and utilize the surface cars to conduct the local or short distance traffic and to carry passengers to the express stations. Both lines would be operated by electric traction, the surface cars taking current through a slot from conductors which would be readily accessible from the tunnel below. The conduit for the conductors, it will be seen, would open directly into the tunnel and all difficulties with respect to drainage would be obviated. The slot in the conduit, Mr. Aims thinks, would furnish ventilation for the tunnel.

In places where this construction was impracticable on account of local conditions, the subways could be depressed, passing into circular shield tunnels (if in soft ground), and even passing one on top of the other, if necessary, as at some places in the London subways.

Mr. Aims suggests that the construction which he has designed would be a better solution of the rapid transit problem in New York city than the four-track subway which is the plan that has been adopted. In this matter we are unable to agree with him. As a practical question, the city could not annul the franchises of the companies which already operate railways on the surface of the streets, and it is evident that the same corporation should own and operate both the surface and tunnel tracks to make Mr. Aims' plan a success. Again as a purely engineering question, the distances to be overcome by rapid transit lines in New York city are so great and the streets are so crowded that to rely on surface cars to carry passengers to the express stations of a rapid transit system would rob the express service of a large part of its efficiency. But for cities where the distances to be overcome are less than in New York, but still great enough to demand rapid transit, the plan of Mr. Aims seems to be excellently adapted, as it effects the combination of local and express service on parallel tracks, which we believe is the only satisfactory solution of the rapid transit problem in large cities.

A LARGE DIRECT-DRIVEN CENTRIFUGAL PUMP.

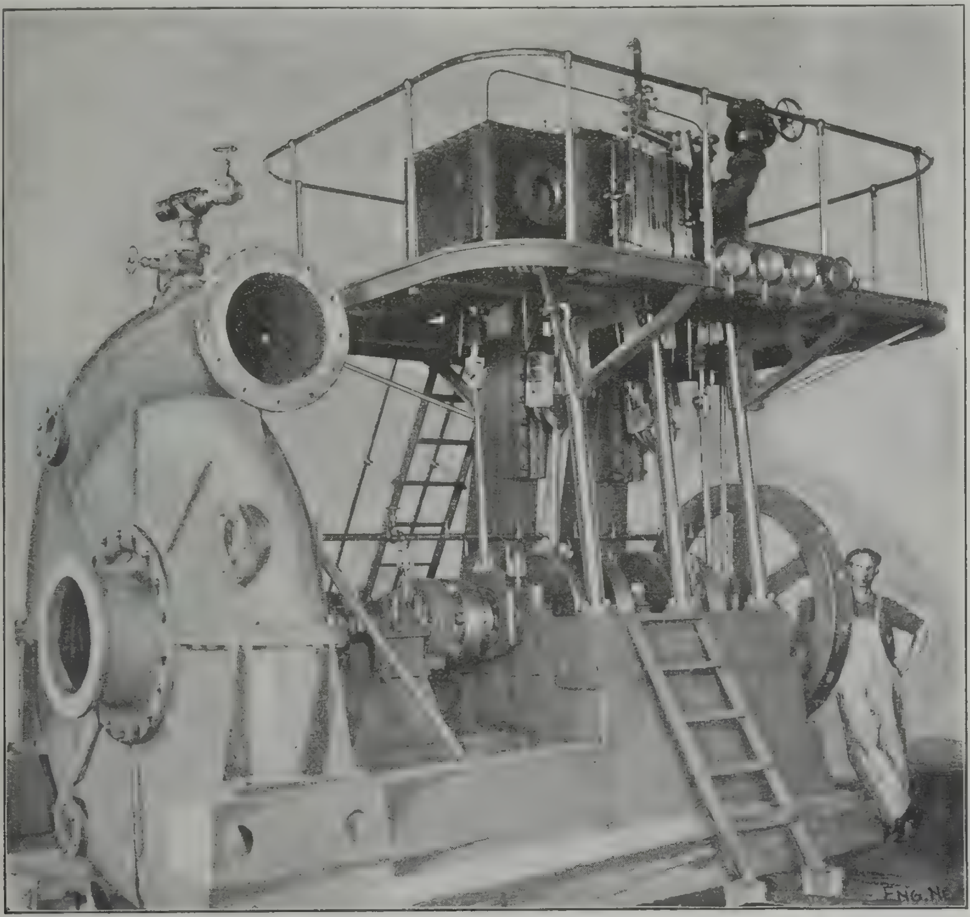

FIG. 1.—CENTRIFUGAL SEWAGE PUMPING ENGINE AT NORFOLK, VA.
Designed and Built by the Morris Machine Works, Baldwinsville, N. Y.

We illustrate herewith a centrifugal sewage pump designed and built for the city of Norfolk, Va., by the Morris Machine Works, Baldwinsville, N. Y. The pump has 20-in. suction and 18-in. discharge, the latter connected to a 20-in. piping. The actual head worked against is 26 ft., but when the pump is driven to its maximum capacity, discharging about 9,000 gallons of water per minute and forcing it through the discharge pipe, which is 1,600 ft. long, the total head pumped against is equivalent to about 5 ft. Inasmuch as this pumping outfit will often be required to run night and day, it was thought advisable in designing the machine to make the pump runner of large diameter so as to keep the engine speed moderately low. The engine, which has 14 and 28-in. cylinders by 18-in. stroke, will, therefore, under average work only run at a speed of from 120 to 140 revolutions per minute and its maximum speed is 180 revolutions per minute. The sewage and drainage from the city flows into a well from which the pump takes its supply, discharging it in the river. The side and sectional views, Fig. 2, show the construction of the pump. The runner is made completely of bronze, so as to withstand the corroding action of sewage and the gases contained therein. The pump shaft is made of steel covered with bronze where it passes through the stuffing box into the pump. In order to keep the sewage from working back into the stuffing box a fresh water injection is arranged which is continually forcing a stream of water through the bearing into the pump, thereby preventing sewage water from working in.

The vanes on the runner are made rather wide apart so as to pass through pieces of wood, rags or other solid matter that may be pumped with the sewage. The high-pressure cylinder on the engine is fitted with a Meyer adjustable cut-off so that the steam consumption can be regulated according to the amount of work the pump is doing.

The engine is throughout very substantially built; the crank shaft is made of steel, counterbalanced; connecting rods are of the forked type, also made of steel; as are also the cross-head, piston rods and valve motion. About a year and a half ago a machine similar in general design to the one here illustrated was furnished for the city of Norfolk, which has, since it was put in, been running almost day and night, giving the best of satisfaction. It can be depended upon, in case the quantity of sewage is small, to work successfully handling a small amount of it, or can be speeded up until without difficulty it takes care of all the sewage which flows into the receiving well. The engine here illustrated is run condensing, exhausting into a jet condenser.

We are indebted to the builders of the pump and engine for the photographs and drawing from which our illustrations are prepared.

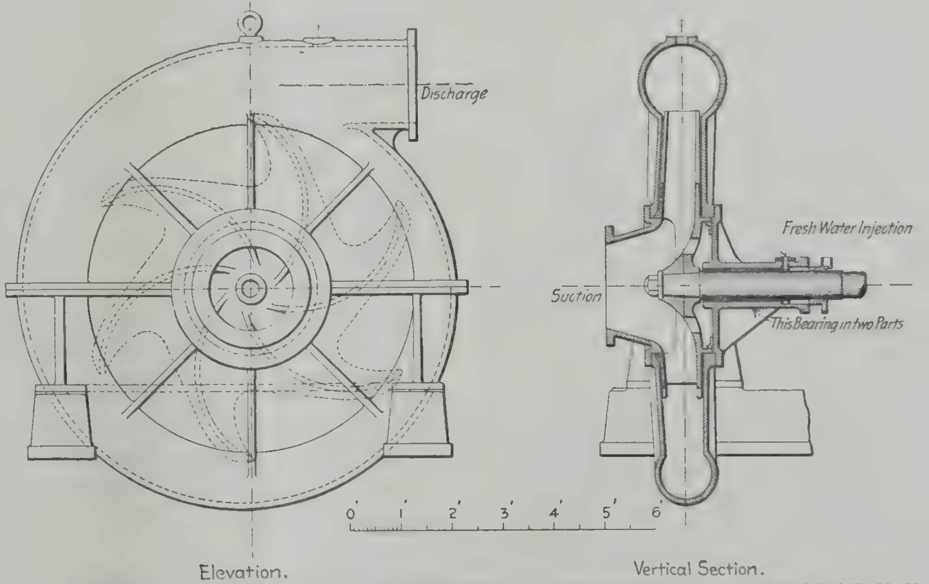

FIG. 2.—CENTRIFUGAL PUMP BUILT BY THE MORRIS MACHINE WORKS, BALDWINSVILLE, N. Y.

ALUMINUM BRONZE SEAMLESS TUBING.*

By Leonard Waldo, M. Am. Soc. M. E.**

The so-called alloys of copper and aluminum must be considered as radically different from the various metallic mixtures of copper, zinc, tin, nickel, manganese, and lead which have made the bulk of the copper alloys of commerce. There are, as is well enough known, certain chemical compounds among these last-mentioned alloys. In the aluminum bronzes or aluminides of copper there is no commercial method of separating the two constituents.

The results of the chemical [illegible] of aluminum and copper is the strongest of the copper compounds or alloys. Wire is readily drawn from it with a tensile strength of 180,000 lbs. per sq. in.

---

*Abstract of a paper presented at the New York meeting of the American Society of Mechanical Engineers.

**Secy. Waldo. Foundry Co., Bridgeport, Ct.

But there are points in which aluminum bronze seems mechanically superior to any steel. It cannot, at present, be tempered, but it does not seem to show any change in the nature of crystallization under stress or shock. Thin, soft ribbon may be indefinitely coiled and uncoiled or run over rollers. A bar may be struck indefinitely upon one end. A rifle firing-pin was struck over 120,000 blows without apparently changing its molecular condition. It can be made of all degrees of hardness, and its strength and percentage elongation varied from 40,000 to 100,000 lbs. per sq. in., and from 70% to 1% in 10-in. bars. As an illustration of this combination of strength with ductility, I cite the fact that aluminum-bronze cartridges made for the new small-caliber low-trajectory rifle were fired for more than 90 consecutive rounds, charged with smokeless powder, at the Frankford Arsenal, for a firing test. Added to these mechanical values are the chemical resistance to corrosive influences, and the small electric potential of the combined aluminum and copper. The non-corrosiveness is only excelled by that of the noble metals; and the low, almost zero, electric potential of the aluminum bronze gives it a value in structural engineering which peculiarly fits it for acid industrial works or water-tube boilers and condensers. This value has already been tested on a large scale in underground tide-water retaining bolts in our seacoast batteries and in sulphite pulp mills and the electrolytic vats of large copper refineries. As its cost is reduced by improved methods of working, it is finding its way into many uses where steel or iron has a short life from rust, inability to resist corrosion, or lack of density and strength.

It has long been evident that aluminum bronze was an ideal metal for drawn tubes; but serious difficulties presented themselves at every stage of production, from the ingot down. It was my belief that the Mannesmann or some kindred process presented the most feasible solution of getting the cylindrical ingot in a sufficiently economical way, and after the ingot was obtained that some plant capable of cold-drawing the higher grades of steel was necessary to produce the finished tube. Experiment had shown that aluminum bronze was not to be economically worked, or even worked at all with many grades, on draw benches originally planned for copper or brass. The hardness and high tensile strength combined were found to be destructive to the dies used in the best hydraulic benches for brass and copper. It remained, therefore, for the combination of the casting plant of the Waldo Foundry, under the direction of its superintendent, Mr. E. S. Sperry, to furnish the solid billet; for the newly-introduced Mannesmann plant at the rolling mills of Benedict & Burnham at Waterbury, under the superintendence of Mr. Chas. S. Morse, to convert the solid ingot into a cylindrical tube; and for the new Pope Tube Works, built to cold-draw the nickel and other strong steels, under the superintendence of Mr. H. H. Eames, to convert the cylindrical tube billet of the Mannesmann process into the finished tube for the market. To these three gentlemen is due the success of the process.

The process of making the solid aluminum-bronze ingot has not yet been described. The system of solid hot tubular ingot-rolling known as the Mannesmann process is outlined in some detail at page 384 of the "Transactions, American Institute of Mining Engineers," Vol. XIX., 1891. The Benedict & Burnham Co. have introduced benefiting changes in the details of the process there described, and the Waterbury plant is a model of its kind. From one to two minutes is the time required to reduce a solid three-inch billet to a cylindrical forging ready for the draw bench.

After leaving the Mannesmann rolls the cylindrical aluminum-bronze ingots were given several passes on the draw benches at Benedict & Burnham's, to lessen their size to a point where they could be taken by the Pope company's benches, as at that time completed, the larger Pope company's benches not yet being in place.

The new hydraulic cold-drawing plant of the Pope Tube Works is driven by two triple-expansion, single-acting Riedler pumping engines rated at 500 HP. each, but which can work up to 1,000 HP. each. The arrangement is designed by E. D. Leavitt, and an idea of the total efficiency may be had from the fact that 1 HP. is obtained for somewhat less than 12 lbs. of steam with 135 lbs. initial pressure. These engines work through two hydraulic accumulators having 16-in. rams, and working the 8 and 6-in. draw benches with a maximum pressure at the benches of 1,280 lbs. per sq. in.

Aluminum-bronze tubes require frequent annealing during the process of drawing, and this is especially true of the higher compounds, such as Cu$_4$A, which are as difficult to draw as nickel steel.

It is known that, up to the limit of commercial temperatures—say 400° to 500° F.—that aluminum bronze retains its initial strength. In this respect it shows its great superiority to ordinary brasses and bronzes.

Table I. gives the chemical analysis and the tests of the best brass tubes the market now affords, together with the tests of the same size tubes of open-hearth Swedish steel and a low aluminum-bronze—about Cu$_9$Al, or a 4½% bronze.

TABLE I.—Tests of Tubes at Ordinary Temperatures, Cold-Drawn and Not Annealed.

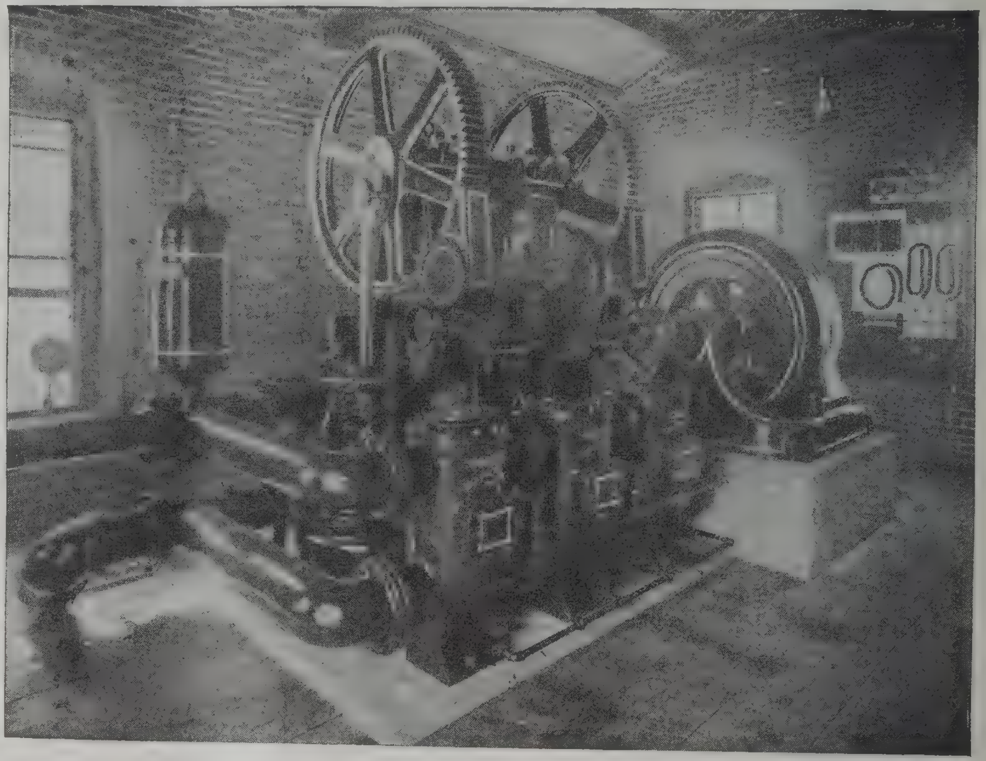
A THREE-PHASE ELECTRIC TRANSMISSION SUPPLYING BOTH LIGHTING AND FIRE-PUMP SERVICE.

An interesting three-phase power transmission plant, which furnishes current for both arc and incandescent lighting and for a 750-gallon fire pump, has been installed by the General Electric Co., at Itasca, Wis., just east of Superior, the headquarters of the Chicago, St. Paul, Minneapolis & Omaha R. R. Co.

The railway shops, roundhouses and storerooms are located at Itasca, and about a mile and a quarter distant extensive docks have recently been built, with a warehouse 1,500 feet long and 300 feet wide. Boats are loaded and unloaded on one side of the dock, tracks are laid on the opposite side, and the cars are loaded and unloaded at any point in the warehouse.

The protection of the warehouse from fire, and its lighting by arc and incandescent lights would have required, by the usual method, the installation at the dock of a complete plant of boilers, engines and their accessory apparatus, in addition to the fire pump and electric generator. By the plan adopted, the cost of an engine and boiler plant at the dock, together with the expense of its superintendence and a large part of the operating expenses, have been saved. By this plan the power for driving the pump and furnishing the lights is obtained from the railway shops in the shape of a three-phase current, produced by a General Electric 100 K. W. three-phase generator, at a pressure of 2,000 volts; this voltage having been adopted in order to do away with the necessity of step-up transformers. The engine is driven at 900 revolutions per minute, by a 110 H.P. Ball & Wood engine. The pumping plant installed at the dock is shown in the accompanying illustration. It consists of a 75 K. W. General Electric 2,000-volt induction motor, coupled to a Gould triplex pump of 750 gallons capacity per minute, operating at 80 lbs. water pressure and able to throw four effective fire streams upon the docks and into the warehouse.



AN ELECTRIC PUMPING STATION FOR FIRE PROTECTION AT THE DOCKS OF THE CHICAGO, ST. PAUL, MINNEAPOLIS & OMAHA R. R., ITASCA, WIS.

The inside of the warehouse is provided with five fire stations, fitted with electric fire alarm apparatus for transmitting signals between the docks and the engine house; also switches connecting the motor and pump to the power wires. Hydrants and reels are suspended from the walls, each reel having 100 ft. of hose, so that, after the fire signal has been given from the engine house, one man can carry hose and water to the fire in from 10 to 30 seconds. A fire corps has been organized, and the men are drilled three times each week. In addition to current furnished to the pump, the generator also supplies electricity to 12 alternating current arc lamps, 6 on each side of the dock, supported on brackets from the sides of the building. Over 200 16 c. p. lamps are required to light the warehouse; and in Itasca itself about 150 more 16 c. p. incandescent lamps are also installed.

RAMIE AND CANAIGRE IN MEXICO.

Sir Henry Dering, the English Minister to Mexico, has lately forwarded to the British Foreign Office, an extended report upon the vegetable products of Mexico, and the portion relating to the cultivation of ramie and canaigre is briefly abstracted as follows:

Ramie was introduced into Mexico from Java in 1867, and various companies are now engaged in raising the plant and extracting its fiber. There

* For 24 days.

are two distinct plants, China grass (Boehmeria nivea) and ramie, or rhea (B. tenacicsima), the stalks of which reach 3 to 5 ft. in height. The best climate for its cultivation seems to be one that has a mean temperature of 36° Fahr. and an altitude of about 800 ft. above the sea. The land must be damp or easily irrigated, rich in humidity and perfectly permeable so that the accumulated dampness may not rot the roots. The fiber produced is fine, silky and brilliant, and superior to all other vegetable fiber in length, strength and beauty. It is used in rope-making and in the manufacture of handkerchiefs, curtains, carpets, tablecloths, etc. Textiles made from it have the strength of linen, and a luster resembling that of silk.

The Mexican Department of Public Works says that from one square league of ground 1,936 tons of ramie can be produced and transported to New York for $203,007; and the price in New York is given as $250 per ton. The capital invested in this particular undertaking was $30,000 for machinery, in addition to the sum named above, or $233,007 in all.

A very interesting part of the report is that referring to canaigre, a tanning material of great value now grown extensively in Mexico, and in certain parts of the United States. This plant is known botanically as Rumex Hymenosepalus and it grows wild in western Texas, Arizona, New Mexico, Mexico and California. It is found generally on sandy loam and in moderately moist localities, and is described as a "many-headed root, black externally and yellow within." Its value lies in the fact that its tubers contain from 23 to 33% of tannic acid, and it has been fully proved to be a most valuable material for making leather. The Mexicans and Indians employ it to some extent as a purgative, and the leaves are used as food, having the general taste and properties of rhubarb, or "pie-plant."

Hemlock bark contains only 14% of tannic acid, and though canaigre has long been used by the Mexicans, both for medicinal and tanning purposes, its use as a substitute for hemlock bark has only recently attracted the attention of the general commercial world, as a valuable source of tannic acid. It is stated that one acre of canaigre, properly cultivated, will yield from 20 to 30 tons of green roots, equal to 7 tons of the dried material ready for shipment. The prices of this product are from $25 to $30 per ton in the United States, and $60 to $80 per ton in Europe. At the lowest estimate of both yield and profits, says the report, one acre of canaigre should bring in $175, and $225 is believed to be a safe and reasonable estimate.

The value of canaigre as a tanning medium is settled, and the only question now is to obtain enough of it at satisfactory prices. Sir Henry believes that an extract containing the tanning properties could be readily manufactured in Mexico, and money thus be saved in transport. The older the root the heavier is the percentage of tannic acid; roots one year old yield 20 to 25%, and older roots yield from 25 to 40%.

◆

THE U. S. BATTLESHIP "TEXAS," says Secretary of the Navy Herbert in an official statement, instead of being in any degree a failure, as has been currently reported, ranks with the best ships of her class in the world. He admits original structural defects in her hull and some of her machinery, but he says these defects have been remedied, except those relating to her water-tight bulkheads, as developed by the recent flooding of the vessel. The Department has issued orders to have these latter deficiencies made good and the work can be done in a few weeks at a comparatively small cost. Mr. Herbert also publishes a letter from Mr. Chas. H. Cramp, treating of the trouble with the "Texas." This letter says that the design submitted by Mr. John, the eminent English naval architect, was the best of all plans submitted at that time to the Navy Department; and though the scantling was light, this lightness was then in accord with the best foreign practice, and the "whole hull construction involved the best mechanical distribution of minimum weight" Mr. Cramp had ever seen. This lightness was a result of the introduction of steel and an undue faith in the effect of this then new material upon the general strength and rigidity of the hull, as compared with iron.

◆

THE BAZIN ROLLER-BOAT is now at Rouen, says the London "Telegraph," with its engines in place and all fittings nearly ready for the trial trip across the English Channel, which it is proposed to make in January next. M. Bazin is as sanguine as ever as to the success of his enterprise, and predicts that ships with rollers 65 ft. in diameter can cross the Atlantic in 96 hours. The experimental boat has three pairs of 32-ft. rollers, with a screw in addition.

◆

AN EXTRAORDINARY FEAT OF DEEP-SEA DIVING is reported from Hong Kong by "Chambers' Journal." In August, 1895, the steamer "Catterthun," on the way from Sydney to Hong Kong, struck upon a submerged rock and was sunk about 3 or 4 miles from Seal Rocks Bay, off the mainland of New South Wales. On board this ship were $45,000 in gold, and the insurance companies determined to make an effort to recover this treasure. Capt. John Hall, of Sydney, was commissioned to perform this service, and by skillful work he located the wreck and found that the bottom of the iron tank chamber containing the gold was 165 ft. below the surface of the sea. The door of the manhole was blown off by dynamite; but the hole was too small to admit a man in a diving dress. But after numerous failures seven boxes of gold were fished up in a kind of basket-net and $39,710 were thus recovered. The wreck was located by trailing a steel cable over the supposed route of the ship, and diver Briggs, with his assistant, descended 9 times to the deck of the ship in one day, remaining as long as 15 minutes on one occasion. Adverse weather, local currents and the extreme general difficulty of the operation consumed the time between May 4 and August 18, of the present year, in the recovery of the treasure after the wreck was located.

◆

A RAILWAY WITH SUBMERGED TRACK, at Brighton, England, called the Brighton & Rottingdean Electric Ry. was opened to traffic on Nov. 28. The peculiarity of this line, 3 miles in length, lies in the fact that the railway is located in the sea parallel to the coast line, and at high tide the road is operated in from 10 to 12 ft. of water. To meet this condition two parallel tracks, of 2 ft. 8½ in. gage each and 18 ft. between outer rails, are laid upon blocks of concrete deeply bedded in the beach and spaced 3 ft. apart. The car, with a capacity for 150 passengers, rests upon a platform supported by four tubular inclined posts, 24 ft. long and well braced at the bottom and top. At the foot of each of these posts is a four-wheeled truck completely boxed in to protect the wheels from obstruction. Down two of the legs pass two shafts, each driven by a 30-HP. electric motor, which takes current from an overhead wire. Down two other posts pass rods operating powerful brakes. The maximum speed attained in the official trial trip was 6 miles per hour. A somewhat similar railway, shorter but running in a much greater depth of water, has been in use for some years past in connecting two villages on the French coast, separated by a narrow tidal stream.

◆

CAR LIGHTING BY ELECTRICITY is in use on the express trains of vestibuled corridor cars now being run by the Southeastern Ry. (England) between London, Hastings and St. Leonards. Each train has five cars, each 50 ft. long, mounted on four-wheel trucks. There are 16 lights in the car, including 1 in the lavatory and 3 in the smoking room. Each car has its own dynamo and accumulators, the dynamo being driven by a 2½ in. link belt from a pulley on one of the axles. The novelty in the system is the means of getting constant voltage independent of the speed at which the train is going. Instead of allowing the speed of the dynamo to vary, and regulating the magnetic field to correct for this, the dynamo is suspended so that its weight gives the necessary tension to the belt. The weight of the machine and the torque on the armature then exactly balance each other at normal output. Any further effort causes the dynamo to be pulled nearer to the driving axle. This slackens the belt and allows it to slip over the dynamo pulley. Thus a condition of equilibrium is reached, and a further increase of speed is impossible. The armature connections are reversed with a reversal of direction of rotation. An automatic switch, worked by a small governor on the shaft, closes first the shunt circuit and then the main circuit as the speed incrases to the normal. The inverse operation takes place as the train slows up. The accumulators are placed in two wooden boxes under the middle of the car, one on each side. There are 16 of these to each car, the plates being contained in teak boxes. The dynamos on the car give about 35 amperes at full load. The lamps used throughout are of 10 c. p. at 30 volts, and are controlled from the attendant's recess. A switch turns on one-half or the whole of the lamps as may be required. The equipment was built by J. Stone & Co., to the specifications of Mr. W. Lennard, Telegraph Engineer of the Southeastern Ry.

◆

FOUR MONSTER DYNAMOS are now being placed in the Allegheny County Light Co.'s station at 12th and Elm St., Pittsburg, Pa., by the Westinghouse Electric Co. Each of the dynamos is 30 ft. long and 24 ft. high, and weighs over 110 tons. Each armature is 16 ft. 8 ins. diameter and weighs over 30 tons. Each dynamo is driven by a 2,000-HP. Westinghouse double-acting vertical compound engine. The four machines are designed to furnish current for 20,000 incandescent and 5,000 arc lights.

◆

A ST. LAWRENCE RIVER WATER-POWER PLANT is projected, to be established at Massena, N. Y., and it is said that 100,000 to 200,000 HP. can be developed. A canal will supply the inlet pipes, and the flumes from the turbines will discharge into Grass River, the difference in level between the two rivers being about 45 ft. Stewart & Co., of Wall St., New York, are said to be behind the enterprise; with Mr. John Bogart, M. Am. Soc. C. E., as Consulting Engineer, and Mr. James Patten in charge of the design of the electrical plant.

◆

WATER RIGHTS IN CALIFORNIA are not subject to charges in addition to the amounts paid for the water itself, according to a recent decision of Judge Ross, of the State Supreme Court. The decision was rendered in a suit brought by Mr. Chas. D. Lanning, Receiver of the San Diego Land & Town Co., against one of its consumers. The company sought, it appears, to collect money for the right to use water, as well as for water used. The state constitution provides for the fixing of water rates by County Boards of Supervisors, and the practice which the company sought to follow, and which others have followed, is considered as evading this regulation.

◆

GASOLINE PUMPING PLANTS are said to be under consideration by the Atchison, Topeka & Santa Fe R. R.

as substitutes for the present steam plants at the numerous water stations on the road.

◆

EXAMINATIONS OF ENGINEERS who are applicants for government engineering positions will be held by the Civil Service Commission at Washington, D. C., in January. Those who pass will be placed on the eligible list for the positions of inspector, surveyor, topographer, hydrographer, transitman, levelman, etc. Particulars may be obtained by addressing "The Civil Service Commission, Washington, D. C."

◆

LOCOMOTIVES FOR JAPAN are now being built by the Rogers Locomotive Works, Paterson, N. J., to general specifications prepared by the authorities of the Japanese Government Railways, the details of the design being prepared by the builders. There are 18 of these engines, all of the mogul type, with eight-wheel tenders. They are for tracks of 3 ft. 6 ins. gage. The leading dimensions are as follows:

Driving wheels	4 ft. 0 ins.
Truck wheels	2 " 4 "
Wheelbase, driving	11 " 6 "
" total of engine	18 " 8 "
" total of engine and tender	40 " 0 "
Weight in working order	92,000 lbs.
Cylinders	16 × 22 ins.
Valve gear	Stephenson link.
Boiler	Straight top.
" diameter	4 ft. 8 ins.
" thickness of barrel plates	9-16-in.
Working steam pressure	170 lbs.
Firebox	Radial-stayed.
" length	8 ft. 6 ins.
" width at grate	2 " 0 "
" width at crown sheet	3 " 9 "
" depth at front	4 " 8 "
" depth at back	4 " 0 "
Tubes, 173; diameter	2 "
Tubes, length	10 ft. 3 "
Capacity of tender tank	2,600 gallons.

◆

THE LARGEST FREIGHT CARS yet built are said to be two box cars for the Mansur & Tebbetts Implement Co., of St. Louis, Mo., and the Hutchinson Cooperage Co., of Peoria. They are of 40,000 lbs. carrying capacity and weigh about 40,000 lbs. The former has a truck wheelbase of 8 ft. and axle journals 4¼ × 8 ins. The top arch bars are 1¼ × 4 ins.; lower arch bars, 1⅛ × 4 ins.; tie-bars, ½ × 4 ins. The cars were built by the Missouri Car & Foundry Co., of St. Louis, Mo., and their dimensions are given as follows in an article in the "Car Jorunal":

	M. & T. I. Co.	H. C. Co.
Length over end sills	60 ft. 0 ins.	59 ft. 3 ins.
Width over side sills	8 " 10 "	9 " 2½"
Height from sill to side plate	9 " 2 "	10 " 9¾"
End sills	7 × 13 "	7 × 13 "
Center sills	4¾ × 9 "	5 × 8½"
Side sills	5¾ × 9 "	5 × 10 "
Intermediate sills	4¾ × 8 "	5 × 10 "
Transoms	11 × 5 "	....
Side plates	4 × 8 "	4 × 8 "
Number of truss rods	6	6
Diameter of truss rods	1¼ ins.	1¼ ins.
Diam. truss rods at upset ends.	1⅛ "	1⅛ "

◆

RAILWAY EMPLOYEES AS STOCKHOLDERS will be a feature of the Illinois Central R. R. Co., the directors having adopted plans by which its employees can purchase stock. The plan has been prepared by the President, Mr. Stuyvesant Fish, and over 1,500 applications have already been received.

◆

THE ABANDONMENT OF A RAILWAY LINE 30 miles long is recorded in the recent report of the Railroad Commissioners of Connecticut. The Meriden, Waterbury & Connecticut River R. R. was built eight years ago, and was leased to the New York & New England R. R. for the term of ninety-nine years from Sept. 1, 1892, at an annual rental of $22,500, though it had never earned its operating expenses. The rent was only paid till July 1, 1894, and the reorganization committee of the New York & New England R. R. purchased all the outstanding bonds, and delivered them to the New England R. R., which foreclosed the mortgage. The road was sold under order of the Court, and the New England R. R. ceased to operate it, nor has it been operated by the purchaser. Nothing has as yet, however, been done toward taking up the track or removing the bridges or disposing of the station buildings.

BOOK REVIEWS.

THE STORY OF THE MINE as Illustrated by the Great Comstock Lode of Nevada.—By Charles Howard Shinn. New York: D. Appleton & Co. 8vo.; pp. 272; illustrated. $1.50.

This is not a technical treatise upon mining operations, but an exceedingly readable sketch of the discovery of gold in California, and of the palmy days of silver-mining in Nevada. The author seems to write from the standpoint of intimate personal acquaintance with the pioneers and prospectors of '49; and in any event he has closely studied their character and tells of their personal peculiarities, their trials, suffering and success, or ill fortune, with a delightful freshness. As a history of gold-hunting in California, of bonanzas and of speculation in mining shares, as controlled by the ups and downs of famous mines, it is well worth reading. And the reader of this book will better appreciate the fact that for every dollar in gold or silver thus won there is a counter-balancing amount of human toil, privation, suffering and disappointment somewhere.

THE MECHANICAL WORLD POCKET DIARY AND YEAR BOOK FOR 1897.—Tenth Year of Publication. The "Mechanical World," Manchester, Eng. Boards; 4 × 6½ ins.; pp. 202. Price, 6d.

This little book contains a very good collection of useful notes, rules, tables and data, for the use of engineers, draftsmen, mechanics, etc., together with 52 blank pages for a diary, and about 30 pages of advertisements. The notes, rules, tables, etc., appear to be compiled chiefly from D. K. Clark's works and other English authorities.

RETAINING WALLS FOR EARTH, Including the Theory of Earth-pressure as developed from the ellipse of stress, with a short treatise on foundations, illustrated with examples from practice.—By Malverd A. Howe, C. E., Professor of Civil Engineering, Rose Polytechnic Institute, Member of American Society of Civil Engineers. Third edition revised and enlarged. New York: John Wiley & Sons. 12mo.; 132 pp.; illustrated; $1.25.

In this new edition Prof. Howe has added throughout the text a number of examples of retaining walls and foundations as taken from actual practice, and the treatise on foundations is entirely new. The latter, while very concise, covers the general principles of foundations upon rock, earth and soft earth, and the supporting power of piles. Foundations under water and deep foundations are also discussed and illustrated by existing examples. This work has been reviewed by us before and it only remains to say that it is made more valuable still by the revisions and additions.

CATALOGUE OF THE PUBLIC DOCUMENTS OF THE 53D CONGRESS and of all Departments of the Government of the United States for the Period from March 4, 1893, to June 30, 1895.—Prepared under the supervision of the Superintendent of Documents. Washington, Government Printing Office. Large 8vo.; pp. 638.

This is the "Comprehensive Index" provided for by the act approved Jan. 12, 1895, requiring the Superintendent of Documents to issue such an index at the close of each regular session of Congress. As the first issue of a work brought out with a newly organized staff, and in the absence of any previous systematic index of departmental documents, Mr. Crandall has done an excellent work. The arrangement of the Index is entirely alphabetical, covering authors and subjects, and sometimes titles. It is strictly a "dictionary catalogue," without index, side columns, or attempt at complicated chronological or numerical classification. But there are cross references, and with each subject or author is a brief synopsis of the matter dealt with; enough to give an idea of contents and the size and importance of the document. It is in itself an extremely valuable record of government publications, and so far as we have attempted to use it the arrangement is very satisfactory for the purpose intended.

CHEMISTRY FOR ENGINEERS AND MANUFACTURES.—A Practical Text-Book. By Bertram Blount and A. G. Bloxam. With illustrations. Vol. II., Chemistry of Manufacturing Processes. London: Chas. Griffin & Co., Ltd. 1896. 8vo.; pp. 484; $4.50.

We had occasion recently to review Vol. I. of this work, which treats of the chemistry of engineering, building and metallurgy, and expressed our opinion that it was too much condensed to be of great service to engineers engaged in any particular specialty. The same criticism might be made of this second volume, but the authors forestall it by the following paragraphs in their preface:

> The sole object of the chapters comprising this volume is to give the reader a general view of the principles which underlie the several manufactures described. It is in no way intended to present such an account of details as will suffice for the student of any particular industry, as indeed must be obvious from the size of the book.
>
> The usefulness with which the authors venture to accredit their work is to be found in the fact that it seeks to expound those dominant principles which are too often hidden beneath masses of mere detail, and are consequently apt to be overlooked by the specialist in any one branch, to his detriment, in that he frequently fails to apply to his own work principles which are matters of common knowledge elsewhere.
>
> These remarks are rendered necessary by the fact that the scope and intention of the first volume of this book appear to have been occasionally misunderstood.

With this explanation before us we are disposed to be rather lenient with this second volume. It treats briefly of the chemistry of the manufacture of sulphuric acid, alkali, artificial manure, lime and cement, glass, sugar and starch, oils, resins and varnishes, soap and candles, coloring matters, paper and pasteboard, pigments and paints, leather, glue and size, and minor chemical manufactures, also of destructive distillation, petroleum, clay industries, brewing and distilling, textiles and bleaching, and is probably as good a handy manual on this variety of subjects for the use of a general reader as can be expected in a work of its size. A bibliography at the end of the work is useful in giving sources of information for those who desire further details on any particular subject.

A TEXT-BOOK OF PLANE SURVEYING.—By William G. Raymond, C. E., M. Am. Soc. C. E., Professor of Geodesy, Road Engineering and Topographical Drawing, in the Rensselaer Polytechnic Institute. New York, Cincinnati, and Chicago: American Book Co. 8vo.; pp. 484; with illustrations and diagrams; $3.

In this work Prof. Raymond has set forth, in an exceedingly clear and simple manner, the whole art of plane surveying. It is especially designed as a text-book for beginners, leaving to the teacher the work of amplification rather than that of explanation of the subject. With the exception of two formulas only, a knowledge of trignometry is all that is required by the reader or student. The work commences with a very complete illustrated description of the instruments and appliances used, with directions for their adjustment and care, practical hints as to their handling, and the various degrees of accuracy attainable under different conditions of use. This matter takes up the first 140 pages and includes an excellent special chapter on stadia measurements. Land survey computations follow, with a full treatment of the computation of areas by the modern method of co-ordinates; and in this connection there is an illustrated description of the use of planimeters of various types, and an unusually full treatment of the slide-rule, as designed by Gunter, Mannheim, Thacher and Fuller, with clear directions for their use. Book II. applies to general surveying methods, presenting and discussing common problems of land surveying, for both private and public lands and for city work. The laying out of curves is briefly described, in principle and practice, and then follow topographical surveying, simple triangulation and map-making, including the use of the plane-table, etc. Chapter X. takes up earthwork computations, by ordinary methods and by estimation from maps. Under the head of hydrographic surveying are described the methods and location of soundings, the use of the sextant, and the measurement of velocities and discharge. Underground surveying, for mines, etc., and the instruments and methods employed, complete the more technical portion of the work. In an appendix are included a large number of problems and examples, and articles on the judicial functions of surveyors, the ownership of surveys, and the geographical positions of base lines and principal meridians governing the public surveys. A full series of tables applicable to land surveying finish the volume, including those of the common logorithms of numbers and the logorithms of trigonometric functions. This work is to be especially commended for the fullness and clearness of its text, its excellent illustrations, and its modern treatment of the problems of plane surveying.

AMERICAN HIGHWAYS.—A popular account of their conditions and of the means by which they may be bettered. By N. S. Shaler, Dean of the Lawrence Scientific School of Harvard University. New York: The Century Co. 12mo.; cloth; 293 pp.; illustrated; $1.50.

Prof. Shaler, as a member of the Massachusetts Highway Commission, engaged in the actual work of laying out and building country roads in that state, and as a geologist and a close student of roadway practice here and in Europe, is well fitted to write upon this subject. Commencing with a general history of roadmaking, from the Romans to Telford and Macadam, this work takes up the early American roads, and the effect of climate and influence of topography and forests upon roads. The nature and distribution of road materials and their method of use are very fully discussed by this competent authority; and as these materials cover about all that is available in almost every section of the United States the hints given as to their best use and the methods for testing their suitability for roadmaking purposes, are exceedingly valuable. The difficult problem of road maintenance, by the government, by states and by private corporations, is next taken up, with an expressed preference for state administration, somewhat after the manner adopted for Massachusetts and here described. The preliminary study for and the construction and repair of roads forms another long chapter, teeming with practical suggestions and advice deduced from modern practice. Supplementary to this is another chapter on road administration and inspection, the Commonwealth system being here again advocated. Following this are chapters on road machines, cost of road-building and the importance of specific training and education in highway engineering. In his summary and conclusions Prof. Shaler says that the failure of the Americans to attain success in the management of their highways is not due to any lack of public spirit or to any incapacity to deal with public affairs, but is mainly to be ascribed to the exceeding popular ignorance as to the nature and value of good roads. Consequently the first important step towards the amendment of our system is the education of the people as to the means whereby roads may be improved. His book is one of the best means towards this end; for while it is written for popular use, it is the work of one who knows whereof he speaks, and it is quite as useful, in its practical hints and directions, to the engineer as it undoubtedly is to those who wish to be better informed as to the material value of good roads as compared with bad ones.

ENGINEERING NEWS
AND
AMERICAN RAILWAY JOURNAL.

Vol. XXXVI., No 27.

TABLE OF CONTENTS.

ENGINEERING NEWS OF THE WEEK........425, 440
- Movable Dams on the Great Kanawha River, West Virginia (illustrated)... 426
- Comparative Cost of English and American Boilers. 427
- The Woodiline Preservative for Ties and Timber (illustrated).... 428
- A Let-Down Step for a French Railway Car (illustrated) ... 428
- A Hydraulic Ram Plant for a Public Water Supply (illustrated) ... 429
- The Mira River Bridge, Nova Scotia (illustrated).. 430
- A Method of Determining Selling Price........... 430
- New Terminal Station of the Canadian Pacific Ry., at Montreal (illustrated). ... 434
- Timber and Wood Consumption in the Comstock Mines...... 434
- Proposed Sanitary Supervision of Water Supply and Sewerage Systems in Illinois.................. 435
- Notes of a Transcontinental Trip (illustrated).... 436
- Derailing Device for Protecting Street and Steam Railway Crossings (illustrated)....... 437
- A Hoisting Engine with a Novel Valve Gear (illustrated) ... 438
- Contraction and Deformation of Iron Castings in Cooling from the Fluid to the Solid State....... 438
- Notes from the Engineering Schools............. 439

EDITORIAL NOTES... .. 432
- The Mining Industry and the Timber Supply—A Proposed State Sanitary Supervision of Municipal Water Supply and Sewerage Systems in Illinois.

EDITORIAL.

- The Principles and Policy of Engineering News.... 432

LETTERS TO THE EDITOR.......... 433
- Formulas for Bridge Expansion Joints, Correction—Wooden Barrel Outlet Sewers Used at New York City (illustrated)—Dynamite Exploded by Warming.

THE ROEBLING CONCRETE FLOOR, whose test by fire was described in our issue of Nov. 5, was subjected to a test load of 4,000 lbs. per sq. ft. on Dec. 11, by the Building Department of New York city. As shown in the report in our issue of Nov. 5, the floor forming the roof of a brick building, 12 × 16 ft. floor area and 12 ft. high, was made of 10-in. I beams, 25 lbs. per ft., spaced 4 ft. between centres, with concrete arches 3 ins. thick at the crown sprung across the space. The concrete was made of 1 part Aalborg Portland cement, 2 parts sand, and 5 parts ashes from steam boiler furnaces. A wood fire was maintained under this floor for five hours, during the last three of which it was held at over 2,000° F., and at the end of the time a stream of water from a fire engine was applied to the under side. During this test the floor sustained a load of 150 lbs. per sq. ft. On the next day the load was increased to 600 lbs. per sq. ft. without injury.

A test of the floor to destruction was determined upon by the builders. The test was begun on Dec. 11, and continued on Dec. 12 and 14. A section of the middle arch 4 ft. wide between the I beams, and 2 ft. 6 in. in length, making 10 sq. ft. area, was isolated from the remainder of the floor by cutting openings at each end of its length. On this section a brick pier 1 ft. high was built, and over it was placed a platform of heavy plank 7½ ft. square. This was loaded with brick and stone until 40,000 lbs. was supported by the loaded area of 10 sq. ft., or 4,000 lbs. per sq. ft., when the load became so top-heavy it was considered dangerous to continue the test further. The deflection of the center of the arch under this load was just one inch; after the load was removed it decreased to ⅝ in.

◆

A TEST OF A CONCRETE FIREPROOF FLOOR constructed by the Columbian Fireproofing Co., 156 5th Ave., New York city, was made by the Building Department of the city at 68th St. and Avenue A on Dec. 23. The test was conducted in the same manner as the other tests that have been made by the department during the last four months, which have been described in our columns. The floor was loaded to 150 lbs. per sq. ft. and subjected to a heavy fire for five hours, and then suddenly cooled by a stream from a fire engine. The floor sustained its load throughout the test, the maximum deflection being about 3 ins. We shall give in next week's issue a more detailed account of this test, with a drawing showing the construction of the floor.

◆

A LIMIT FOR THE HEIGHT OF BUILDINGS is demanded by the New York fire and health officials, in answer to queries submitted by the Committee of the New York Board of Trade and Transportation now investigating this subject. The Fire Department favors a limit of 85 ft., as provided for in the building laws. So-called fireproof buildings do not come under this law and some of them are 300 ft. high. Chief Bonner does not believe these buildings are fireproof, and said that when the height exceeded 125 ft. there should be an auxiliary fire plant on each floor handled by trained men. He recommended that no office building be more than 12 stories high for a street not less than 85 ft. wide; commercial buildings should not exceed 10 stories, with 70 ft. as a minimum street width; and apartment house 7 stories on a 60 ft. street. The Board of Health objected to high buildings from a sanitary point of view, stating that they restricted sunlight; they made artificial light necessary, and were difficult to supply with good water on the higher floors. Statistics were submitted showing that in all foreign cities there were restrictions keeping the height below the width of the streets, and that the greatest height, 82 ft., was in Vienna.

◆

THE BOSTON TERMINAL PLANS have been submitted to the mayor for approval, and are found to embody some highly interesting features. There will be two floors, one slightly above and the other slightly below the street level, reached by easy inclines instead of stairs. On the upper level will be 28 parallel tracks, leading out to two four-track main lines (one for the New York, New Haven & Hartford R. R., and one for the Boston & Albany R. R.). On the lower level is a double track loop with three platforms, this being intended for the suburban traffic (which, it is expected, will be operated by electric traction). Each of the two tracks can accommodate 20 cars. No switching will be required, the trains coming in on the two inbound tracks, passing round the loop, and going out on the two outbound tracks. The trainshed will be 700 ft. long and 650 ft. wide, having a central span of 228 ft 6 ins., and two side spans of 165 ft. 9 ins. The plans have been prepared by Mr. George B. Francis, M. Am. Soc. C. E., Resident Engineer for the Boston Terminal Co.

◆

THE EAST RIVER TUNNEL scheme has received the approval of the Railroad Commissioners, and the New York & Brooklyn R. R. Co. has been authorized to proceed with the work of construction. The tunnel is proposed to extend from Fulton St., Brooklyn, to Ann St. and Broadway, in New York city. Messrs. Sooysmith & Son, of New York, are the consulting engineers.

◆

THE MOST SERIOUS RAILWAY ACCIDENT of the week, and the worst that we have had to record for some time, was the derailment of a local train on the Birmingham Mineral R. R., near Birmingham, Ala., Dec. 27. The train was derailed on the Cahaba River bridge, and fell to the ground, 120 ft. below. The wreckage caught fire, and 23 persons were killed by the fall or in the burning of the wreck. It is said that train wreckers had loosened or taken up a rail. The bridge is about 800 ft. long, with a central span of 110 ft., and was built four years ago.

◆

A LOCOMOTIVE BOILER EXPLOSION occurred Dec. 19 on the St. Louis, Iron Mountain & Southern Ry. at Gad's Hill, Mo. Two men were killed and one injured. The engine was standing on a sidetrack at the time.

◆

A GRADE CROSSING COLLISION between an electric car and a passenger train of the Central R. R. of New Jersey, occurred Dec. 25, at East Allentown, Pa. The conductor signaled the motorman to come on, and then saw the train, but too late to warn the motorman. The train struck the front end of the car, killing the motorman and injuring five of the passengers.

◆

THE MIAMI & ERIE CANAL broke its bank near Dayton, O., recently, and the water ran out into the Miami River. It is said that the bank had been badly weakened by rats.

◆

THE FERRYBOAT "NEW BRUNSWICK," of the Pennsylvania R. R., was burned at her slip in Jersey City on Dec. 28. The boat was burned in 1889 and was then rebuilt as a double deck boat. It was one of the older type, having sidewheels instead of twin screws.

◆

A COLLIERY EXPLOSION occurred Dec. 26 in the mine of Maule & Son, at Princeton, Ind., by which six men were killed and eight injured.

◆

A FIRE IN A WORKED-OUT COAL MINE, located in the 13th Ward of Pittsburg, Pa., is causing much trouble to the authorities of that city, who have thus far failed to check it. It is now proposed to call in consultation a number of mining experts, including the State mining inspectors, and to act according to their advice.

◆

A STRIKE OF EMPLOYEES occurred last week on the West End Street Ry., of Boston, Mass. Traffic on the suburban lines was largely stopped for a time, but cars were running again as usual by Dec. 26. The company employed many new men, and is giving them preference over the former employees who apply to be reinstated.

◆

THE SOUTH 22D ST. BRIDGE, in Pittsburg, Pa., completed less than one year ago, is said, by the Pittsburg "Dispatch," to show two cracks in each of its piers, and some settlement of the foundations is feared. The matter is being investigated.

◆

ENGLISH RAILWAY ACCIDENTS are reported upon by the Board of Trade for the 6 months ending June 30, 1896. These accidents to trains, rolling stock, permanent way, etc., caused the death of 2 passengers and 1 employee and 54 passengers, 49 employees and 5 other persons were injured. In the 6 months there were 9 collisions between passenger trains or parts of them; 15 collisions between passenger trains, and goods trains or light engines, and 13 collisions between goods trains, or parts of such trains. Trains running into stations at too high a speed, and into buffers or vehicles at rest, injured 20 passengers and 3 employees. There were 33 cases of passenger trains leaving the rails, and 8 similar cases for goods trains. In addition to the above, there were reported 259 failures of tires, 136 failures of rails, and 79 failures of axles in the 6 months. Of the axles failing, 50 were locomotive axles, and of these 31 were crank, or driving axles, and 18 trailing axles. The failing rails were all steel, except 4, and of these 36 were double-headed (of which 24 had been turned), 77 were single-headed, and 23 were Vignoles rails. The average mileage of the 13 iron crank axles that failed was 269,511 miles; that of 18 failing steel crank axles was 267,550 miles.

◆

SOME BADLY SCAMPED SEWER WORK at Manchester, Eng., is described in the London "Surveyor" for Nov. 6. Extensive sewer building has been under way for some time past under the direction of the Rivers Committee. A recent report by the city surveyor describes the character of some of the work done. The "Surveyor" says that "miles of sewers have been formed of half, or even less than half, the correct thickness," and presents illustrations showing vacant spaces about the sewer lining nearly as large as the sewer itself.

◆

A DEVICE FOR TESTING THE TIGHTNESS of sewerage plumbing work of houses and other buildings is now being made by the Rossman & Bracker Co., plumbing contractors, 132 East 42d st., New York city. While we have not seen the machine in operation, the descriptive matter sent out by the makers indicates that it is a handy and serviceable apparatus for use where either the smoke or peppermint test of completed plumbing is ordinarily employed. The essential part of the device is a series of trays for developing a dark-colored vapor, with or without a pungent odor, and a 13-in. fan blower, driven by a hand crank, for forcing the vapor into the pipes to be tested. The vapor, when odorless, is formed by passing air over muriatic acid and then over ammonia. When a pungent odor is desired a third pan, filled with ether, is used. The trays and fan, with spaces for tools, are placed in a box about 28 in. sq. and 18 in. high, with the crank and wheel on top, and the whole mounted on a tricycle for convenience and rapid transportation.

◆

IMPROVEMENTS TO THE GARBAGE DISPOSAL plant of the St. Louis (Mo.) Sanitary Co. must be made within six months, in accordance with a recent court order. The order is the result of a suit brought by citizens to compel the closing down of the works on the ground that the odors arising from the plant constitute a nuisance.

◆

INVESTIGATION OF MUNICIPAL OWNERSHIP OF gas works in Brooklyn was voted down, 16 to 8, by the aldermen on the day following the adoption of a resolution ordering such an investigation by the aldermen of New York city.

◆

THE 4-CT. STREET RAILWAY FARE ORDINANCE in Chicago, recently passed, has been vetoed by the Mayor, and the veto has been sustained by the council. The Mayor urges that better service is needed more than lower fares, and that it would be delayed by the proposed reduction. He also advocates the exacting of a percentage on the gross receipts of street railway companies.

◆

THE DISADVANTAGES OF DRAWBRIDGES near railway terminals are commented upon by some of the Boston papers in connection with the new Boston Terminal Station, in consequence of a recent disabling of the low level bridge carrying the present lines over the Fort Point channel, which channel will be crossed by the line to the new terminal. It is suggested that the railway should be elevated so as to allow mastless vessels and barges to pass under it, or else that the channel should be filled in.

◆

THE ALABAMA IRON EXPORT TRADE is rapidly developing, says a Birmingham, Ala., news item. This opinion is based upon the fact that the Tennessee Coal, Iron & Railway Co., the largest iron producer in the South, in November last sold more iron to foreign consumers than to the home trade. The exact figures are not given, however, and without them the statement means little.

◆

A NEW PIG IRON TONNAGE RECORD has been made by the Carnegie Steel Co.'s new furnace, No. 1, located at Duquesne, Pa. In 30 days it produced 17,195 gross tons, an average of 574 tons per day. Two of the Duquesne furnaces are now in operation, and two others are in an advanced stage of construction.

MOVABLE DAMS ON THE GREAT KANAWHA RIVER, WEST VIRGINIA.

The construction, operation and general appearance of the movable dams, now being built by government engineers on the western rivers, will be novel and interesting to many engineers. As a rule the greater part of the trestles and wickets forming these dams are placed by divers after the coffer dams are removed, and the photographs here reproduced are the first we have ever seen that show clearly the various parts of the dams connected and in position. We are indebted to the courtesy of Mr. Addison M. Scott, U. S. Resident Engineer, for the use of these photographs and for the general elevation, and the notes which we have made use of in describing this work.

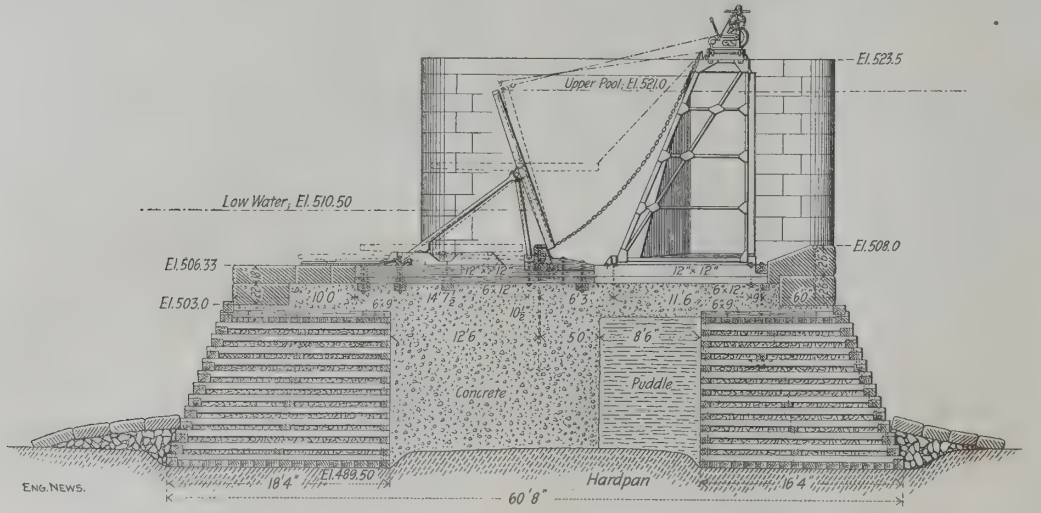

FIG. 1.—GENERAL SECTION OF NAVIGATION PASS, WITH CENTER PIER IN ELEVATION; GREAT KANAWHA RIVER IMPROVEMENT.

Dam No. 11, where these photographs were taken, is within 1¾ miles of the mouth of the river and is the lowest lock and dam in the Great Kanawha system. While all the other dams are founded upon rock, lying from 5 to 13 ft. below low water, this dam rests upon a compact indurated clay, or hard pan, lying from 19 to 24 ft. below low water mark. The character and depth of the river bottom at this point called for a material modification in the foundation plans; and the methods plainly shown in Fig. 1 were adopted.

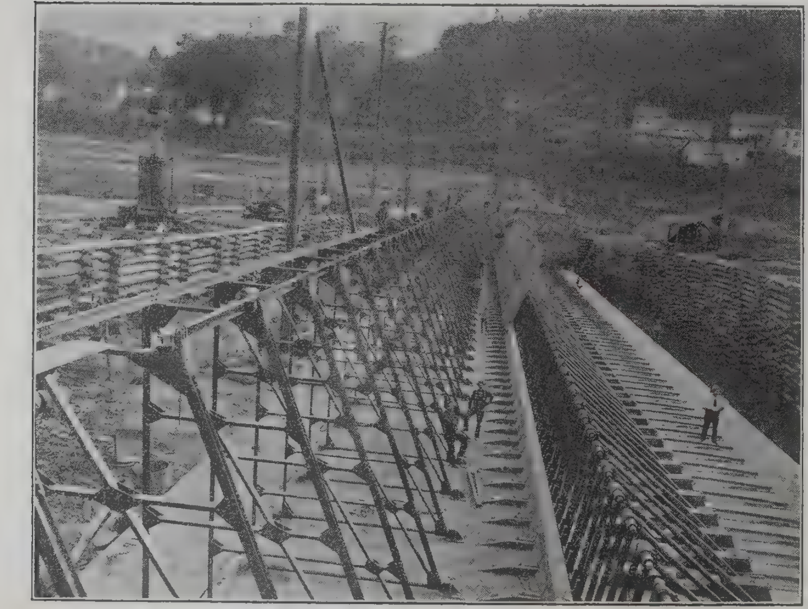

FIG. 2.—NAVIGATION PASS, DAM NO. 11; LOOKING TOWARDS LOCK, FOOT-BRIDGE TRESTLES AND WICKET-TRESTLES RAISED AND PART OF THE WICKETS IN PLACE.

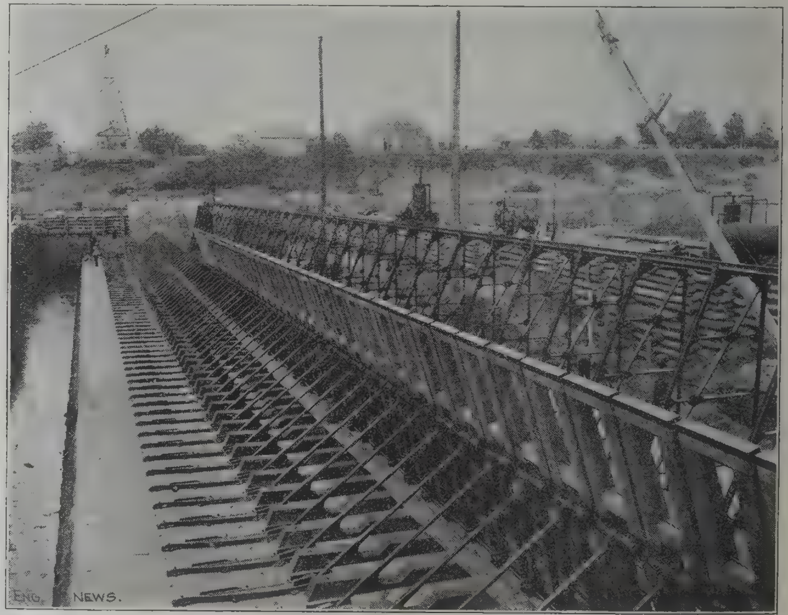

FIG. 3.—NAVIGATION PASS, DAM NO. 11, LOOKING TOWARDS CENTER PIER; SHOWING UNDER SIDE OF WICKETS AND WICKET-TRESTLES, AND THE PASQUEAU HURTERS.

It may be stated here that the improvements on the Great Kanawha River when completed will include ten locks and dams, covering 90½ miles of the river. The two upper dams in this system are fixed, with a maximum lift of 12 ft.; but all below that are movable with lifts varying from 6½ to 10 ft., and giving a navigation pass generally 248 ft. wide, and a weir from 210 to 372 ft. wide. Dam No. 11, however, provides a pass 304 ft. wide, and Dam No. 5 has a pass 250 ft. wide. With the fixed and movable dams are locks, 50 ft. wide at Dam No. 6, and 55 ft. wide below that, and 342 ft. long between quoins for all locks below Dam No. 6, inclusive. Locks and dams Nos. 4 and 5 were completed and put into operation in July, 1880, and were the first movable dams for slackwater navigation in America. Three other movable and the two fixed dams have also been completed and three others are now under construction. This improvement of the Great Kanawha River is mainly designed to facilitate the transport of coal carried down the river in barges usually 130 ft. long by 25 ft. wide, and drawing 6½ ft. The minimum low water depth on mitersills is 7 ft.

Returning to the description of Dam No. 11, we find a navigation pass 304 ft. wide closed by 76 Chanoine wickets operated by a service bridge. These wickets are 14 ft. 1 in. long and 3 ft. 8 ins. wide each, with their tops 13 ft. vertically above the sill. The bridge trestles are 8 ft. apart between centers, and they are 16 ft. 10 ins. high; thus placing the foot-bridge 2 ft. 6 ins. above the level of the upper pool, with the wickets closed. With the exception of the La Mulatiere dam, at Lyons, France, which has wickets 14 ft. 3½ ins. long, these are the largest wickets ever built.

The lowering of the wickets is performed by means of the winch and chains shown in Fig. 1. Each wicket is first put on the swing, as shown by the dotted lines, and then pulled up-stream far enough to free the end of the prop from its seat in the Pasqueau hurter, and it is then lowered by the winch and butt chain. This method is shown in Fig. 1; but the general Kanawha River practice is to place a clutch and double line over the top of the wicket, as is shown, and to pull the standing wicket by the top until the prop is free, and then to disengage the clutch and let the wicket fall. The advantage of the second method is a great saving in time, as the operation of lowering can be done in about one-fourth of the time, and the two or three hours thus saved may be of great importance when a quick rise in the river occurs. No injury is done to the wickets by this method, as the water below soon checks the rapidity of the fall, and the wicket settles down on the cushions without any noticeable shock. As is more plainly shown in the photographs, the bottom of each wicket-trestle is hinged to the dam and the top carries two journals, upon which the wicket is articulated, and a third journal which carries the prop for supporting the wicket. When the wickets are down the wicket-trestle and the props lie in the same line on the floor and the wickets themselves lie flat above them. When the dam is to be raised, a strong pull on the up-stream end of the wicket raises the trestle and the wicket and the prop follow until the foot of the latter drops into the notch in the hurter provided for it. The up-stream end of the wicket is then depressed until it strikes the wooden sill shown, and the wicket stands in a nearly vertical position and does duty as part of the dam. The wickets, when raised, do not touch each other by one or two inches, and this space is usually closed by a scantling dropped into the opening on its diagonal.

The peculiarity of the Pasqueau hurter here employed is that the prop pursues one path while the trestle is rising, and another while it is being lowered. In the rising path is the notch, or step which engages the prop, when it has reached the proper height, and holds the wicket firmly. When the trestle is pulled slightly up-stream, however, the foot of the prop follows and reaches a point where the track terminates; it then slides sideways into the second and unobstructed track and moving down it, allows the trestle and wicket to fall freely. As will be seen in the photographs, the trestles carrying the operating foot-bridge are also hinged on the line of the dam, and when the wickets are all down and the navigation pass is opened these trestles can also be let fall so as to fold one over the other and present no obstruction. For a more detailed description of the operation of these dams we would refer our readers to a paper read by Mr. Scott before the American Society of Civil Engineers and published in the Transactions, vol. xxxi., p. 539.

The construction of the lock and dam here described was commenced in 1893. At the present time the lock masonry is nearly completed and the navigation pass is practically so, and since the photographs were taken the cofferdams have been removed. Assuming a fairly good season for river work the locks and dams Nos. 9, 10 and 11 will be completed next year. From the beginning of work upon this slackwater improvement, in 1874, up to 1894, Gen. William P. Craighill, the present Chief of Engineers, U. S. A., was in charge of this work. Since 1894 Col. Peter C. Hains, Corps of Engineers, U. S. A., has had charge. The construction of dams Nos. 9 and 10, with their locks on this same stream, were described and illustrated in our issue of Aug. 13, 1896.

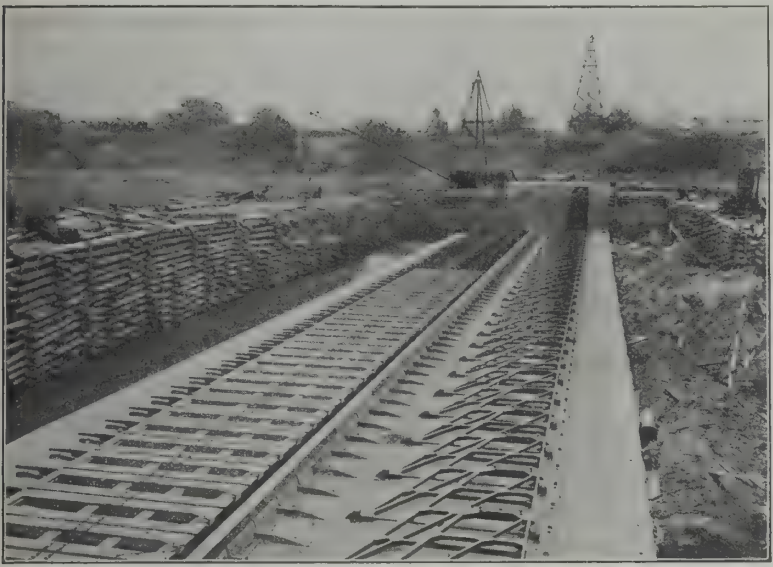

FIG. 4.-NAVIGATION PASS, DAM NO. 11, LOOKING TOWARDS CENTER PIER; WICKET AND OPERATING BRIDGE TRESTLES LOWERED. ONLY PART OF THE WICKETS IN PLACE.

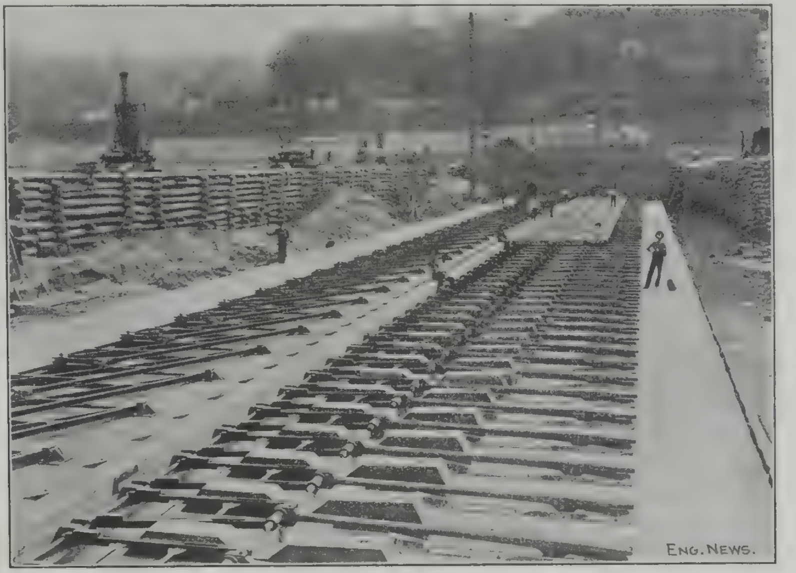

FIG. 5.—NAVIGATION PASS, DAM NO. 11, LOOKING TOWARDS LOCK; WICKET-TRESTLES AND PROPS DOWN; SHOWING THE CONSTRUCTION OF THE WICKET-TRESTLES AND THE PROPS AND HURTERS.

* * *

COMPARATIVE COST OF ENGLISH AND AMERICAN BOILERS.

We have received some data from Mr. Geo. I. Rockwood, M. Am. Soc. M. E., of Worcester, Mass., who has recently returned from a three months' visit to Europe, concerning the relative prices of steam boilers in England and in the United States, which are of interest as illustrating the wide difference in the practice of the two countries. Comparing the ordinary horizontal fire-tube externally fired boiler, which is most common in this country but is almost unknown in England, with the Lancashire internally fired boiler, which is the old-time English favorite but is not used at all in this country, Mr. Rockwood says:

> In Worcester or Boston the price, for instance, of a 72-in. × 20-ft. horizontal return tubular fire-tube boiler, f. o. b. cars, with all fixtures, is $1,000. This boiler has about 2,000 sq. ft. of heating surface, giving, at 12 sq. ft. allowed for one boiler horse power, a total of 166 HP. $1,000 divided by 166 gives $6.25 as the cost per HP. The price of a 66-in. × 18-ft. boiler, f. o. b. cars, with all fixtures, is $800. This boiler has about 1,550 sq. ft. heating surface, or 130 HP. $800 divided by 130 gives again $6.25 as the cost per HP.
>
> These boilers are made to first-class specifications having ½-in. shells of best fire-box steel, triple-riveted butt-strap joints, with rivet holes drilled. They are guaranteed "drop-dry" at 225 lbs. water pressure, and to withstand a working pressure of 150 lbs. steam all their lives.
>
> Now the price quoted me for the 8 ft. diam. × 30 ft. length Lancashire boiler was 20% and 2½% off from £585 [(585 — 117) — 11.7] = £456.3. Calling £1 $4.90 in round numbers, gives $2,235, f. o. b. cars, as the cost of the Lancashire boiler in American money. The total heating surface is 1,080 sq. ft., which makes the boiler cost $2.07 per sq. ft. as compared with 52 cts. a sq. ft. for each of the two American boilers; thus the Lancashire boiler is about four times as expensive per sq. ft. of heating surface. But, on the other hand, the heating surface of the English boiler is more effective than it is in the return tubular boiler; not only because the Lancashire fire-box is inside instead of outside the shell, but also because of the higher temperature at which the flue gases escape.
>
> The claim is made that the English boiler will evaporate economically 6,500 lbs. of water from and at 212° per hour, the maximum evaporation being 8,000 lbs. Taking 8,000 lbs. = 230 boiler HP. gives 2,235 ÷ 230 = $9.75 as the cost per HP. If we take the maximum power of the 66-in. × 18-ft. boiler as 175 HP. (obtained with a combustion of 18 lbs. of coal per sq. ft. of grate per hour) then the comparative cost of the American boiler is less than half that of the English type. Whether the Lancashire boiler could be made in the United States at a price less than it can be purchased for now in England is an open question, as we have no data or experience from which to form an opinion; it seems to me not impossible, as the prices of all steam goods in this country are so much depressed by the severe domestic competition which has developed at a rapid rate within a comparatively recent period.
>
> The only internally-fired boiler which is used much in the factories of the United States—the Manning type—is still much cheaper than the Lancashire boiler, costing but $7.70 per HP. when built for the highest pressures, and requiring no brick work. The item of brick work should also be considered in estimating the comparative cost of the return tubular and Lancashire boilers. On account of the great weight per HP. of the Lancashire when filled with water, and also on account of its great length, 30 ft., it is necessary to provide much deeper and better foundations for it than we provide for the American type, and in addition, separate brick return-flues must be used for the Lancashire, as it is not economical to operate the boiler without the use of an economizer. The reason for this appears when one takes into account the relative cost of the heating surface in the Lancashire boiler and in the Green economizer. The cost of the economizer, all erected ready to be operated except for the brick setting, is 30 shillings per tube, $7.35. This makes the cost per square foot of heating surface 73 cts., as the tubes are 4 ins. diam. × 10 ft. long, and thus have about 10 sq. ft. of surface per tube. As the heating surface in the boiler costs 8.4 shillings, or $2.07 per foot, whereas that in the economizer costs 3 shillings or 73 cts. per foot, it is plainly to the advantage of the Englishman to buy as much economizer and as little boiler as he can use. The dividing line comes in at about the middle of the whole amount of surface needed; that is, the economizer is given the same number of square feet of heating surface as is provided in the boiler.
>
> In this country the economizer costs something more than double the cost of the boiler per square foot of heating surface, and is, therefore, of more specialized utility than must be the case in England.
>
> It should be said that brick work is done far cheaper in England than in the United States, a "one hundred yards" chimney costing less than half what we should pay. The same ratio of cost obtains, of course, in brick boiler settings.

To further exemplify Mr. Rockwood's comparison we may compare the combination of the Lancashire boiler and its economizer, which will evaporate economically 6,500 lbs. of water per hour from and at 212°, with an American tubular boiler designed to do the same work without an economizer; one horse power being taken at 34½ lbs. evaporation per hour from and at 212°, and American practice giving 12 sq. ft. of heating surface per HP. This gives an evaporation of 2.875 lbs. per sq. ft. of heating surface per hour. The American boiler would, therefore, have 6,500 ÷ 2.875 = 2,295 sq. ft. heating surface, which would ordinarily be furnished in two boilers. At the price given by Mr. Rockwood, 52 cts. per sq. ft., this would cost $2,295 × $0.52 = $1,193. The English boiler for the same service would have 1,080 sq. ft., costing $2,235. But the English boiler, in order to operate economically, needs to be provided with an economizer. The heating surface of the required economizer is equal to that of the boiler, or 1,080 sq. ft., at 3 shillings or 73 cts. a foot, equals $788, which, added to $2,235, gives $3,023 as the cost of the boiler and economizer without brickwork, or nearly three times the cost of the American boilers.

As to the relative economy of fuel of the two systems, there is probably little difference. The American boiler, when run at an economical rate of less than three lbs. evaporation per sq. ft. of heating surface, will discharge its gases at about 400° F. The Lancashire boiler will discharge them at 800° or 900°, and the economizer will, when it is kept clean, reduce them to 300°, an advantage of 100° in favor of the English system. The English system undoubtedly has the advantage on the points of safety and durability, and it is a characteristic of the Englishman that he is willing to pay a good round price for what he considers the best article, while the American is apt to consider first cost as the prime consideration.

* * *

HOLLOW FORGED STEEL SHAFTS, made by the Bethlehem Iron Co., South Bethlehem, Pa., have been introduced on stern wheel steamboats on the Ohio and Mississippi Rivers. The company recently closed a contract with the Pittsburg & Cincinnati Packet Line, of Cincinnati, O., for a hollow forged nickel steel oil tempered shaft, 38 ft. 9 ins. long, 14 ins. outside diameter, with a 7-in. hole running through it. Such a shaft is 3,500 lbs. lighter and 3½ times stronger than the solid wrought iron shaft which ordinarily would be placed in such a vessel. This shaft is for a new vessel which the line is having built by the Cincinnati Marine Railway Co., of Cincinnati, O. A similar shaft is to be put into the new steamer which the Mississippi Valley Packet Line, of New Orleans, La., will shortly build.

THE WOODILINE PRESERVATIVE FOR TIES AND TIMBER.

In most of the processes of treating railway ties and timber with preservative compounds, considerable time and care are expended in first extracting the sap and then forcing in the preservative compound under heavy pressure, such processes requiring the establishment of extensive and costly plants. A process which is now being brought to the attention of railway officers, and which has already been used to a large extent by a prominent eastern railway, consists in immersing the timber in a hot bath of a liquid called woodiline, which readily penetrates even such hard wood as white oak. The actual composition of the liquid is not made public, but we are informed that it is a mixture of certain powerful antiseptics with wood-creosote, and other ingredients. The liquid is said to solidify and harden after entering the timber, so that the timber is not only made materially tougher in its outer fibers, but the wood-creosote is not liable to be washed out under the action of moisture, or to be evaporated. While the best method for impregnating the timber is by dipping it into the liquid, good results have been obtained by applying the preservative hot, with a brush, three coats being used. Some 800 gallons were used in this way in treating the white oak ties and guard timbers used on a bridge built by the Cincinnati, New Orleans & Texas Pacific Ry. over the Cumberland River last summer. Which ever way is used, the cost per tie varies from 15 to 19 cts., including material and labor.

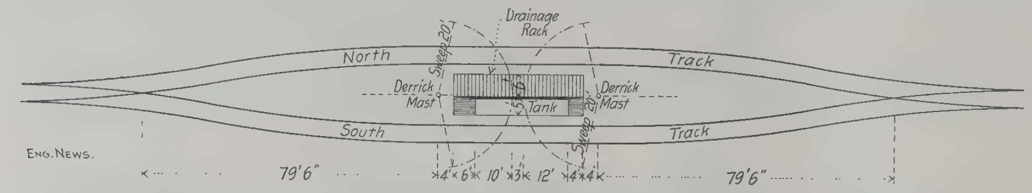

FIG. 2.—PLAN OF TRACKS AND DERRICKS AT THE TREATING TANK.

It is desirable that the timber should be dry before being treated, and all the experiments made indicate that one gallon of the liquid will adequately treat 40 to 50 sq. ft. of surface. If desired, more may be used, but it is not considered necessary. The liquid does not form a surface coating upon the wood, but penetrates it more or less deeply, depending on the duration of treatment, kind of timber, etc. The pores, however, are not sealed up, and if there is moisture at the heart of the wood, it may escape, so that dry rot is avoided.

Regarding the penetration of the material into such hard woods as oak by simple immersion, it is of interest to note that several prominent railways have used woodiline to a considerable extent in the treatment of oak, one road in particular having used somewhat over 12,000 gallons during the first half of the present year, largely on oak ties and bridge timbers.

The treatment of timber in this way requires only very simple and inexpensive apparatus, such as may readily be duplicated at as many points as desired. The first cost of a treating plant, and the cost of transporting timber to and from the plant are considerations to be taken into account in estimating the cost of treating timber, and in this process the liquid is supplied ready for use and can be readily and cheaply applied at any convenient point. The treatment, we are informed, does not impair the strength of the wood or render it brittle.

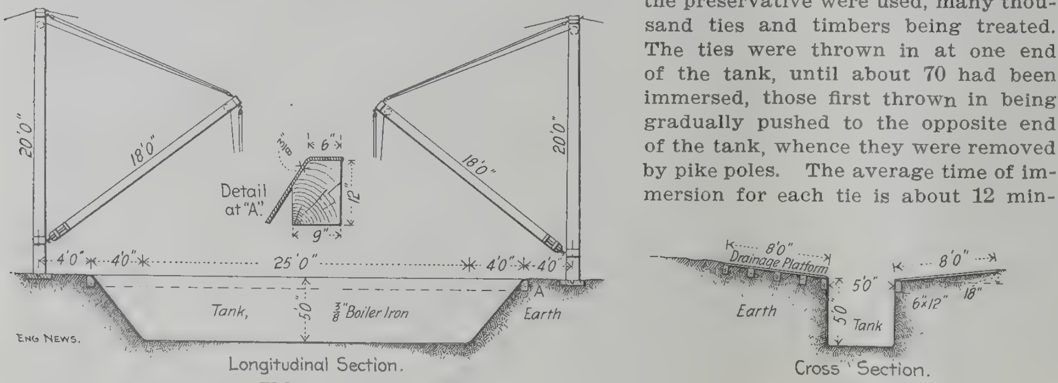

FIG. 3.—SECTIONAL VIEWS OF TREATING PLANT.

The first important use of woodiline in railway work, was on the Amboy Division of the Pennsylvania R. R., where some treated ties of red and black oak were laid in 1883. These ties are just outside of the station at Camden, N. J., in a rather unfavorable location. The traffic over them is heavy, but they are still sound, and in place in the track, after a service of about 13 years, and while there has been some slight cutting under the rails, this has not been sufficient to warrant the removal of the ties. This fact is regarded by the makers as a striking proof of the hardening and toughening effect of the treatment on the fibres of the wood. It is interesting, by way of comparison, to note that two, and in some cases three, sets of untreated white oak ties have been removed from positions immediately adjoining these treated ties.

To obtain further evidence as to the probable value of woodiline, other tests, of a similar nature, but including white oak ties, were made from time to time, at various points along the line of the road. The uniformly good results obtained caused the officials of the road to look with increasing favor on the process, especially for such work as bridge ties, trestle timbers, guard timbers, etc. In 1895 plans were made for a treating tank to accommodate ties and timbers up to 30 ft. in length, and this was built during the latter part of that year. This tank, shown in Fig. 1, is 35 ft. long, 5 ft. wide and 6 ft. deep, built of ⅜-in. iron. Its edges are supported by heavy timbers, and a coil of 1½-in. steam pipe, laid inside, around the bottom, serves to heat the liquid to about 150 deg. F. A small, upright boiler, placed in the boiler house near by, supplies steam. Plank platforms surround the tank, and it is provided with a removable cover to keep out rain. The cost, with all details, exclusive of the boiler, was about $390.

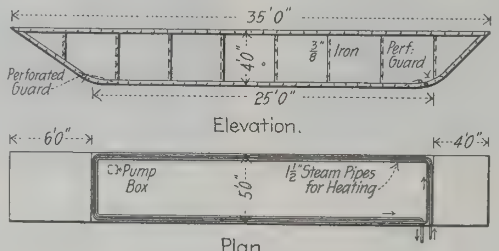

Fig. 1.—Tank for Treating Ties and Timber with Woodiline; Pennsylvania R. R.

During the spring and summer following the completion of this tank, about 12,000 gallons of the preservative were used, many thousand ties and timbers being treated. The ties were thrown in at one end of the tank, until about 70 had been immersed, those first thrown in being gradually pushed to the opposite end of the tank, whence they were removed by pike poles. The average time of immersion for each tie is about 12 minutes, during which time about ½ gallon of the liquid per tie is absorbed. The experiments made indicate that this amount is sufficient for a tie of standard size. It is, of course, evident, however, that by increasing the time of immersion, a greater amount of the liquid may be absorbed. An immersion of three hours, with a close-grained, black oak tie, showed about 1½ gallons absorption. With the bath at a higher temperature, these figures could be increased.

Some objections were found to the treating tank in its original form, and plans were made for an improved plant. It was thought that, with a different arrangement of tracks, and with the addition of derricks for the rapid and economical handling of heavy timbers, the capacity of the plant would not only be increased, but the cost of handling the timber would be reduced. It was also thought best to build an inclined platform alongside the tank, upon which the timber, after treatment, might be allowed to lie for a short time, in order that the superfluous liquid clinging to it might drain back into the tank. This drainage platform, of 2-in. pine planks, with oak battens, 1 × 3 ins., over the joints, to keep the timbers clear of the platform and allow the liquid to drain under them, is shown in the plan of the improved plant, Fig. 2.

The first step in these changes was taken recently, when the old 8 HP. boiler was replaced with one of 20 HP. The first boiler was ample for heating the liquid, but the new one is designed to serve the double purpose of heating the liquid and driving the hoisting engine of the derricks. With a plant such as that just described, the untreated ties delivered at the cars on one track, will be made up into bundles of 10 to 15 ties, secured by chains; the bundles will then be placed in the tank, and after a proper interval will be lifted on to the draining platform and from there loaded onto the cars on the other track. With sawed ties, sticks of wood may be placed between them, or a cast-iron separating frame may be used to keep them apart. Such a tank will hold three bundles of ties at one time, and its capacity should be from 1,200 to 1,500 ties per day. As formerly used, the capacity of the tank was, at a maximum, 600 ties per day. The improved arrangement of tracks and derricks is shown in Fig 2. Fig. 3 shows a section of a tank similar in many respects to that of the Pennsylvania R.R. It is, however, set deeper in the ground, and is a little shorter, and not quite so deep.

A novel form of tank has been suggested, consisting of an ordinary coal or gondola car, lined with sheet iron, thus forming a tank of size to accommodate large timbers. Steam for heating the liquid could be taken from the locomotive drawing the car, and a pole derrick set up at stopping points for handling the timber. Or, if desired, a crane, engine and boiler could be carried on a flat car coupled behind the tank car.

The process is controlled by the American Wood Preserving Co., of Philadelphia, Pa. Mr. Fred A. Kummer, Room 502, 72 Trinity Place, New York city, is the general representative of the company.

A LET-DOWN STEP FOR A FRENCH RAILWAY CAR.

On the occasion of the late visit of the Tsar of Russia to France the Compagnie Internationale des Wagons-Lit built a special train for the use of the imperial party, which train was made up of sleeping and dining cars, and a car especially arranged for receptions, etc., or seven cars in all. The majority of these cars had end-entrances, with a passage way down one side in the case of

A French Adjustable Car Step.

doors with steps were necessary, and to make these latter easy of ascent and yet capable of being folded up out of the way of station platforms, etc., a special step was devised.

This step is here illustrated from a cut in "Le Genie Civil," and practically describes itself. It is a counter-poised, double, folding step, requiring a force of only 5 kilograms, or 11 lbs., to operate it. When the train is in motion the steps take the position indicated by the dotted lines.

A HYDRAULIC RAM PLANT FOR A PUBLIC WATER SUPPLY.

The hydraulic ram has been used in a small way ever since its invention by Joseph Michael de Montgolfier, in 1796, to whom credit is given for having first perfected the automatic machine. John Whitehurst, of Derby, England, is said, however, to have understood the principle as early as 1775, but his machine required an attendant who opened and closed the waste valve by hand.

Hydraulic rams are in quite common use, but they are practically all of small size, designed to raise but small quantities of water and that to small heights.

The Power Specialty Co., 126 Liberty St., New York city, however, is manufacturing an improved ram, which is of sufficient size and capacity to deserve the name of engine. A section of the so-called double acting or double supply type, to be described later, is shown in Fig. 1. Considering it first without regard to the double supply feature, suppose the opening at H to be closed. The valve at B being open, the water from the source of supply at more or less elevation above the machine flows down the drive pipe A, and escapes through the opening at B until the pressure due to the increasing velocity of the water is sufficient to close the valve B. At the moment when the flow through this valve ceases, the inertia of the moving column of water produces the so-called ramming stroke which opens the valve at C and compresses the air in the air chamber D until the pressure of the air plus the pressure due to the head of water in the main is sufficient to overcome the inertia of the moving column of water in the drive pipe. This motion may be likened to the oscillation of water in an U-tube. At this instant the column of water in the drive-pipe has come to rest, and the air pressure being greater than the static head alone the direction of motion of the moving column is reversed and the valve C closes. The water in the drive-pipe is then moving backward and with the closing of C a tendency to a vacuum is produced at the base of the drive-pipe; this negative pressure causes the valve B to again open, completing the cycle of operations. At the moment of negative pressure the little snifting valve E admits a small quantity of air, and at the following stroke this passes into the air chamber which would otherwise gradually fill with water, the air being gradually taken up by the water.

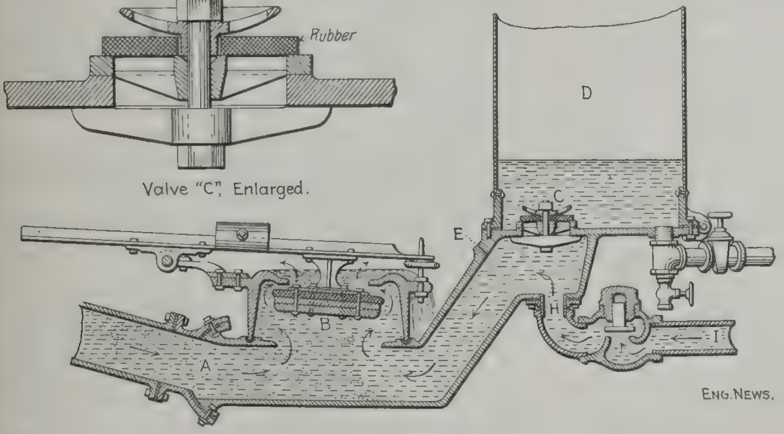

FIG. 1.—SECTION OF RIFE HYDRAULIC RAM FOR PUMPING PURE WATER, USING IMPURE WATER FOR POWER.

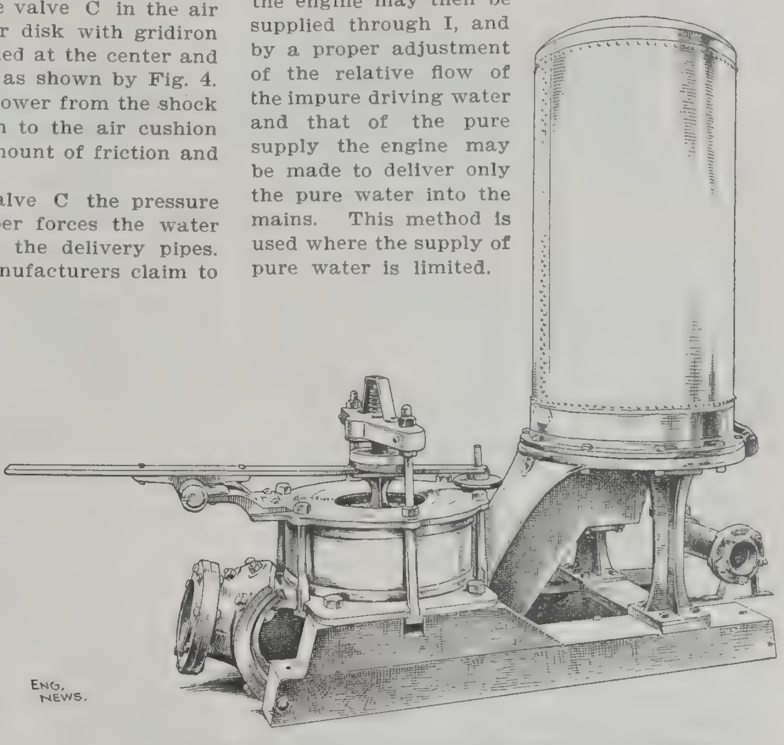

FIG. 2.—PERSPECTIVE VIEW OF THE RIFE HYDRAULIC ENGINE. Made by The Power Specialty Co., 126 Liberty St., New York City.

In many machines the mistake is made of making the waste valve B sufficiently heavy to overcome the static head of water in the drive-pipe. In fact most writers on this subject, including the "Encyclopedia Brittanica," state that the weight of the waste valve B must be greater than the pressure of the statical head of water on its under side, so that it may open when the column of water comes to rest. In the machine which we are describing this would be practically impossible on account of the large area of the opening at B.

In this machine the valve B is made as light as is consistent with the necessary strength; the negative pressure at the end of the stroke is relied upon to open the valve. With the largest size of these machines this valve is 18 ins. in diameter, and with a head of 8 ft., which is a common head for use with hydraulic rams the static pressure on the under side of this valve is 883 lbs.; it can be seen that the great shock of a valve of this weight would rapidly destroy the valve and its seat.

The waste mechanism of the Rife engine consists of a large port with flat ample opening and a large rubber valve with a balance counterweight and spring seating, removing almost entirely the jar of closing. The valve C in the air chamber consists of a rubber disk with gridiron ports and convex seat, fastened at the center and lifting at the circumference, as shown by Fig. 4. The effort is to transfer the power from the shock of the driving water through to the air cushion with the smallest possible amount of friction and jar.

After the closing of the valve C the pressure of the air in the air chamber forces the water in the air chamber out into the delivery pipes. With the Rife engine the manufacturers claim to elevate water 30 ft. for every foot of fall in the driving head; the machine is built in capacities as high as 150,000 gallons per day and the efficiency of 82% is claimed.

The engine illustrated in Fig. 2 weighs 2,800 lbs.; the capacity of the air chamber is 20¾ cu. ft.; diameter of drive pipe, 8 ins.; diameter of waste valve, 18 ins.; weight of waste valve, 50 lbs.; diameter of delivery pipe, 4 ins.; height to top of air chamber, 7½ ft.

To the reader who has carefully followed the above description, it will be clear that the most important detail in which the Rife engine differs from the ordinary hydraulic ram is the waste valve. It will be seen by the drawing that the counterweight on the projecting arm of this valve permits the adjustment of this valve to suit varying heads and lengths of drive pipe. By adjusting the counterweight so that the valve is nearly balanced the valve comes to its seat very quickly after the flow past it begins. The result is that the ram makes a great number of short, quick strokes, which are much easier on the mechanism than slower and heavier strokes. Of course the stroke must be sufficiently powerful to act efficiently in overcoming the head in the delivery pipe. The adjustable weight permits this to be effected with the greatest nicety.

The question of efficiency of hydraulic rams has been much discussed, and such authorities as Rankine and D'Aubisson differ considerably in their calculations. The Power Specialty Co. uses Rankine's formula in calculating efficiency, which is

$$E = \frac{q\ h}{(Q - q)\ H},$$

where Q is the quantity of water flowing per second in the drive pipe; q, the quantity flowing per second to the stand-pipe through the discharge pipe; H, the height from the escape valve to the level of the reservoir which feeds the drive pipe; and h the difference in level of the water supply reservoir and the water in the stand-pipe. D'Aubisson states the formula for efficiency as

$$E = \frac{q\ (H + h)}{Q\ H}.$$

D'Aubisson's is the correct one, considering the mechanism as a machine receiving energy at one end and delivering it at the other, while if the machine is considered as elevating water only from the one reservoir to the other, Rankine's formula is the correct one to use.

When a pipe is attached at H (Fig. 1), the engine is termed double acting; spring water or that which is purer than the water used to drive the engine may then be supplied through I, and by a proper adjustment of the relative flow of the impure driving water and that of the pure supply the engine may be made to deliver only the pure water into the mains. This method is used where the supply of pure water is limited.

A battery of five Rife engines is now being installed in connection with a water-works plant at West Reading, Pa. The driving water is supplied from Wyomissing Lake, which delivers 810 gallons per minute. The battery of engines which will consist of three large and two small rams is located nearly 200 ft. from the lake; a fall of 8 ft. is obtained by a 4 ft. dam across the outlet of the lake and by sinking the engines in a pit; this pit is drained into the stream at a point further down. Each of the three large engines has a separate wrought iron drive pipe 194 ft. long and 8 ins. diameter.

The water to be delivered to the city stand-pipe comes from a spring 1,000 ft. away and at an elevation of 8 ft. above the level of the lake. The spring water is carried by a 6-in. pipe to a small stand-pipe, situated on the dam. Under the conditions of the contract this spring water had to be delivered to the city stand-pipe without mixing with the water from the lake. With a fall of 8 ft. from the surface of the lake to the engines, the spring water must be delivered to the base of the large No. 80 engines under a head of only 2½ ft. in order to avoid wasting the spring water, and at the same time prevent lake water passing into the city mains. From the spring level to the base of the No. 80 engines there is a fall of 16 ft. To reduce this head from 16 to 2½ ft., two so-called single acting engines, No. 40, are interposed, which are driven by spring water alone. The spring flows about 120 gallons per minute. Half of this is delivered to each No. 40 engine under a head of 13 ft., and they pump directly into the main. The waste spring water from the No. 40 engines is delivered into a small reservoir in the corner of the pit where the three large engines are situated. This reservoir overflows at a point which maintains a constant head of 2½ ft. on the three No. 80 engines. The main which leads to the stand-pipe is 6 ins. diameter and 1½ miles long. The elevation of the water in the city stand-pipe above the engine pit is 175 ft. The two No. 40 engines pump into the main six gallons per minute, or 8,640 gallons per day, and discharge by waste 114 gallons per minute into the reservoir, which supplies the three large engines. The three No. 80 engines receive 810 gallons per minute of lake water and 114 gallons per minute of spring water. They force into the main 25 gallons of spring water per minute, 36,000 gallons per day; the combined delivery of the five engines is 44,640 gallons.

The figures given above are the contract requirements, and it is stated that they will be exceeded in practice.

The cost of this pumping plant was $3,000. The cost of operation will be nothing, as no attendance is required, and the cost of maintenance will be $32 per year for new valves.

◆

THE MIRA RIVER BRIDGE, NOVA SCOTIA.

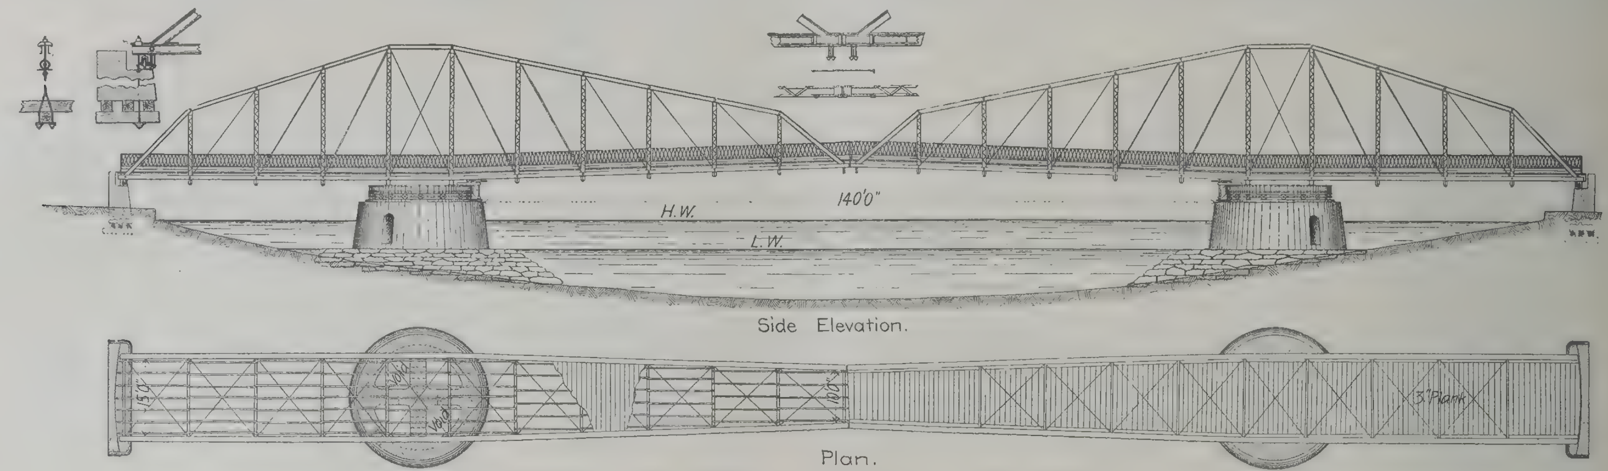
By M. Murphy.*

The highway bridge over the Mira River is not remarkable for its size, nor for the difficulties attending its erection, but for the cheapness with which it was constructed. The Mira River is navigable for small craft for a distance of about 20 miles from its mouth. Its width is irregular, narrowing between cliffs of sandstone for some miles up, and extending into lakes still further up. Heavy ice forms in the still waters of these basins in the winter season, and is carried downwards with the stream in the spring, with sufficient velocity to destroy an ordinary structure, where the channel is contracted and the current is strong. For this reason, a bridge spanning the whole stream was considered the most advisable to adopt. The span is 140 ft. between piers, so that a vessel can beat through against the wind and tide. The highway traffic is of a light, rural character, hence the lightness of the design.

The construction of the circular pivot piers for the bridge may be worthy of remark. They are founded on flat stones, placed as regularly as possible without the aid of dams in the stream, up to extreme low tide. Upon this foundation is spread a 2 ft. bed of Portland cement concrete, covering the whole base of the pier. From thence, up to the top the pier is built hollow, as shown by the plan. A passage communicates with each open space, so as to allow a man to examine the machinery of the swing span and paint it when necessary. The walls are of Portland cement rubble concrete, faced with Portland cement fine concrete. The plan shows the temporary wooden casing, within which the walls were built.

The bridge is located near the mouth of the river, where it empties through a shingle beach into Mira Bay.

The bridge crosses the stream by two cantilever draw spans, on pivot piers of concrete on each side of the stream, the short lever arm of each truss being anchored to the abutments, when the bridge is closed across the river. The roadway is 15 ft. at pivot piers and 10 ft. in the clear at the center, so as to prevent two teams from passing each other on the extreme points of the lever arms at one time.



THE MIRA RIVER BRIDGE, CAPE BRETON CO., NOVA SCOTIA.
M. Murphy, M. Can. Soc. C. E., Provincial Government Engineer.

The bridge is proportioned to carry a rolling load of 80 lbs. per sq. ft. of roadway, plus the static load of the bridge. The specifications included the following requirements:

Ultimate strength of iron	50,000	lbs. per sq. in.
Compressive strength of iron	40,000	" "
Greatest tensile strain must not exceed	10,000	" "
Shearing across grain must not exceed	7,500	" "
Pinhole intrados bearing must not exceed	12,500	" "

The cost of the bridge was as follows:

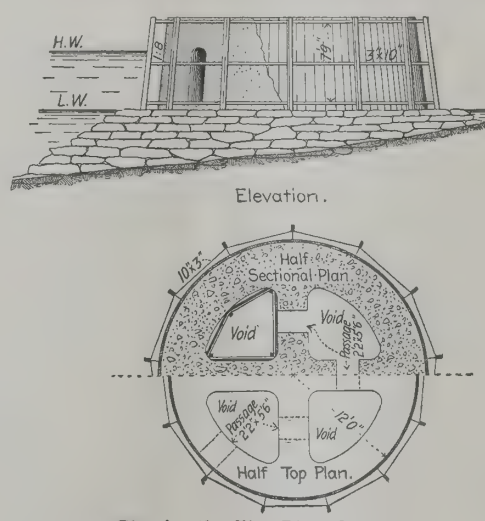
Metal work	$6,700
Piers, abutments and approaches	2,318
Total	$9,018

◆

A METHOD OF DETERMINING SELLING PRICE.*

By H. M. Lane, M. Am. Soc. M. E.**

In business it is necessary that both ends meet, and desirable that they overlap. To accomplish this, receipts or value produced must exceed expenditure. It is customary to transact business for a year, and then ascertain the results from the records, at a time when it is too late to apply remedies which would affect the result of that year. It is the purpose of this paper to propose a method by which the conditions affecting the final result of a year's business may be shown in a simple manner at the end of each month or week. It is in no sense a substitute for the usual bookkeeping and inventory, but an auxiliary for the convenience of the manager relating to organization and operation.



Pier for the Mira River Bridge.

There are in these close times concerns of which it is true that 25 years ago a difference of 10% in the result of a year's business would have been a profit of 25 instead of 35%, while now a difference of 10% would probably mean a loss of 5% instead of a profit of the same amount.

It is the purpose here to show what the volume of product must be, and what value must be placed upon it unsold, or what selling price when sold, in order to make both ends meet and to overlap for a given organization and general expense.

First, an annual estimate or prospectus, Table I., for the succeeding year, is prepared, based upon experience and judgment. In this case the capital invested in the business is assumed to be $100,000, and the annual payroll to be $50,000, equally divided between producers and non-producers. All those whose time can be directly ascertained and charged against some specific order or article produced for sale are classed as producers, and all others as non-producers, and in case of doubt safety lies in erring on the side of classing an individual as a non-producer rather than a producer. The column, Estimated Expenditure, Table I., requires no explanation. It shows in this assumed case that for the conduct of the business for the succeeding year $156,000 must be secured. The question then arises, from what sources is this sum to be derived?

In the column, Estimated Receipts, adjoining:

(a) Fixed income $600, this being the sum derived from rental of a portion of the factory buildings, interest on bonds or returns from investments.

(b) Interest $400 is the estimated sum to be derived from notes given for deferred payments, overdue accounts, etc.

(c) It is assumed that in case of a machine shop with tools varying greatly in size, value, floor space occupied, and power required, that there should be a separation of the charge for the workman and for the tool. The hourly charge for a man at 25 cts. working on a $5,000 horizontal boring-mill should not be the same as for the same priced man working on a $300 lathe. Separating tool time from workman's time, it is estimated that the tools would yield a plant charge of $5,000.

(d) Material and merchandise are estimated at $75,000. This item is the same as in the column of estimated expenditures, to which is added, say, 20% (e), which yields $15,000.

(f) Producer's wages is the estimated amount to be derived by charging producer's actual time at his actual rate against the product. The sum of all these estimated receipts is $121,000, while the sum of the estimated expenditures is $156,000, which would show a deficit of $35,000 on the year's business. Now from what source is it possible to secure this $35,000? Clearly from a percentage added to producer's wages. In this case producer's wages are $25,000, and in order to derive there-

from the $35,000, to make good the deficit, 140% must be added.

We have now a sure method of determining the necessary selling price when the actual cost of material and merchandise, the number of hours and rate per hour, and the tool hours and rate per hour are known; thus, material and merchandise, plus 20%, tool hours at their established rate and labor plus 140% equals the selling price under the conditions assumed in the annual estimate.

But, unfortunately, the business manager cannot sit at his desk in December and predict that his losses for the succeeding year will be $500, and his legal expenses $300, and contingent expenses $1,000, and that he will employ and get the benefit of the product of $25,000 expended in producer's wages. It is this difficulty that the method now presented meets and overcomes by the use of the tabulated monthly statement, Table II. This is shown in monthly form, but so little labor is involved that the manager may keep in closer touch with his business by using a weekly form. This sheet provides for bringing the actual receipts and expenditures together with the estimated, item by item and month by month, so that a glance will show if any item of expenditure is actually overrunning the estimated, and if any item of receipts is underrunning the estimated, and show it in time for correction. It will also show for any month if the total actual receipts or expenditures vary from the estimated, and which way and how much. This is desirable, for one item may exceed the estimated and be compensated by another, so that the total shall be unaffected. This table is prepared and used as follows: The items—Estimated Receipts and Expenditures, Sheet I.—are divided by twelve, and one-twelfth of each item entered in the column, "Month Ending January 31," and on its properly designated horizontal line, under February, two-twelfths; March, three-twelfths, etc., the amounts being cumulative until at the end of the year or under December they amount to the sum shown in the annual estimate. These spaces may be all filled out as shown for the last half of the year—Table II.

It will be noticed that in the two horizontal lines of totals (receipts and expenditures), Table II., the estimated amounts are always equal. They must be if both ends are to meet. At the end of the first month of the new year actual figures are available and are filled in the proper spaces, and the items and totals for the year, as far as it has gone, are directly comparable with the corresponding estimates; and right here the manager has a chance to earn his salary by managing. This method gives him eleven more chances and eleven months' time for remedies.

Answering the proper objection, that selling prices are not made by ascertaining the value of material and labor and adding a percentage, but by competition, it is nevertheless true that unless the value of material and labor will admit of the addition of the percentages proved to be necessary by the annual estimate, without making the selling price so high as to keep the goods out of the market, then the end of the year will show a deficit. When it is found that a selling price arrived at by this method is too high, the obvious remedy is to reduce the amount (not necessarily the rate) paid for labor or material until they will bear the addition of the necessary percentage without throwing the article out of the market. It is clear that, other things being equal, twice the producing force will require but one-half of the percentage to be added. It is also clear that a reduction in the total expenditure, or an increase in any items of receipts, will reduce the percentage necessary to be added. This gives the manager a definite method of making readjustments, as he obtains results of actual business as the year advances. In this method one assumption is necessary, but it is a fair one, viz., that the employment of a certain number of dollar's worth of productive labor produces a corresponding value of product plus the percentage shown to be necessary by the estimate. The manager must secure this result. In other words, every dollar paid to producers plus the required percentage must be charged to the product (this together with the plant charge and material plus its percentage), must be the real value of the product, sold or unsold, and all things must be adjusted to this end.

◆

A NEW METHOD OF EXTRACTING GOLD from quartz has recently been described in England, and said to have been successfully tried on Australian gold-bearing rocks. It is called the "ore-atomic" system. The rock is crushed to lumps of convenient size, it is then, in a closed chamber, from which air is excluded, exposed to the heat of a furnace, and to the action of water, gas, and hydrogen. The sulphur in the ore is thereby eliminated, as sulphuretted hydrogen, and any oxide in the ore is reduced to the metallic state. After being thoroughly heated the material is suddenly quenched by the injection of cold water. This operation is repeated several times, until the quartz is so softened as to be easily crushed by the fingers, and crumbled into powder. The contents of the chamber are then dumped into a tank, and the gold separated by washing. It is claimed that by this process there is absolutely no loss by "float gold" or by oxidation, and that all of the gold in the ore or rock is recovered.

THE FASTEST TRAINS IN GERMANY, says the "Revue Generale des Chemins de Fer," are the express trains between Berlin and Hamburg. On this 177 miles of line, the grades are very easy and the curves are of large radius. Three trains daily leave Berlin and reach Hamburg in 3 h. 36 m., the average speed being 49 miles per hour, not including a stop of 4 minutes at Wittenberg and another of 1 minute at Friedrichruh. The average speed between these two last stations is 52 miles per hour. The normal train hauled is made up of four heavy "corridor" passenger cars, mounted on trucks, and two baggage cars, on 6 wheels each; the total weight is about 133 metric tons. The locomotive has 4 coupled driving wheels, 6.56 ft. in diameter and is provided with a leading truck. The fastest Austrian train is the "train de luxe," running between Vienna and Carlsbad. The 283 miles is made in 419 minutes, including stops aggregating 40 minutes. Deducting these stops, the average speed is about 44.7 miles per hour; this is very good, as some of the grades are heavy and the curves are sharp. The train weighs 140 tons and the locomotive 80 metric tons.

◆

THE DEEPEST BORE-HOLE IN THE WORLD, says Mr. C. Zundel, in a late communication to the Industrial Society of Mulhouse, is one of 6,571 ft. below the surface of the soil, made at Paruschowitz, near Rybrick, Upper Silesia. The previous record for depth was the 5.733 ft. hole drilled some years ago at Schladebach, near Leipsig. The later bore-hole was made in a search for coal measures, and 83 seperate seams, some of considerable thickness were penetrated. The hole was 12 ins. in diameter at the beginning and this was lined with a tube about 0.4-in. thick; at a depth of 230 ft., the bore was reduced to 8¼ ins. diameter, and thus continued for 351 ft. At this point the blue marl encountered became so compact that the diamond-drill had to be used and under the action of the water the marl swelled to such a degree that the diameter of the pipe had to be again reduced. The greatest difficulty encountered was the great weight of the boring rods, as the depth increased. Though steel was used, at a depth of 6,560 ft. the total weight of the tools reached 30,155 lbs. Under this weight ruptures of the rods were frequent, and an accident of this nature finally stopped the work; about 4,500 ft. of rods fell to the bottom, and being jammed under a part of the tubing it was impossible to withdraw it. The diameter of the well at the bottom was 2¾ ins. Temperature observations made showed 12° C., or 53.6° F., at the surface, and at the depth of 6.571 ft. the temperature reached 69.3° C., or 157° F. This is equivalent to an average augmentation of heat of 1° C. for every 34.14 m. of depth, or 1° F. for every 63 ft. These figures differ slightly from those obtained in other deep borings. The increase of heat at Schladebach corresponded to 1° C. in 35.45 m.; that at Sperenberg, near Berlin, to 1° C. in 32.51 m.; and at the artesian well of Grenelle, at Paris, which is only 1.797 ft. deep and furnishes water at a temperature of 27.70° C., it is estimated that the increase of heat is equivalent to 1° C. in 31.83 m. The boring at Parnschowitz was commenecd on March 26, 1892, and it reached its maximum depth on May 17, 1893, or in 399 working days. The total cost was $18,800, or about $2.86 per lin. ft.

ENGINEERING NEWS
AND
AMERICAN RAILWAY JOURNAL.

Published every Thursday at Tribune Building, New York.
Entered at the Post Office, New York, as Second Class Matter.

D. McN. Stauffer, Charles Whiting Baker.......Editors.
Wm. Kent, E. E. R. Tratman, M. N. Baker, Chas. S. Hill, A. B. Gilbert............... Associate Editors.
Chas. W. Reinhardt....................Chief Draftsman.

Alfred E. Kornfeld, New York...... F. A. Peckham, Chicago................. Advertising Representatives.

Publication Office..........Tribune Building, New York.
Chicago Office.......................1636 The Monadnock.
London Agencies: Kegan Paul, Trench, Truebner & Co. (Limited), Paternoster House, Charing Cross Road; Sampson Low, Marston & Co., (Limited), St. Dunstan's House, Fetter Lane.

SUBSCRIPTION RATES: United States, Canada and Mexico, One Year, $5.00; *6 months,* $2.50; *2 months,* $1.00; *Single copies,* 15 *cents. To all other countries in the Postal Union, add* $2.08 *per annum* (4 *cents per number*) *to above prices for postage. No club rates allowed. Mailing addresses may be changed at will by sending both old and new address. We shall be obliged if subscribers who fail to receive their papers promptly will notify us without delay. The number on the address label of each paper indicates when subscription expires, the last figure indicating the year and the one or two preceding figures the week of that year; for instance, the number* 326 *means that subscription is paid to the 32d week* (*that is the issue of Aug* 6) *of the year* 1896; *the change of these figures is the only receipt sent, unless by special request.*

ADVERTISING RATES: 20 *cents per line agate measure. Want notices, special rates, see page* 22. *Rates for standing advertisements sent on request. Changes to standing advertisements must be in hand on Monday afternoon; new advertisements, Tuesday afternoon; transient advertisements by Wednesday noon.*

The rapid destruction of the forest resources of the United States has frequently been pointed out in our columns, and we have long advocated the institution of protective measures to check this destruction. A notable example of the enormous consumption of timber for mining purposes is given in the paper which we reprint in another column, giving details of the amount and cost of timber used in the Comstock mines, of California. From 1870 to 1891, it is estimated that there have been used for the mines and mills 674,765,000 ft. B. M. of timbers and lumber, and 391,070,500 cu. ft. of wood, representing a total cost of $46,072,548. About 200,000 acres of forest have been destroyed to operate the mines, and when the remaining 45,000 acres of timber land and wood land are denuded, the timber supply will have to be obtained at a distance of more than a hundred miles from the mines. Even now the bulk of the supply has to be transported 65 miles by railway and flume. Timber is now growing on the area already denuded, but it is said that nearly a century must elapse before this new growth attains the size required for mine timbers. Certainly this area of new growth should be under government care and protection. The paper contains much matter of interest in regard to the supply and consumption of timber and wood for mines, but its most important lesson is that forest protection is a matter of vital importance for this country.

◆

The importance of securing pure water for cities and towns and of quickly and safely removing it after it becomes fouled by use was never before so fully realized in this country as at present. Massachusetts and New York have for some time past vested in their respective state boards of health a general supervision of this matter, and Ohio not long ago followed their example. The engineering societies of Illinois, together with the State Board of Health and the University of Illinois, have drafted a bill looking to the same end, to be submitted to the coming session of the legislature.

We are heartily in favor of the supervision by state authorities of matters affecting the public health, and we hope that legislation to that end may be enacted in Illinois; but some features of the proposed bill, which are reprinted elsewhere, should be modified before the bill is presented to the legislature, if good results are desired from the law. In the first place, it would be a piece of useless red tape to require the approval of the State Board of Health "before any sewer or extension of sewers" could be constructed. There is not a city of any size in which new sewers are not continually being built. On the other hand, the present draft of the bill requires only that systems of public water supply shall be submitted to the board. It would therefore be possible for any city to alter its water supply and take it from a wholly new source without the approval of the board, which is exactly what it is desired to avoid.

◆

We understand from the information received that the analyses are to be made not only at the University of Illinois, but by members of the staff of the University. This, coupled with the proposed nomination of the engineer by the Illinois Society of Engineers and Surveyors, would be withholding from the State Board of Health the selection of the working force necessary for the contemplated investigations. We suppose the idea is to utilize laboratories already established for the chemical and bacteriological work, and that it is assumed that these laboratories are, or may be, properly equipped with men and apparatus for the proposed investigations. With all conditions as favorable as possible, this plan might work most admirably. We are not in a position to speak of the conditions existing in Illinois, but elsewhere the views of a State Board of Health and those of the professors of a state university might not always agree as to methods of investigation, and provided the former had pronounced and meritorious views on the subject this might be a serious matter. In the same way the engineer chosen by the board from the three men nominated by the Illinois Society of Engineers and Surveyors might not prove, later on, acceptable, perhaps through no fault of any of the parties concerned. In such a case must the board retain him, whether or no, until the expiration of his term? There seems to be a chance for both political and professional strife within the society if this nominating power is vested in it. In short, there can be no reason for vesting the nominating power in a wholly unofficial body, unless the official body or persons in whom such powers are generally vested are incompetent, or false to their trusts. The Massachusetts State Board of Health selects its own engineers, chemists and bacteriologists. The work of that board is universally recognized as a model of its kind, and in magnitude surpasses anything ever attempted in this country or, we think, in the world. It is true that Massachusetts is noted for the high character and ability of the men who serve on its public commissions, but if the commissions in other states are less able is it likely that amends will be made by taking away from them the selection of their own working staff? Under such circumstances, one of three results may be expected: (1) Conflict; (2) the working force will finally be controlled by the commission; (3) the commission will automatically adopt the recommendations of its engineers and other scientific workers, in which case the work in hand might as well be given outright to those who actually perform it, and the useless body abolished.

PRINCIPLES AND POLICY OF ENGINEERING NEWS

It has seemed to us, in perusing some of the letters that we receive from our readers, that many of the subscribers to this journal sometimes fail to make it as useful to them as it might be, because they do not understand its general aims and policy or the system on which some of its various departments are conducted. We have therefore selected this last issue of another yearly volume as an appropriate time to present some statements, the subject matter of which is indicated by the title above.

This journal aims to cover the entire field of engineering. We do not, of course, pretend to claim that within the limits of its space can be published everything of value in current engineering literature; but it is the purpose of its editors to keep in touch with the whole broad field of engineering work and select for publication the best that they find in every department of engineering.

We are frequently asked whether an article on this or that subject is "in our line." The answer is that all articles on subjects connected with any department of engineering are directly "in our line," and whether they will be acceptable or not depends solely on the editors' judgment as to their interest and value to the readers. All such contributions, from any source whatever, the editors are always pleased to receive. They are examined as soon as time permits, and such as are found unavailable for use in any form are returned to the senders where such a return is requested.

An opinion as to whether an article on a given subject is likely to prove available is given on request; but the final acceptance of an article can in no case be made until the complete manuscript with illustrations, if any, is submitted.

In general, the receipt of matter offered for publication is not acknowledged, unless this is especially requested. Losses in the mails are so rare that it is not deemed worth while to incur the additional labor of such acknowledgment.

In the case of contributions found unavailable and returned to the sender, the editors have found it impossible to state by personal letter the reason which influence their decision. A printed letter accompanies such manuscripts in which it is explained that the return of the article does not necessarily imply that it is lacking in merit or interest, as the amount of matter offered for publication is so large that a rigid selection has to be made and many articles of merit have to be returned.

We may note in passing that this printed note recently brought us an indignant letter from a "scientist," who had offered us a manuscript in which he upset(?) a well-known engineering formula that has been in universal use for half a century. We quote from it verbatim, for our reader's entertainment, the following interesting passage:

> The return of my paper by means of a printed blank, looked to me so mean and insulting that I concluded, to avoid being reminded of the insult, by henceforth considering "Engineering News" as non-existant. * * * * It is hard for an old scientist, to have his work judged of in private by newlings, but harder yet to have it done by printed blanks. The rudeness of it must make enemies unless my nature is all different from that of others.

We regret to be considered "non-existant," and our curiosity is great as to what a "newling" may be. For the reasons above stated, however, we shall continue the use of the printed blanks and run the risk of making enemies of "old scientists" like the one just quoted.

What has been said with reference to the offer and return of articles above, applies, of course, especially to papers which are submitted for publication and for which their writers expect compensation; but the general principles apply also to all classes of matter sent to us. We are frequently asked, for example, what our position is with reference to what are commonly known as "trade write-ups." The same rule applies to this as to the other matter, that the first consideration is the interest of our readers. We fully recognize the fact that outside what is commonly known as "civil engineering," the great bulk of the engineering work that is carried on in this country is done by manufacturing firms. It is to these that we have to look chiefly, therefore, for a great deal of matter of interest and practical value to engineers; and we welcome contributions from such firms on the same basis as those from any other source. If a manufacturer has a new machine or device of interest to engineers, and will furnish us such drawings and particulars concerning it as will enable an engineer to form a judgment as to its merits, we can often prepare an article from it that will be of great practical value to many of our readers. On the other hand, the manufacturer who sends us a cut of a machine which shows nothing except what a wood engraver imagines its external appearance might be, and a so-called description which, in reality, is only a string of vague generalities concerning what he considers its merits, has no cause for complaint at our decision that such matter is not of sufficient interest to our readers to warrant us in giving it space.

A department of this journal which we believe is much appreciated by our readers is that of "Letters to the Editor," and its development during the past two or three years has been a source of much gratification to us. We intend this department to be a place for the open discussion of any and all matters of interest to engineers, and it is our intention to conduct it with entire impartiality, and to permit free expression of contributors, whatever their views or opinions may be, provided their letters come under our rule above stated, i. e., that they are matter of interest to our readers.

It often happens that letters sent to us for publication criticise the work of some person or firm, and in such cases, where the letter is found to be worthy of publication, it is our practice to submit an advance proof to the party who is criticised and afford him an opportunity to make a reply in the same issue in which the criticism appears.

In the case of such a discussion we expect those taking part to observe the usual courtesies of debate and to refrain entirely from personalities.

Contributors either to this or other departments of this paper are at liberty to veil their identity under a nom-de-plume if they choose; but in writing to us, must give their real name; otherwise the waste basket yawns for their contributions.

We sometimes find some misapprehension as to the degree to which the editors assume responsibility for the matter published in various departments of the paper. While the matter published on the editorial pages, and, in fact, all matter not signed or credited to some source, may be understood to be prepared by the editors; the contributed matter and the matter taken from the proceedings of engineering societies represents the views and opinions of those to whom it is credited, and not necessarily the opinions of the editors. Of course, all such matter has been examined by the editors, and has been judged by them to be of sufficient interest to be worth publication; but it does not follow that they approve or agree with the ideas or opinions which the writer may express. In the department of "Letters to the Editor" especially, it is our aim to give a fair field to all who have something to say that is worth saying, whether it coincides with our own opinions or not.

In thus defining the extent to which the editorial responsibility extends, we should not be misunderstood as magnifying the importance of the editors' opinions. The editors are well aware that they are far from infallible, and that they, like the rest of mankind, are prone to err. In fact, they are probably better aware how far their work falls short of the standard which they have set for themselves than are any of their readers. But they are at least conscientious in adhering to the principles they have laid down of impartiality and constancy to the interests of their readers and of the profession which it is the aim of this journal to serve.

The change which we inaugurated two years ago, of separating the Construction News and the other matter which is of little value for binding for permanent reference from the main part of the paper, has, we believe, been generally acceptable to our readers. With the first number of the new year a further change will be made in this department, and this eight-page supplement, which is now printed separately, will be bound with the advertising pages. It is our intention also gradually to change the arrangement of these pages so that eventually all the contents of this supplement will be printed on right-hand pages, while the opposite or left-hand pages will be filled with advertising matter. One reason for making this change is that it will enable us to add extra pages to our Construction News department on weeks when there is a surplus of matter, which we cannot now do, except at considerable expense on account of difficulties in connection with the binding. We find also that many of our readers make a practice of cutting up their Construction News supplement, and when the pages are backed with advertisements they will be able to do this without losing the construction news on the back of the sheet.

We believe this arrangement will be especially advantageous also to those who desire to preserve for reference our department of "Contract Prices." These detailed reports of the unit prices bid at contract lettings in all parts of the United States and on all classes of engineering work and materials are of great value to an engineer in preparing estimates. We advise our readers who do not bind their supplements to preserve these items in a special scrap-book, classifying them by materials, and they will find in the course of a year or two that they have a more valuable and extensive record than anything their own note books can furnish.

There is, perhaps, no department in which we are more dependent upon our readers for assistance in carrying out our ideas of improvement than that of "Personals." We wish to make this as complete a summary as space permits of the items of real personal interest concerning engineers of every class; but in order to do this, we must rely on our readers to furnish us the necessary information. What we especially desire is notices of appointments and changes in official position, but space prevents our making note of reelections and reappointments, under ordinary circumstances.

We desire to call especial attention to the use which readers may make of our departments of "Book Reviews," "New Publications" and "Trade Publications." The first of these departments is included in the body of the paper and will be found exceedingly convenient by purchasers of engineering books, who desire information concerning the merits of recently published treatises. Under "New Publications" are included public documents and publications of societies, corporation reports, pamphlets, etc. In nearly all cases the publications noted under this head are for free distribution, and we believe every engineer will be well repaid if he will make it a rule to look systematically through these and the "Trade Publications," and drop a postal card request to the publisher (whose name and address are in every case given) for such of these pamphlets as may interest him. We may say also respecting the trade publications that many of them nowadays contain matter of much practical interest to engineers, and which can be found nowhere else in technical literature. The engineer who does not aim to keep an up-to-date file of the trade catalogues in connection with his particular specialty is likely to be mortified by finding himself ignorant of some technical matter which the commercial man will have at his fingers' ends.

WOODEN BARREL OUTLET SEWER, USED AT NEW YORK CITY.
Horace Loomis, M. Am. Soc. C. E., Engineer in Charge of Sewers.

We have reason to believe that most of our subscribers preserve and bind their copies of Engineering News; and, while from one point of view it is of no interest to us what becomes of our issues after they reach the subscribers, in pursuance of our purpose to make this journal of the greatest usefulness to the engineering profession, we would strongly advise our readers to preserve their files complete and regularly bind them for reference.

We are aware that some of our readers pursue the practice of cutting from the paper such articles as are in their especial line, which they file on some system or other, and throw away the remainder of the paper. Perhaps if a man were absolutely sure that he would follow a particular specialty all his life long and would never have need of information on any other department of engineering work, this would be a good course to pursue; but very few engineers can map out their future in that way. Ten years ago thousands of engineers were devoting all their attention to steam railway construction. To-day, nine-tenths of them are in other fields of engineering work, and it is quite safe to say that those fared the best in making the change who were the best equipped for these other lines of work and who had kept in touch with them so far as possible during their work on railway construction.

We would advise our readers, for their own interest, to preserve and bind their files of this journal. The time is very likely to come when the information they can find in its pages on other departments of engineering than that on which they are now engaged, will be of the greatest value to them.

In this connection we are pleased to make an announcement, which will be of interest, we are sure, to those who regularly bind and preserve their papers: At present any one who desires to find all that has been published in this journal on a given subject must search through the semi-annual indexes, and where the search extends over the files of a considerable number of years, the labor involved is considerable. To save this labor in our own office, we some time ago began the preparation of a general index to Engineering News, and its usefulness is so great that it is probable that we shall eventually publish it in book form. The work of its compilation is still in progress and we are not yet able to state positively as to its publication. It is our expectation however, eventually to make it available to our readers, and with this aid, the possessor of a file of Engineering News will have at his hand a cyclopedia of modern engineering progress which will be almost as easy of reference as a dictionary, and which will constitute in itself a completed library of engineering literature.

LETTERS TO THE EDITOR.

Formulas for Bridge Expansion Joints—Corrections.

Sir: In the letter which you published in your issue of Dec. 17 over my signature, the formula $Y = \frac{I}{\cos\ \theta}$ should read $Y = \frac{T}{\cos\ \theta}$.

Yours very truly,
F. P. McKibben.
Mass. Inst. of Technology, Boston, Dec. 22, 1896.

Wooden Barrel Outlet Sewers Used at New York City

Sir: There appeared in your issue of Nov. 5, 1896, a description of the wooden barrel sewer as constructed in Brooklyn. This is the same as has been used in this city for many years past. We have found by experience, however, that the construction of these barrels in lengths of say 10 to 15 ft., and putting them together with butt joints supported by cross beams on the piling of the pier is somewhat weak. The impact of large vessels, such as railroad floats and ferry boats, is liable to cause the piers to sway from side to side, opening these joints, and, in some cases, a whole length has been displaced and the barrel collapsed. To obviate these difficulties we think we have improved upon this plan by constructing a continuous barrel, according to the following specifications:

The sewer will be built so as to form one continuous section, each stave will be so placed that there will be a lap of 4 ft. at every stave, and each stave as it is put in place is to be nailed to the next one with 6-in. tinned wire nails, and everything is to be done to make the sewer secure and rigid and to make it impossible for the staves to become loosened.

Under this method of construction the barrel is built continuous, from end to end, as will appear by the sketch which I enclose. This I believe to be a more permanent construction than that formerly employed.

Yours respectfully,
Horace Loomis, Engineer in Charge of Sewers.
New York, Dec. 14, 1896

Dynamite Exploded by Warming.

Sir: It is generally supposed that dynamite will not explode except when used in connection with an exploder cap; in other words, that it will not explode by being ignited by fire. I wish to say that there are exceptions to the above belief.

Some time in October last, while being warmed by an open fire, the dynamite became ignited and thirteen sticks exploded; fortunately no one was near and there were no serious results.

Afterwards a single stick was placed in an open fire as an experiment and it also exploded. There must be a difference in the ingredients used in making dynamite by the different companies, for the writer has often seen dynamite burning where it was being warmed by an open fire.

The above mentioned dynamite was of a black color, "Nonpareil Powder" brand, manufactured by "The Rock Glycerine Co.," of Bradford, Pa.

I am, respectfully,
North Lake, N. Y., Dec. 18, 1896. F. W. S.

[The explosion of dynamite under like conditions is not so rare as our correspondent seems to believe. Warming any dynamite at an open fire is a dangerous operation, to say the least, and that this danger is generally recognized is made evident by the precautions taken in thawing out dynamite by heated water, sand, etc., in specially contrived vessels. Theoretically, dynamite requires a sharp and sudden shock to explode it, but commercial dynamite is seldom theoretically pure, and we advise caution in handling it when frozen, since accidents are constantly occurring from carelessness in thawing the material.—Ed.)

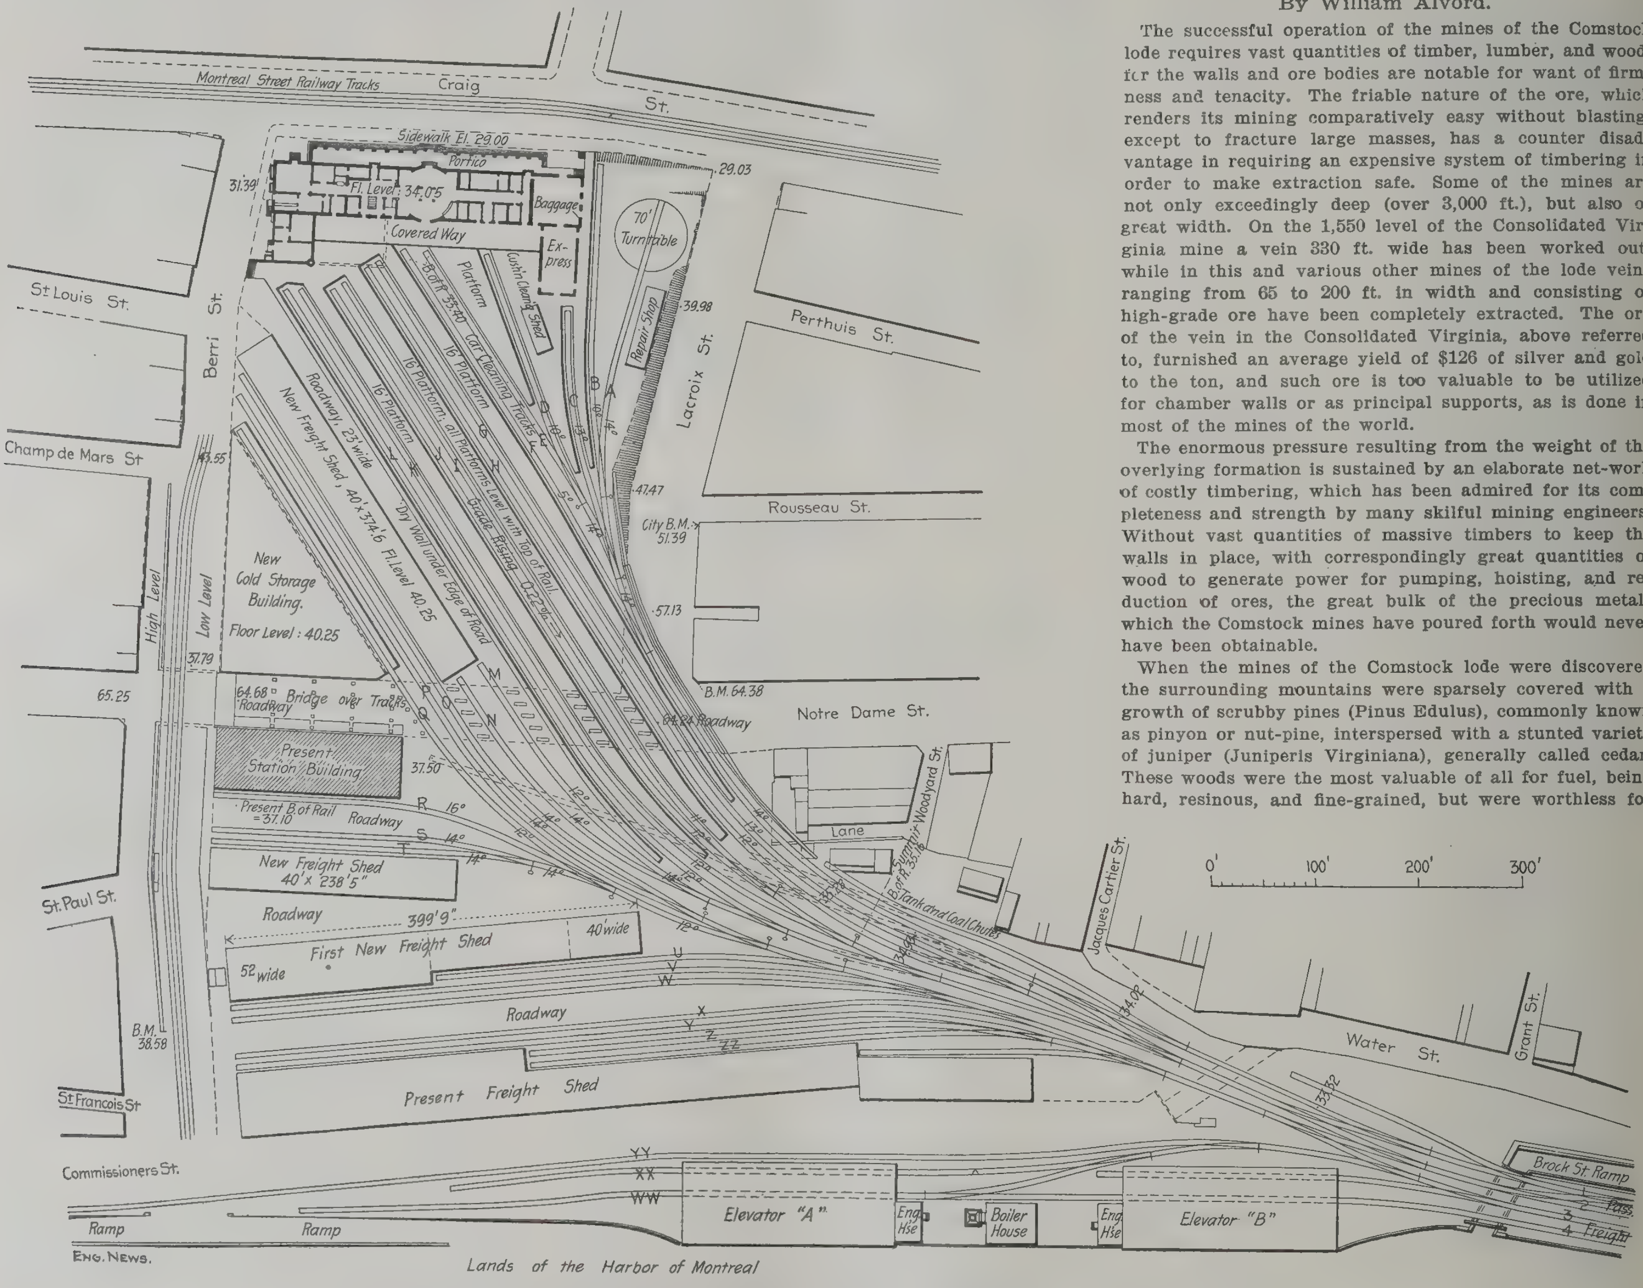
NEW TERMINAL STATION OF THE CANADIAN PACIFIC RY. AT MONTREAL.

The Canadian Pacific Ry. has at Montreal two important terminal stations, one at the east end and the other at the west end of the city, the only rail connection between which is by a roundabout route outside the city. At the west end of the city is the Windsor St. station (Eng. News, March 3 and 17, 1888), at which is handled all the traffic for the main transcontinental line, the Ontario Division and the south shore lines. At the east end of the city is the Dalhousie Square station, which has a brick station building and no train-shed. At this station is handled all the traffic for the line to Quebec and for several of the small local lines. In the aggregate the traffic is quite considerable and the railway company has for some time been carrying on the preliminary work for a large new station with a headhouse to be utilized for offices and hotel purposes. Additional yard room is also required, the Hochelaga yard being too small and too far away from the terminal. The accompanying plan shows the general arrangement of the tracks, etc., for the new building, being taken from a blue print furnished us by Mr. P. Alex. Peterson, M. Am. Soc. C. E., Chief Engineer of the C. P. Ry.

The present station is situated at the side of Notre Dame St., the offices being on the street level, while the tracks are 27.88 ft. below, the station yard having formerly been bounded by a retaining wall supporting the side of Craig St., and an archway having recently been driven to carry Berri St. under Notre Dame St. at the side of the station. The new station will occupy the entire block bounded by Notre Dame, Craig, Berri and Lacroix Sts., the grade of the ground surface falling away from Notre Dame St. to Craig St., so that the latter is practically on the same level as the present yards. The city gave the necessary authority for the new work, stipulating that a handsome station building and hotel should be built fronting on Craig St. It also gave the land, the railway company giving in exchange land for a small park. The government gave assistance to the project on condition that all trains of the Quebec Division and of the eastern district should run to and from this station. The architect for the headhouse is Mr. Bruce Price, of New York city. The city builds the retaining wall in the eastern boundary of the site, using stone from Terrebonne. Mr. Howard is the engineer in charge of this work for the city.

The first step was to remove the solid ground carrying Craig St. and replace it by a metal viaduct. This work has already been completed, the positions of the piers and columns being shown on the plan. Construction tracks were then laid under this and the grading for the new station was commenced. Of the four main line tracks at Brock St., from which the track system is developed, two (1 and 2) are passenger tracks, and two (3 and 4) are freight tracks. Of the station tracks, these marked A to N (inclusive) will be for passenger service, and those marked O to W W will be for freight service. There will be six main tracks (G to L), in pairs, separated by three platforms 16 ft. wide, the tracks rising from the headhouse on a grade of 0.22%, the summit of this grade being reached near the coal chutes. The platforms will be level with the rail heads. The new arrangements will include ample freight shed capacity; a cold storage building, 70-ft. turntable, repair shop, water tank, coal chutes, etc. The grading is being done by the railway company by day labor.



PLAN OF NEW DALHOUSIE SQUARE TERMINAL STATION AT MONTREAL; CANADIAN PACIFIC RY.
P. A. Peterson, M. Am. Soc. C. E., Chief Engineer.

TIMBER AND WOOD CONSUMPTION IN THE COMSTOCK MINES*

By William Alvord.

The successful operation of the mines of the Comstock lode requires vast quantities of timber, lumber, and wood, for the walls and ore bodies are notable for want of firmness and tenacity. The friable nature of the ore, which renders its mining comparatively easy without blasting, except to fracture large masses, has a counter disadvantage in requiring an expensive system of timbering in order to make extraction safe. Some of the mines are not only exceedingly deep (over 3,000 ft.), but also of great width. On the 1,550 level of the Consolidated Virginia mine a vein 330 ft. wide has been worked out, while in this and various other mines of the lode veins ranging from 65 to 200 ft. in width and consisting of high-grade ore have been completely extracted. The ore of the vein in the Consolidated Virginia, above referred to, furnished an average yield of $126 of silver and gold to the ton, and such ore is too valuable to be utilized for chamber walls or as principal supports, as is done in most of the mines of the world.

The enormous pressure resulting from the weight of the overlying formation is sustained by an elaborate net-work of costly timbering, which has been admired for its completeness and strength by many skilful mining engineers. Without vast quantities of massive timbers to keep the walls in place, with correspondingly great quantities of wood to generate power for pumping, hoisting, and reduction of ores, the great bulk of the precious metals which the Comstock mines have poured forth would never have been obtainable.

When the mines of the Comstock lode were discovered the surrounding mountains were sparsely covered with a growth of scrubby pines (Pinus Edulus), commonly known as pinyon or nut-pine, interspersed with a stunted variety of juniper (Juniperis Virginiana), generally called cedar. These woods were the most valuable of all for fuel, being hard, resinous, and fine-grained, but were worthless for timbers and lumber, being too small. They supplied the wants of the mines during the prospecting and surface-mining eras and as long as fuel only was wanted. As soon as any considerable depth was reached, the supply was exhausted and the forests of the eastern slope of the Sierra Nevadas, where accessible, were encroached upon. The forest-line of these mountains has receded westward before the woodman's axe until now it is west of the eastern crest of the Sierra range and almost on a line paralleling the western shore of Lake Tahoe, fairly within the limits of the state of California.

Timbers, lumber, and wood are now principally supplied to the Comstock mines from the southern portion of the Lake Tahoe basin, on the California side of the state line, by the Carson & Tahoe Lumber & Flume Co., a corporation entirely independent of the mines. The wood and logs are first transported about twelve miles over the company's railway to the lake shore at Bijou, the railway extending on piles 1,700 ft. out into the lake, to a depth of water where the steamers and barges can moor alongside of the track. The wood is unloaded from the cars on barges having a carrying capacity of from 75 to 140 cords each. The logs are dumped from the cars into the lake and enclosed in boom timbers forming immense rafts.

---

*Abstract of a paper in Vol. X. of the Proceedings of the American Forestry Association.

The company has two powerful steamers engaged in towing these barges and log rafts to Glenbrook, on the eastern shore of the lake. At this point the logs are sawed into timbers and lumber which, with the wood, are reloaded on cars and transported up a long incline to the summit, over another railway, about ten miles long, belonging to the company. At the summit these are unloaded and conveyed through a flume for about twelve miles, to the wood and lumber yards at Carson City, Nev., and from there taken by the Virginia & Truckee R.R. 20 miles to the mines, making a total distance of 65 miles from the forest, over two rugged mountain chains. From the forest to the mines the timber, lumber, and wood are necessarily handled thirteen times.

In the operation of its system the Carson & Tahoe Lumber & Fluming Co. owns and uses 30 miles of railway track and switches, 2 locomotives, 40 cars, 2 steamboats, 6 barges, and 25 miles of flume. This flume is in form of a V, and is provided with all of the improvements which the experience of 20 years in flume transportation have suggested. It has 32 to 34-in. sides, a top width of from 45 to 48 ins., and has a diameter in the bottom of from 5 to 7 ins. It was constructed in 1870, has been in use ever since, and has a reliable supply of water from springs and creeks in the high Sierras. It has a carrying capacity of 600 cords of wood a day, and will transport the heaviest mining timbers as well as lumber and cord-wood.

About 15,000 cords of wood are annually supplied from the forests surrounding the headwaters of the Carson river in Alpine county, California, these being floated down the river in drives during the early summer stages of water. About 8,000 cords a year are consumed in the mills along the Carson river, and the remainder is shipped by rail to the Comstock mines. At present, 120,000 acres of the Sierra Nevada's choicest forests around Lake Tahoe and 75,000 acres around the headwaters of the Carson river have been denuded to operate the mines. When it is considered that this area equals an expanse of land 305 miles long by one wile wide, it will be apprehended that there is good reason for calling the Comstock "The tomb of the Sierras."

Not more than 10,000 acres of timber land and 35,000 acres of woodland are now available to supply the mines. Upon the exhaustion of these it will be necessary to develop the timber regions north of the Truckee river in order to obtain an adequate supply of timbers and wood. This will remove the base of supplies more than one hundred miles from the mines, and will require a heavy expenditure to construct lines of transportation. None of the Comstock mining companies have ever owned or controlled their timber supplies, but have relied on independent companies or individuals for the same.

From Jan. 1, 1880, to Jan. 1, 1891, in all, 249,756,000 cu. ft. of timbers and lumber were shipped to and used in and about the Comstock mines. During the same period 100,776,440 cu. ft. of wood were consumed, and to the latter amount should be added 11,264,000 cu. ft. consumed by the Carson River mills, auxiliary to the mines, making a total of 875,316 cords. These figures are taken principally from the books of the Virginia & Truckee R.R. Co., and may be relied upon. For the decade commencing Jan. 1, 1870, and ending Jan. 1, 1880, which includes the period of development and working of the bonanzas in the Crown Point, Belcher, Consolidated Virginia, and California mines, the timber, lumber, and wood used cannot be ascertained with exactitude, but a conservative estimate by men most familiar with the facts and with sufficient data upon which to base a nearly correct estimate, fixes the figures at 425,000,000 ft. of timber and lumber and 268,800,000 cu. ft. of wood, to which should be added 10,240,000 cu. ft. used in and about the Carson River mills.

In 1870 the timber and lumber sold for $35 per M. ft. at the mines, and wood at $13 per cord, but the prices have gradually fallen since that time, until now timber and lumber are sold at the mines for $22 per M. ft., and wood for $9 per cord. A conservative and probably underestimate of the average price paid at the mines for timber and lumber since 1870 is $23 per M. ft., and for wood $10 per cord.

Summarizing the above statistics, the Comstock mines since 1870 have used 674,756,000 ft. of timbers and lumber, and have paid therefor, at $23 per M. ft., $15,519,388. During the same time the mines and mills have used 391,070,488 cu. ft. of wood, costing, at $10 per cord, the sum of $30,553,160; making a grand total cost of $46,072,548. The pumping machinery of the mines was partially stopped in 1882 and entirely shut down in 1884, which accounts for the much smaller quantity of wood used in the last eleven years than was required for the ten years previous thereto.

The consumption of forest products by the mines for the period embraced between the discovery of the Comstock lode and 1870 can hardly be approximated, as there are no data for that time obtainable, but an estimate that the entire cost of timbers, lumber, and wood used in and about the Comstock mines, from the date of their discovery until the present time, is $55,000,000, could hardly exceed the true amount.

With the exception of the shafts and bulkheads, the prevailing system of timbering in the Comstock mines is that devised by Mr. Philip Deidesheimer in 1860 and commonly known as the "Deidesheimer system." It consists of timbers so framed that when a post is set up there is a place on its top for the ends of four caps, and when these are placed in position a mortise is formed into which the end of the next post fits. The same connections are made with each of the four posts, forming a hollow cube, and there is always a place for the caps of the sets to be fitted on any side.

These sets form cribs of timber 6 ft. square, strengthened by timbers connecting opposite corners in the manner of diagonals of squares. These cribs, when completed, make convenient places in which to stow away waste rock, and make the whole almost as firm as the original material. These sets are as compact as the cells of a honeycomb, to which they bear a striking resemblance except in figure, and by repetition may be extended in all directions to any distance that may be required. This system of timbering exemplifies the truth of the old adage that "Necessity is the mother of invention," for without it the Comstock miners could do nothing, but with it, the mines can be safely worked to any depth, width, or length. The seeming endless labyrinths of timbers in the Comstock mines when ignited and beyond control make a subterranean fire which burns and smolders for years. Many lives have been lost in the mines by reason of these fires, but none have been recorded as having been lost because of any inherent defect in the timbers or system of timbering.

A large proportion of the timber and lumber used in these mines has been in the constructing of shafts and bulkheads. Many of these shafts are from 2.000 to more than 3,000 ft. deep, and are completely encased in timbers. In the Consolidated Virginia mine there is one bulkhead 300 ft. long, 200 ft. high, and 80 ft. wide, containing 57,650,000 ft. of timbers. Another bulkhead in the same mine is 150 ft. long, 100 ft. high, and 50 ft. wide, and contains 9,000,000 ft. of timbers. There are other bulkheads of smaller dimensions, but containing in the aggregate vast amounts of heavy timbers.

The sizes of the timbers used in these mines vary from the huge pieces 16 ins. square and 24 ft. long to the smaller pieces 8 ins. square, used in cribbing.

The species used consist of yellow pine (Pinus poderosa), fir, (Picea magnifica), and cedar (Thuya gigantea), of which the latter is found in such small quantities as to be hardly worth considering. Fully two-thirds used is yellow pine, nearly one-third fir, and less than 1% is cedar.

In a comparison of these woods, in point of durability, red fir would rank at 100, yellow pine at 90, and white fir at 65. In a comparison in point of strength, red fir would rank at 100, yellow pine at 90, and white fir at about 90. In the generation of heat, they would rank in the order of yellow pine, red fir, and white fir. Yellow pine is a favorite timber with mire carpenters on account of its exactitude in joining. Cedar is inferior to no known timber, not even excepting redwood, for its lasting qualities underground. Yellow pine has been taken from the lower levels of these mines so compacted by the enormous pressure it has withstood as to have a density and weight exceeding lignum vitae, and has been made into handsome paper weights and other ornaments.

None of the timbers in the Comstock mines have yet badly decayed, and their life there cannot be accurately determined. The heat and the vapors of the mines, surcharged with mineral matter, appear to have a decidedly preservative effect upon the timbers.

Nearly or quite all of the timber cut for these mines is felled during the winter and spring months; it is flumed during the summer and autumn months, but the timber and lumber are in the water only during their passage through the flume—not more than 75 minutes. Upon being discharged at the mouth of the flume in the yards, the timber is at once piled up in such a way as to prevent warping and cracking and so that the air can circulate freely between each piece. The wood remains until shipped as it is discharged by the flume. As it is built up almost to a level with the flume, the latter is extended so that the wood is piled up by the water in long pyramidal masses about 30 ft. wide at the bottom, 10 ft. wide at the top, and about 20 ft. high; being thoroughly wet when discharged by the flume and drenched as piled, it remains more or less wet for several months and sometimes partially sours. For this reason, flume wood will not generate quite as much heat as will wood which has never been in the water. The effect of the water on timbers and lumber, when handled as herein described, is hardly appreciable.

The area upon which the forest has been cut off to supply the mines is now growing up, principally in pine, but the reproductive growth is so slow that it will require more than a century for the trees to attain a size sufficient to furnish the timbers required by the mines. The new growth is very thick, but as it becomes large the economy of nature, "the survival of the fittest," will kill out the weaklings and leave the stronger young trees at a proper distance apart. On some of the lower slopes of the mountains where the new growth is over 20 years old there are few trees 10 ins. in diameter, and the average diameter will not exceed 6 ins. In the Tahoe Basin, which has been cut over principally within the last ten years, the reproductive growth is about 5 ft. high and will average about 4 ins. in diameter. It is especially noticeable that in the Sierra Nevadas fir predominates on the north slopes where the snow remains the longest and the sun shines the least. On the other slopes pine largely predominates. This indicates that the Sierra fir thrives in a colder climate than is congenial to pine. A further fact is noticeable, that the reproductive growth contains a much larger percentage of pine and a less percentage of fir than the original growth contained. This is satisfactorily accounted for by reason of the sun reaching the ground after the primeval forest is cut off. As the new growth becomes larger and the ground is shaded a larger number of young pines than firs die, but a careful observation leads to the conclusion that when the trees become large enough for use the percentage of pine will exceed and that of the fir be less than in the primeval forest.

The present condition of the mines seems to indicate that the timber available will be adequate to their demands, but if extensive ore bodies should be discovered in the lode, or additional lodes within fifty miles of the Comstock, an enormous expenditure must be incurred to supply necessary forest products.

PROPOSED SANITARY SUPERVISION OF WATER SUPPLY AND SEWERAGE SYSTEMS IN ILLINOIS.

The sanitary supervision and control at all times of all public water supplies, both surface and underground, within the state of Illinois, and likewise the supervision and control of the methods and means of collecting and disposing of sewage is placed in the hands of the State Board of Health by a bill which will be introduced into the Illinois State Legislature at its coming session. This bill had its origin in the Illinois Society of Engineers and Surveyors, and has been drafted by a committee made up of members of that society, the Western Society of Engineers, the State Board of Health and of the Faculty of the University of Illinois. In Sec. 2 of the bill the scope of the legislation asked is given as follows:

> No sewer, extension of sewers, system of sewage (sewerage?—Ed.), or system of public water supply, shall be constructed by any city, village or town in this state, or by any corporation, individual or individuals, until the plans and specifications for such sewer, extension of sewers,system of sewage(?), or system of public water supply, shall have been submitted to the State Board of Health, and received its approval. And in addition to the approval of the plans for the development of public water supplies, the State Board of Health shall examine and cause to be made, analyses of the waters from the source, or sources, of supply, and determine their fitness for domestic and culinary purposes before such waters shall be issued to the municipality, corporation, individual or individuals, signed by the president of the board and attested by the secretary, with the seal of the board.

Sec. 3 of the bill provides that the required analyses shall be made at the laboratories of the University of Illinois, and shall be prima facie evidence of the matters therein stated. Secs. 4 and 5 provide for the publication of rules and regulations made by the State Board of Health under this law for three consecutive weeks in at least one newspaper in each county of the state, and orders that the affidavits of the publishers affirming such publication shall be filed with the County Clerk and shall be conclusive evidence of all facts stated therein. Sec. 6 authorizes the State Board of Health to make such inspections as are necessary to determine whether the terms of the law and the regulations of the board have been violated or not. In case of violation, notice to that effect is to be served upon the violators, and if the fault is not corrected, or good reason shown why such correction is not made, within ten days after service, action may be brought against the violators before any Justice of the Peace in the county where the violation occurred for the recovery of the penalties prescribed, and upon proper showing an injunction may be secured restraining continued violation. Sec. 7 provides that the penalties for violation shall not be less than $50, nor more than $200, for every violation, and an extra penalty of $10 per day for every day the violation is continued after conviction. Sec. 8 provides as follows:

> The State Board of Health shall, at its annual meeting, each year, elect a sanitary engineer, to be elected from three persons, recommended by the Illinois Society of Engineers and Surveyors, whose duty it shall be, under the direction of the board, to examine all plans for the construction of proposed sewers, extension of sewers, system of sewage(?) and water supply, and to perform such other duties in the line of his profession, as may be assigned to him by the board; to make report to the secretary before the regular quarterly meetings of the board, of all inspections made by him; for which service he shall be paid a sum not to exceed (sum to be specified by the legislature) dollars, to be paid out of the regular appropriations of the board.

Sec. 9 provides for an annual report of the Board of Health to the Governor of the state of all its acts in reference to this law. Sec. 10 provides that the provisions of the bill shall not apply to cities of the first class. The effect of the last provision is simply to exclude the city of Chicago from the jurisdiction of the law. We have commented on this proposed legislation in our editorial columns.

◆

NOTES OF A TRANSCONTINENTAL TRIP.

VII.

Tacoma, Wash.

This is one of the new large cities of the Pacific Northwest. It was first founded in 1868, but its history as a place of commercial importance dates from 1873, when the Northern Pacific R. R. made this its Pacific terminus. At the time of my visit, however, the city was quiet and business was dull, owing partly to the general commercial depression and partly to the dullness of the summer season. The city is pleasantly situated at the southeastern extremity of Puget Sound, and has fine facilities as a port. The city itself is mainly on high ground, 80 to 100 ft. above the water, but there are extensive mud flats along the shore which are to be filled in for the extension of the docks, wharves and other terminal structures of the Northern Pacific R. R. At Edison, near by, are the new railway car shops, which have cost nearly $1,250,000, while the total cost of the improvements carried out by the Northern Pacific Railway Co. at this point amounts to nearly $6,000,000, these improvements including grain elevators and warehouses of 3,500,000 bushels capacity, and coal bunkers of 22,000 tons capacity, besides two miles of wharf frontage in 30 ft. of water. In June last a contract for a dry dock was awarded by Capt. John E. Higgins to Dougan, Bringham & Cowen, at $86,000, while the repair shops, machinery, etc., will bring the cost up to $1,250,000. The dock will be 425 ft. long, 21 ft. deep, 50 ft. wide on the bottom and 90 ft. wide on the top. There is now a smaller dock, which was built in 1891.

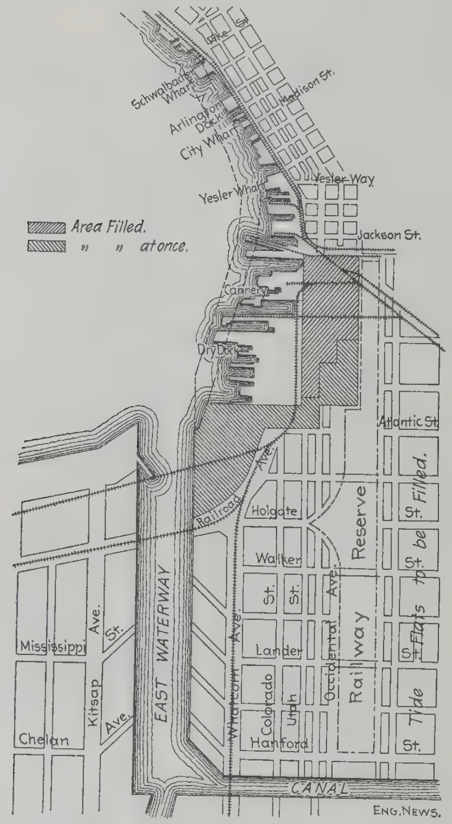

Fig. 1.—Map of Tide-Flat Filling at Seattle, Wash.

The water supply and electric light plant are owned by the city, and there are about 110 miles of graded streets, 54 miles of sewers and 74 miles of cable and electric railways. Wooden block paving and California asphalt paving are used on the main streets, and plank paving is also used on some streets. The Port Defiance, Tacoma & Edison Electric Ry. has box freight motor cars, which haul ordinary railway freight cars. The population was 36,000 in 1890, and is now estimated at 50,000. There is a smelter here at which 17,000 tons of ore were handled in 1895, the value of the output being $739,150. There is a considerable maritime traffic, including a large percentage of the tea imports (639,042 packages in 1895), and the Northern Pacific Steamship Co. has a tri-weekly service of steamers to China and Japan, while smaller lines of steamers run to various points on Puget Sound and up to Alaska.

Seattle.

This city is about 40 miles north of Tacoma, on the east side of Puget Sound, and a fierce rivalry exists between the two cities. Seattle had a population of 40,000 in 1890, and this is now probably between 50,000 and 60,000. The city is decidedly larger and more bustling than Tacoma, but it is smokier, and not so attractive to the traveler. As at the latter place, great terminal facilities and harbor accommodations are projected, to be built on made land in the shallow water, as the ground upon which the city is built rises steeply up from the water. In consequence of this the approach to the city by rail presents a most singular view. Great areas of open water are thickly dotted with piles, while here and there a roadway or a wharf extends over the piles, and in some cases houses have already been built on a pile substructure. At some distance behind the city are large fresh water lakes, and canals are proposed to connect these with the harbor, the purpose being to facilitate the extensive local marine traffic with places on the lakes and the sound, for Seattle is a great center for local navigation. The city has a considerable amount of brick paving on its streets, and, like all the places of which it is a type, it has a very complete and extensive rapid transit system, the cable and electric lines reaching all parts of the city and suburbs, and extending far into the country. Many of the lines have very steep grades and sharp curves, over and around which the cars are run at high speed, giving the passengers considerable exercise in sliding and swinging about. Some of the changes of grade are made with such sharp curves that fenders cannot be used, as in rising from the level street intersection to the grades the car plaform almost touches the pavement. A new water supply, from Cedar River, is now projected.

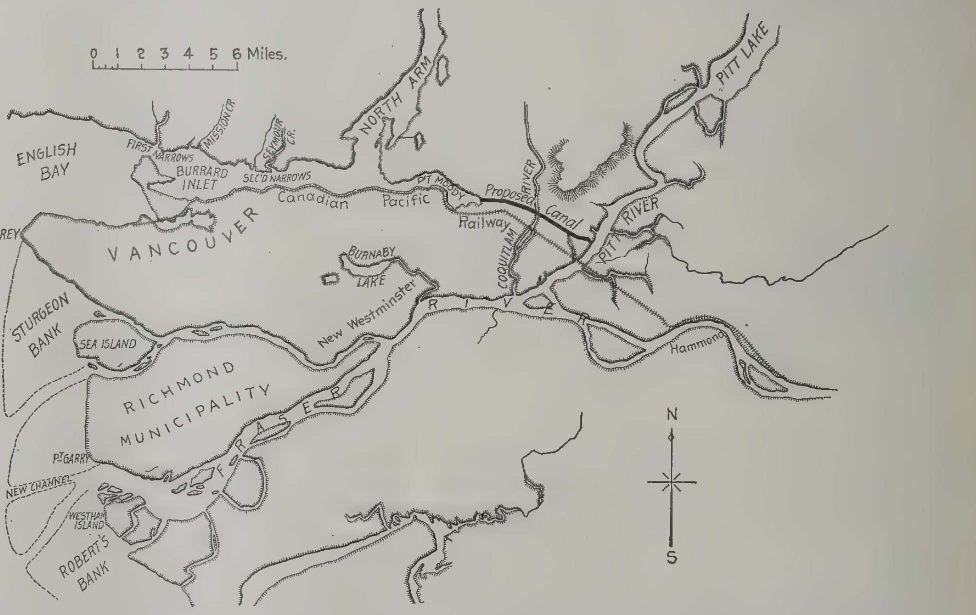

FIG. 2.—MAP OF PROPOSED RELIEF CANAL FOR FLOOD WATER IN THE FRASER RIVER; VANCOUVER, B. C.

The city is not on the Northern Pacific R. R. main line, but on a branch line, which has connections giving a through route to the Canadian Pacific Ry. at Mission, B. C., through trains being run between Portland and Vancouver. There is not a very good railway station, but the Northern Pacific R. R. proposes to purchase a block and erect a large modern station. In view of the large number of transportation interests centering here, and the disadvantages which would result from rivalry in establishing independent stations, yards, etc., the municipal authorities and the Chamber of Commerce have been endeavoring to promote the establishment of a terminal company to provide facilities and accommodations for the joint use of the various railway and steamship lines, thereby increasing the convenience for passengers and shippers and reducing the cost of handling passengers and freight. The railways, etc., would hold stock in proportion to the values of their respective properties in the city, and all details of operation, switching, etc., would be under the control of the terminal company. Another matter of commercial interest at the time of my visit was the proposed establishment of a new line of steamers to Japan, by a Japanese company, and a representative of that company was then on the coast, viewing the various harbors from Victoria and Vancouver, B. C., down to San Francisco and San Diego, Cal. Every coast city, therefore, was pointing out (through its papers and its citizens) its own supreme advantages as the port of such a line, and the adsurdity of the claims of all the other cities interested.

The proposed canals to connect Puget Sound with Lake Washington were described in Engineering News of March 15 and July 12, 1894, and Jan. 24, 1895. There are two of these projects, one of which is being carried on by the U. S. Government, the other by the Seattle & Lake Washington Waterway Co. No appropriation for actual construction of the Government Canal has yet been made. The other enterprise, which is as much a land reclamation project as a canal scheme, is in active progress. A summary of the work thus far done was recently furnished, as follows:

> The company has filled in at present a little less than 50 acres of tide lands immediately adjoining the town. In doing this it has moved over 1,000,000 cu. yds. of sand an average distance of about 4,000 ft., and have dredged the East Waterway for about 2,000 ft. to a depth of 26 ft. below low tide. There are at present two of the largest Bowers hydraulic dredgers at work, and the company proposes to build another in the spring, and also to start work on the hill section part of the canal. The terminal and dock facilities were planned by Mr. V. G. Bogue, M. Am. Soc. C. E., and are shown on the accompanying map (Fig. 1.) They were first considered in platting this part of the tide flats.

Mr. Edgar Ames, General Manager of the company, states that the railways are all to enter along the railway reserve and have their freight houses and yards along this strip. Then along Railway Ave. and Whatcom Ave. there will be tracks with spurs leading on to the docks, so that freight will be handled directly from steamer to car. The east and west waterways will be 1,000 ft. wide, but 448 ft. of this is allowed for lengthening of docks and wharves to accommodate large ocean steamers. The lock will be 400 × 50 ft., with 32 ft. of water on the upper sill and 16 or 32 ft. on the lower sill at low or high water. The excavation of the big cut will be done by hydraulic giants, the excavated material being conveyed in flumes to the tide flats. The bulkheads for the inner harbor lines have three rows of piles 6 ft. apart, with horizontal timbers, some of these timbers being 9-in. tree trunks, with branches extending back into the made ground. These three pile bents are 12 ft. apart, and a brush mattress filling is placed between the piles.

Seattle to Victoria and Vancouver.

At 10:15 a. m., on July 26, I left Seattle on the steamer "City of Kingston" for Victoria, B. C., a trip of about 80 miles. The "City of Kingston" is a Hudson River steamer, which was purchased some years ago to run between Tacoma, Seattle and Victoria, and was successfully navigated around Cape Horn to its new service on the Pacific. The boat is a screw vessel, built by Harlan & Hollingsworth in 1884. Its trip is mainly in smooth water, but beyond Fort Townsend (crossing the Strait of Juan de Fuca, which connects the sound with the Pacific Ocean) there is something of a sea swell.

Victoria (or Vancouver Island), the capital city of British Columbia, is an attractive city, very pleasantly located, and has a population of about 20,000. The old government buildings are of wood of the Swiss chalet style of architecture, but a large and handsome stone building is now being erected to replace the several old wooden structures. The streets, etc., have a general air of neglect, due, apparently, to a careless and unsystematic administration of municipal affairs, an example of which was brought to light by the inquiry into the terrible disaster caused by the failure of the Point Ellice Bridge in May, as described in Engineering News June 18 and July 2. After the accident, a new steel bridge was proposed, but this was voted down by the council and a plan adopted to build a pile bridge, or trestle, alongside the old bridge, the cost of this to be $5,200. The citizens presented a petition for a steel bridge, to be paid for by the city, the government and the street railway company, but the trestle was adopted as being more rapidly built to re-open communication with Victoria West. As the accident occurred on May 26, and the trestle was still unfinished when I saw it in July (when only a very few men were at work upon it), neither the builders nor the council seem to have been in any hurry to reopen this communication, leaving persons bound for Esquimault to walk across a railway bridge and then walk 1½ miles along a dusty country road to the street car line on the opposite side of the wrecked bridge. So affected was the municipal mind by this disaster, that all bridges and trestles are now closed to street railway traffic, which is a brilliant precaution against accidents. The whole thing seems to have been a dreadful muddle. As to the street railway company, which shared the responsibility for the disaster, it has a most curious and inconvenient way of running its cars, the passengers being liable at almost any time, apparently, to be told that their car does not go any further, but that they must get out and walk on a block or so, where they will find another car. From Victoria, the Esquimault & Nanaimo Ry. extends to the coal mines of Nanaimo, 73 miles, and Wellington, 78 miles, while at Esquimault, two or three miles from Victoria, is the British naval station, with a great land-locked harbor and a masonry dry dock.

On reaching Canadian territory it is interesting to note the difference in appearance, style, dress and accent of the people, which makes it at once evident that this is a part of "Greater Britain," and this difference is accentuated by the scarlet and blue uniforms of the military which pervade the streets, and also by the appearance of the buildings. On the other hand, however, one sees that in all railway affairs American methods prevail, to the exclusion of English methods and practice.

After one day at Victoria, I left at 2 a. m., July 28, for Vancouver, on the steamer "Charmer," of the Canadian Pacific Navigation Co., a vessel built by the Union Iron Works, San Francisco, Cal., in 1887. This northeast trip of about 84 miles was considerably rougher than that from Seattle to Victoria. Vancouver was reached at 9 a. m. (one hour late), the steamer landing at the dock close to the S.S. "Empress of India," of the Canadian Pacific Ry. Co.'s line to Japan and China. The city is small, with a population of about 20,000, but has fine buildings and streets and a general air of prosperity and local pride, which are entirely wanting at Victoria. At the time of my visit it was unusually dull, the mining excitement in the province having drawn away a number of the people. The city was founded in 1886, and a steady commercial growth may be expected for it, as it is the terminal of a transcontinental railway and of two important transpacific steamship lines. The C. P. Ry. has shops and a fine hotel at this place, but in view of the class of passengers and the number of distinguished persons carried by this road, it is strange that a somewhat imposing terminal station has not as yet been built to replace the present small and commonplace wooden structure.

The Canadian Pacific Ry. has two lines of ocean steamers from this port. The fleet of its royal mail line to Japan and China consists of three fine large steamers, which leave every three weeks during the summer and every four weeks during the rest of the year. They are all built to the same plans, being 485 ft. long and 51 ft. beam, and having twin screws driven by triple expansion engines, giving the vessel a speed of over 19 knots. The interior arrangements are very handsome, and the hull is painted white, to aid in keeping the vessel cool in the hot Eastern climate. The other line of steamers runs to Australia (Sydney, New South Wales), stopping at the Hawaiian and Fijian Islands. This fleet consists of four vessels, sailing once a month.

DERAILING DEVICE FOR PROTECTING STREET AND STEAM RAILWAY CROSSING AT ALTON, ILL.
Paige Iron Works, Chicago, Ill., Builders.

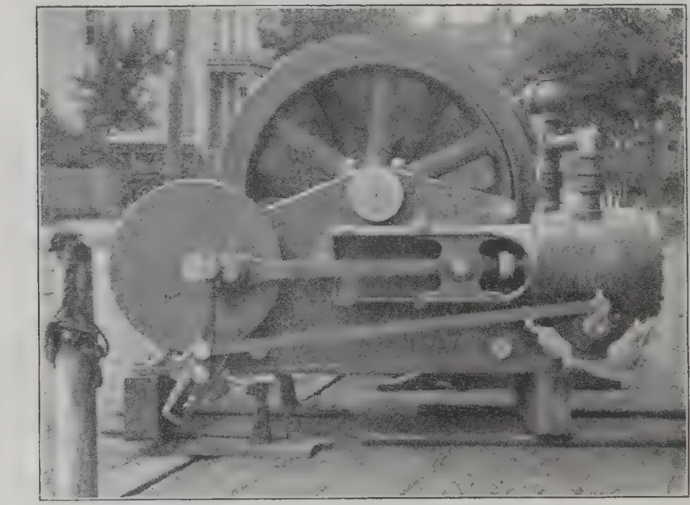
The flat meadow lands along the rivers for some miles east of Vancouver are very fertile, but are subject to inundation by the fierce floods in the Fraser River. To protect these lands a canal is proposed to carry off flood water from the Fraser River, and discharge it direct into an arm of the sea. The project to build a canal between the points indicated on the accompanying map, Fig. 2, is of an entirely private nature, although government assistance has been asked. It is not likely, however, that permission will be granted to construct it without locks, as the wash of gravel into Burrard Inlet would, in all probability, be very considerable and highly detrimental to that harbor. The Minister of Public Works of the Dominion, the Hon. J. Israel Tarte, has been recently in British Columbia studying the whole question of the control of the flood waters of the Fraser River, and it is his intention to send out government engineers to make a careful survey of the channel and to consider the feasibility of diking the banks in a satisfactory manner. Mr. Thomas H. Tracy, City Engineer of Vancouver, states that on the Pitt River, and also on the Fraser River, a great deal of very satisfactory diking has been done by private parties and by the various municipalities. The dikes on the Pitt River, built to reclaim the grazing lands, are from 40 to 54 ft. wide at the base, 12 to 15 ft. in height, and 6 ft. wide on top, and so far they have answered admirably. The British Columbia Drainage & Diking Co. owns about 14,000 acres of the Pitt meadow lands, under a diking concession from the Dominion Government, and has built dikes to protect its land from the flood water.

Mining in British Columbia.

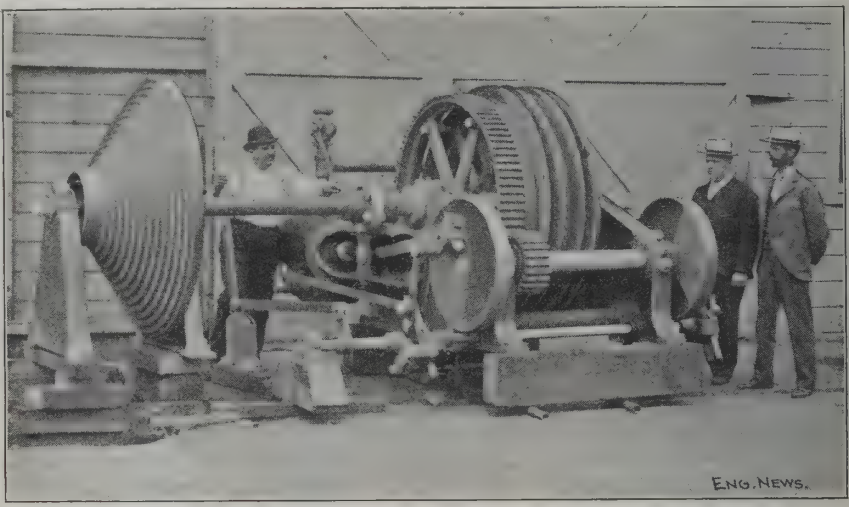
During the past summer there has been a great mining boom in this province, mainly in gold mining, and numerous very rich and valuable properties have been developed, although here, as in all other such cases, many wildcat schemes are founded by unscrupulous promoters. Mr. P. A. Peterson, M. Am. Soc. C. E., Chief Engineer of the Canadian Pacific Ry., and Prof. T. H. Egleston have reported very favorably upon the mineral resources of the province. The iron deposits on Vancouver Island are also being given some attention. Placer mining of gold bearing gravel is being commenced in some districts, and as the province has not yet had bitter experience enough to lead it to adopt legislation restricting the dumping of the debris into the rivers, the mining companies can work for the present with free hands. A less dangerous system is that of dredging the gravel from the river bottoms, and Beatty & Sons, of Welland, Ont., manufacturers of dredging and excavating machinery, have built a complete plant for this work on the Fraser River. The gravel will be raised by a dipper and dumped into a "grizzly," from which the finer material goes to the sluice-box to be treated by quicksilver, while the coarser material goes overboard to a dump scow. Better railway facilities are needed in most of the new districts, and locally there is great dissatisfaction expressed because the Canadians are so slow to provide these, while Americans have invested heavy amounts of capital in developing the resources of the new districts, and have already built lines which divert much of the traffic to points in the United States. The Canadian Pacific Ry. has now some small local connections and steamer lines, but a through line is much to be desired, and this could be afforded by the proposed Crow's Nest Pass line through the southern part of the province. This will not be built, however, unless the government gives the railway company a good subsidy. Mr. Collingwood Schreiber, Deputy Minister of Public Works, has recently visited British Columbia to investigate the actual requirement for such a line, and the desirability of granting a subsidy. The company has had careful investigations made by its mining expert, with very satisfactory results, and in consequence of this new smelting plants may be erected. The smelting has been done largely by the Kansas City Smelting Co., at Kansas City, Mo., 2,000 miles distant, but the company and the C. P. Ry. Co. will probably put up local smelters for their combined interests. One of the latest new lines is the Columbia & Western Ry. (narrow gage), which was completed from Trail to Rossland this past summer, the contractor being Mr. Henry Blackwood. A line from Vancouver to the celebrated Kootenai district is also projected, and the enterprise has been incorporated by McLean Bros., of Vancouver, as the Vancouver, Victoria & Eastern Ry. & Navigation Co. Another railway project heard of in this province is the British Pacific Ry., which is proposed to run north from Winnipeg, Man., and then westward, north of the Canadian Pacific Ry., touching the latter's branches at Prince Albert and Edmonton.

DERAILING DEVICE FOR PROTECTING STREET AND STEAM RAILWAY CROSSINGS.

We illustrate in the accompanying cut a derailing device designed to prevent collisions at the crossings of steam and electric railways, which was recently installed at Alton, Ill., at the crossing of the Chicago & Alton R. R. and the Alton Ry. & Illuminating Co.'s tracks. The device is manufactured by the Paige Iron Works, of Chicago, Ill., and as will be seen from the drawing consists simply of a hand operated derailing switch placed on each side of the steam railway tracks and about 50 ft. distant. Normally the switch is open—that is, it is set to derail the electric car, and to pass it the conductor must cross the steam railway track and raise a lever which throws the switch into line by means clearly indicated in the drawing. The lever B opens the switch A and the lever D opens the switch C, and each lever must be held up until the car passes the switch which it controls. After the car has cleared the switch the lever is dropped and the switch is returned to its original open position by means of a spring. The various structural features of the device are clearly shown by the illustration.



HOISTING ENGINE WITH HACKWORTH VALVE GEAR.
Manufactured by the C. W. Hunt Co., 45 Broadway, New York City.



FRONT VIEW OF HOISTING ENGINE, SHOWING WINDING DRUM WITH SPIRAL GROOVE.

A HOISTING ENGINE WITH A NOVEL VALVE GEAR.

We illustrate herewith a hoisting engine, built by the C. W. Hunt Co., 45 Broadway, New York city, which is noteworthy on account of its use of the Hackworth valve gear, which seems to be especially suitable to this class of engines. It has an overhung eccentric crank, and a rotary valve motion. There are only three moving parts in the valve gear, viz., the valve motion connecting rod, the sliding block and the valve rod. The valve gear is described as follows:

The eccentric is in the same radial line as the crank. The eccentric rod is supported at its lower end by a sliding block, of which the path may be given greater or less inclination, so that the crank end of the rod describes a circle concentric with the shaft, while the other is guided in a straight line by the sliding block. The valve rod is attached to the eccentric rod between the eccentric and the sliding block, and the point of attachment moves in an elliptical orbit, the major axis of the ellipse having the same direction as the path of the sliding block. The sliding block guide being set at a greater or less inclination, the travel of the valve is correspondingly varied, and its inclination being reversed with respect to the center line of the rod, the motion of the engine is reversed.

This device gives constant lead and a better motion of the valve than the link motion, especially at short cut-off. The strains are all in line; the bearing surfaces are all cylindrical or straight, ensuring good work and long service. The motion of the valve is benefited by the rocking of the valve arm, as the effective radius is shorter at the ends of the stroke, consequently the valve has a more rapid motion as its distance from the center line increases. The eccentric rod introduces an irregularity in the motion, and the connecting rod introduces an irregularity in the motion of the piston. The length of the connecting rod and of the valve rod and their relative positions are so chosen as to neutralize each other's irregularities.

CONTRACTION AND DEFORMATION OF IRON CASTINGS IN COOLING FROM THE FLUID TO THE SOLID STATE.*

By Francis Schumann, M. Am. Soc. M. E.**

Introduction.

One of the most serious and annoying difficulties to the iron founder is the tendency of castings to deformation, due to unequal cooling and consequent unequal contraction, excessive initial stresses, if not cracked castings, often resulting, no matter how carefully molded or with what care the iron is selected and manipulated. Our knowledge as to the causes has been but vague, notwithstanding the thought and attention given the subject.

The writer, impressed with the importance of the matter, and having opportunities for observation and experiment through his connection with foundries where great diversity in the form of product resulted, decided to investigate with a view of discovering what laws of physics applied, and in how far the cause and effect were determinable and controllable.

After some twelve years of observation and research the writer is enabled to submit the result of his labors, which it is hoped will prove of practical use to the engineer and foundryman.

General Laws Advanced.

Cast iron, as well as all other bodies, with but few exceptions, expands or contracts equally in all directions, with the increase or decrease of its temperature, respectively. Hence the proportion of a body, whether its temperature increases or decreases, remain alike. At moderate low temperatures, from 32° to 212° F., the change is directly as the temperature. At high temperatures the changes are greater than the changes in heat.

Contraction takes place just when incandescence disappears, or when the color changes from red to black, and continues until the temperature is that of the surrounding mediums.

Contraction and Deformation of Prisms Cast in Sand Molds.

A prism cast in a sand mold will maintain its alinement, after cooling in the mold, provided all parts around its center of gravity of cross section cool at the same rate as to time and temperature.

Deformation is due to unequal contraction of the elements of the cross section surrounding the center of gravity of the section. Unequal contraction is due to unequal cooling, causing, or tending to cause, initial stresses in the elements of the prism, resulting in deformation or rupture.

The rate of contraction between the fluid (heated) state and the solid (cold) decreases with the volume or mass of the casting, and inversely as the time of cooling. Rapid cooling tends to increase the density of the iron; the crystals are diminished in size, and the fracture denotes greater compactness, with more evenness of surface and less ruggedness. The color tends towards white, denoting a change of carbon into the combined state at the moment of solidification. The size of crystals decreases with an increase of combined carbon. Its resistance to impact is lessened, and the rate of contraction is increased.

Slow cooling develops larger crystals, less density, and increased ductility. The fracture is darker or more gray in color, the surface uneven and rugged, and the carbon is in a more free state. The contraction is lessened, and the casting has greater resistance to shock, although its resistance to a quiescent cross-breaking force may be less.

In any prism, variations in density may occur by reason of differences in the rate of cooling, the more rapidly cooling part being more dense, made so by the molecules drawn from the still fluid part of the casting, which, cooling later, will be less dense or with a diminished number of molecules. The molecules in adjusting themselves follow and flow in lines coinciding in direction with the waves of cooling, being from a high to a lower temperature, thus tending to create a void, and lessening the density of those parts which cool slower.

The rate of cooling, or dissipation, of heat, is uniform around the perimeter of the cross section. The total amount of heat to be dissipated per unit of perimeter of section may or may not be uniform or equal, depending upon the character of the cross section. The greater the amount of heat to be dissipated per unit of perimeter the slower the cooling.

A plane of neutral or mean action, relative to the total dissipation of heat, passes through the centre of gravity of the cross section. In symmetrical sections the action is alike on either side of the neutral plane, while in unsymmetrical sections it will, or may, vary.

The dissipation of heat through the perimeter of a section follows wave lines perpendicular, in direction, to the perimeter. The amount of heat to be dissipated per unit of perimeter varies in proportion to the volume or mass of the prism of which the respective unit forms the dissipating side. The relative amount of heat dissipated in a prism, per unit of time, varies in proportion to the dissipating surface of the perimeter divided by its respective volume of cross section.

The crystals that form in cast iron, when changing from the liquid to the solid state, have the tendency, when no disturbing causes interfere, to form themselves into regular octahedrons, or double four-sided pyramids, with their bases joined. Their size varies, the mean increasing with the slowness of cooling. The long axis of the crystals tends to adjust itself perpendicular to the plane of cooling surface of the casting. Thus, in a cylinder, the axis would coincide with the radial lines, while in a square prism, the axis of the crystals being perpendicular to the four sides, will tend to flow apart on a plane bisecting the angle of two sides; on this bisecting plane the casting will be less dense and of diminished cohesion.

---

*Abstract of a paper presented at the New York meeting of the American Society of Mechanical Engineers.

**President Tacony Iron & Metal Co., Tacony, Pa.

A prism, unsymmetrical in section, in which the proportion of cooling surface to mass varies around the centre of gravity of the cross section will have the greatest proportion of smaller crystals in the parts cooling the quickest. Where the change in the rate of cooling is greatest will be the place of greatest interference to the natural adjustment of the crystals, as to size and position and hence the place of least cohesion. Contraction is in a direct relation to the rate of cooling, and size of crystals. The more rapid the cooling the smaller the crystals and the greater the contraction.

In any prism, unsymmetrical in section, composed of a smaller mass joined to a larger, the greatest longitudinal contraction will occur in the larger mass. This apparent contradiction to the general law, that contraction decreases with the mass and rate of cooling, is explained when we consider volumnar contraction. The larger mass will have its rate of contraction equal in all directions; the smaller mass is restricted in its contraction longitudinally by the larger mass at the point of juncture of the two masses, but maintains its greater rate of contraction transversely; were the transverse rate the same as that of the larger mass, its longitudinal contraction would be the same, but its transverse rate being greater, the excess in volume flows in direction of length, resulting in a greater length, after cooling, of the smaller mass.

When the rate of contraction in the elements of the cross section of a prism are known, the resulting change in alinement and initial stress, due to the differences in contraction, can be determined.

The line of mean contraction passes through the centre of gravity, or neutral plane, of the cross section. In unsymmetrical sections the centre of action of the maximum and minimum contraction coincides with the centre of gravity of the area elements that are separated by the neutral plane which passes through the centre of gravity of the whole section.

Modifying causes that affect the results obtained by the application of the preceding laws are: Imperfect alloying of two or more different irons having different rates of contraction; variations in the thickness of sand forming the mold, which is the medium for conducting the heat from the surface or perimeter of the cross section; when the prism is cast in a horizontal position, and thin layers of sand at top and bottom affect the dissipation of heat, which becomes unequal by reason of the difference in circulation of air between the upper and under external surfaces of the mold, the upper surface dissipating the greater amount of heat; the position and form of cores, which tend to resist the action of contraction, also the difference in the conducting power between moist sand and dry-baked cores; differences in the degree of moisture of the sand surrounding the prism, especially when small in mass; unequal exposure by the removal of the sand while yet in the act of contracting; flanges, ribs, or gussets that project from the side of the prism, of sufficient area to cause the sand to act as a buttress, and thus prevent the natural longitudinal adjustment due to contraction; in light castings of sufficient length the unyielding sand between the flanges, etc., may cause rupture.

Influence of the Principal Constituents of Iron Upon the Rate of Contraction.

Carbon is the most active element, when in the combined state, to increase the rate of contraction. As strength and hardness result from slight increase in the proportion of combined carbon to that in a free state, it follows that strong irons have a greater rate of contraction than those in which a lesser amount is present. When the combined carbon exceeds certain limits, hardness and contraction increase rapidly and the strength decreases. Increase in the proportion of free carbon has the opposite tendency.

Silicon, when present, not exceeding certain limits, tends to free the carbon, reduces the rate of contraction, and increases the ductility and softness of the iron. Increasing the silicon up to, say, 10%, causes the iron to become brittle, hard, and weak, and increases contraction.

Sulphur tends to change the carbon into the combined state, and hence increases the rate of contraction.

Phosphorus, while tending to harden the iron, has little, if any, influence upon the proportion of combined to free carbon. It lessens the rate of contraction, and diminishes the strength of the iron.

Manganese, as usually present in foundry irons, about 1%, has no appreciable effect. When, however, it reaches 1.5%, and the iron is low in silicon, it tends to hardness and increases contraction, although no alteration in the carbon is affected. In some hard irons the combined carbon is lessened, as also the contraction, by adding small quantities, not exceeding 0.15% of manganese to the molten iron in the ladles just before pouring in the mold. Increased strength also results.

Repeated remelting increases the rate of contraction; it tends to harden the iron, and increases its density. Originally soft mixtures become stronger and harder, while hard mixtures become harder; the proportion of free carbon decreases and the combined increases; the total carbon is slightly decreased. Silicon and manganese rapidly decrease, phosphorus to a less extent, while sulphur rapidly increases, due to the fuel.

Section of Test-Piece.

The cross-sectional area of test-pieces for determining the rate of contraction of a given mixture of iron should increase with the increase of combined carbon contained in the mixture when intended for large castings.

In the remainder of the paper Mr. Schumann develops a practical method of computing the contraction which will take place in any casting and also the initial stresses due to unequal contraction, illustrating the method by numerous examples of which the solution is given in detail. Lack of space compels us to omit this part of the paper, and any of our readers interested in the study of the subject can probably procure copies of the complete paper from Mr. Schumann or from the Secretary of the American Society of Mechanical Engineers. The conclusions with which the paper closes are as follows:

> The deformation of prisms due to unequal contraction can be overcome by providing counter deformation in the pattern, or by the addition of auxiliary parts that can be readily removed from the casting. Generally the section should be so subdivided or designed that the ratios of cooling surface to cross section of the piece are alike around the center of gravity of the section.
>
> In complex machinery castings the design should be so modified or chosen that there will result in the least differences in the rate of cooling of the different members. Sudden changes in form cause severe initial stresses, if not fracture, and should be rigidly avoided.
>
> Imperfectly proportioned flanges, ribs, or gussets added to the main body of a casting, either for the purpose of increasing the strength or connections, may be sources of weakness.
>
> Hollow cylindrical columns, although cast of even thickness and left in the mold until cold, may become crooked by reason of the unequal rate of cooling between the upper and lower halves, due to the currents of air passing through the column and clinging to the under side of the upper half after the core arbor is removed, which is usually done shortly after pouring and while the casting is still red hot. This deformation is avoided by stopping the ends with sand immediately after the withdrawal of the core.
>
> Greater attention to the laws of cooling and correct forms and proportions of castings will result in increased strength and economy, besides the avoidance of annoying crooked castings and mysterious breakdowns.

NOTES FROM THE ENGINEERING SCHOOLS.

Michigan Mining School.—The catalogue of the School for 1896-1898 has lately been issued, containing 238 pages. Besides the usual matter in work of this kind, it contains tables giving the classification of rocks and minerals for the use of students taking the course in Geology, Mineralogy and Petrography. The catalogue contains also statistics concerning the mineral production of the United States, and of Michigan in particular. Mention is made of the equipment and work of many of the most important copper and iron mines in the Upper Peninsula.

The storage battery plant which was donated to the school last year by Hon. J. M. Longyear is now being set up. On its completion, the laboratories will have all the supply of current necessary for use in the experiments made. In connection with this work, Mr. Edgar Kidwell, Professor of Mechanical and Electrical Engineering in the school, has developed an automatic circuit make and break switch, designed especially for use with storage battery plants.

Worcester Polytechnic Institute, Worcester, Mass.—The following changes in the faculty are reported: Profs. Geo. I. Alden, head of the department of mechanical engineering; Geo. E. Gladwin, professor of free-hand drawing, and M. P. Higgins, superintendent of the Washburn shop, have resigned. These gentlemen had been with the institute since its opening, 28 years ago, and its present high standing is largely due to their efforts. The first two named have gone into commercial life as manufacturers of direct plunger elevators, a business which has grown up under their direction in the Washburn shops, and which they purchased from the institute. Mr. Gladwin's department was reorganized as a section of the new department of drawing and machine design, now directed by Prof. W. L. Ames, formerly of the Rose Polytechnic Institute. A further resignation was that of Asst. Prof. W. W. Bird, of the mechanical engineering department, who was always a non-resident, and who now devotes all of his time to his iron foundry in Cambridge, Mass.

The new men are: Prof. J. J. Guest, from Cambridge, Eng., where he graduated with high honors and has since been instructor, who comes to take the head of the department of mechanical engineering from McGill University, Montreal; Prof. W. L. Ames, who was mentioned above; Prof. H. B. Smith, from Purdue University, to take the electrical engineering department; Dr. Fred. L. Dunlap, from the University of Michigan and Harvard, recently instructor in chemistry at Sheffield Scientific School, Yale University, occupying the new chair of industrial chemistry; Supt. C. A. Chandler, of the Washburn shops, a past graduate of this institute. New instructors have been appointed in mathematics and in the mechanical laboratory. Prof. Sidney A. Reeve has been appointed to the new chair of steam engineering and hydraulics. He took his degree and was instructor at the Sheffield Scientific School.

Columbia University, New York city.—Plans for the new gymnasium have been completed. It is to occupy about half of a building, to be known as the "University Building," the remainder being devoted to a power house and rooms for literary and other societies. The structure will be three stories high. In the basement will be a swimming pool,100 ft. in diameter and 10 ft. deep,and around the pool will be the shower, tub and needle baths. The principal gymnasium room will be 160x100 ft., 30 ft. high. The total cost of the gymnasium and swimming pool, it is estimated, will be $400,000, and that of the entire building, $800,000.

The Schools of Mines, Chemistry, Engineering and Architecture, of Columbia University, have issued a set of pamphlets, giving general information of the courses for 1896-97. Under the new arrangement of faculties, the Faculty of Applied Science has charge of the four professional Schools of Mines, Chemistry, Engineering and Architecture. In the School of Engineering four separate four-year courses are given, viz., civil engineering, sanitary engineering, electrical engineering and mechanical engineering. The last-named will be offered for the first time in 1897, or upon removal to the new site. Two four-year courses are given in the School of Mines, viz., mining engineering and metallurgy. Candidates intending to enter one of the four professional schools above-named, are advised first to take a four-year course in Columbia College, leading to the degree of Bachelor of Arts, at the same time preparing themselves to enter the third year of either of the professional schools, so that the technical degree may be taken two years later. We take pleasure in quoting the following extract from the pamphlet of General Information, showing how the idea that engineering students should obtain a liberal education before beginning the professional course is being favored by Columbia:

> As students may and do enter the college two years earlier than they enter the professional schools, students taking this combined course of study will be able to obtain the professional degree at the same age as though they entered the professional school in the first instance at the present average age of such students, with the added advantage that they will have had at the same time the elements of a liberal education before they enter upon a strictly professional course of study. This combined six-year course is strongly urged and recommended, for the reason that engineers, chemists, and architects, as professional men, need the liberal training offered by a collegiate course quite as much as do lawyers, physicians, or clergymen. Experience has shown that those who have taken a liberal course of study in the past, and who have enjoyed the advantages of such an education before beginning their technical studies, have taken a much higher standing in their profession, have exercised greater influence in the community, and have been much more useful men than those who have relied upon a purely scientific or professional course of study.
>
> Without sacrificing the necessary elements of a liberal education, the widest opportunity for elective work in science is offered in this new curriculum, which will permit the student to pursue almost any desired line of study and to specialize in it to almost any desired extent. A properly chosen course of study in the college will thus fit students for advanced work and original investigation, and is to be recommended to candidates for higher degrees under the Faculty of Applied Science, or the Faculty of Pure Science.

An alternative to the plan of taking a four-year collegiate, followed by a two-year professional course, is proposed in the announcement of the School of Mechanical Engineering, as follows:

> It is very desirable that every mechanical engineer should have had a course of liberal and literary studies.
>
> As the strictly professional course offers no time for these studies, students are warmly urged, for their own sakes, to take two preparatory years of such study in Columbia

College before entering the School of Engineering. Special facilities are offered for such a combination of courses. All the alternatives are of equal disciplinary value, so that while retaining the element of strength, the courses thus derive advantage from the flexibility which belongs to the university.

The School of Architecture issues, in pamphlet form, an admirable paper by Prof. William R. Ware, entitled "The Instruction in Architectural Drawing at Columbia University," profusely illustrated and describing his system in great detail. We strongly advise teachers of drawing and any others interested in architectural study to procure a copy of this paper. It was originally published in the "School of Mines Quarterly" for April and July, 1896.

Thayer School of Civil Engineering (Dartmouth College, Hanover, N. H.)—Prof. Robert Fletcher, director of this school, sends us a 12-page pamphlet giving a numbered list of engineering reference books and periodicals used in the schedules of the courses of instruction. In the schedules reference is made by number only. In the list the names of authors are given with the titles, and prices, and the names and addresses of publishers. Books of general value, considered indispensable as part of the equipment of any engineer, have their titles printed in small capitals, and other books of special value, for example, the best, or one of the best, in a particular branch or specialty of engineering, are indicated by an asterisk (*). Such a list as this should be of great value to students in any technical school, and we commend the plan to the attention of engineering teachers generally.

Cornell University.—The new hydraulic laboratory of the College of Civil Engineering has made use of the picturesque gorge and waterfall near the college to construct a rock cut canal 500 ft. long, 20 ft. wide and 10 ft. deep, with a steel stand-pipe 6 ft. diameter and 70 ft. high. This should afford excellent facilities for experimental work in hydraulics.

Ohio State University, Columbus, O.—The Department of Clayworking and Ceramics, which was authorized by an act of the legislature, in May, 1894, is now in the third year of its existence. We quote the following from a circular issued by the Department:

> It is the only school on American soil which has made a direct step toward placing the ceramic industries on the same plane as that occupied by the other branches of engineering science and chemical technology. At present the clay-working industries of America, while they enjoy a prosperity due partly to our unrivalled deposits of crude materials, and partly to the mechanical skill and business energy with which they are prosecuted, are feeling constantly the effects of foreign competition, and find themselves at some disadvantage in this contest on account of the wasteful and uneconomic methods used here, and also the very limited extent to which scientific training and chemical technology are employed in counteracting this waste.
>
> Clay industries are essentially chemical industries, and their problems are such as can be readily solved and controlled by the use of good chemical engineering. It is to create such a class of ceramic engineers, men who can apply to the clay industries of to-day the full fruits of the best knowledge of modern science, that this department has been organized and maintained; and it is confidently hoped that the clay industries will co-operate with it in its efforts to achieve present progress, and lead them to ultimate international supremacy.
>
> There are two courses offered: A long one of four years, leading to the degree of Engineer of Mines in Ceramics, and a Short or Industrial Course of two years' duration, which leads to no degree, but for which a certificate of work accomplished is issued.
>
> The four-year, or Engineers' Course, is designed to be complish the objects just set forth, and is therefore made the full equal, both in quantity and quality of the work done, of any engineering course offered by the University.
>
> The two-year or Industrial Course is designed to assist young men who have already been actively engaged in the ceramic industries, and who, on account of mature years, or lack of means, or lack of previous educational advantages, are unable to avail themselves of the full and complete course, and yet who wish to increase their earning power or chances of promotion by fitting themselves for other than routine labor.

Washington State University, Seattle, Wash.—President Harrington has asked the legislature for an appropriation to establish and maintain an engineering department in the University. He says:

> It is proposed to provide teachers and apparatus for beginning effective work in civil, mining, electrical and mechanical engineering. The desirability of these lines of professional training in this state need hardly be argued. In our opportunities for marine commerce, in our extensive mineral resources, in the many irrigation problems of the eastern two-thirds of the state, and in even the commonplace and universal problems of highways and bridges, there is more need in this state of all lines of engineering than in most other states of the Union. The estimates provide a very modest beginning for the four lines of engineering mentioned. The proposal is that the new teacher of civil engineering shall also teach mechanical drawing, and the teacher added for electrical engineering shall for a time have charge of the technical mechanical work.

THE BENEFICIAL EFFECT OF WATER METERS at Atlantic City, N. J., is shown by the annual report of Mr. W. C. Hawley, Assoc. M. Am. Soc. C. E., Superintendent of the water-works. On Aug. 1, 1895, there were about 350 meters in use. During the ensuing fiscal year 1,456 meters were added, making about 1,800 in all. The setting of the new meters began in February and was finished July 15. When the work was begun the total pumpage was over 250 gallons per capita per day. The per capita consumption later on is not given, and cannot be estimated by an outsider, Atlantic City being a summer resort. Comparison made be made with 1895, however. This is done in the following table, in which it will be noticed that during the first three months of 1896, or before or during the early part of the meter setting, the consumption was greater than in 1895, and during the succeeding four months of 1896 it was less than in 1895:

	Pumpage, gallons per day		
	1895.	1896.	Increase or decrease.
January	4,478,440	4,756,238	277,798 +
February	4,427,545	5,060,008	632,463 +
March	4,394,366	5,268,073	873,707 +
April	4,537,553	4,609,964	72,411 —
May	4,776,210	4,642,114	134,096 —
June	5,509,314	4,609,330	899,984 —
July	6,639,762	5,695,708	944,054 —

The cost of the 1,456 meters in place, including valves, fittings and labor, averaged $15.19, the meters ranging in size from 3 ins. to ⅝-in., as follows: 9 3-in.; 6 2-in.; 19 1½-in.; 47 1-in.; 378 ¾-in.; 997 ⅝-in.

THE EXCLUSION OF GROUND WATER FROM A sewer has been effected in a method described by Mr. Robert Godfrey, Assoc. Inst. C. E., in an advance publication of "Proceedings of the Institution of Civil Engineers." The sewer was of concrete, lined with 21-in. earthenware pipe. The defective portion was was 1,320 ft. long, laid in a tunnel through gravel and running sand, 10 ft. deep at one end and 54 ft. at the other, having a grade of 1 in 343. A shaft was sunk 968 ft. from the upper end, there being a manhole at the latter point. Wrought-iron pipe, 12 ins. in diameter and of ⅜-in. plates, was lowered in the shaft in lengths of 14½ ft. Each length of pipe had a special malleable iron collar, which served to connect the lengths by means of lead calking. Two runners were attached to the under sides of the collars to prevent injury to the pipe as the new pipe was drawn through. As one section after another was joined up the new pipe was pulled forward by means of a cable connected to a hand windlass operated by two men. The cable was attached to a bar laid across the end of the lower pipe, thus avoiding strains on the joints which would result from attaching it to the front end of the pipe. The total weight drawn forward after connecting the last length of pipe was about 14 long tons. The pipe was inserted in the 352 ft. of sewer below the shaft and pushed down the grade, as added on, by means of levers. After the new pipe was all in place the annular space between it and the old pipe, at the lower end, was packed with clay and concrete for a distance of 3 ft., thus holding the water back from the stretch of original pipe below. Gagings showed an infiltration of about 35,000 U. S. gallons of ground water in the 1,320 ft. of pipe treated as above, or about 140,000 gallons per mile.

THE NEW YORK STATE CANALS have been reported upon for the year 1896 by State Superintendent Aldridge. The total freight carried in the year amounted to 3,714,894 tons, divided as follows: Erie Canal, 2,742,438; Champlain, 802,510; Oswego, 57,245; Black River, 57,953; and the Cayuga and Seneca canal, 54,739. Of the total tonnage, 852,467 tons were products of the forest, 1,126,665 tons were agricultural products, 152,322 tons were manufactures, 270,603 tons were merchandise, and 1,032,837 tons of unclassified articles were carried. The gain in tonnage over the season of 1895 was 214,580 tons. The average price received by boatmen for the transport of wheat between Buffalo and New York was 3¾ cts. per bushel, the highest price in any year since 1890, except 1893. The report says that contracts for $3,500,000 have already been made out of the $9,000,000 especially appropriated for canal improvement, and work was commenced on Dec. 1. The Superintendent asks for $770,000 for the next fiscal year, for lock-tending and the ordinary repairs of the canal, which is the same amount that was appropriated for 1896.

THE 20-FOOT NAVIGABLE CHANNEL from Duluth to Buffalo, says Capt. Alexander McDougall, of Duluth, in the "Pioneer Press," is no nearer realization than it was in 1891, despite the work of the government in deepening the channels at St. Mary's River, the Lime Kiln Crossing, at the head of Lake Erie, and at other points. His contention is that since the government engineers ocmmenced these improvements, 10 years ago, the water has fallen 27 ins., as a direct result of cutting a deeper channel through the area of shallow water at the foot of Lake Huron and opposite the mouth of the St. Clair River. He says that, instead of having a deeper channel, we have simply succeeded in maintaining a depth previously utilized. Capt. McDougall is an advocate of the damming of the Niagara River as a means of raising the lake levels.

A NEW FLOATING DOCK FOR HAVANA, says a Madrid paper, has been ordered by the Spanish Government from Swan & Hunt, of Wallsend-on-Tyne, England. This dock is to be capable of lifting ironclads as well as ordinary vessels, and will be 450 ft. long, 82 ft. clear width, and will have 27½ ft. of water over the sill. Its lifting capacity is to be 10,000 tons, and the contract price is about $595,000, to be delivered in complete working order at Havana 11 months after signing the contract.

THE U. S. GUNBOAT ANNAPOLIS was launched at the Crescent shipyard, Elizabethport, N. J., on Dec. 23. It is one of six composite gunboats authorized by act of Congress, July 14, 1895. Three other vessels of this class, the Marietta, Vicksburg, and the Newport, have already been launched. The Annapolis measures 168 ft. on the water line, 200 ft. over all, 35 ft. beam; displacement, 1,000 tons. Babcock & Wilcox water-tube boilers, designed for a working pressure of 225 lbs., will be used. A single screw will be used, driven by a triple expansion engine with cylinders 15¼, 23½ and 36 ins. diameter and 30-in. stroke, developing 800 HP. at 150 revs. per minute. The boat will be barkentine rigged, carrying 11,500 sq. ft. of sail area. The hull of the vessel is built with a steel double bottom, planked with four inches of yellow pine planks to just above the water line. The planks are fastened by manganese bronze bolts, and are then covered by copper sheathing. The stem, sternpost, and rudder are all of bronze, so that no steel is exposed to the action of the sea water in contact with brass. She will thus be able to go on cruises of several years' duration on stations where there are no docks, as she will not have to be subject to frequent scraping of the bottom, as in the case of steel ships. Her large sail area and hull, shaped for easy handling under sail, will enable her to make most of her passages under sail, and to save coal, while her light draught will enable her to visit almost any port.

THE TORPEDO BOAT DESTROYER ENTRE RIOS, one of four boats recently built by Yarrow & Co., London, for the Argentine republic, has completed a voyage from London to Buenos Ayres, making a run of 3,700 miles from St. Vincent to Buenos Ayres without calling at any port. No other torpedo-boat destroyer has ever made a journey of this length without coaling.

A MILITARY TANDEM BICYCLE has been designed by an officer of our army and is illustrated and described in the "Journal of the U. S. Artillery" for November-December by Lieut. Wm. C. Davis, U. S. A. The chief feature of the device is the absence of sprocket and chain. The two riders sit directly over the front and rear wheels respectively, and the crank axles are geared up to the proper speed by a suitable mechanism in a gear-box on the axle. This is a simple epicycle gear, giving two revolutions of the wheel to one of the axle. The front or steering wheel is analogous to the "geared ordinary," and the two wheels are connected by a Humber frame. The gearing is in a dust-proof gear-box, and is oiled through the hollow axle; the frame may be hinged to make it more portable, and the weight of this bicycle need not exceed 40 lbs. for the roughest service. It is designed to carry two riders and 40 lbs. additional weight of equipment. The same article describes a number of bicycles designed for military use in the French and German armies; but all of these have chains.

LOW DUTIES IN THE TARIFF are favored by the Executive Committee of the National Association of Manufacturers. This body met in Philadelphia Dec. 18 and completed arrangements for the annual convention of the Association, which is to be held in Philadelphia Jan. 26, 27, and 28. The committee extends a cordial invitation to all manufacturers of the United States, whether members of the Association or not, to attend this convention; of course only members will be entitled to take part in the debate and the voting. The following resolution was adopted:

> "Resolved: That it is the sense of this Executive Committee that the tariff laws should be revised at the earliest possible moment, in order that uncertainty be removed, confidence restored, and business permitted to revive.
>
> "Rates of duties should be made as low as possible, consistent with the fair protection of our industries and the labor they employ."

WAGES AT THE CARNEGIE STEEL WORKS have been fixed to remain in force during 1897, the same as they were in 1895-6. The arrangement affects over 6,000 employes. The prices of pig iron and of finished products have fallen from 10 to 25% since the last scale was signed.

THE RENO INCLINED ELEVATOR has been put into experimental use at the New York end of the Brooklyn Bridge. It is only a small machine, intended to give a practical exhibition of its working, as the elevation attained is only 7 ft., so that passengers using it have still to walk up stairs the rest of the way

PERSONALS.

Capt. John. A. Shannon has been elected City Engineer of Oskaloosa, Ia.

Mr. George V. Alsop has been elected City Engineer of Newport News, Va.

Mr. John P. Fiscus, President of the Dunlap Coal & Coke Co., died July 15.

Mr. F. A. Ruhe was recently elected a Water Commissioner of Allentown, Pa.

Mr. J. R. Sanford, civil engineer, of Cooperstown, Mich., died July 3, aged 91.

Mr. N. H. Brown, Train Master of the Texas Central R. R., has been appointed Superintendent of Transportation.

Mr. John N. Gamewell, the inventor of the Gamewell fire-alarm system, died in Hackensack, N. J., July 19, aged 74.

Col. F. S. Benson has been appointed Chief Engineer, and Mr. Thomas E. Byrne, Superintendent of Street Mains of the Brooklyn Union Gas Co., Brooklyn, N. Y.

Mr. J. P. Head, Foreman in Bridge and Building Department of the Texas Central R. R., has been appointed Road Master.

Mr. Thomas J. Cree, civil engineer on the Boston & Maine R. R., was married to Miss Etta B. Stebbins, of St. Johnsbury, Vt., on July 8.

Mr. Aurin Wood, an inventor and for many years head of the ironworking tool firm of Wood, Light & Co., died in Worcester, Mass., July 19, aged 84.

Mr. Hiram P. Randall, civil engineer, of Indianapolis, Ind., died July 14, aged 80. He was born in Boston, Mass., and for many years was Assessor of Indianapolis.

Mr. J. D. Higgins, Superintendent of the Rome Gas Light Co., Rome, N. Y., has resigned, and Mr. Stephen Parrish, of New York city, has been elected to succeed him.

Mr. Joseph McWilliams, Engineer and Superintendent of the Texas Central R. R., has resigned to accept service with another company, and the office has been abolished.

Mr. W. T. Gould, Resident Engineer of the Texas Central R. R., has been placed in charge of all engineering and construction, under the direction of the General Manager.

Mr. W. F. R. Mills has been appointed General Superintendent of the Denver, Lakewood & Golden R. R. to succeed Mr. J. B. McCormic, with headquarters at Denver, Colo.

Mr. L. D. Badger, Roadmaster of the Fitchburg R. R., with headquarters at Mechanicsville, N. Y., has resigned. Mr. Thos. Casey, of Waltham, Mass., is filling the position temporarily.

Mr. Bascom Sykes was elected City Surveyor of Portsmouth, Va., instead of City Engineer of Norfolk, Va., as stated in our issue of July 9. Mr. W. T. Brooke continues to be City Engineer of Norfolk.

Mr. W. F. Holloway has resigned his position as a member of the Board of Water-Works and Electric Light Trustees of Columbiana, O., and Mr. John E. Allen has been appointed to succeed him.

Mr. W. S. Frisbey, surveyor and civil engineer, representing Messrs. Geo. A. Ogle & Co., of Chicago, Ill., atlas publishers, was drowned while bathing in the Chippewa River, near Durand, Wis., July 14.

Mr. Joseph Downey, Commissioner of Buildings, of Chicago, Ill., has been appointed Commissioner of Public Works to succeed Mr. William D. Kent, whose resignation was noted in our issue of May 21.

Mr. J. W. Lovett, Superintendent of Bridges and Buildings of the Fifth Division of the Southern Ry., has been appointed to a similar position on the Georgia Midland & Gulf R. R., to succeed Mr. J. B. Glover.

Mr. J. S. Lemond, Roadmaster of the Fifth Division of the Southern Ry., has been appointed to succeed Mr. J. B. Glover as Roadmaster of the Georgia Midland & Gulf R. R., with headquarters at Columbus, Ga.

Mr. H. L. White, of the firm of White & Wetherbee, civil engineers of Brockton and Braintree, Mass., was married July 16 to Miss Grace W. Emery, of Wollaston, Mass. Mr. White is a member of the Boston Society of Civil Engineers.

Mr. H. M. Warren has been elected President and Treasurer, Mr. A. E. Jenks, Vice-President, and Mr. T. C. McNeely, Secretary and General Agent of the new Hendersonville & Brevard Ry., with headquarters at Hendersonville, N. C.

Mr. James M. Barr, General Superintendent of the Great Northern R. R., with headquarters at St. Paul, Minn., has been ordered to perform the duties of General Manager in place of Mr. Charles H. Warren. Mr. Barr will retain, however, his present title.

Mr. John Vanderslice, who has filled the position of Shop Superintendent of the Pottsville Bridge Co., Pottsville, Pa., for the past 5½ years, has accepted a similar position with the Carnegie Steel Co. and will have charge of the Keystone Bridge Shops.

Mr. Charles R. Barnes, City Electrician of Rochester, N. Y., having charge of the fire-alarm telegraph system and the electric lighting of the city, has been appointed Consulting Electrical Engineer and Electrical Expert to the Railroad Commission of New York State.

M. Jules Guichard, one of the associates of M. Ferdinand de Lesseps in the Suez Canal project, died recently aged 70. He was a member of the French Senate and after the resignation of Count de Lesseps was elected a Vice-President of the Suez Canal Co.

Mr. Clarence R. Neher, formerly Division Engineer of the New York & Pennsylvania R. R., has been appointed Resident Engineer of the Erie Canal at Rochester, N. Y., to succeed Mr. Alfred T. Jones, whose resignation was noted in our issue of July 2.

Capt. Smith S. Leach, Corps of Engineers, U. S. Army, has been relieved from duty at Burlington, Vt., where he has been in charge of the river and harbor improvements, and has been placed in charge of similar work at New London, Conn. Maj. William S. Stanton will succeed him at the former place.

Mr. Nehemiah S. Bean, the inventor and builder of the first steam fire engine ever constructed in New England, died at Manchester, N. H., July 20, aged 78. He was an ex-Chief Engineer of the Manchester fire department, and at one time was in charge of the locomotive works of the Essex Mfg. Co., of Lawrence, Mass.

Mr. John Brunner has resigned his position as Assistant to Chief Engineer of the Carnegie Steel Co., Pittsburg, Pa., and has been appointed by Mr. E. M. Bigelow, Director of Public Works of that city, to examine the suspension bridge across the Monongahela River and to prepare plans and specifications for the reconstruction of the same.

Mr. Ernest G. Barrow, Assistant City Engineer of Hamilton, Ont., has been appointed City Engineer to succeed Mr. William Haskins, whose death was announced in our last issue. Mr. Barrow, although only appointed Assistant City Engineer six years ago, has assisted Mr. Haskins for the past 20 years. He is a native of England and a member of the Canadian Society of Civil Engineers.

Mr. Oscar Lowinson, Jun. Am. Soc. C. E., 39 Cortlandt St., N. Y., is engaged on a series of tests on the transverse crushing strength of full-sized specimens of timber taken from buildings which are being strengthened. The object is to obtain such values as might be considered safe in determining the safety of existing structures, such as bridges and buildings where a question frequently arises as to the life of the same and the advisability of reconstructing.

Mr. Albert Stanwood, at one time a member of the Board of Water Commissioners of Boston, Mass., died at Waterford, Me., July 20, aged 72. His connection with the water department began more than 40 years ago. In 1856 he resigned as the Superintendent of the Eastern Division and became the Superintendent of the Western Division of the Department, resigning the latter position in 1873. From 1883 he served continuously as a member of the board.

Mr. Andrew Rinker, formerly City Engineer of Minneapolis, Minn., has accepted and entered upon the duties of Engineer and General Agent of the Great Falls Water-Power & Townsite Co., of Great Falls, Mont. This company owns the water-power created by the Missouri River for a distance of about 10 miles below the city of Great Falls, in which distance the river has a total fall of over 400 ft. and includes Black Eagle, Rainbow and Great Falls. (For a complete account of this plant see Eng. News for July 19, 1894.)

Mr. Henry I. Bliss, M. Am. Soc. C. E., of La Crosse, Wis., died recently aged 65. He was born in Hartford, Conn., and graduated frim Yale College in 1853 as a civil engineer. He assisted in surveying the New York & Boston Air Line R. R. and, after going west, was engaged in the survey of the Milwaukee & Fond du Lac R. R., the La Crosse & Prairie du Chien R. R., Southern Minnesota R. R. and several other preliminary and trial lines. In 1858 he located at La Crosse and formed a partnership with Mr. George Gregory and later with Mr. Wallace M. Spear. From 1860 to 1884 Mr. Bliss was City Engineer of La Crosse and was instrumental in having many valuable improvements made in the varions public works of the city.

Hon. Arthur Sewall, the Democratic nominee for Vice-President of the United States, is a prominent resident of Bath, Me., where he was born in 1835. He was trained as a carpenter's apprentice in his father's ship-yard, and in 1858 became associated with his brother, Mr. Edward Sewall, under the firm name of E. & A. Sewall, as successors to their father as shipbuilders. Upon the death of Mr. Edward Sewall, about 20 years later, the firm name was changed to A. Sewall & Co., the members being the sons and nephew of the senior partner. This firm has built several of the largest wooden ships afloat, one being the "Roanoke," a leader in tonnage of that class of the merchant marine. Three years ago, at great expense, the firm changed their wooden shipbuilding plant to one for steel shipbuilding, and soon after built the "Dirigo," the only steel merchant sailing vessel built in the United States. Mr. Sewall was the President of the Maine Central R. R. and a Director of the Boston & Maine R. R. for a number of years. He is President of the Maine Water Co., a concern that controls water plants in seven large towns and cities of Maine, and he is also a member of the Bath Board of Trade.

◆

ENGINEERING SOCIETIES.

COMING TECHNICAL MEETINGS.

SOUTHERN AND SOUTHWESTERN RAILWAY CLUB.
Aug. 20. Kimball House, Atlanta, Ga.
SOCIETY FOR THE PROMOTION OF ENGINEERING EDUCATION.
Aug. 20 to 22. Annual meeting at Buffalo, N. Y.
AMERICAN ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE.
Aug. 24. The annual meeting will be held in Buffalo, N. Y. Secy., Prof. F. W. Putnam, Cambridge, Mass.
AMERICAN MATHEMATICAL SOCIETY.
Aug. 31 to Sept. 1. Annual meeting at Buffalo N. Y.
ROADMASTERS' ASSOCIATION OF AMERICA.
Sept. 8. Annual meeting to be held at Niagara Falls, N. Y.
RAILWAY SIGNALLING CLUB.
Sept. 8. Secy., Geo. M. Bashford, The Rookery Bldg., Chicago.
AMERICAN STREET RAILWAY ASSOCIATION.
Oct. 24 and 25. Annual convention will be held in St. Louis.

CIVIL ENGINEERS' CLUB OF CLEVELAND, O.—At the regular meeting held Tuesday evening, July 14, a paper was read by Mr. H. F. J. Porter, of Chicago. It was illustrated by lantern slides of photos and drawings and gave a description of the plant of the Bethlehem Iron Co., at South Bethlehem, Pa., and the company's processes in the production of large forgings.

F. A. Coburn, Secy.

WESTERN FOUNDRYMEN'S ASSOCIATION. — The regular meeting of the association was held at the Great Northern Hotel, Chicago, Ill., July 15, and a paper on "The Practical Value of the Various Metalloids in Cast Iron" was read by Maj. Malcolm McDowell. The author called attention to the lack of definite knowledge on this subject and proposed a series of careful tests and experiments to determine definitely if possible the action of metalloids in various proportions and combinations. After some discussion the association voted that a special committee be appointed to carry out a series of experiments of the character suggested by the paper. This committee consists of Mr. A. Sorge, Jr., Maj. Malcolm McDowell and Mr. John K. Mackenzie. It was announced that there would be no meeting of the association in August and that the September meeting would be held at Cleveland, O.

RAILWAYS.

East of Chicago.

CHESTER & BECKET.—This company is being organized to construct a standard gage railway from the main line of the Boston & Albany, just east of the village of Chester, Mass., to the quarries of the Hudson & Chester Granite Co., in the town of Becket, a distance of 5¼ miles. The capital stock has all been subscribed. The directors include several of the directors of the Boston & Albany R. R. Co. The surveys are completed and construction will probably be begun in August. J. B. Haviland is the chief engineer, with offices in room 19 of the B. & A. depot at Boston, Mass. Frederick J. Collier, of Hudson, N. Y., is clerk of the company.

Southern.

ALABAMA & LITTLE RIVER.—This company has been incorporated to build a railway through Monroe and Baldwin counties, Ala. The capital stock is $50,000; the incorporators are J. T. McKervy, Edwin Lashbrook and Jos. S. Greenwood.

BEATTY LUMBER.—The officers of this company, Crow, W. Va., are quoted as saying that eleven miles of a tram road are now completed. The company expects to complete the entire railway by Oct. 1, 1896. The equipment has been purchased.

PRIVATE.—A. Knabb & Co., of Krug, Md., are said to be building a railway five miles in length.

SEBASTIAN & CINCINNATUS FARMS.—Gen. Mgr., W. W. Russell, Sebastian, Fla., writes us that the projected length is 10 miles, to connect Sebastian and "The Cincinnatus Farms." The work is all finished except laying the track; this will be done by Aug. 1. A. O. Russell, Cincinniati, O., is the owner.

Northwest.

ALLOWEZ BAY.—Press reports from Superior, Wis., state that Winston Bros. & Dear have been awarded the contract for building this railway. The entire distance to be constructed is said to be 100 miles.

CHICAGO & NORTHWESTERN.—Press dispatches state that 25 miles of the extension north of Gillett, Wis., have been graded and that 700 men are now at work. Ch. Engr., John E. Blunt, Chicago, Ill.

CAVALIER & WALHALLA.—The surveys for a railway between Cavalier and Walhalla, N. Dak., are stated to have been completed. The distance is 21 miles. The grading is to be commenced at once and it is expected to have it finished in two months.

Southwest.

DENVER, OKLAHOMA & GULF.—It is stated that negotiations are pending to build this railway from Henrietta, Tex., by way of Breckenridge, Brownwood and Fredericksburg, to connect with the San Antonio & Aransas Ry. at Comfort, Tex.

MEXICAN INDUSTRIAL.—This company is said to have been organized to build a railway around the city of Mexico for transfer purposes. It will connect the Mexican Central, the Inter-Oceanic and the Mexico, Cuernavaca & Pacific. Three miles have already been constructed, and to complete the road it is proposed to issue bonds.

MISSISSIPPI & LA FOURCHE.—It is reported that work has begun on this railway at Lauderdale, near Donaldsonville, La. It is expected to complete the road from Lauderdale to a point on the Bayou La Fourche, near Klatzville, La., a distance of 7½ miles. Rails have been purchased for the first miles. Pres., R. W. Edwards; Treas., C. Kline. The road will be a feeder of the Southern Pacific system.

MISSOURI CENTRAL.—A press dispatch from Chicago states that a company has been organized in that city for the purpose of building a line of railway in Missouri from Versailles to Lebanon, a distance of 60 miles, passing through several county seats and the great Ha-Ha Tonka Park and Springs. This road, it is stated, will open up the richest mining section of the state, which is rich with coal, lead and zinc ore. Farming and fruit lands are also located along the line of the proposed route.

SOUTHWESTERN, ARKANSAS & INDIAN TERRITRY.—Geo. R. Brown, Little Rock, Ark., is quoted as saying that contracts have been awarded to R. W. Dodson for extending this line from Antoine, Ark., to a new town to be known as Pike City, 15 miles distant. The road has been in operation between Smithton and Antoine for several years, and is now 20 miles in length. It is expected to reach the terminus about Sept. 1.

TEXAS CENTRAL.—Wm. F. Gould, Resident Engr., Waco, Tex., writes us that preliminary surveys have been completed from Albany, Tex., westward 35 miles. Nothing further will be done until fall. Pres., H. K. McHaig.

WHITE RIVER VALLEY & WESTERN.—This company has been incorporated to build a railway 250 miles in length, from Stilwell, Ind. Ter., to Bald Knob, Ark. The incorporators are: George A. Hagerty, of Fayetteville, Ark.; G. H. Candel, Lowell, Mass.; Elgar Gurnsey, and eGorge P. Bassett, of Cincinnati, O. The route lies through the Arkansas fruit belt.

Rocky Mountain and Pacific.

ASTORIA & COLUMBIA RIVER.—Press reports state that the contract for building this railway from Astoria to Goble, Ore., has been awarded to Honeyman, De Hart & Co., of Portland, Ore., at about $500,000, and bonds for the performance of the work, in the sum of $100,000, have been furnished. This work will probably furnish employment for from 700 to 1,000 men for a year.

GULF, RIO GRANDE & PACIFIC.—This company has been incorporated at Santa Fe, N. Mex., to aquire contracts and concessions from the Mexican government for the construction, equipment and management of railway and telegraph lines in Mexico. The incorporators are. H. L. Warren, Albuquerque, New Mex.; William Hutchison, B. Y. McKeyes, Deming, New Mex.

SILVERTON NORTHERN.—It is stated that this railway has recently been completed for six miles north of Silverton, Colo., through the mountains of San Juan county. The present terminus is at Eureka, but it is proposed to extend the road to Mineral Point, five miles further. The line has been built by Otto Mears and reaches a gold producing district. It is expected that it will be finished to Mineral Point by October. The estimated cost of the road is placed at $600,000. Pres., Fred Walson, Denver, Colo.

STREET AND ELECTRIC RAILWAYS.

RUTLAND, VT.—It is reported that the Rutland St. Ry. Co. will soon extend its lines. Pres., J. W. Cramton; Treas., N. V. Chaffee; Supt., M. McKeogh..

SPRINGFIELD, VT. —Press reports state that work has begun on the Springfield Electric Ry. It will be built from Springfield to Charleston, N. H., a distance of eight miles. W. H. Slack, G. F. Leland and E. B. Flinn are interested.

PROVIDENCE, R. I.—The Union Ry. Co. has been granted permission to extend its lines. The company has 90 miles of railway in operation. Gen. Man., A. T. Potter; Ch. Engr., G. C. Tingley.

BRENTWOOD, N. Y.—It is reported that the state will build an electric railway to connect the asylums at Kings Park and Central Islip.

SYRACUSE, N. Y.—The Onondaga Lake R. R. Co. has been incorporated to construct a double-track street surface electric railway about seven miles in length, from Clinton square to the resort known as Long Branch, Onondaga Lake; capital stock, $250,000; directors, John S. Kaufmann, W. R. Smith, Bruce S. Aldrich, Edward A. Powell, Jas. M. Belden, P. R. Quinlan, W. H. Gallup.

LANGHORNE, PA.—Engineers have completed the survey for an electric railway between Langhorne and Frankford. The line is intended to accommodate passengers to Neshaminy.

PITTSBURG, PA.—It is said that the West End Street Car Co. will build an electric railway from the West End in Pittsburg, to Monongahela. It has purchased the franchise of the Little Saw Mill Run R.R. Co., and has secured the right of way through nearly all of the property along the route. A force of 200 men is at work grading the road at West Liberty. The road will be known as the West Side Belt Line R. R., and will extend from the Pittsburg terminals of the Little Saw Mill Run R.R., up the Saw Mill Run valley through Shalersville, West Liberty, Fairhaven, Castle Shannon, Curry Station, Finleyville and thence up the river to Monongahela. A branch will be built from Curry to Duquesne, a distance of ten miles. The length of the main line is 27 miles.

CHARLESTON, S. C.—Therrell & Co. are quoted as saying that they will make a proposition to the owners of the Charleston St. Ry. to adopt electricity. In case the proposition is accepted, work will begin at once upon the reconstruction of the Charleston system.

CINCINNATI, O.—It is reported that the Consolidated St. Ry. Co. is distributing rails for extensive improvements and that bids will soon be asked for doing the work.

CLEVELAND, O.—The Cleveland "News" states that the Cleveland Electric Ry. Co. has made application for permission to extend its track to Cedar Glens and Euclid Heights. Right of way has already been obtained. Pres., H. E. Andrews; Supt., H. J. Davies.

PORTSMOUTH, O.—The Portsmouth St. Ry. & Light Co. is reported to have made appropriations for extensions and new machinery to cost $12,000 to $15,000. Pres., F. L. Smith; Supt., S. P. Baird.

ZANESVILLE, O.—A press report states that the Zanesville St. Ry. Co. has doubled its capital stock, making it $500,000. The line will be extended and new equipment added. Pres., A. L. Conger; Supt., A. H. Johnson.

ST. JOSEPH, MICH.—W. Worth Bean, Pres., writes us that the St. Joseph & Benton Harbor St. Ry. Co. is projecting an electric railway, two miles long, to be completed by July 1, 1897.

MADISON, WIS.—A press dispatch states that Wingra Park citizens have raised $4,000 of the $7,000 required to extend the Madison Electric St. Ry. from its terminus on University Ave. to Harrison St., while the University Heights citizens have pledges for $3,000 of the $4,500 needed to secure an extension to that suburb. Pres., W. Lamprecht.

RACINE, WIS.—It is stated that the Belle City St. Ry. Co. has accepted the additional franchise upon the streets of Racine. Pres., J. I. Case.

MASON CITY, IA.—O. E. Stanley, Asst. Cy. Engr., writes us that the city has granted a franchise for an electric railway to W. E. Brice and L. H. Ong, Tama City, Ia., and that a local company will be organized to push the project. The city of Clear Lake has also granted a franchise to the same parties and efforts will be made to build the road between this city and Clear Lake, a distance of about eight miles. It is hoped to complete it this summer.

BEATRICE, NEB.—A press dispatch states that the Beatrice Electric Co. will make some improvements in the way of straightening and relaying its tracks. The company now owns 7½ miles of track.

KANSAS CITY, MO.—It is said that the Missouri, Kansas & Texas Trust Co. is backing a scheme to connect Kansas City, Leavenworth, Kan., Atchison, Kan., and St. Joseph, Mo., by an electric road.

OGDEN, UTAH.—W. H. Rowe, as receiver, has sold the track, rights of way, franchises and other properties of the Ogden Street Ry. Co. to Daniel Van Dam, whose bid was in the name of Roland R. Conklin, of New York city. The amount paid was $350,000. It is expected that extensive improvements will be made. The tracks are 12 miles long.

UNIVERSITY PARK, ORE.—Isaac Leskard writes us that he is working on some improvements in the Barnes Heights Electric Ry., and that the Portland General Electric Co. may aid in the work of extending this line to Hillsboro, Ore., a distance of 18 miles, east of Portland.

WATERLOO, ORE.—An electric railway may be built from here to Lebanon, Ore. Dr. J. L. Hill, Albany, Ore., is interested.

LOS ANGELES, CAL.—A press dispatch states that the council will receive bids until 11 a. m. Aug. 17 for a franchise for the construction and operation of a street railway along certain streets. C. A. Luckenbach, Cy. Clk.

SAN FRANCISCO, CAL.—The Geary St. Park & Ocean Ry. Co., has applied for a franchise to build an electric railway upon certain streets.

SANTA ROSA, CAL.—An application is stated to have been made for a franchise for an electric railway between Sonora and Santa Rosa. From Santa Rosa the line will extend to Melitta, thence to Kenwood, thence to Glen Ellen, from there to Agua Caliente and from Agua Caliente to Sonora.

ELECTRIC LIGHT AND POWER.

HARDWICK, VT.—A committee has been appointed to make a contract with Mr. Almon to furnish this place with electricity. It was instructed to give $5.50 each for the street lights per year. The village will have 100 street lights thus making a cost for the street lighting $550 per year, $3.50 for 16-c. p. lights for house lights and $4 per year for store lights of 30 c. p. The power at George Smilie's mill will be utilized for the plant. The street lights will be ready for operation in October or November.

CHICOPEE, MASS.—The council has appropriated $6,000 for extending the electric light plant.

WESTERLY, R. I.—An election will probably be held to vote on the question of a municipal electric light plant.

BUFFALO, N. Y.—Wm. B. Rankine, Secy. Niagara Falls Power Co., this week made the statement that the contract for the transmission pole-line to this city will be let within a few days. The company will deliver 1,000 HP. in this city Nov. 1.

LITTLE FALLS, N. Y.—Jesse Peterson, Pres. Indurated Fibre Co., Lockport, N. Y., proposes to erect an electric light plant in this city.

WADDINGTON, N. Y.—An electric light plant is contemplated. R. S. Dalzell, Village Clk.

ASBURY PARK, N. J.—The Atlantic Coast Electric Co. proposes putting in a new plant to cost about $500,000. Isaac C. Kennedy, of Asbury Park, is the counsel.

STOCKTON, N. J.—Young & Bailey, of Philadelphia, Pa., are preparing plans for an electric light plant of 100-arc light capacity to be erected at North Cramer Hill.

WEST NEWTON, PA.—The construction of an electric light plant at this place is proposed.

MANCHESTER, VA.—The council has appointed a committee to investigate the advisability of erecting a city plant.

CONCORD, N. C.—The Concord Electric Light Co. finds it necessary to increase the capacity of its plant. New boilers, etc., will be added at once.

ANDERSON, S. C.—It is reported that arrangements are being made for the immediate construction of a power plant at Poilman Shoals, 10 miles from this place, for the Anderson Light & Power Co.; estimated cost, $200,000. W. C. Whitner, Gen. Mgr., Anderson.

DAWSON, GA.—Bids are asked until Aug. 10 for an electric light plant. Consult. Engr., Frank Lederle, 608 Gould Bldg., Atlanta, Ga.; Dr. J. G. Dean, Chn. Com.

LAFAYETTE, LA.—The council has awarded to James Ferguson, of New Orleans, the contract for constructing an electric light plant and water-works, for which $36,000 in bonds will be issued.

BLANCHESTER, O.—G. L. McKibben, Cy. Engr., of Van Wert, O., has been engaged to prepare plans and specifications for a water and electric light plant, and to superintend the erection.

CINCINNATI, O.—Bids are asked until July 29 for furnishing the House of Refuse with one 75-HP. engine, medium speed, to drive dynamo; one 45-K.-W. multipolar dynamo, 110-volt constant potential, slow speed; one set of accumulators, 300 ampere hones 110 volts, and one 10-HP. 110-volt constant potential motor, wire work and appliances. James Allison, Secy. Bd. Directors.

IONIA, MICH.—The county surveyor has completed surveys for a dam for the Ionia Electric Co.

PORTLAND, MICH.—The following bids were received July 7 for erecting an electric light plant; Engrs., H. H. Humphrey, 22 Bennett Bldg., Detroit, Mich.; R. W. Alton Pres. of Village:

Fort Wayne (Ind.) Electric Corporation. accepted	$6,495
General Electric Co, Chicago, Ill	6,620
Westinghouse Electric & Mfg. Co., Pittsburg, Pa.	6,700

THREE OAKS, MICH.—F. B. Hinchman, Three Oaks, writes us that this place will soon vote on the question of putting in a plant. Plans and specifications have been prepared by Geo. C. Morgan, of Chicago.

CHICAGO, ILL.—Bids are asked until July 28 for furnishing 50 electric lamp poles for Garfield Park. Engr., Foree Bain, 1657 Monadnock Bldg.; Harvey T. Weeks, Pres.

DENVER, COLO.—Press reports state that the east side power house of the Denver Consolidated Electric Works was destroyed by fire July 12, causing the loss of 18 engines and 17 generators of the Westinghouse pattern, worth about $130,000.

GREAT FALLS, MONT.—The Great Falls Water-Power & Townsite Co., which is a large owner of lots and lands in this city, and plotted in the original townsite, is also the owner of the water power created by the Missouri River for a distance of about ten miles below the city, in which distance it has a total fall of over 400 ft., and includes the Black Eagle, Rainbow and Great Falls. The former of which is now developed to the extent of 40 ft. head, and capable of furnishing at the average flow of the river about 30,000 gross HP. A large portion of this power is now being used by the Boston & Montana Copper Smelting Co., the Street Ry. & Electric Light & Power Co., Royal Milling Co. and other industries. Andrew Rinker, Engr., and Gen. Agent, Great Falls; Samuel Hill, Pres.; Paris Gibson, Vice-Pres.; Wm. W. Conner, Secy. and Treas.

PETERBORO, ONT.—Bids are asked until July 29 for lighting the streets with 80 arc lights, according to reports. S. R. Armstrong, Town Clk.

NEW COMPANIES.—Dubinski Electric Co., San Antonio, Tex.; $10,000; Benjamin Dubinski.

Farmington Electric Light Co., Farmington, Me.; $10,000; Pres., E. S. Dingley, of Farmington; Treas., J. P. Flint, of Farmington.

Winn Water & Power Co., Bangor, Me,; $100,000; Pres., N. M. Jones; Treas., J. E. Clark; Clk., M. F. Scott, Contract Power Co., Hamilton, Ont.; $99,000; J. M. Gibson, James Dixon, John Moodie, John W. Sutherland, John Patterson, E. D. Patterson, all of Hamilton.

Consumers' Electric Light & Power Co., Newark, N. J.; $300,000, with $5,000 paid in; Benj. Atha, Albert O. Headley, Edward L. Conklin, of Newark, and Thos. C. Barr, of Orange, N. J.

Montezuma Electric Co., Illinois; $2,400, with all paid in; Arnold Beck, Sr., Arnold Beck, Jr., Ernest P. Olshausen, Henrietta Plate.

BRIDGES.

SOUTH PARIS, ME.—A committee has reported on plans and estimates for a new bridge at this place.

WOONSOCKET, R. I.—The council has decided to rebuild the wooden bridge over the Blackstone River by the erection of a steel structure.

TORRINGTON, CONN.—The construction of a bridge to cost about $5,000 is proposed at Main St., according to reports.

BINGHAMTON, N. Y.—At an election held July 14 the proposition to appropriate $60,000 for erecting a bridge at Ferry St. was defeated. S. E. Monroe, Cy. Engr.

BROOKLYN, N. Y.—The East River Bridge Commission has adopted the plans for the proposed bridge between this city and New York. Ch. Engr., L. L. Buck.

BUFFALO, N. Y.—Bids are asked until Aug. 3 for constructing three iron bridges on masonry substructures over Scajaquada Creek. R. G. Parsons, Secy. Dept. Pub. Wks.

NIAGARA FALLS, N. Y.—At a recent election it is reported that the citizens voted to build a bridge over the railway tracks at Pierce St.; estimated cost, $15,000. W. W. Read, Cy. Engr.

SLOANSVILLE, N. Y.—Chas. Wright, Central Bridge, N. Y., informs us that it is proposed to erect a one-span bridge 280 ft. long at a cost of $10,000. No contracts have yet been awarded.

PATERSON, N. J.—Bids are asked until Aug. 3 for the purchase of $60,000 of bridge bonds. Geo. F. Feuerstein, Chn.

EASTON, PA.—It is reported that A. J. Cooper, Easton, has been engaged to prepare plans for an iron bridge in Northampton county.

PHILADELPHIA, PA.—It is proposed to build a new bridge at Gray's Ferry to cost $550,000. Of this amount the Pennsylvania R. R. Co. will contribute $75,000, under the condition that the Union Traction Co. contributes a like sum.

PITTSBURG, PA.—John Brunner has been engaged to prepare plans for reconstructing the suspension bridge over the Monongahela River. E. M. Bigelow, Dir. Pub. Wks.——The Oakland bridge over Three Mile Run at Halket St. was recently destroyed by heavy rains, causing a loss of about $2,500.

GASTONIA, N. C.—The commissioners of Gaston county at the monthly meeting last week, decided to build an iron bridge across the South Fork of the Catawba River, near McAdensville, N. C. The bridge is to be 350 ft. long, with wooden approaches 100 ft. and 25 ft. Bids will be received for the next two weeks for building the same.

ROANOKE RAPIDS, N. C.—The new bridge across the Roanoke River at this town, recently built by the Roanoke Rapids Power Co., was washed away and totally destroyed last week by the rise in the Roanoke River, caused by the unusually heavy rains. It was 275 ft. long. It will be replaced at once by an iron and steel structure of the same size, but at a higher elevation. Address Roanoke Rapids Power Co., Roanoke Rapids, N. C. This is a new manufacturing town and is located five miles above Weldon, N. C.

NORTH CAROLINA.—Owing to the heavy rains and consequently swollen streams, many of them rising higher than has been known in 50 years, especially the Roanoke and Cape Fear and other rivers and streams in Eastern North Carolina, a number of bridges and trestles owned by the Carolina Central, Wilmington & Weldon and other railway companies were washed away, or so badly damaged as to make rebuilding necessary. Our correspondent writes that bridge companies could afford to send representatives to that section to ascertain at once the exact location of several which must be replaced.

CLEVELAND, O.—Bids are asked until Aug. 12 for constructing a timber Howe truss bridge over the railway tracks at Seneca St., and also to construct a 400-ft. inclined timber roadway. D. E. Wright, Dir. Pub. Wks.

COLUMBUS, O.—W. H. Halliday, County Audr., informs us that on account of a decision by the supreme court it was decided not to award the contract for building the proposed 144-ft. steel bridge over Big Walnut Creek, bids for which were asked until July 16.

TROY, O.—E. E. Pearson, County Audr., informs us that the following bids were received July 17 for constructing a 140-ft. iron bridge over Panther Creek, noted in our issue of July 2:

Variety Iron Works Co., Cleveland, O.	$3,800
Oregonia Bridge Co., Oregonia, O.	3,850
Canton Bridge Co., Canton, O.	3,875
H. H. Barker, Br. Conctr., Mount Vernon, O.	4,000
Bellefontaine Bridge & Iron Co., Bellefontaine, O.	3,821
Cincinnati Bridge Co., Cincinnati, O.	$3,995 and 4,230
Indiana Bridge Co., Muncie, Ind.	4,070
Groton Bridge & Mfg. Co., Groton, N. Y.	$3,875 and 3,995
Penn Bridge Co., Beaver Falls, Pa.	4,100 and 4,000
Brackett Bridge Co., Cincinnati, O.	$3,795 and 3,810
Toledo Bridge Co., Toledo, O.	3,962
Champion Bridge Co., Wilmington, O.	3,795
Youngstown Bridge Co., Youngstown, O.	$3,920 and 3,680
Iron Substructure Co., Columbus, O.	4,260
King Bridge Co., Cleveland, O.	3,860 and 3,890
Hamilton Construction & Tool Co., Hamilton, O.	3 926
*Massillon Bridge Co., Massillon, O.	3,000 to 3,575

*Awarded contract at $3,700.

JOLIET, ILL.—Press reports state that Troy, Ill., has petitioned the county commissioners for a new bridge over the Du Page River, about a mile north of the village, to cost $4,500, and that Jackson asks for a structure over Jackson Creek, to cost $2,500.

PROPHETSTOWN, ILL.—C. A. Wetherbee, of Sterling, Ill.; D. C. Waite, of Ustick, and Wm. Beswick, of Clyde, Ill., have been appointed a commission to investigate the advisability of building a bridge over Coon Creek, at this place, to cost $1,500. A. R. Hendricks, Chn. Comn., Morrison, Ill.

MILWAUKEE, WIS.—Bids will be asked this week for constructing two handsome steel arch bridges over two ravines at Lake Park, on the shore of Lake Michigan. Each bridge will have an 87-ft. span between abutments, and a roadway 26 ft. wide and two sidewalks, each 9 ft. wide; estimated cost, $40,000. For the present it is the intention of the park commissioners to start work with the masonry and put in the steel work later in the fall. Consult. Engr., Oscar Sanne, Room 69 Colby & Abbot Building, Milwaukee.

URBANA, ILL.—At the court house the commissioners of Crittenden township will let the contract for a 70-ft. steel highway bridge on masonry. Prof. Ira O. Baker, Champaign, Ill., Engr.

MENASHA, WIS.—W. W. Reed, Cy. Engr., is reported to have been directed to prepare plans for a pile bridge. S. S. Little, Cy. Clk.

WHITE SULPHUR SPRINGS, MONT.—Bids are asked until Sept. 7 for constructing a three-span wooden bridge in the Musselshell Valley, according to reports. C. W. Hall, County Clk.

SHELTON, WASH.—Bids are asked until Aug. 6 for constructing a bridge over the west branch of the Satsop River. Thos. McCarthy, County Audr., Shelton.

STEVENSON, WASH.—The following bids were received July 6 for an 80-ft. 2-span timber Howe truss bridge, with 60-ft. approaches, over Wind River. C. G. Green, Clk.:

The Rowe Lumber & Mfg. Co., Lyle, Wash.	$899
J. P. Gillette, Chenoweth, Wash.	800
Gordon Wilson, Carson, Wash.	650
R. G. Connor, Cascade Locks, Ore.	530

DALLAS, ORE.—The clerk has been directed to advertise for bids for constructing a bridge over the Yamhill River on the Lee Rowell Road, according to reports.

SALEM, ORE.—The county court has decided to ask for bids for constructing a pile bridge near Champolg. The structure will have a 70-ft. span and 270 ft. of approaches.

PLACERVILLE, CAL. — Messrs. Lachman and Porter have been appointed by the supervisors as a committee to meet the Sacramento supervisors and see what can be done in the matter of a bridge in the southern part of the county.

SACRAMENTO, CAL.—The county surveyor has recommended the construction of a 2-span steel bridge, 258 ft. long and the extension of a trestle from 596 ft. to 1,100 ft.

SAN JOSE, CAL.—Bids are asked until Aug. 3 for constructing a 60-ft. bridge over Stevens Creek, according to reports. H. A. Pfister, County Clk.

BUILDINGS

BARNSTABLE, MASS.—Bids are asked until July 30 for additions to the plumbing at the county buildings in this town. Engr., Ernest W. Bowditch, 60 Devonshire St., Boston.

WORCESTER, MASS.—Norwood & Morton, of Worcester, have been awarded the contract, at $27,745 for erecting an eight-room school building on Lamartine St., and Rankin & Woodside have the contract for a four-room school building to cost $19,795. Archs., Earle & Fisher, 592 Main St., Worcester.

PALMER, MASS.—Bids are asked until July 30 for the heating, plumbing, electric lighting, etc., for the Massachusetts Hospital for Epileptics. Archs., Rand & Taylor and Kendall & Stevens, 87 Milk St., Boston, Mass.; Wm. N. Bullard, Chn.

HARTFORD, CONN.—Plans are asked until Aug. 1 for a brick school building at Market and Morgan Sts. Address Chas. L. Ames, 661 Main St., or Geo. C. Bailey. Chn.

BROOKLYN, N. Y.—The heirs of E. B. R. King propose to erect a 17-story building at 205 to 213 Montague St.

BUFFALO, N. Y.—The board of public works has been directed by the council to prepare plans and specifications and advertise for bids for a 3-story brick fire-engine house at Lovejoy and Gold Sts.——Morris Grant Holmes has prepared plans for a handsome brick and stone church to be built for the Methodist congregation at Depew, N. Y. It will cost $55,000.——Carl Schmill, Morgan Bldg., has prepared plans for a brick and stone convent to be built for the Polish church at Cheektowaga; estimated cost, $40,000.

COLLINS, N. Y.—Bids are asked until Aug. 4 for constructing an administration building, etc., at the Collins State Homeopathic Hospital, as stated in our advertising columns. August C. Esenwein, Arch., 707 Mooney Bldg., Buffalo; Fred J. Blackmore, Treas., Ellicott Square, Buffalo.

NEW ROCHELLE, N. Y.—It is stated that an election will be held Aug. 4 to vote on the question of issuing $50,000 in bonds for erecting a new school building.

NEW YORK, N. Y.—Bids are asked until July 27 for making alterations and improvements to about 20 school buildings and also for erecting a structure at 91st St. and First Ave., J. J. Little, Chn., 146 Grand St.——Bids are asked by the comptroller until July 27 for the purchase of $400,000 of 3½% bonds for making improvements on school buildings and on the new city college.——Bids are asked until July 31 for erecting a new police station at 133 to 137 Charles St.; surety, $30,000. Wm. H. Kipp, Ch. Clk., 300 Mulberry St.——Bids are asked until Aug. 3 for erecting three buildings for the Manhattan state hospital, and also for the steam heating and ventilating apparatus for these buildings. Arch., I. G. Perry, Albany, and Binghamton, N. Y.; Dr. A. E. Macdonald, Gen. Supt.; John M'Anterney, Acting Pres. Bd. Mgrs., 1 Madison Ave.——John Jacob Astor proposes to erect a 12-story office building at Duane St. and Broadway, and an apartment house at 56th St. and Fifth Ave.——Contracts have been let for the construction of the new passenger station of the New York Central, between 124th and 126th Sts., in Fourth Ave., and work will begin at once under the direction of Col. Walter Katte, Chief Engr. Inasmuch as the plans provide for a station under the elevated structure, instead of at the side, it will be necessary to sink the grade of a section of the elevated structure about 8 ins. in order to give room for the platform. This part of the work will consume considerable time, thereby causing further delay in the running of trains over the new steel viaduct and the four-track drawbridge. The date of the completion of the station is indefinite.——Plans have been filed by the New York Savings Bank for a 4-story brick bank building at Eighth Ave. and 14th St., to cost $220,000.——Wm. A. Clark, Pres. United Verde Copper Co., 62 William St., New York, is reported as about to erect a mausoleum in Woodlawn Cemetery, at a cost of $100,000. Archs., Lord & Hewlett, 123 East 23d St.

PLATTSBURG, N. Y.—Bids are asked until Aug. 15 for the heating, plumbing, etc., for the barracks. Capt. Geo. E. Pond, Asst. Qr. M., Plattsburg.

POUGHKEEPSIE, N. Y.—Bids are asked until Aug. 6 for electric wiring, etc., for two wings of the Hudson River state hospital. I. G. Perry, State Arch., Albany and Binghamton, N. Y.; Amasa J. Parker, Pres. Bd. Trustees.

ROCHESTER, N. Y.—A. J. Warner, Powers Bldg., has completed plans for a new cathedral for St. Patrick's, on Vought St.; estimated cost, $60,000.

YONKERS, N. Y.—The plans for a new city hall, prepared by Edwin A. Forsyth, have been accepted by the council.

WILLET'S POINT, N. Y.—Bids are asked until Aug. 14 for constructing a storehouse. Lieut. E. W. Van C. Lucas, Q. M., Willet's Point.

ALLEGHENY, PA.—Bids are asked by the controller until Aug. 22 for erecting an engine house at Branch and Forest Sts., to cost about $30,000. Arch., Joseph Stilberg, 204 Fifth Ave., Pittsburg, Pa.

BEAVER FALLS, PA.—It is reported that S. E. Gallagher, of Beaver Falls, of the firm of Cooper & Gallagher, now in the liquor business, has secured an option on two corner lots on Seventh Ave. and 13th St. After the deal is consummated a fine hotel will be erected.

CARBONDALE, PA.—Bids are asked until Aug. 10 for furnishing the material and remodeling the city police station, as stated in our advertising columns. T. L. McMillan, Cy. Clk.

ERIE, PA.—The council has decided to compel owners of buildings over three stories high, excepting residences, to put up fire-escapes.

LANCASTER, PA.—Plans are asked by the school board until Sept. 3 for an 8-room school building at Mulberry St. and Marion Alley.

PITTSBURG, PA.—The Consolidated St. Ry. Co. proposes to build a new car barn to hold several hundred cars.——Plans have been completed for a residence, two large shelter houses and two other buildings for Schenley Park. E. M. Bigelow, Dir. Pub. Wks.; Wm. Falconer, Park Supt.——The Masons have appointed G. W. Morris, W. G. Foster, of Pittsburg, and Chas. H. Bronson, Audr. Pittsburg & Lake Erie R. R. Co., a committee to consider the advisability of constructing a masonic university.——S. T. McClarren, Westinghouse Bldg., has completed plans for a building for State Bank of Pittsburg.

SALEM, PA.—It is stated that the board of education has awarded the contract for erecting the new school buildings to W. C. Wilkins, of Pittsburg, Pa., at $55,000.

SISTERSVILLE, PA.—F. H. De Arment, 708 Penn Ave., Pittsburg, Pa., has prepared plans for a bank building.

MONONGAHELA CITY, PA.—A new school building will be built. Bartberge & East, Westinghouse Bldg., Pittsburg, Pa., are preparing plans.

BALTIMORE, MD.—Bids are asked until July 29 for erecting a school building at Carey and Chappell Sts. Benj. B. Owens, Inspector of Bldgs.

BALTIMORE, MD.—The following bids were received July 15 by B. B. Owens, Inspector of Bldgs., for erecting a school building at Linden Ave. and Koenig St: Walter Bros., $47,565; John Stack & Sons, $49,184; Morrow Bros., $47,234; Fred. Decker & Sons, $46,020; Thos. P. Johns, $47,400; John Hughes, Jr., $45,574.50; C. Sheehan & Sons, $48,215. New bids will be asked, as these were considered too high.

WASHINGTON, D. C.—Bids are asked until Aug. 5 for constructing a masonry observation tower on the Antietam battlefield, Va. Maj. Geo. W. Davis, Pres. Bd., War Records Office, Washington.

RICHMOND, VA.—A committee has been appointed to consider the question of a new city jail.

WEST LIBERTY, W. VA.—Bids are asked until Aug. 7 for erecting additions to the normal school building at this place. Archs., Frank E. and Henry B. Davis, 1 Fayette St., Baltimore, Md.; Virgil A. Lewis, Pres. Trustees, Charleston, W. Va.

WHEELING, W. VA.—It is reported that the Baltimore & Ohio R. R. Co. is considering plans for a new passenger station in this city. Ch. Engr., W. T. Manning, Baltimore, Md.

ASHEVILLE, N. C.—The county commissioners are about to select a site for a new county court house.

ATLANTA, GA.—Grant Wilkins, Atlanta, has about completed plans for a new county jail to have 225 cells and to cost $175,000.

BIRMINGHAM, ALA.—E. W. Walpoole, of Talladega, Ala., has had plans prepared by him accepted for a girls' industrial school; estimated cost, $50,000. T. S. Plowman, Chn. Com., of Talladega.

MERIDIAN, MISS.—Bids are asked until Aug. 7 for erecting a post office building in this city. Wm. Martin Aiken, Supervising Arch., Washington.

LEXINGTON, TENN.—Bids are asked until Aug. 3 for erecting a court house in this city. Arch., R. H. Hunt, Keystone Block, Chattanooga, Tenn.; E. J. Timberlake, Chn. Com.

CINCINNATI, O.—Bids are asked until Aug. 12 for furnishing engines, boilers, smoke connections, ventilating and heating apparatus, plumbing, etc., for the north wing of Hanna Hall. Archs., S. Hannaford & Sons, Hulbert Block; J. M. Robinson, Chn. Com., University of Cincinnati, Cincinnati.——Bids are asked until Aug. 10 for a steam heating and power plant for the house of refuge; bond, $6,000. Archs., Samuel Hannaford & Sons; James Allison, Secy.

CLEVELAND, O.—John F. Rust proposes to erect a 7-story office building on Euclid Ave. to cost about $90,000. Arch., Geo. H. Smith, 29 Euclid Ave.

CLEVELAND, O.—The Baltimore & Ohio R. R. Co. has decided to spend about $500,000 on reconstructing its passenger station at South Water St.

HUDSON, O.—Bids are asked until Aug. 6 for enlarging the town hall. E. E. Rogers, Township Clk.

DETROIT, MICH.—The following bids were received June 30 by Maj. M. P. Adams, U. S. Engr., for erecting buildings, etc., for the North Manitou Light Station, as advertised in Engineering News:

Joseph V. Gearing, Detroit, Mich., accepted	$10,642
McCurdy Bros., Houghton, Mich.	11,791
O'Sullivan & Jenks, Port Huron, Mich.	12,674
J. T. Moyhen, Detroit, Mich.	14,288
Robert Dunn & Co., Detroit, Mich.	15,187

CHICAGO, ILL.—The following bids were received by W. B. Wickersham, Secy. Bd. Directors, for furnishing electric elevators for the public library building; the first price being for 10 elevators and the second for 8:

Eaton & Prince Co., Chicago	$18,985	$15,300
Standard Elevator & Mfg. Co., Chicago	26,795	21,640
Smith-Hill Elevator Co., Quincy, Ill.	24,862	19,951
Crane Elevator Co., Chicago	18,820	15,294

——The Tower Co. has been incorporated with a capital stock of $800,000 to erect a tower 1,150 ft. high and 300 ft. at its base. The structure will have 14 elevators. Pres., D. R. Proctor.

CHICAGO, ILL.—Bids are asked until July 31 for constructing an 8-room and assembly hall school building at Ashland and Greenleaf Ave. Arch., Aug. Fiedler, Schiller Bldg.

RACINE, WIS.—Bids are asked until Aug. 21 for constructing the U. S. post-office building in this city, as stated in our advertising columns. Wm. Martin Aiken, Supervising Arch., Washington, D. C.

SIOUX CITY, IA.—Wm. M. Aiken, Supervising Arch., Washington, received the following bids July 14 for furnishing and placing a steam heating and ventilating apparatus in the court-house and post-office building in this city, as advertised in Engineering News:

		Time, days
Bayley Heating Co., Milwaukee, Wis.	$11,566	120
Sproul & McGurrin, Grand Rapids, Mich.	12,974	120
Optenberg & Sonneman, Sheboygan, Wis.	9,999	90
J. J. Hanighen, Omaha, Neb.	12,320	114
Chas. B. Kruse Heating Co., Milwaukee, Wis.	11,099	120
Thomas & Smith, Chicago	11,880	120
Davenport Steam Heating Co., Davenport, Ia.	10,979	120
Allen Black, St. Paul, Minn.	13,495	90
Samuel I. Pope Co., Chicago, (by telegraph)	10,870	

FERGUS FALLS, MINN.—Bids are asked until Aug. 12 for a heating and ventilating apparatus for the east wing of the state hospital. Arch., W. B. Dunnell, Bank of Commerce Bldg., Minneapolis, Minn.; T. H. Titus, Secy., Fergus Falls.

ANACONDA, MONT.—A. C. Schweinfurth, of New York, N. Y., is to prepare plans for the new Hearst library in this city, to be built by Mr. Hearst, of San Francisco, Cal. Fred Clark, Librarian, Anaconda.

HELENA, MONT.—An election will be held July 25 to vote on the question of issuing $61,000 in bonds for work on city buildings and for furnishing a heating and ventilating apparatus for the high school building. Arch., Clarence Johnson; Peter Winne, Chn. Com.

ST. LOUIS, MO.—Bids are asked until July 27 for erecting a new school building and for furnishing hot blast heating apparatus for six school buildings. John Kissner, Chn. Com.; C. L. Hammestein, Secy.

PUEBLO, COLO. — The following bids were received July 16 for erecting a post-office building in this city, as advertised in Engineering News. W. M. Aiken, Supervising Arch., Washington, D. C.:

		Time, mos.
L. L. Leach & Son, Chicago, Ill.	$187,774	18
Chas. A. Moses, Chicago, Ill.	208.300	18
Thos. H. O'Neil, Denver, Colo.	237,715	20
Fleming Bros., Denver, Colo.	288,657	20
Frank Anderson, Denver, Colo.	249,860	..
James A. McGonigle, Leavenworth, Kan.	249,600	20
G. W. Atkinson & Son, Colorado Springs.	216,763	19

OREGON CITY, ORE.—Bids are asked until Aug. 8 for the purchase of $6,000 of 6% school building bonds. Jacob Shade, County Treas.

SEATTLE, WASH.—The Northern Pacific Ry. Co. is reported as considering the question of building a passenger station in this city. Heretofore this company has used a station jointly with the Seattle, Lake Shore & Eastern R. R. Co.

SPOKANE, WASH.—It is reported that Spokane's new army post is to be begun at once. A. E. Johnson will have charge of the architectural department of the buildings and grounds. The plans were prepared in Washington, D. C., but may be changed, and the contracts will be let, as all work is to be done by contract.

SAN FRANCISCO, CAL.—Press reports state that the Regents of the State University have decided to petition the next legislature for a special appropriation of $500,000 for building purposes, and $500,000 more for the same purpose from the succeeding legislature, in order to have a building fund of $1,000,000 for the erection of suitable college buildings.——Col. A. S. Kimball has awarded to M. McGowan the contract, at $74,700, for constructing two barracks at the Presidio.

SAN FRANCISCO, CAL.—Press reports state that the governor has approved the plans for the Affiliated Colleges, and bids will be at once asked for the construction. The buildings will number four, grouped on Parnassus Ave., between First and Fourth Avs., north of the Park; will be on ground given by Adolph Sutro. Archs., J. E. Krafft and Martens & Coffey, Academy of Science Bldg.

SAN JOSE, CAL.—A resolution has been introduced directing the city clerk to advertise for plans for a high school building and also a public library building. The high school plans must be for a building which will not cost more than $75,000, and the library building is not to exceed $25,000.

AMHERSTBURG, ONT.—Alfred B. Wood is reported to have prepared plans for a $100.000 hotel for the L'Hotel Oriental Co. The building will be 274 × 118 ft.

WATER-WORKS.

BANGOR, ME.—Bids are asked until Aug. 13 for furnishing and erecting a stand-pipe, as stated in our advertising columns (postponement from July 30). A. B. Tower, Engr., Holyoke, Mass.; Walter L. Brown, Clk. Bd.

PHILLIPS, ME.—A press report states that the construction of the new water-works was expected to begin July 20.

ST. JOHNSBURY, VT.—The Deane Steam Pump Co. has the contract for a 1,000,000-gallon power pump for this village.

ASHLAND, MASS.—William F. Merritt, Town Clk., writes us that nothing has been done except to appoint a committee to investigate the question of introducing water-works.

HOLDEN, MASS.—We are informed that the construction of works will probably be commenced next year; supply by gravity from a pond in Rutland; estimated cost, $40,000. Z. W. Armington, Town Clk.

HOLYOKE, MASS.—The water commissioners are reported as considering plans for the proposed new dam in the Manhan River.

LAWRENCE, MASS.—The water board is reported to have ordered 500 meters from the National Meter Co. and to have voted to advertise for bids for the new high-service stand-pipe.

MEDWAY, MASS.—E. V. Mitchell, of Medfield, is interested in the Medway Water Co., which proposes to construct works at this place; no plans or definite action yet decided on.

MERRIMAC, MASS.—B. Jacques, Town Clk., writes us that a committee has been appointed to report at the next annual meeting in March in regard to water-works; nothing will be done before then.

SOUTH DEERFIELD, MASS.—The South Deerfield Water Co. will probably commence the construction of works this fall; water supply from a stream; estimated cost, $25,000. E. M. Roche is interested.

SUTTON, MASS.—Efforts are being made to secure an extension of the Manchaug Water Co.'s mains to this village for fire protection, at a cost of $1,000.

TAUNTON, MASS.—A new pumping engine will probably be needed next year; no steps yet taken. Geo. T. Chace, Supt.

SUFFIELD, CONN.—The contract for pipelaying has been awarded by the Village Water Co. to A. R. Leete, of Thompsonville; pipe purchased from the Chattanooga Pipe & Foundry Co.; foundation for the stand-pipe is now being laid.

ARGYLE, N. Y.—The village clerk writes us that the proposed works will probably cost $5,000 to $8,000; supply by gravity from a lake at an elevation of 410 ft. above the village; there is some talk of organizing a company to construct the plant.

BOLIVAR, N. Y.—J. B. Bradley, E. R. Kilbury and Louis Seibert have been appointed water commissioners. It is expected that a special election will soon be held and $12,000 in bonds voted for a gravity system.

BUFFALO, N. Y.—Bids are asked until July 30 for 100 tons of pig lead for the water department. R. G. Parsons, Secy. Dept. Pub. Wks.

CLAYTON, N. Y.—Plans for works have been prepared by Hinds & Bond, of Watertown, and are now in the hands of the state board of health; water supply will probably be pumped from the St. Lawrence River to a stand-pipe. H. W. Morse, Village Clk.

ELMIRA, N. Y.—J. M. Diven, Secy., is quoted as stating that the water company has adopted plans for a 6,000,000-gallon filter plant, and that bids for the construction will be asked as soon as the specifications are completed.

FLUSHING, N. Y.—The village trustees are reported to have decided to purchase an additional pump, as recommended by the water committee.

KINGSTON, N. Y.—O. C. Longyear, Supt., writes us that it is proposed to build a new impounding reservoir and pipe line, as recently noted in these columns; no contracts have yet been awarded; the present plant was recently purchased by the city and as soon as necessary financial and other matters are arranged bids will be advertised for.

LIVONIA, N. Y.—Owing to the opposition of taxpayers the water-works project has been abandoned for the present.

NORTH TANAWANDA, N. Y.—It is stated that specifications are nearly completed for the proposed extensions, for which bonds have been voted.

NEW YORK, N. Y.—The lowest bid received July 21 for furnishing and laying two 48-in. water mains in Fifth Ave., from 80th St. to Fourth St., was that of Wm. T. Baird, at $452,460. There were 10 bidders; itemized bids will probably be published next week. Chas. H. T. Collis, Comr. Pub. Wks.

RAVENA, N. Y.—John Longear, of Kingston, has prepared plans for works estimated to cost $75,000; supply from Lawsons Lake; plant will probably be completed next year. C. L. Diston, Town Clk.

RENSSELAERVILLE, N. Y.—J. Vaughn, of Stamford, has the contract and has commenced the construction of water-works at this place, to be owned by the Rensselaer Water Co.

ROCHESTER, N. Y.—Bids are asked until July 24 for trenching and laying water pipe in six groups of streets. Thos. J. Neville, Clk. Executive Board.

SILVER CREEK, N. Y.—Bids are asked until Aug. 1 for constructing works, as stated in our advertising colunms. J. F. Witmer, Engr., Buffalo; Frank L. Smith, Village Clk.

SKANEATELES, N. Y.—A press report states that the water company has not replied to the offer of the commissioners to purchase the plant for $24,000 and that bids will soon be asked for constructing new works, for which the Stanwix Engineering Co. has prepared plans.

TARRYTOWN, N. Y.—Bids are asked until July 28 for the purchase of $150,000 in 4% 30-year water bonds. John F. Schall, Secy.

WURTSBORO, N. Y.—William H. Cowan, of Montgomery, N. Y., and associates have petitioned for a franchise, which the village trustees are expected soon to take action upon; supply by gravity from springs about one mile distant; estimated cost, $10,000 to $15,000. G. F. Harding, Village Clk.

CHATHAM, N. J.—Works will probably be constructed next year; supply to be pumped from springs to a stand-pipe.

CLINTON, N. J.—We are informed that a good gravity supply could be obtained for water-works at this place and that the common council would probably grant a franchise. Chester Tomson, Cy. Clk.

JERSEY CITY, N. J.—Bids are asked until July 28 for laying water pipe in the public streets until May 1, 1897. Geo. T. Bouton, Clk. Comrs.

NEWARK, N. J.—The East Jersey Water Co. is said to have in contemplation important extensions of its system, in addition to the work now in progress.

VINCENTOWN, N. J.—The Vincentown Water Co. has commenced the construction of works to cost $9.000; plant will probably be completed this month. Edgar A. Alcott, Engr., Mount Holly, N. J. John A. Kinney is interested.

ALTOONA, PA.—S. C. Corson, of Altoona, has been engaged to prepare plans for water-works for Juniata borough, Blair county, Pa. It is probable that a temporary dam and about four miles of pipe line will be constructed.

AVONDALE, PA.—J. W. Ledoux, 1319 Filbert St., Philadelphia, is reported to have prepared plans for works at this place; supply from creek; probable cost, $10,000. J. L. Paiste, Chn. Water Com.

CHARLEROI, PA.—The water company is talking of building a reservoir.

CHESTER, PA.—A permanent injunction has been granted restraining the borough of Norwood from borrowing $30,000 for water-works, sewers, etc.

CORAOPOLIS, PA.—The construction of works will probably be commenced soon; water supply from the Ohio River; estimated cost, $25,000 to $30,000, for which bonds will be issued. E. H. Ferres, Clk.; J. W. Arras, Chn. Com.

CORAOPOLIS, PA.—Bids are asked until July 25 for the purchase of $8,000 in 4½% 5 to 30-year water bonds. E. H. Ferree, Clk. of Council.

DRIFTWOOD, PA.—The question of water-works will probably be revived at this place at an early date.

DUSHORE, PA.—B. S. Collins, Secy., writes us that capital has been partially secured for the construction of a $15,000 water-works plant by a private company.

GROVE CITY, PA.—The Grove City Water Co. secured a charter some time ago but has not yet been granted a franchise; probable cost of plant, $25,000; work must be commenced within 1½ years to retain charter. J. C. Van Orsdell, Cy. Clk.

HATBORO, PA.—No definite action has been taken by council in regard to water-works, although the question is being discussed; water supply will probably be pumped from an artesian well to a stand-pipe. Comly Walton, Clk. of Council.

JERMYN, PA.—Property owners have secured a temporary injunction restraining the borough authorities from issuing $16,000 in bonds for water-works.

LANCASTER, PA.—The Conoy Water & Power Co. was incorporated July 17 with a capital stock of $1,000. Treas. Edward R. Heitshue, Lancaster.

LEBANON, PA.—The council has passed a bill providing for an election July 25 to vote on an issue of $200,000 in bonds for a water supply from Hammer Creek, according to reports.

LIGONIER, PA.—An election will be held Aug. 7 to vote on a 2% tax for water-works. Bids for constructing a system were opened last month, as advertised in Engineering News. L. W. Fogg, Engr., Latrobe, Pa.

LINESVILLE, PA.—The Bunday Water Co. is constructing works at this place; supply from springs. S. W. Lowing, Clk. of Council.

LITTLETOWN, PA.—This borough is sinking a well and it is stated that $15,000 in bonds will be issued for works. E. M. Kenly, Engr., Baltimore, Md.; Abia Smucker, Secy.

MIFFLINBURG, PA.—Authority has been obtained from the legislature for the construction of works estimated to cost $30,000; supply by gravity from mountain stream. T. M. Getgen, Town Clk.

MILLHEIM, PA.—There has been some talk of organizing a water company at this place; supply by gravity from a mountain stream 1½ miles distant; estimated cost, $4,000. H. E. Duck, Clk.

NAZARETH, PA.—The Nazareth Water Co. has important extensions of its plant in contemplation. The town is negotiating for the purchase of the plant. Frank Kunkel, Treas.

PITTSBURG, PA.—Bids are asked until July 28 for furnishing and erecting at Garfield pumping station two compound condensing duplex pumping engines of 1,500,000 gallons capacity each. E. M. Bigelow, Dir. Pub. Wks.

TYRONE, PA.—Bids are asked until Aug. 1 by the Tyrone Gas & Water Co. for the construction of a reservoir, as stated in our advertising columns. T. J. Humphreys, Engr.; C. A. Morris, Secy.

WEST BROWNSVILLE, PA.—Geo. Jenkins, of Monongahela, has been engaged as engineer of the proposed works at this place, estimated to cost $8,000; water supply will be pumped from Monongahela River to reservoir. J. D. S. Pringle, Burgess.

YORK, PA.—William H. Griffith, of this city, is treasurer of the following three water companies, each incorporated July 20 with a capital stock of $1,000: Water Company of Manchester Township; Water Company of Spring Garden Township; Water Company of West Manchester Township.

ABERDEEN, MD.—The town commissioners are reported as soon to call an election to vote on an issue of bonds for water-works and other improvements.

BALTIMORE, MD.—Bids are asked until July 25 for 15 tons of Omaha pig lead for the water department. William L. Kenly, Ch. Engr.

HYATTSVILLE, MD.—A. Cass. Clk., writes us that no official action has been taken by corporation in regard to water-works.

OAKLAND, MD.—We are informed that the question of water-works has been abandoned for the present.

SNOW HILL, MD.—It was expected that the construction of works at this place would be commenced last week, plant to be completed by Jan. 1; water supply to be pumped from wells to stand-pipe; estimated cost, $18,000. E. S. Dashiell is interested.

TANEYTOWN, MD.—This city expected to commence the construction of works this month; water supply to be pumped from springs; estimated cost, $12,000. H. D. Mehring, Burgess; L. D. Reid, Clk.

TAKOMA, PARK, D. C.—Geo. A. Warren, Town Treas., writes us that the charter of this town provides for the construction of water-works and that the council has discussed the cost of same, but it is not probable that additional action will be taken this year; water supply would probably be pumped from deep wells or Sligo Creek to stand-pipe.

FALLS CHURCH, VA.—M. E. Church, who was granted a franchise some time ago, writes us that the necessary capital has not all been secured and it is not known when the construction will be commenced; water supply from springs or artesian wells; probable cost $25,000.

RIVERTON, VA.—It is reported that the Royal Water Co., of Front Royal, Va., contemplates extending its gravity system to this place, about two miles.

GASTONIA, N. C.—This city has talked some of constructing works to cost about $30,000, but no legislative authority has yet been secured or definite action taken. Edgar Love, Clk.

LOUISBURG, N. C.—Geo. S. Baker, Cy. Clk., writes us that the question of water-works has not yet assumed definite shape.

WILMINGTON, N. C.—The water company may possibly erect a filter plant; question not decided. W. F. Robertson, Supt.

CHARLESTON, S. C.—A local paper states that Capt. U. R. Brooks will organize a water company to furnish the city with a water supply from artesian wells.

CHESTER, S. C.—C. C. Edwards, Clk., writes us that Perry Andrews, of Atlanta, Ga., has been awarded the contract for an artesian well and work has commenced; nothing will be done about plans for water-works until the well is completed, which will be about Oct. 1; population, 4,100.

GAFFNEY CITY, S. C.—This town has been granted authority to construct works to cost $15,000, but no commissioners have been appointed or bonds issued; water supply from springs 1½ miles distant. L. Baker, Town Clk.

EAST ROME, GA.—This town is laying water mains; supply from the mains of the city of Rome. O. H. McWilliams, Mayor.

HAWKINSVILLE, GA.—S. A. Way, Mayor, writes us that the plans and specifications for proposed water-works, etc., have not yet been completed.

HOGANSVILLE, GA. — We are informed that no definite action has been taken in regard to water-works in this town, although there has been some talk of a gravity system.

LAKELAND, FLA.—C. D. Clough, Cy. Clk., writes us that the question of water-works is now under consideration.

MIAMI, FLA.—The construction of work has been commenced, plant to be finished by Jan. 1. A. L. Knowlton, Engr.

GENEVA, ALA.—Wm. J. Hall, City Clk., writes us that this city desires water-works but that no definite action has yet been taken.

GURLEY, ALA.— Giles, Vance & Co., of Maysville, Ala., are the contractors for works in this city, to cost about $1,000; plant to be completed in 60 days; water supply to be pumped from an artesian well to a tank. F. T. Walker, Engr., Gurley.

ABERDEEN, MISS.—R. P. Houston, Cy. Clk., writes us that this city will probably have works soon, but has not yet taken definite action. J. M. Acker, Mayor.

BAY ST. LOUIS, MISS.—R. Mendes, Cy. Clk., writes us that nothing is now being done in regard to the proposed water-works.

GREENWOOD, MISS.—An artesian well has been sunk, flowing 30 ft. above surface of ground, but nothing definite has been done in regard to water-works.

WEST POINT, MISS.—The city clerk writes us in regard to the proposed works that no definite system has yet been decided upon.

LAFAYETTE, LA.—A press report states that the contract for constructing water-works and an electric light plant has been awarded to James Ferguson, of New Orleans, at $36,000, for which amount bonds will be issued.

WASHINGTON, LA.—This place is reported to have been granted legisuative authority to issue bonds for a water-works and electric light plant.

CLARKSVILLE, TENN.—The contract for a 25 × 100-ft. stand-pipe has been awarded to Walsh & Weidner, of Chattanooga, at $5,434, exclusive of foundation; 125 tons of 12 and 10-in. pipe has been purchased of the South Pittsburg Pipe Works, at $22.50 a ton delivered; valves purchased of the Chapman Valve Co. J. N. Hazelhurst & Co., Consult. Engrs., Atlanta, Ga.; R. E. McCulloch, Supt.

DECHERD, TENN.—It is probable that works to cost $35,000 will be constructed to supply this place and Winchester. E. D. Sanford may be addressed.

MARTIN, TENN.—J. E. Kennedy, Mayor, writes us that the legislature will be petitioned in January for authority to issue $15,000 to $18,000 in bonds for works and the contracts awarded as soon thereafter as possible; water supply will probably be pumped from a deep well to a stand-pipe; no engineer has been engaged.

ROCKWOOD, TENN.—J. A. Shadden, Cy. Recdr., writes us that legislative authority was secured some time ago but that no election has been held or other steps taken toward the construction of works.

TULLAHOMA, TENN.—Geo. W. Davidson, Cy. Recdr., writes us that it is expected to secure authority and commence the construction of a $25,000 water-works plant next year.

SPRINGFIELD, KY.—H. R. Thompson, Clk., writes us that the construction of works will probably be commenced next month; plant will include a stand-pipe; probable cost, $2,200.

UNIONTOWN, KY.—The question of water-works is now being discussed but nothing definite has been decided; probable cost, $20,000.

WEST COVINGTON, KY.—It is stated that a company will construct works at this place if enough takers can be procured; water supply from the Covington reservior at Newport, Ky. Joseph Ryan, Cy. Clk.

BLANCHESTER, O.—G. L. McKibben, Cy. Engr., Van Wert, O., has been engaged to prepare plans and specifications and to superintend the construction of the proposed water-works and electric light plant at this place.

CLEVELAND, O.—Bids are asked until Aug. 14 for building foundations of a new smoke-stack, for a short aqueduct and other work at the Division St. pumping station. D. E. Wright, Dir. Pub. Wks.

COSHOCTON, O.—A large well and a new pumping engine are among the projected improvements. D. A. Raiff, Supt.

EAST CLEVELAND, O.—At a special election last week only 20 votes of the 196 were opposed to the issue of bonds to lay water pipes.

FOSTORIA, O.—A press report states that the trustees of the water-works have voted to require all consumers to put in meters.

GREENWICH, O.—B. J. Ashley, of Chicago, is reported to have prepared plans for works at this place; supply to be pumped from the wells to stand-pipe; probable cost, $14,000; no definite action yet taken. I. J. Brooks, Clk.

HIRAM, O.—Contract for constructing works to cost about $12,000 will probably soon be awarded. Edwin L. Hall, Clk.

IRONTON, O.—Bids are asked until Aug. 1 for furnishing and placing in position a 150-HP. boiler. Geo. A. Meyers, Pres. Trustees.

MANSFIELD, O.—S. C. Clark, Supt., writes us that the proposed extensions include 12,000 ft. of 6-in. main, with 25 hydrants and 18 6-in. valves; work to be done by the city; water mains, valves and hydrants to be furnished by the Barnes Mfg. Co., of Mansfield.

PIQUA, O.—The proposition to issue $20,000 in bonds for water-works improvements lacked 69 votes of the necessary two-thirds, at the recent election and the improvements will not be made at present.

WEST ALEXANDRIA, O.—W. H. Burbaker, Clk., writes us that the question of water-works is not yet settled; water supply could probably be pumped from wells to stand-pipe; probable cost, $17,000.

ZANESVILLE, O.—The water-works trustees are reported as planning several improvements, including a pumping engine to cost $10,000 or $12,000.

SULLIVAN, IND.—R. H. Hutchison writes us that the Howe Pump & Engine Co., of Indianapolis, has the contract for works, to be completed Nov. 1. John H. Haines-worth, Engr., Indianapolis.

WALKERTON, IND.—Bids are asked by the Walkerton Water-Works Co. for the erection of a tower, pumping station and equipping of a complete system of water-works, as stated in our advertising columns. Wm. Clem, Secy.

BENTON HARBOR, MICH.—A press report states that the 13 wells from which the city water supply is obtained are inadequate to supply the demands and that the supply is decreasing.

HIGHLAND PARK, MICH.—The injunction to prevent this village from constructing works has been dissolved and it is stated that the construction will now be pushed as rapidly as possible; the village is to lay 26,445 ft. of pipe beyond the Detroit city limits, at a cost of $23,000, and pay the city 3 cts. for each 1,000 gallons of water used.

THREE OAKS, MICH.—Bids are asked until Aug. 7 for constructing works. Geo. C. Morgan, Engr., Chicago; F. B. Hinehman, Clk.

ASSUMPTION, ILL.—The town council is reported to have appropriated $20,000 for a water supply.

CHICAGO, ILL.—Bids are asked by the department of public works until July 27 for laying water mains in 24 streets.

EDWARDSVILLE, ILL.—Bids are asked until Aug. 4 by the committee on water-works for the construction of works, for which plans have been prepared by F. W. Raeder, Equitable Bldg., St. Louis.

GALENA, ILL.—The city council is negotiating with the Galena Water Co. for the purchase of the works.

GENOA, ILL.—The construction of works to cost $8,000 will probably be commenced in February. Hill & Enricht, Engrs., Chicago; A. U. Schneider, Cy. Clk.

GREENUP, ILL.—It is probable that works to cost $10,000 will soon be constructed at this place. M. T. Monohon, Clk.

JOLIET, ILL.—An election will probably be held Aug. 25 to vote on an issue of $200,000 in bonds for a water supply from artesian wells.

OAKLAND, ILL.—It is stated that C. J. Taber will commence the construction of works at this place about Sept. 1; water supply to be pumped from river to stand-pipe; probable cost, $12,000. Andy Shaffer, Engr.; Col. F. Gruber, contractor, both of Oakland.

PLYMOUTH, ILL.—It is reported that an election was held last week to vote on an issue of $3,000 in bonds for water-works.

SHELDON, ILL.—The contract for constructing works will probably be awarded at an early date; probable cost, $20,000. Jacob A. Harman, Engr., Peoria; M. B. Wood, Clk.

TONICA, ILL.—J. W. Richardson, Clk., writes us that this village wants water-works, but does not feel able to construct a plant at present.

BANGOR, WIS.—It is probable that the construction of works will be commenced in September, although nothing definite has yet been decided. R. W. Davis, Town Clk.

LA CROSSE, WIS.—Bids are asked until July 27 for constructing a water main in 12th St., from Badger to La Crosse St. Jacob Hahn, Secy. Bd. Pub. Wks.

MANAWA, WIS.—We are informed that works will probably be constructed at this place next year.

MILWAUKEE, WIS.—The water main crossing the Milwaukee River at Michigan St. broke July 12 causing a loss of about 10,000,000 gallons of water, according to local papers.

OSHKOSH, WIS.—The city has opened bids for $20,000 in water bonds authorized for extensions of the water mains in the manufacturing districts.

PORTAGE, WIS.—Receiver Maxcy, of the water company, is quoted as stating that work on the new intake will not be begun until Aug. 15.

SHULLSBURG, WIS.—The council is reported to have voted to call a special election to vote an appropriation for a stand-pipe.

WAUPACA, WIS.—The council has selected a site for a reservoir at an elevation of 117 ft. above Main St.

WAUPACA, WIS.—F. S. Baldwin and A. M. Hansen are expected soon to commence work on a water-works system to cost $45,000, plant to be completed within one year; water supply to be pumped from river to stand-pipe. C. G. Burbank, Cy. Clk.

WAUWATOSA, WIS.—Myron Gilbert, ex-Village Clk., writes us that the decision of the Supreme Court two or three weeks ago was that the law under which villages have been incorporated in this state is unconstitutional and that nothing is therefore now being done to construct water-works in this village.

BEDFORD, IA.—There is talk of constructing works to cost $20,000. F. S. Sturtevant, Clk.

DOON, IA.—Bids are asked until Aug. 3 for constructing works, as stated in our advertising columns. L. F. Wakefield, Engr., Sioux City; A. N. Thompson, Town Clk.

ELGIN, IA.—It is probable that works to cost $6,000 will be constructed. L. Y. Ehrich, Chn. Com.

GRANVILLE, IA.—It is reported that bids were received July 21 for constructing works. F. E. Wade, Engr., Sheldon, Ia.; N. H. Graff, Cy. Recdr.

LOHRVILLE, IA.—Bids are now asked, according to reports, for constructing works for which $4,500 in bonds have been voted. Fairbanks, Morse & Co., Engrs., Chicago; W. J. Gillam, Cy. Recdr.

RUTHVEN, IA.—E. C. Rowell, Mayor, writes us that this city will not be in condition financially to construct works for a year or more.

SANBORN, IA.—It is probable that works will be constructed at a cost of about $5,000. F. B. Owen, Recdr.

FOSSTON, MINN.—Bids are asked until July 28 for the purchase of $10,000 in bonds, voted June 30, for water-works and electric lights. I. O. Brandt, Cy. Recdr.

ST. PAUL, MINN.—The contract for the pumping station at Centreville has been awarded to Hennessy & Cox, at $9,429.

ROCHESTER, MINN.—Burt W. Eaton has been appointed receiver of the water company at this place.

WATERVILLE, MINN.—A. W. Knaak, Recdr., writes us that this village expects to construct works, but that no definite information can now be given.

GREENWOOD, S. DAK.—Bids are asked for furnishing all material and putting down one or more artesian wells on the Yankton Indian reservation. James A. Smith, U. S. Indian Agent.

BIG TIMBER, MONT.—It is reported that this city is about to construct water-works.

BELT, MONT.—P. C. Kittle, Mgr. Castner Coal & Coke Co., writes us that the private works noted in our issue of July 2 is nearly completed.

MISSOULA, MONT.—Bids are asked until Aug. 10 for furnishing the city with water for 10 or 20 years, at least 30 hydrants to be contracted for. It is reported that improvements to cost $40,000 to $50,000 are needed in the present plant.

WHITE SULPHUR SPRINGS, MONT.—It is reported probable that bonds will be issued and works constructed at this place. Powell Black, Cy. Clk.

ALBANY, MO.—W. W. Millen, Clk., writes us that no action has been taken by the council except to offer a franchise to any good party who will put in a plant.

GLASGOW, MO.—The contract for a stand-pipe is reported to have been awarded to the Warren City Boiler Works, of Warren, O., at $1,198.

KANSAS CITY, MO.—The board of public works is examining pumping machinery with a view to buying a new pump for the Turkey Creek station.

RICHMOND, MO.—This city is reported to have voted in favor of works to cost $45,000.

ST. LOUIS, MO.—The estimates for the water department include $275,000 for pipe, $500,000 for extensions and new work and about $70,000 for miscellaneous work.

COTTON PLANT, ARK.—F. B. Robinson, Recdr., writes us that works to cost about $1,000 will probably be constructed this year.

HEMPSTEAD, TEX.—Bids are asked by the Hempstead Artesian Well Works Co. until July 20 for sinking an artesian well 1,200 ft. deep. M. Schwarz, Secy.

HICO, TEX.—It is probable that works to cost $7,000 will be constructed this winter; no definite action yet taken. G. W. Hail, Cy. Secy.

ROGERS, TEX.—We are informed that J. C. Thompson, of Waco, Tex., has been awarded the contract for an artesian well at this place.

SEABROOK, TEX.—An artesian water supply of 50,000 gallons daily has been obtained at a depth of 570 ft.

BUENA VISTA, COLO.—The town contemplates the construction of a reservoir with seepage supply. H. M. Kemble, Supt.

CASTLE ROCK, WASH.—H. Orchard & Co., of Kalama, Wash., will probably construct works at this place to cost about $5,000. A. J. Hicks, Clk.

ILWACO, WASH.—H. A. Cory, Clk., writes us that there has been some talk of water-works, but nothing definite has been done.

KALAMA, WASH.—H. Orchard, Pres. Orchard Water Co,. writes that works to cost $15,000 have just been completed at this place.

SEATTLE, WASH.—This city voted $1,200,000 at the general election for the construction of a gravity water supply of 25,000,000 gallons daily from Cedar River. Several surveys have been made and reports state that it has been decided to build a dam in Cedar River which will turn the water into Swan Lake, from which place a conduit will be built to the terminus of the present city mains at Lake Washington.

HARNEY, ORE.—There is some talk of constructing works. Address the clerk.

WARRENTON, ORE.—There is talk of constructing works to supply this place, Flavel and New Astoria, at a cost of $45,000.

AZUSA, CAL.—We are informed that the water-works project noted in our issue of July 2 has been defeated.

LAKEPORT, CAL.—This town will probably construet works to cost $15,000 within a year; nothing definite yet decided. H. V. Keeling, Town Clk.

SANTA ANA, CAL.—The water company has appointed a committee to investigate the feasibility and probable cost of a reservoir near Anaheim, for storage purposes in the summer months.

SUISUN, CAL.—O. B. Powers, Town Clk., writes us that at the election July 13 the proposed issue of $42,000 in bonds was authorized by a vote of 122 to 6. O. H. Buckman, Engr., Napa City, Cal.

KENDRICK, IDAHO.—It is probable that a gravity system will be constructed; probable cost, $11,000; bonds now for sale. W. R. Graham, Engr., Kendrick; Lewis Hunter, Clk.

DESERONTO, ONT.—It is reported that this place is likely to construct works at a cost of $35,000.

LISTOWELL, ONT.—An election will be held Aug. 21 to vote on an issue of $15,000 in bonds for water-works, a gas or electric light plant, etc.

LONDON, ONT.—Surveys and plans are being prepared for increasing the water supply. John M. Moon, Supt.; O. Ellwood, Secy.

OWEN SOUND, ONT.—T. I. Thomson, Chn., writes us that metering is the most important change contemplated at present. Isaac Markle, Supt.

STURGEON FALLS, ONT.—H. E. McKee, Town Clk., writes us that bids will probably be received in September for constructing works estimated to cost $17,500; soil is sandy and very level; water supply to be pumped from the Sturgeon River. Alan Macdougall, Engr., Toronto.

ST. JOHN, N. B.—The city proposes to improve the pressure on heights by installing a small pumping plant to be driven by water power. Wm. Murdock, Engr. and Supt.

IRRIGATION.

DENVER, COLO.—Colorado and New York capitalists are said to be considering plans for building a storage reservoir in the Platte canyon for irrigation and power purposes. This reservoir will hold the waters of the South Platte River and is estimated to cost about $1,800,000. Engrs., S. G. Rhodes, of Denver, and Mr. Cook, of Chicago. Sylvester Smith and Cyrus W. Fisher, of Denver, are interested.

CUERO, TEX.—Press reports state that the object of the Cuero Power & Irrigation Co., noted in our issue of last week as incorporated by Alex. Hamilton, V. Weldon, J. J. Sumners, F. A. Taylor and Sam C. Lackey, is the construction of a dam across the Guadalupe River in De Witt county at or near a place known as Hell Gate, for diverting a portion of the water of the stream into ditches for irrigating the adjacent lands. The corporation will also have the right to build a power house, for milling, manufacturing and irrigating, and to furnish water for water-works and sewers for Cuero, and to furnish power for electric lights.

NEW COMPANIES.—Rio-Grande Land & Irrigation Co., El Paso, Tex.; $5,000; Isaiah A. Barnes, William Bremme, James Longwell.

Calamus Valley Irrigation Canal Co., Taylor, Neb.; $3,500; R. Hesselgesser, J. J. Collopy, C. B. Hesselgesser, M. A. Hesselgesser.

SEWERAGE.

BOSTON, MASS.—Bids are asked until July 27 for constructing 1,500 ft. of 18 and 15-in. pipe sewers. The work will include 750 cu. yds. of solid and loose rock excavation. Benj. W. Wells, Supt. of Sts.

QUINCY, MASS.—We are informed that the council has appropriated $5,000 for surveys, maps, etc., for a sewer system. The system has been adopted and work will be begun early next year. C. F. Knowlton, Comr. Pub. Wks.; Albert F. Schenkelberger, Sewer Comr.

WORCESTER, MASS.—F. A. McClure, Cy. Engr., informs us that $100,000 has been appropriated by the council for a sludge disposal plant, for which plans are now being prepared. Local papers state that the city engineer was authorized by the council on July 13 to engage an engineer and also a chemist to consult with him on the plans for the sewage separation system.

PROVIDENCE, R. I.—Bids are asked until Aug. 3 for constructing about 3,500 ft. of 105 × 75 to 36-in. brick sewers, etc., as described in our advertising columns. Robt. E. Smith, Comr. Pub. Wks.

WOONSOCKET, R. I.—Bids are asked by the sewer commissioners until Aug. 17 for constructing sections 1, 2 and 3 of the sewer system, as described in our advertising columns. The work will consist of a river wall, about 4,350 ft. of 36 to 30-in. brick sewers, four siphons under the Blackstone River, etc. Consult. Engr., Rudolph Hering, New York, N. Y.; S. P. Cook, Cy. Treas.; Arthur R. Sweet, Supt. Sewer Dept.

BROOKLYN, N. Y.—Bids are asked until Aug. 4 for constructing sewers in three streets. Theo. B. Willis, Comr. Cy. Wks.; R. M. Whiting, Secy.

BUFFALO, N. Y.—The council has ordered the board of public works to prepare plans and specifications and advertise for bids for constructing pipe sewers in nine streets.

JAMESTOWN, N. Y.—B. T. Wheeler, of Boston, Mass., has recommended the construction of sewage filtration beds.

TROY, N. Y.—Bids are asked until July 28 for constructing sewers in five streets. E. Ogden Ross, Secy.

YOUNGSTOWN, N. Y.—Bids are asked until Aug. 5 for a system of surface drainage at Fort Niagara, N. Y. Lieut. P. C. Harris, Q. M., U. S. A.

IRVINGTON, N. J.—Merton B. Owen and W. C. Ward, Jr., have been appointed by Clinton township to confer with the sewer committee of this place on plans for a system.

MONTCLAIR, N. J.—The committee has reported in favor of about 10,000 ft. of sewer extensions in Park and Chestnut Sts., at a cost of about $30,000.

PITTSBURG, PA.—Bids are asked until July 31 for constructing 36-in. brick sewers in two streets, and 18 and 15-in. pipe sewers in 25 streets. E. M. Bigelow, Dir.

READING, PA.—The city engineer has been directed to prepare specifications for extending the storm sewer in Penn Ave., and for making house connections and other extensions in this avenue, as it is proposed to pave Penn Ave. at a cost of about $100,000.

SHARPSBURG, PA.—An election will soon be held to vote on the question of increasing the debt for constructing a system.

YEADON, PA.—Bids are asked until Aug. 24 for the purchase of $11,000 of sewer bonds. Albert Moore, Secy.

CHILLICOTHE, O.—J. P. Force, of Fostoria, O., has completed plans for a system to cost about $94,000. Edward Kern, Chn. Com.

CLEVELAND, O.—Bids are asked until Aug. 5 for constructing sewers in two streets. D. E. Wright, Dir. Pub. Wks.

MIDDLETOWN, O.—L. Martin, Secy., writes us that only preliminary steps have as yet been taken toward a sewer system. The committee was organized July 7.

FRANKFORT, IND.—Bids are asked until Aug. 11 for the construction of about 966 ft. of 10-in. pipe sewer, with 6-in. house connections, with two manholes and one flush tank. A. J. Hammond, Cy. Engr.; Jas. A. Price, Cy. Clk.

MONMOUTH, ILL.—John W. Matthews, J. A. Higgins and Geo. B. Denman have been appointed a committee to consider the advisability of building a sewer in South Second St.

MONTICELLO, ILL.—Bids are asked until Aug. 4 for constructing about 3,700 ft. of pipe sewers, etc., as described in our advertising coumns. D. E. Widdersheim, Cy. Clk.; Ray S. Carberry, Engr., Monticello.

LA CROSSE, WIS.—Bids are asked until July 25 for constructing 15 and 12-in. pipe sewers in Eighth St. S. F. Nice, Chn. Comr. Pub. Wks.; Pred Ring Comptroller.

DES MOINES, IA.—Bids are asked until July 27 for constructing a 12-in pipe sewer in 27th St. John Sherman, Geo. C. Sims, Bd. Pub. Wks.

MASON CITY, IA.—Plans are being prepared for over a mile of 22-in. pipe and about half a mile of 10-in. pipe sewers, which will probably be built in the fall. Chester T. Dike, Cy. Engr.

SAN FRANCISCO, CAL.—It is reported that a resolution has been adopted by the supervisors ordering the city engineer to prepare plans for a system of sewers petitioned for by the Potrero Land Improvement Co. J. A. Russell, Clk.

HAMILTON, ONT.—W. F. Grant & Co., of Toronto, Ont., have been awarded the contract for furnishing a supply of sewer pipe.

GARBAGE DISPOSAL—STREET CLEANING.

ALTOONA, PA.—A committee has been appointed by the councils to investigate certain plans for a garbage disposal plant, according to reports.

PITTSBURG, PA.—The American Reduction Co. has been directed by the court not to deposit garbage at its plant until certain projected improvements are made to destroy the unpleasant odors.

STREETS AND ROADS.

BOSTON, MASS.—The Metropolitan Park Commission is reported to be in favor of building the Charles River Boulevard, for which the last legislature passed a bill appropriating $1,000,000.

BOSTON, MASS.—Bids are asked until July 24 for 13,000 sq.yds. of brick sidewalks, 8,960 lin. ft. of edge stones, etc. Benj. W. Wells, Supt. of Streets.

LOWELL, MASS.—It is proposed to pave 2,000 sq. yds. of Moody St. with brick. Geo. Bowers, Cy. Engr.

WATERTOWN, MASS.—It is proposed to widen and improve Mount Vernon St. at a cost of $60,000, about $25,000 of which is for land damages.

PAWTUCKET, R. I.—The committee has been petitioned to pave 3,000 lin. ft. of Cottage St. with asphalt; estimated cost, $20,000.

PROVIDENCE, R. I.—Arrangements are being made by the state commissioner of roads for the construction of half-mile sample macadam roads in a number of towns, for which the general assembly over a year ago approved an appropriation of $60,000.

HARTFORD, CONN.—Press reports state that 87 towns have applied to the Connecticut highway commission for state aid in constructing improved highways. Each town which completes its work will receive about $950 as its share of the state appropriation. Last year each town received $980, but more towns applied this year than last. Following is a list of towns that will receive a share of the state appropriation this year; James H. McDonald, Chn., 25 and 27 Capitol, Hartford:

Hartford county—Hartford, Avon, Berlin, Bloomfield, Bristol, East Hartford, East Windsor, Enfield, Farmington, Glastonbury, Manchester, New Britain, Newington, Plainville, Rocky Hill, Southington, South Windsor, Suffield, West Hartford, Wethersfield, Windsor, Windsor Locks.

New Haven county—New Haven, Ansonia, Derby, Hamden, Meriden, Middlebury, North Branford, North Haven, Orange, Seymour, Wallingford and Woodbridge.

New London county—New London, Norwich, Bozrah, Griswold, Groton, Montville, Voluntown, Waterford.

Fairfield county—Darien, Easton, Fairfield, Greenwich, Huntington, New Caanan, Norwalk, Ridgefield, Stamford, Stratford, Trumbull, Westport, Wilton.

Windham county—Brooklyn, Eastford, Killingly, Plainfield, Pomfret, Putnam, Thompson, Windham.

Litchfield county—Litchfield, Bethlehem, New Milford, Plymouth, Thomaston, Torrington, Watertown.

Middlesex county—Middletown, Cromwell, Durham, East Haddam, Essex, Middlefield, Old Saybrook, Portland, Saybrook.

Tolland county—Tolland, Andover, Ellington, Mansfield, Somers, Stafford, Vernon.

PLYMOUTH, CONN.—Henry E. Hinman, First Selectman, Terryville, Conn., informs us that the following bids were received July 8 for constructing 2,650 lin. ft. of macadam road: Fred T. Ley & Co., Springfield, Mass., $1.40 per lin. ft. for road in Terryville, and $1.85 per lin. ft. for the Plymouth Hill section; W. H. Scott & Co., Pequabuck, Conn., $1.30 and $1.75; John H. Doolittle & Co., New Haven (awarded contract), $0.98 and $1,28.

BROOKLYN, N. Y.—Bids are asked until July 27 for granite block repaving in Main St. and Maspeth Ave. Theo. B. Willis, Comr. Cy. Wks.——It is proposed to repave portions of Driggs and Putnam Aves. with asphalt at a cost of $47,000; Cropsey Ave. with macadam, at a cost of $37,000, and Bath Ave. with Belgian blocks, at a cost of $24,000.——The park commissioner proposes to macadamize the Park Plaza at a cost of $50,000.——E. J. McKeever & Bros. were the lowest bidders on the granite block paving in Tompkins Ave., at $37,442.

DEPEW, N. Y.—Bids are asked until July 27 for about 3,600 lin. ft. of macadam paving. Anthony Hartung, Village Treas.; Patrick E. Scully, Clk.

FLUSHING, N. Y.—We are informed that the following bids were received July 9 for macadamizing 2¼ miles of Bell Ave., as advertised in Engineering News; G. A. Roullier, Engr., 20 Main St., Flushing:

Thomas F. Touhy, Flushing	$31,282
Smith & Burden, Long Island City, N. Y.	27,855
Thomas J. McKenna, 35 Broadway, New York	26,826
Harvey B. Peace, Flushing	24,802
Wm. F. McCabe, Mamaroneck, N. Y.	23,742
*Ridgeway & Chapman, 253 Broadway, New York	21,793

*Awarded contract.

JAMAICA, N. Y.—Bids are asked until July 30 for macadamizing a road nine miles long between Jamaica and Hempstead, and until Aug. 6 for macadamizing a road two miles long, from Newtown to Jamaica, as described in our advertising columns. Robt. Seabury, Clk.; John J. McLaughlin, County Engr., Bank Bldg., Jamaica.

LANSINGBURG, N. Y.—The question of paving Second Ave. at a cost of about $100,000 is being discussed.

NEW YORK, N. Y.—Bids are asked by the department of public parks, the Arsenal, Central Park, until July 27, for about 14,000 sq. yds. of granite block paving, 2,200 sq. yds. of gravel paving, 31,000 sq. ft. of concrete walk, etc., and for other work in constructing Riverside Park and Drive, from 120th to 129th St; surety, $70,000.

NEW YORK, N. Y.—Bids are asked until Aug. 1 for asphalt paving in Alexander Ave., and for sewers in two streets, etc. L. F. Haffen, Comr.

NORTH TONAWANDA, N. Y.—The board of trustees of the village has announced its intention to have several streets graded and some paving done. Bids will be invited for the work.

ROCHESTER, N. Y.—Bids are asked until July 24 for cement sidewalks in four streets. Thos. J. Neville, Clk. ——The city engineer is preparing plans for asphalt paving in Monroe St., from Oxford to Alexander St.

ROCHESTER, N. Y.—It is proposed to pave Allan St. with Medina stone at a cost of $32,000, and South St. Paul St. at a cost of $24,000, and make improvements in seven streets, at a cost of about $44,000. T. S. Pulver, Cy. Clk.

TROY, N. Y.—Bids are asked until July 31 for granite block paving in Vanderheyden St. E. Ogden Ross, Secy.

DELFORD, N. J.—Bids are asked until Aug. 3 for grading and macadamizing the streets of this borough, as stated in our advertising columns. R. W. Cooper, Mayor; Milton G. Demarest, Clk., address Oradell, N. J.

LONG BRANCH, N. J.—Bids are asked until Aug. 10 for constructing five miles of macadam road, with gravel wings, at Long Branch, as stated in our advertising columns. John Guire, Chn. Road Com.; W. H. De Nyse, Engr., Long Branch.

MAGNOLIA, N. J.—Gloucester county formally accepted the Swedesboro stone road on July 16 from the contractor, R. A. Montgomery, of Lambertville, N. J.; paying him the balance due. J. J. Albertson, Engr.

WOODBURY, N. J.—It is reported that at the meeting of the Gloucester county board of freeholders July 16 a committee of five was appointed to prepare plans and specifications for a stone road from Swedesboro to Paulsboro, which had been deferred for some time. The committee was also instructed to investigate the cost of shell roads. John S. Jessup, County Solicitor, gave an opinion that the cost of maintenance of stone roads would, after their acceptance, fall upon the county, and that no portion would be paid by the townships direct.

BLAIRSVILLE, PA.—It is stated that this place has voted to issue $10,000 in bonds for paving certain streets.

BRADFORD, PA.—Bids are asked until July 27 for paving portions of Jackson and Walker Aves., as stated in our advertising columns. James A Lindsey, Cy. Clk.

PITTSBURG, PA.—E. M. Bigelow, Dir. Pub. Wks., is making arrangements for constructing the Boulevard, bids for which will soon be asked.

PITTSBURG, PA.—Bids are asked until July 31 for grading, asphalt paving, curbing, macadamizing, etc., portions of 16 streets. Edward M. Bigelow, Dir. Pub. Wks.

READING, PA.—We are informed that a $100,000 appropriation ordinance is now pending to pave Penn St. with asphalt. John H. Keppelman, Member of Select Council; E. Chamberlain, Cy. Engr.

ANNAPOLIS, MD.—Bids are asked until July 28 for grading and paving in three streets. F. M. Ramsay, Ch. Bureau of Navigation, Washington, D. C.

WASHINGTON, D. C.—Bids are asked until Aug. 5 for constructing about 2,800 lin. ft. of a macadam road, 12 ft. wide. Maj. Geo. W. Davis, Pres. Antietam Battlefield Board, Washington.

FORTRESS MONROE, VA.—Bids are asked until Aug. 7 for constructing brick pavements and a concrete sea wall. J. W. Pullman, Asst. Q. M., U. S. A., Fortress Monroe.

WICKLIFFE, KY.—It is reported that J. B. Postlethwaite, of Paducah, Ky., has prepared plans for paving certain streets. W. T. White, W. O. Schelbourne and I. E. Conley are interested.

NASHVILLE, TENN.—The board of public works has decided to advertise for new bids for furnishing pipe, brick, clay and other street supplies.

CLEVELAND, O.—Bids are asked until Aug. 12 for asphalt paving in Princeton St., bond, $2,000. D. E. Wright, Dir. Pub. Wks.

EVANSTON, O.—Bids are asked until Aug. 8 for brick paving in two streets. Engr., Chas. A. Ewing, 36 Carlisle Bldg., Cincinnati, O.; Wm. H. Krapp, Clk.

SOUTH BEND, IND.—The city engineer has been directed to prepare specifications for paving three streets with brick.

BRAZIL, IND.—Kattman & Murphy, of Brazil, Ind., and Paris, Ill., have been awarded the contracts for macadamizing about 13¾ miles of road in Brazil and Posey townships, at $33,629. Thos. Phillips, County Audr.

GRAND RAPIDS, MICH.—We are informed that James McDermott has been awarded the contract at $38,317 for paving South Division St., from East Fulton St. to Fifth Ave., with cedar blocks on concrete, and that Gilner & Miller have the contract at $18,182 for cedar block paving in South Division St., from Fifth Ave. to Hall St.

PORT HURON, MICH.—Plans have been prepared for paving Stone St. with cedar blocks, laid on a pine board foundation, from Thomas St. to River St. It will require 14,230 sq. yds. of paving and 7,660 lin. ft. of curb stone; estimated cost, $14,402. F. F. Rogers, Cy. Engr.; Henry Raumeier, Supt. Pub. Wks.

CHICAGO, ILL.—Bids are asked until July 28 for about 2,000 lin. ft. of granite concrete combined curb and gutter in Garfield Park. Harvey T. Weeks, Pres.; Geo. F. Talty, Secy., West Chicago Park Comrs, Union Park.

GALESBURG, ILL.—Bids are asked until Aug. 3 for paving two streets with brick. M. J. Blanding, Cy. Engr.; A. W. Truedson, Cy. Clk.

BELOIT, WIS.—Bids are asked until Aug. 7 for about 8,000 sq. yds. of brick and macadam paving, as stated in our advertising columns. Edgar S. Greene, Pres. Bd. Pub. Wks.; E. F. Hansen, Secy.

KANSAS CITY, MO.—Bids are asked until Aug. 3 for grading the Atherton and the Barton roads. F. J. O'Flaherty, County Surv., Kansas City.

ST. PAUL, MINN.—Bids are asked until July 27 for improving and boulevarding Summit Ave., from Sixth St. to Rice St. R. L. Gorman, Pres.; John C. Mueller, Clk. Bd. Pub. Wks.

TACOMA, WASH.—The "Ledger" of July 7 says the county commissioners have decided to again reject all bids for the construction of the Puyallup Boulevard, and to readvertise for new ones.

PORTLAND, ORE.—It has been decided to pave Washington St. with asphalt, work on which will be begun in September.

MANUFACTURING PLANTS.

YARMOUTH, ME.—It is stated that the Forest Paper Co. proposes to erect a new paper mill which will be two stories high with basement 150 × 50 ft.

BROOKLYN, N. Y.—Fire has partly destroyed the plant of the Alberine Varnish Works. The loss is estimated at $50,000. H. J. Romburg, F. J. Emanuel and Julius Hannan are the owners.

GLOVERSVILLE, N. Y.—It is stated that the Excelsior Fur Sewing Machine Co. intends to build a factory for the manufacture of sewing machines and bicycles. The company has options on several building lots and a building will be erected as soon as arrangements can be made.

NEW YORK, N. Y.—The Gas Engine & Power Co. of Morris Heights has plans and specifications for a new two-story machine shop, 250 × 76 ft., to be constructed of steel.

PAINTED POST, N. Y.—The Weston Engine Co., whose plant was recently destroyed by fire, will rebuild at once.

CONNELLSVILLE, PA.—It is reported that the contract has been let for the new plant of the Sloymaker-Barry Co. The building will be of steel.

ELWOOD CITY, PA.—A press dispatch states that the Baker Forge & Iron Co. is doubling the size of its forge works.

GREENVILLE, PA.—A press report states that the Lozier Tube Co. is to erect a large tube works, in which it will install entirely new machinery.

NEW CASTLE, PA.—Press reports state that an open-hearth steel plant may be erected costing about $750,000. Phelps, Dodge & Co., of New York; Norton Bros., of Chicago, and the tin plate and tubing mills at New Castle, Pa., are said to be among those who are backing the enterprise. The product of the plant will be hollow steel billets suitable for the manufacture of all kinds of tubing, including pipe.

POTTSTOWN, PA.—It is stated that the Glasgow Iron Co. is to erect another rolling mill.

CHARLOTTE, N. C.—The Louise cotton mill is being erected and will soon be ready for equipment. H. S. Chadwick, Pres., Charlotte, N. C.

COLUMBIA, S. C.—The Columbia Cotton Mills Co. has increased its capital stock from $700,000 to $1,000,000 and will either build an additional mill or largely increase the size of the present plant.

ATLANTA, GA.—The Atlanta Textile Mfg. Co. and the Piedmont Cotton Mills Co. have combined their capital and will build a large mill, which with the equipment will cost $500,000 or more and will be built at once. R. U. Hardeman, Pres.; W. J. Willingham, Mgr., Atlanta, Ga.

DONALDSONVILLE, LA.—A dispatch states that the Souvenir Sugar Refinery, three miles from here, has been destroyed by fire. The loss is about $75,000. Mr. Goldehaux, New Orleans, La., is the owner.

BRISTOL, TENN.—It is reported that the Willey Boom & Lumber Co. is adding a planing mill to its plant.

CANTON, O.—The Berger Mfg. Co. is pushing to completion a new building, 20 × 60 ft. in size, in which will be manufactured steel tubing for bicycles.

YOUNGSTOWN, O.—Press reports state that an addition is being made to the lower mill of the Union Iron & Steel Co., and improvements are being made in other departments.

JOLIET, ILL.—It is stated that Humphrey & Sons are building a large addition to their foundry. It will contain six pneumatic cranes.

MILWAUKEE, WIS.—Press reports state that the Yeuder & Paeschke Mfg. Co. contemplates the erection of a 40 × 69-ft. three-story addition to its tinware factory.

SAN FRANCISCO, CAL.—The Royal Eagle Distillery Co. has obtained a permit to build a four-story brick building at Powell and Ellis Sts., to cost about $41,345.

MINING.

PITTSBURG, PA.—A local paper states that George Barrett, of this city, has purchased a large tract of land on the river bank between Industry and Cook's Ferry, and will put in railway switches and open one of the largest stone quarries in the western part of the state, at a cost of about $25,000.

CRIPPLE CREEK, COLO.—It is stated that the new Ida May shaft will be sunk an additional 100 ft. For 40 ft. the chute holds firm and at even value and it is now proposed to sink and get below the ore. The vein has been opened by surface workings for a length of 1,000 ft.

DENVER, COLO.—The "Republican" has published a map showing the proposed system of the Pikes' Peak Mining Tunnel Ry. The main tunnel is to start from near Manitou, east of Pike's Peak, cut through the front range and pass under Victor, where are the Portland, Independence, Strong and other mines, at a depth of 2,800 ft., ending at Middle Creek, 21 miles distant. The project contemplates branch tunnels, for which the situation of Cripple Creek is so favorable. The main tunnel will be 14 ft. high and 18 ft. wide.

BUTTE, MONT.—The "Miner" contains the following items: The Anaconda mine is preparing to sink deeper levels, and a depth of 3,000 ft. will probably be reached.——It is reported that a 300-ton concentrator will be put in the Merrill mine at Porphyry dike, 17 miles north of Basin. The Pauper's Dream, at the same place, is soon to have a 300-ton mill. Other properties along the dike are being rapidly improved.——Adam O'Donnell will soon leave to work on his claim in the St. Joe district. He has a tunnel 60 ft. and expects to push it much farther this season.——L. F. Williams and others have purchased the Sullivan group of mines in East Kootenay. They will probably put in a concentrator next season.

GREEN VALLEY, CAL.—It is stated that Fred Jones, of Green Valley, and a number of other capitalists have located a promising quartz claim in El Dorado county. Vigorous operations are now being carried on and the company intends to erect a mill. The property is known as the Omo mine.

YUMA, ARIZ.—Wm. Luce is reported as to put up a 20-ton cyanide plant on the Colorado River, at El Rio.

CONTRACT PRICES.

ASPHALT, BRICK AND GRANITE PAVING.—Minneapolis, Minn.—F. W. Cappelen, Cy. Engr., writes us that the following bids were received July 10 for 16,242 sq. yds. of brick, 2,117 sq. yds. of asphalt and 422 sq. yds. of granite paving:

	5,873 sq.yds.	9,947 sq.yds.	1,695 sq.yds.	422 sq.yds.

MISCELLANEOUS CONTRACTS.

STEAM ROAD ROLLER.—Worcester, Mass.—The street commissioner has been directed to purchase a steam road roller to cost $3,000.

FIRE HOSE.—Baltimore, Md.—Bids are asked until Aug. 3 for furnishing about 9,000 ft. of 3 and 2½-in. fire hose. A. R. Cathcart, Pres. Comrs.

CEMENT.—Brooklyn, N. Y.—Bids are asked until July 28 for furnishing 3,000 to 3,500 bbls. of Portland cement at Wallabout Market lands. T. B. Willis, Comr. Cy. Wks.

STEEL CHIMNEY.—Washington, D. C.—Bids are asked until July 25 for erecting a steel smoke chimney at the government printing office. T. E. Benedict, Pub. Printer.

LEVEE WORK.—Memphis, Tenn.—Bids are asked until July 30 for the construction and repair of levees in Upper Yazoo levee district. Capt. Graham D. Fitch, U. S. Engrs.

DIKE WORK.—New York, N. Y.—Bids are asked until Aug. 15 for constructing and repairing dikes in Hudson River, as stated in our advertising columns. Col. G. L. Gillespie, U. S. Engrs.

WIRE FENCE. — Washington, D. C.—Bids are asked until Aug. 10 for furnishing materials and erecting 18,000 ft. of wire fence, with gates, at Wakefield, Va. Col. John M. Wilson, U. S. Engrs.

STONE AND BRUSH JETTY.—Cleveland, O.—Bids are asked until Aug. 7 for constructing a stone and brush jetty from Cedar Point, at Sandusky Harbor, O. Lt.-Col. Jared A. Smith, U. S. Engrs.

WIRE FENCE.—Washington, D. C.—Bids are asked unlti Aug. 5 for furnishing about 1,200 ft. of wire fencing for the battlefield of Antietam, Va. Maj. Geo. W. Davis, Pres. Bd., War Records Office.

CONCRETE COPING.—East Marion, N. Y.—Bids are asked until July 29 for a concrete coping on the sea wall between East Marion and Orient, Suffolk county. Geo. W. Aldridge, Supt. Pub. Wks., Albany.

REMOVAL OF WRECKS.—St. Augustine, Fla.—Bids are asked until Aug. 20 for the removal of certain wrecks from Key West Harbor, as stated in our advertising columns. Lt.-Col. W. H. H. Benyaurd, U. S. Engrs.

ADDITION TO VAULT.—Brooklyn, N. Y.—Bids are asked until July 28 for building an addition to a vault in the building occupied by the department of health, at 38 and 40 Clinton St. Theodore B. Willis, Comr. Cy. Wks.

CRIBS.—Detroit, Mich.—Bids are asked until July 31 for furnishing materials, constructing, sinking and filling seven cribs in Hay Lake Channel, as stated in our advertising columns. Maj. M. B. Adams, U. S. Engrs.

STEAM ENGINE, LATHE DRILL.—Baltimore, Md.—Bids are asked until Aug. 1 for furnishing the water department with one horizontal 50-HP. stationary steam engine, one 18-in. swing engine lathe, to turn 10 ft. between centers, and one No. 2 radial drill. Wm. L. Kenly, Ch. Engr.

DISINFECTING PLANT. — Pittsburg, Pa. — Bids are asked until July 31 for furnishing the bureau of health and erecting on municipal hospital grounds the following machinery, apparatus and appliances: One jacketed steam disinfecting chamber, having a capacity, in inside measurement, of not less than that represented by a chamber 4 ft. 4 ins. wide, 5 ft. 4 ins. high, and 9 ft. long, together with the necessary boiler, air exhausters, indicators, gages, thermometers, valves, pipes, cars, tracks, racks, cranes, magnesia covering and all such other appliances, apparatus and fixtures as may be necessary to the successful operation of a thorough and effective system of steam disinfection, under pressure. J. O. Brown, Dir. Dept. Pub. Safety.

FIRE ENGINES.—Chicago, Ill.—Bids are asked until July 30 for furnishing two second-class steam fire engines and three third-class combination steam fire engines (engine and hose wagon combined), said engines to be double pump, crane neck, with improved patent circulating coil boiler, made of homogeneous steel and of sufficient strength to bear double the greatest pressure ever required for fire service; to have brass, nickel-plated dome; pumps to be entirely of gun metal, with improved cone valves and relief valve, and engine to be supplied with improved equalizing platform spring rigging in front and half elliptical springs in rear. D. J .Swenie, Fire Marshal.

THIS OFTEN HAPPENS.

Pella, Ia., July 18, 1896.

Engineering News Publishing Co.,
New York city.

Gentlemen: I cannot do otherwise than consider the Engineering News an excellent medium through which to make known the wants of any and all parties desiring bids upon work pertaining to water service, as the small advertisement given two insertions in your publication brought us almost a deluge of inquiries from contractors, supply men, builders, etc., so much so that we did not have specifications enough for all, although we had prepared what we thought to be an ample supply.

Yours truly, D. S. Huber,
Chn. W. W. Com.

BUILDINGS, ETC.

Collins State Homeopathic Hospital, Collins. N. Y.

Sealed proposals will be received by the Board of Managers of the Collins State Homeopathic Hospital until 10 o'clock a. m., Aug. 4, 1896, for constructing an Administration Building and one hospital wing, including plumbing, heating, ventilating and electric work and appurtenances, at Collins, N. Y., aggregating in cost about eighty thousand dollars ($80,000) in accordance with plans and specifications on file with August C. Esenwein, Architect, 707 Mooney Building, Buffalo, N. Y.

Each proposal must be made on blanks provided by the architect, enclosed and addressed as provided in the specifications.

Each proposal must be accompanied by a bond as provided by the specifications.

Proposals will be received upon the whole or any part of said work.

Plans and specifications may be seen and bid blanks secured at the office of the architect.

The right to reject any or all bids is expressly reserved by the Board of Managers.

WILLIAM TOD HELMUTH, M. D.,
ASA STONE COUCH, M. D.,
FRED. J. BLACKMON,
Board of Managers.
AUGUST C. ESENWEIN, Architect. 30-1t

SEWERS.

Monticello, Ill.

Sealed proposals will be received at the office of the City Clerk of the City of Monticello, Illinois, up to 8 o'clock p. m., of August 4, 1896, for constructing sanitary sewers. The work will consist approximately of the following: 3,283 lineal ft. 6-in. pipe sewer, 383 lineal ft. 8-in. pipe sewer, 560 lineal ft. trenching and backfilling between 4 and 6 ft., 1,676 lineal ft. trenching and backfilling between 6 and 8 ft., 1,340 lineal ft. trenching and backfilling between 8 and 10 ft., 100 lineal ft. trenching and backfilling between 10 and 12 ft., 8 manholes, 4 flush tanks, together with lampholes.

Plans and specifications are on file at the office of the City Clerk, and blank forms for bids and requirements for bidding may be had on application to the City Clerk or City Engineer.

The City Council reserves the right to reject any and all bids for any reason they may deem sufficient.

D. E. WIDDERSHEIM,
RAY S. CARBERRY, City Clerk.
Civil Engineer.
Monticello, Ill., July 20, 1896. 30-1t

RESERVOIR.

Tyrone, Pa.

Bids will be received by the Tyrone Gas & Water Co. for the construction of a Reservoir, until noon, Aug. 1, 1896.

Plans and specifications may be seen at the office of the Engineer, Tyrone, Pa.

All bids must be indorsed "Bid for Reservoir," and addressed to

C. A. MORRIS, Secretary,
30-1t Tyrone Gas & Water Co.

U. S. ENGINEER OFFICE, Army Building, New York, N. Y., July 10, 1896.—Sealed proposals for constructing and repairing DIKES in Hudson River, N. Y., will be received here until 12 m., August 15, 1896, and then publicly opened. Information furnished on application. G. L. GILLESPIE, Col., Engrs. 30-3t

---

PAVING.

Bradford, Pa.,

Sealed proposals will be received by the undersigned up to 5 o'clock p. m., Monday,

JULY 27, 1896,

for the paving of Jackson Ave., in the City of Bradford (except that portion thereof which the Bradford Electric Street Railroad Company is required by ordinance to pave). Also for the paving of Walker Ave. Both streets (or avenues) to be paved according to the plans and specifications of the City Engineer, now on file in my office. Each bid to be accompanied by a certified check in the sum of $300, to be forfeited to the city in case the successful bidder fails to enter into a contract for the construction of said pavement within ten (10) days from the date of the awarding of the same. Councils reserve the right to reject any and all bids.

JAS. A. LINDSEY, City Clerk,
Rosenberg & Michael Block.
Bradford, Pa. 30-1t

OFFICE OF LIGHT-HOUSE ENGINEER, 11th District, Detroit, Mich., July 10, 1896.—Sealed proposals, addressed to the undersigned, will be received at this office until 2 o'clock p. m., of July 31, 1896, and opened immediately thereafter, for furnishing 40,968 feet B. M. of white pine timber; 75,832 feet B. M. of hemlock or Norway pine timber; 15,232 feet B. M. of white oak plank; 460 cords of foundation and filling stone; 1,708 lbs. of screw and washer bolts; 6,125 lbs. of drift bolts and spikes; 1,450 lbs. of guy rods, strap fastenings and angle irons, and constructing, sinking and filling SEVEN CRIBS in Hay Lake Channel, St. Mary's River, Michigan. Specifications, forms for proposals and detailed information can be had on application. MAJOR M. B. ADAMS, Corps of Engineers, U. S. A., Light-House Engineer.

U. S. ENGINEER OFFICE, St. Augustine, Fla., July 20, 1896. To whom it may concern: Whereas, the navigation of the Man of War Harbor at Key West, Fla., is obstructed and endangered by certain wrecks, notice is hereby given to all persons interested in said wrecks, and property pertaining thereto, that if within 30 days from date of this advertisement, they shall not have signified their intention to me and taken preliminary steps to REMOVE SAID WRECKS, etc., as soon as practicable the same will be considered as abandoned and derelict and they will be removed by the United States under authority of law. The wrecks are as follows: Bark "Marcelo," Schooner "Adelaide Baker," Bark "Brandon," Schooner "Rosalie," Bark "Anto," Ship "Marie Frederika," Bark "Almora," Steamer "Cochran," and old "Dry Dock." Sealed proposals, in triplicate, for the removal of all these wrecks, etc., will be received here until 11 a. m., August 20, 1896, and publicly opened. Government reserves right to reject any or all bids, and to waive any informalities. For information apply here. By authority of the Secretary of War. W. H. H. BENYAURD, Lt. Col., Engrs. 30-4t

---

TREASURY DEPARTMENT, Office Supervising Architect, Washington, D. C., July 21, 1896.—Sealed proposals will be received at this office until 2 o'clock p. m., on the 21st day of August, 1896, and opened immediately thereafter, for all the labor and materials required for the erection and completion (except heating apparatus) of the U. S. CUSTOM HOUSE AND POST OFFICE BUILDING at Racine, Wisconsin, in accordance with the drawings and specifications, copies of which may be had at this office or the office of the Superintendent at Racine, Wisconsin. Each bid must be accompanied by a certified check for a sum not less than 2% of the amount of the proposal. The right is reserved to reject any or all bids and to waive any defect or informality in any bid, should it be deemed in the interest of the Government to do so. All proposals received after the time stated for opening will be returned to the bidders. Proposals must be enclosed in envelopes, sealed and marked "Proposal for the Erection and Completion (except heating apparatus) of the U. S. Custom House and Post Office Building at Racine, Wisconsin, and addressed to WM. MARTIN AIKEN, Supervising Architect.

WATER-WORKS.

Silver Creek, N. Y., July 9, 1896.

Sealed proposals will be received by the Board of Water Commissioners of the Village of Silver Creek, N. Y., up to 7 o'clock p. m.,

AUGUST 1, 1896,

for furnishing the materials and constructing a gravity system of water-works for said village. There will be required approximately the following:

1,430 tons (about 13¼ miles) of cast-iron pipe.
73 fire hydrants.
87 grate valves and boxes.
Concrete lined reservoir.

Bids will be received for constructing the work independent of furnishing material, for furnishing any of the materials mentioned above and for constructing the works complete, including furnishing material. A certified check equal to 2% of the amount of the bid must accompany each bid.

Plans may be seen and specifications and blank forms of proposal procured at the office of the Secretary of the Board, Silver Creek, N. Y., or at the office of the engineer, J. F. Witmer, Rooms 65 and 66 Chapin Block, Buffalo, N. Y.

The right is reserved to reject any and all bids.

JOHN B. WEBSTER,
FRANK P. STEWART,
HUGO E. FENSKE,
CHAS. L. O'NEIL,
Board of Water Commissioners.
J. F. WITMER, Engineer,
Buffalo. 30-2t

WATER-WORKS.

Walkerton, Ind.

The Walkerton Water-Works Company, of Walkerton, Indiana, is now ready to receive bids for the erection of a tower, pumping station and for the equipping of a complete system of water-works, according to plans and specifications now on file in the office of the secretary of the Walkerton Water-Works Company.

A copy of the plans and specifications may be had by addressing

WILLIAM CLEM, Secretary.
Walkerton, Ind., July 17, 1896. 30-1t

PAVING.

Beloit, Wis.

Bids are asked until Aug. 7, 1896, at 12 o'clock noon for paving with macadam and brick about 8,000 sq. yds. in certain streets in the City of Beloit, Wisconsin. Address

BOARD OF PUBLIC WORKS,
30-2t Beloit, Wis.

POLICE STATION.

Carbondale, Pa.

Sealed proposals will be received by the City Clerk of Carbondale, Pa., until 8 p. m., Aug. 10, for the furnishing of material and labor for the remodeling of the City Police Station, according to plans and specifications on file in the City Engineer's Office.

Bidders will be required to enclose cash or certified check in the sum of $200 as a guarantee of good faith and that the successful bidder will enter into a contract within ten days if awarded the same.

The city reserves the right to reject any or all bids.

T. L. McMILLAN,
30-2t City Clerk.

MACADAM ROAD.

Long Branch, N. J.

Bids will be received until 12 o'clock m., Aug. 10, 1896, by the Board of Chosen Freeholders of Monmouth County, N. J., for the construction of five miles of macadam road with gravel wings, at Long Branch, N. J. For further information, specifications, etc., address JOHN GUIRE, Chairman of Road Committee, or W. H. DE NYSE, Engineer, Long Branch, N. J. 30-2t

---

WATER-WORKS.

Doon, Iowa.

Notice is hereby given that A. N. Thompson, Town Clerk of the incorporated town of Doon, Lyon County, Iowa, will receive sealed bids for the construction of a system of water-works in said town of Doon (according to plans and specifications now on file in my office) up to six o'clock Monday evening, August 3, 1896. Each bid to be accompanied by a certified check in the sum of five hundred ($500) dollars conditioned that the bidder will enter into a written contract with said town for the amount specified in his bid should the town award to him the contract. Said contract to be awarded to the lowest responsible bidder. The town reserves the right to reject any or all bids. Plans and specifications may also be seen at the office of L. F. Wakefield, in Sioux City, Iowa.

A. N. THOMPSON,
Town Clerk.
Dated Doon, Iowa, July 7, 1896. 30-1t

SEWERS.

Woonsocket, R. I.

Sealed proposals will be received by the Board of Sewer Commissioners of the City of Woonsocket, R. I., at their office, Room 15 Longley Building, until 2 p. m., Monday, August 17, 1896, for constructing Sections Nos. 1, 2 and 3 of the sewerage system of said city.

Section 1. River wall, storage tanks, engine house foundations, grading, and a short piece of 36-in. brick sewer.

Section 2. 2,072 ft. 36-in. brick sewer and appurtenances; 148 ft. 32-in. brick sewer and appurtenances; 4 siphons under the Blackstone River and trench.

Section 3. 2,130 ft. 30-in. brick sewer and appurtenances.

Each section will be considered a separate contract.

Contractors may bid upon one or more sections.

Drawings and specifications may be seen and blank forms for proposals may be obtained at the office of the City Engineer, Room 20 Granite Block, Woonsocket, R. I.; also at office of Rudolph Hering, C. E., 277 Pearl St., New York.

Proposals must be made upon the blank forms furnished.

Each proposal for each section must be accompanied by a certified check for five hundred ($500) dollars, drawn to the order of Samuel P. Cook, City Treasurer of the City of Woonsocket, as surety that if the proposal is accepted a contract will be entered into.

The Board of Sewer Commissioners reserve the right to reject any and all bids.

FRANK E. HOLDEN,
GEORGE S. READ,
PHILIPPE BOUCHER,
Board of Sewer Commissioners.
July 14, 1896. 30-2t

Contract Work Should Always be Advertised in a Paper Read by Contractors.

Nearly Every Prominent Contractor and Manufacturer of Contractors' Supplies in North America Reads Engineering News.

PERSONALS.

Mr. Rufus G. Russell, architect, of New Haven, Conn., died Aug. 2, aged 73.

Mr. John Evans has been appointed Superintendent of the Warrior Run (Pa.) Water Co.

Mr. A. J. Breidenbach, of Newark, N. J., has been appointed Superintendent of Sewers.

Mr. Hugh Campbell, an iron manufacturer of Ohio, died at Hanging Rock, O., July 30, aged 86.

Mr. William G. Audenried, President of the Philadelphia Milling Co., died July 28, aged 64.

Mr. H. Fegraus, of Duluth, Minn., has been appointed Chief Engineer of the Duluth & North Dakota R. R.

Mr. Walker W. Smith, Vice-President and Treasurer of the Stilwell-Bierce & Smith-Vaile Co., of Dayton, O., died July 30.

Mr. A. J. Cartter, Superintendent of Bridges and Buildings of the Chicago, Burlington & Quincy R. R., has resigned.

Mr. Edward L. Bartlett has been appointed a Sewer Commissioner of Baltimore, Md., to succeed Col. Henry T. Douglas, resigned.

Mr. F. P. Olcott has been elected President, and Mr. J. H. Hill General Manager, of the Galveston, Houston & Henderson R. R.

Mr. M. P. Myers has been appointed Superintendent of Bridges and Buildings of the Kansas City, St. Joseph & Council Bluffs R. R.

Mr. T. D. Hinchcliffe, General Manager of the Litchfield, Carrollton & Western Ry., with offices at Carlinville, Ill., has resigned.

Mr. William R. Carter, Master Bridge Foreman, of the New England R. R., with headquarters at Boston, Mass., died at Hyde Park, July 25.

Mr. P. T. Downs, Superintendent of Transportation of the Gulf, Colorado & Santa Fe Ry., has been appointed Acting Geoneral Superintendent.

Mr. B. E. McCall has been appointed General Manager of the Litchfield, Carrollton & Western Ry., to succeed Mr. T. D. Hinchcliffe, resigned.

Mr. John Sheridan, of West Virginia, has been appointed a government director of the Union Pacific Ry., to succeed Gen. Fitzhugh Lee, resigned.

Mr. James D. Andrews, Jr., has been appointed Assistant Engineer of the Bureau of Sewers of the Department of City Works, of Brooklyn, N. Y.

Mr. D. Morrice, Assistant Superintendent of the Central Division of the Grand Trunk Ry., with headquarters in Toronto, Ont., has been appointed Local Superintendent.

Mr. James Donohue, lately with the Kansas City, Pittsburg & Gulf R. R., has been appointed Vice-President and General Manager of the recently organized Missouri Central R. R.

Mr. Malcom Jackson, of Richmond, Va., has been elected President of the Parkersburg & Charleston R. R., a new line that will connect the Kanawha and Ohio rivers in West Virginia.

Mr. Thomas C. Woodbury, of Portland, Me., has been elected President of the new Omaha Water-Works Co., of Omaha, Neb., and Mr. Ellis L. Bierbower, of Omaha, has been elected General Manager.

Capt. William H. Hooker has been appointed Supervising Engineer of the Belleville and High Service pumping stations of the Jersey City (N. J.) water-works, to succeed Mr. William S. Miller, resigned.

Mr. W. L. Brubaker, of the firm of W. L. Brubaker & Bros., tap and die makers, of Millersburg, Pa., died July 25, aged 32. He was interested in the Millersburg Fifth Wheel Co., and was treasurer of the Home Water Co.

Mr. Alphonse Fteley, M. Am. Soc. C. E., Engineer of the Croton Aqueduct Commission, New York, has been appointed Chief Engineer, and Mr. Chas. E. A. Jacobsen, Consulting Engineer, of the Passaic River Pollution Commission.

The new Harbor Commission of Niagara Falls, N. Y., created by the last legislature, has been appointed by the mayor and consists of Messrs. John J. McIntyre, Thos. Gaskin, J. W. Caryl Ely, James Low and Albert H. Porter.

Mr. J. V. Patton, General Superintendent of the Pittsburg Division of the Baltimore & Ohio R. R., has resigned, but will retain his position as General Superintendent of the Pittsburg & Western Ry., with headquarters in Pittsburg.

Mr. L. J. Ferriter, Chief Dispatcher and Trainmaster of the Omaha & St. Louis Ry., has been appointed Assistant Superintendent of the Central Division of the Grand Trunk Ry., to succeed Mr. D. Morrice, promoted, with offices at Toronto, Ont.

Mr. F. P. Gridley has been appointed Superintendent of the Sweetwater Coal Mining Co., the Rock Springs Coal Co., the Van Dyke Coal & Mining Co., and the Wyoming Mercantile Co., at Rock Springs, Wyo., to succeed Mr. Charles R. Kelsey.

Mr. H. L. Page, Secretary of the Norfolk & Ocean View R. R., has been elected President, and Mr. C. E. Norton, Auditor of the same, has been elected Secretary and Treasurer of the new Norfolk, Willoughby Spit & Old Point R. R., with offices in Norfolk, Va.

Mr. Thomas Fletcher, of the firm of Broth & Co., leather dealers and shipowners, of New York city, died recently in Liverpool, England, where he was born in 1841. He followed the profession of a civil engineer for some time, being associated with his father.

Sir William Grove, of England, died Aug. 2, aged 85. He made several important discoveries in electricity and optics, and in 1842 announced the doctrine of "the mutual convertibility of the various natural forces and of their being all modes of motion or forms of persistent force.'

Mr. George Lowe, General Superintendent of the Pullman Iron & Steel Co., Pullman, Ill., has been appointed Superintendent of the Rolling Mill Department of the U. S. Car Co., to succeed Mr. Levi Bibbins, resigned, whose appointment to this office was noted in our issue of July 2.

Mr. J. M. Gruber, Division Superintendent of the Great Northern Ry., with headquarters at West Superior, Wis., has been transferred to Great Falls, Mont., as Superintendent of the Montana Central Ry., to succeed Mr. C. H. Jenks, who will resume his position of Division Superintendent at Grand Forks, N. D.

Mr. John J. Hogan, the inventor of the Hogan boiler, died on July 30. He was a native of Ireland and was apprenticed to the Reading Iron Works, near London, England. After coming to this country he resided for a time in New York city, and later in St. Louis, Mo. About two years ago he organized a company which undertook the construction of a water tube boiler of his invention and built works for that purpose at Middletown, N. Y.

Mr. John T. Areson, formerly General Superintendent of Repairs of the Long Island R. R., died at Jamaica (L. I.), N. Y., July 29, aged 86. He laid the first track of the Brooklyn & Jamaica R. R., in 1832, which was the beginning of the present Long Island R. R. system. After the completion of the road to Greenport, at the extreme eastern end of the island, he entered the service of the Pennsylvania R. R., and became General Superintendent of Repairs, resigning to return in a similar position to the former road. He held this office for 21 years.

Mr. De Witt Clinton Weeks, formerly of the firm of D. C. Weeks & Sons, builders, died in New York city, Aug. 3, aged 76. Among some of his most important works were the Charity Hospital, Blackwell's Island; Inebriate Asylum, Ward's Island; Children's Hospital, Randall's Island; St. Thomas' Church, 53d St. and 5th Ave.; Museum of Natural History, the high service tower at 93d St. and Columbus Ave., and the Columbia College Library building, all in New York city. The firm recently completed Mr. Geo. W. Vanderbilt's mansion at Biltmore, N. C.

Hon. Manuel G. Zamora, Mexican consul at New Orleans, died at Mandeville, La., July 24. He was born in Vera Cruz, Mex., Nov. 1, 1850, and was educated as a mining engineer in Berlin, Germany, following his profession afterwards in Freiberg, Saxony and Hanover. In 1871 he returned to Vera Cruz and was appointed to superintend the construction of the public library in that city, which is considered one of the handsomest buildings in the republic. In 1886 President Diaz appointed him Consul of Mexico at New Orleans, which position he has held continuously ever since.

Prof. Heinrich Ernst Beyrich, late Director of the Museum of Natural Science at Berlin, Germany, died July 5. He was born in Berlin, Aug. 31, 1816, and graduated from the University of Berlin with the degree of Doctor of Philosophy in 1837. He was appointed Assistant in the Museum of Mineralogy, and in 1857 obtained the supervision of the paleontological collection, and in 1875 was appointed the head of the museum. He was made Professor of Minerology in 1865. Since 1873 he had been the Associate Director of the government geological department and under his direction a complete geological map of Germany has been prepared.

Mr. Peter P. Parrott, iron manufacturer, died at Arden, N. Y., July 30. He was born in Portsmouth, N. H., June 18, 1811, and during his early life traveled extensively, once making a voyage around the world. He associated himself with his brother, the late Robert P. Parrott, in the manufacture of iron in Orange county, N. Y. Their furnaces for many years were among the most successful in the country and the one at Greenwood made most of the iron from which the celebrated Parrott guns and other ordnance were manufactured at the West Point foundry of Mr. Robert P. Parrott. At one time his property in Orange county contained over 10,000 acres and his employees and their families living on the property numbered over 1,500 persons. Mr. Parrott devoted himself to the improvement and development of his property for over 50 years, building roads and dams and working the numerous iron mines.

ENGINEERING SOCIETIES.

COMING TECHNICAL MEETINGS.

TECHNICAL SOCIETY OF THE PACIFIC COAST.
Aug. 7. Secy., O. Von Geldern, 819 Market St., San Francisco, Cal.
CIVIL ENGINEERS' CLUB OF CLEVELAND.
Aug. 11. "Solar Work in Land Surveying and a New Mechanical Method for Doing It," by J. D. Varney. Secy., F. A. Colburn, Case Library Bldg.
NORTHWESTERN SOCIETY OF ENGINEERS.
Aug. 11. Secy., D. W. McMorris, 635 Burke Block, Seattle, Wash.
ENGINEERS' CLUB OF MINNEAPOLIS.
Aug. 17. Secy., E. Mexer, 1620 S. E. 4th St., Minneapolis, Minn.
WESTERN FOUNDRYMEN'S ASSOCIATION.
Aug. 19. Secy., S. T. Johnson, Monadnock Block, Chicago.
NEW ENGLAND ROADMASTERS' ASSOCIATION.
Aug. 19 and 20. Annual convention at Boston, Mass. Secy., F. C. Stowell, Ware, Mass.
SOUTHERN AND SOUTHWESTERN RAILWAY CLUB.
Aug. 20. Kimball House, Atlanta, Ga. Secy., F. A. Charpiot, Macon, Ga.
SOCIETY FOR THE PROMOTION OF ENGINEERING EDUCATION.
Aug. 20 to 22. Annual meeting at Buffalo, N. Y.
TACOMA SOCIETY OF CIVIL ENGINEERS AND ARCHITECTS.
Aug. 21. Secy., 201 Washington Bldg.
AMERICAN ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE.
Aug. 24. Annual meeting at Buffalo, N. Y. Secy., F. W. Putnam, Cambridge, Mass.
AMERICAN MATHEMATICAL SOCIETY.
Aug. 31 to Sept. 1. Annual meeting at Buffalo N. Y.
ROADMASTERS' ASSOCIATION OF AMERICA.
Sept 8. Annual meeting at Niagara Falls, N. Y.
AMERICAN SOCIETY OF RAILROAD SUPERINTENDENTS.
Sept. 9 and 10. Annual meeting at Niagara Falls. Secy., C. A. Hammond, Asbury Park, N. J.
MASTER CAR AND LOCOMOTIVE PAINTERS' ASSOCIATION.
Sept. 9. Annual meeting in New York city.
AMERICAN INSTITUTE OF MINING ENGINEERS.
Sept. 21 to 30. Annual meeting at Denver, Colo. Secy., R. W. Raymond, 13 Burling Slip, New York city.
AMERICAN RAILWAY ASSOCIATION.
Oct. 7. Annual meeting in New York city. Secy., W. F. Allen, 24 Park Place, New York city.
ASSOCIATION OF RAILWAY SUPERINTENDENTS OF BRIDGES AND BUILDINGS.
Oct. 20. Annual meeting at Chicago. Secy., S. F. Patterson, Concord, N. H.
AMERICAN STREET RAILWAY ASSOCIATION.
Oct. 24 and 25. Annual convention at St. Louis.

NATIONAL IRRIGATION CONGRESS.—The topics to be discussed at the annual meeting, to be held at Phoenix, Ariz., Dec. 15, 16 and 17 are: "Irrigation on Humid America," "Water Storage in Mountain States," "Climatology," and "Irrigation into Arid Regions."

NEW ENGLAND ROADMASTERS' ASSOCIATION.—At the fourteenth annual convention to be held at Revere House, Boston, Aug. 19 and 20, the following subjects will be discussed: "Track Tools," (Continued from last year); "Rail Joints," (Continued from last year); "Elevation of Curves;" "Preparation Necessary and Best Method of Repairing Washouts; Reminiscences of Same;" "How Can We Secure Better Rail in Line, Surface and Quality?" "Is an Automatic Switch Stand Desirable? How Can We Better Protect the Facing Switches?" "How Should a Spring Rail Frog be Constructed?" "How Should We Estimate and Settle Fire Claims?" Secy., pro tem., F. C. Stowell, Ware, Mass.

ASSOCIATION OF RAILWAY SUPERINTENDENTS OF BRIDGES AND BUILDINGS.—At the meeting to be held in Chicago, Oct. 20, the following subjects will be discussed: "How to Determine Size and Capacity of Openings for Waterways;" "Different Methods of Numbering Bridges. Should All Waterways be Numbered?" "Drawbridge Ends, Methods of Locking, including Locking of Turntables;" "Protection of Trestles from Fire, including Methods of Construction;" "Local Stations for Small Towns and Villages, giving Plans of Buildings and Platforms;" "Tanks, Size, Style, and Details of Construction, including Frost-proof protection to Tank and Pipes;" "Shearing of Rivets in Plate Girders and Cause Thereof;" "Best and Uniform System of Report Blanks for Bridge and Building Department;" "Protection of Railroad Structures and Buildings from Fire;" "Mechanical Action and Resultant Effects of Motive Power at High Speed on Bridges;" "Best and Most Economical Railway Track Pile Driver;" "Span Limits for Different Classes of Iron Bridges, and Comparative Merits of Plate Girders and Lattice Bridges for Spans from 50 to 110 ft.;" "Interlocking Signals." S. F. Patterson, Secy.

◆

NEW PUBLICATIONS.

LITERARY MAGAZINES.—We advise any of our readers who desire to broaden their minds by their reading to take one or more of the leading English reviews. The American magazines have for years surfeited their readers with notes of travel, generally too trivial to be worth reading; but in these English reviews we get some clear idea of the people of the far-off countries of Asia and Africa, and an understanding of the questions and problems that are agitating them. The series of papers on South Africa, by Olive Schreiner, now appearing in "The Fortnightly Review," must be ranked as the ablest and most searching discussion of the social questions that affect a nation's life that has appeared for a long time. The literary genius of the gifted author makes it even more interesting than Prof. Bryce's excellent essays on the same topic which have just been concluded in "The Century."

While it is aside from the topics commonly reviewed in this column, we are sure our readers will pardon us for taking space to reprint the following extract from Miss Schreiner's paper in the July "Fortnightly." She has been discussing the problem of the "Half-Castes" in South Africa, and setting forth in powerful language the fact that the "Half-Caste" is what he is in large degree because he is isolated from black and white races alike. She refers to "That almighty 'we,' the consciousness of which lies at the base of all organic virtue," and continues:

> We learn our first lesson in the consciousness of human solidarity, and, therefore, in the true school of virtue, as we lie infants against our mother's breast, white against white, black against black; and, looking to the face above, know dimly we are not alone. It is I and thou—we. Our knowledge widens when we stand betwixt our father's knees, and feel the great hands guarding us from harm—it is father, mother and I. It increases in our contact with the brethren of our blood, who eat of the same bread with us; it spreads wider when in the sports and studies of youth we are linked with certain of our fellows, and our personal interests are absorbed into those of our comrades and company. It takes a vast stride when as adults, beyond the limit of kinship and personal contact, we recognize our union with that vast body of human beings who share our speech and our historic past; and the final expansion takes place when, beyond the limits of the nation and even of the race, in the heart of the poet, the saint or the sage, the fully-developed human creature, that little "We," which for the infant means only "mother, breast, and I," and for the child, kindred; and for the youth, comradeship; and for the adult, nation and race—so widens itself that it enfolds, not merely kindred or nation, but all sentient life, and the final goal of morality is reached.
>
> To the man who has attained this stage it would be as imposible to desire to inflict suffering on the feeblest creature beneath him, as to run a knife into the breast of his mother; he could as little wish to deal falsely with the feeblest alien folk, as to betray his own nation; and the blow struck at the meanest human creature is struck through himself; this man's consciousness is spread abroad like a god's across all life saying—"It is mine." Social action is for him no more the result of compulsion, but instinct. Altruism grafted into the old stock of egoism, draws its life from those very roots which once fed its opposite. He, and he only, is the organically, and therefore perfectly socialized man.

Two other papers in the "Fortnightly" deserve mention here. One is on "Light Railways," and is—we are astonished to find—by Ouida, the French novelist, and about as poor a piece of nonsense as we have run across in a good while. The other is on "Public Sentiment in America on the Silver Question," by F. H. Hardy. We fancy the editor has let this contribution lie pigeon-holed a considerable time, for Mr. Hardy declares at the outset:

> Two years ago the "Silver Sentiment" was dangerously overgrown. Few writing now with a full knowledge of the subject will deny that "silver sentiment has declined to a point where it has ceased to menace the financial stability of the Republic.

It is passing strange that the editor does not keep in better touch with American politics.

"The Contemporary Review" has a paper on "Girls' Technical Schools on the Continent," which everyone interested in educational work will do well to read. It will surprise many to learn that in the public schools of France, Germany, Belgium and Holland girls spend three hours a day over their books and an equal length of time in the study of housework, cooking, dressmaking, needlework, drawing, typewriting, telegraphy, etc. In an editorial on "Money and Investments," the editor says:

> Among the external events which have interested British investors during the past month, the St. Louis convention was by far the most important. Having sunk many millions of his savings in the development of the United States, and having already written off a considerable portion of these investments as a dead loss, John Bull regards with melancholy anxiety the vagaries of the politicians who pull the wires on the other side of the Atlantic. The spectacle is anything but reassuring. The Republican party is now dominant in the United States, and has been holding its convention at St. Louis to select a candidate for the Presidential election which takes place next "fall." It was feared for some time before the assembling of the convention that the silver faction stood a very good chance of capturing the party "machine," and pledging it to a policy of free coinage at a ratio of 16 to 1. This apprehension caused a mild flutter in the silver market in London, and made holders even of the best secured and most gilt-edged of the American railroad bonds feel uncomfortable as to the possibilities of the future.

In "The Contemporary Review," Dr. Lennox Browne writes on the "Anti-Toxine Treatment of Diphtheria," and presents a variety of statistics going to show that the value of anti-toxine as a therapeutic agent has been greatly overestimated. He acknowledges, however, that there is undoubtedly an increased resistance to the disease when the treatment is begun early, and suggests the possibility that the injection of pure sterilized blood serum would produce equally good results.

The August "McClure's" is a mid-summer fiction number, and we find nothing worthy of note here. The July number of the same magazine, however, contained an excellent review of the progress of motor carriages by Mr. Cleveland Moffett. The August "Harper's" is likewise a "hot weather" number. Charles Dudley Warner, in the "Editor's Study," pays a compliment to Col. Waring and refers to the organization and esprit de corps which has been created in the New York Street Cleaning Department as a "municipal triumph."

In the "North American Review," Robert P. Porter discusses the question "Is Japanese Competition a Myth?" He states that we buy of Japan about $54,000,000 worth of goods per annum, while we sell to her about $9,000,000 worth. England buys of Japan goods to the value of $7,000,000, and sells to her about $56,000,000. Other statistics show that whatever may be the future of Japan, its export trade is still in its infancy. In 1895 it exported of textiles of all kinds $22,000,000 worth. This with $3,000,000 worth of matting, $4,000,000 worth of matches, and $11,000,000 worth of porcelain, curios and sundries, comprise the bulk of her exports of manufactured articles. No doubt with the nation's rapid progress in civilization it will become an important competitor in certain lines of manufacture. The necessity of importing many of its raw materials, however, promises to limit the lines in which its competition is likely to prove serious.

In the "Popular Science Monthly," we find an extended account of scientific work at the University of Pennsylvania. No mention is made, however, of its work in the department of applied science. Prof. W. G. Sumner has an able paper on the proposed dual organization of mankind, in which he presents the Monroe Doctrine in a wholly new light. Some reminiscences of early meetings of the American Association for the Advancement of Science are given by Mr. W. H. Hale.

In "The Century" we note a most interesting description of the famous Chinese Viceroy, Li Hung Chang, from the pen of Hon. John W. Foster, which is of especial interest at this time, in view of the great statesman's visit to this country.

RAILWAYS.

East of Chicago.

CANADIAN PACIFIC.—It is stated that this company contemplates the early extension of its Vondreuil & Rigaud line to the capital of the Dominion. Engr., Hugh D. Lumsden has been making preparations to build a portion of the Montreal & Ottawa line between Rigaud and a point near Alfred, a distance of 28½ miles. The new railway offers no serious engineering difficulties, and after leaving Rigaud will pass through St. Eugene, Vankleck Hill and Caledonia Springs into Alfred.

CONNELLSVILLE & PITTSBURG.—A press report from Baltimore, Md., states that Orland Smith, of Baltimore, Pres. Connellsville & Pittsburg Ry., has filed petition in the United States Circuit Court asking that the issue of receivers' certificates to the value of $650,000 be authorized, the proceeds of the sale of which would be used in making permanent improvements in the line of road. The proposition is to construct terminals at Pittsburg to the value of $340,700; to build 6½ miles of second and 7½ miles of third track, at a cost of $143,000; to construct a new yard at Connellsville at a cost of $72,000; to put in reservoirs at Layton, Griffin, Robbins and Glencoe at a cost of $12,500, and to construct the line from Foley's Siding to Fair Hope. This would cost $181,000.

CLEVELAND & PITTSBURG.—A press report states that the right of way has been secured for an extension up Beaverdam Valley. All preliminary work has been about completed for the extension and the road will be built as far as New Cumberland this fall. The survey has been made. The extension is to be made for the purpose of developing fields of coal. This is a branch of the Pennsylvania. Ch. Engr., Thos. Rodd, Pittsburg.

KANONA & PRATTSBURGH.—It is stated that plans are now being discussed for an extension of this road north from Kanona to Stanley or to Penn Yan, N. Y., and on the south to Hornellsville, N. Y. Several routes are proposed for the northern extension, the line to Stanley being 25 miles long, with light grades, and that to Penn Yan, two miles less in distance, but involving some heavy grades. The latter is the more important town, and would give connections with the Northern Central and a branch of the Fall Brook line. A good deal of right of way has already been promised. J. G. Baker, Engr., Prattsburg, N. Y.

McKEESPORT TERMINAL.—This company has been incorporated to build a connecting railway about one mile long at McKeesport, Pa.; capital stock, $100,000; commencing with $10,000; Pres., Richard M. Wood, Allegheny, Pa.

NEW YORK & GREENWOOD LAKE.—This railway has been leased to the Erie Ry. Co. It may be double-tracked and otherwise improved. Ch. Engr., C. H. Buckholz, New York city.

NORTHEASTERN.—This company has been incorporated at Columbus, O., with a capital stock of $100,000, by Frank L. Lyon, Chas. N. Sheldon, Wm. D. Bennet, Gustave Runge and Lafayette Kilball. The road is to run from a point in Euclid township, Cuyahoga county, through Cuyahoga, Lake and Summit counties to Hudson village in Summit county. It is said to be a connecting link for the C., A. & C. between Hudson and Cleveland.

PENNSYLVANIA.—Plans have been made for elevating a portion of the company's tracks at Philadelphia. Thirty street grade crossings and one steam crossing will be removed. The work is estimated to cost about $2,000,000, of which the company will pay one-half. Ch. Engr., W. H. Brown, Philadelphia.

WOODSTOCK & CENTREVILLE.—The contract for the construction of the Woodstock & Centreville Ry., from Woodstock, N. B., to Bridgewater, Me., has been let to Babcock, Lary & Co., of New York; construction to begin at once; length of road, 32 miles.

Southern.

CAROLINA, TENNESSEE & OHIO.—J. L. D. Queen, Supt. of Construction, Wilmington, N. C., writes us that the projected length is 30 miles from El Paso to Town Creek, N. C. The surveys have been made, capital secured and contract let to Frank H. Blodgett, Wellston, O. He will sub-let much of the work. Pres. J. E. Challenger, Philadelphia, Pa.; Ch. Engr., Walter MacRae, Wilmington, N. C.

CAROLINA MIDLAND.—Woolsey Finnell, Batesburg, S. C., writes us that tracklaying on the 18-mile extension from Seivern to Batesburg, S. C., will begin during the next ten days; work willl be finished by Sept. 15, including grading, trestles and tracklaying.

CAPE FEAR & YADKIN VALLEY.—H. L. Fry, Ch. Engr., Greensboro, N. C., writes us that the report that this company is extending its lines is incorrect. No new work is contemplated.

LITTLE ROCK & MEMPHIS.—Bids are asked until Aug. 10 for filling trestle No. 8 on line of this road, six miles west of Memphis. Plans and specifications on file at the superintendent's office, in Memphis, and at the treasurer's office, in Little Rock. Rudolph Fink, Recvr.

Northwest.

ALLOWEZ BAY.—Winston Bros., contractors, Minneapolis, Minn., writes us that this is only a short line and is now finished.

CHICAGO & EASTERN ILLINOIS.—It is stated that this company has purchased the Chicago, Paducah & Memphis Ry., a line extending from Altamont to Marian, Ill., 97 miles long. The company contemplates an extension of its own line from Shelbyville to Altamont, a distance of about 20 miles, to connect with its new acquisition.

SHELBYVILLE SOUTHERN.—This company has been incorporated to build a railway to connect the Chicago & Eastern Illinois R. R. with the Chicago, Paducah & Memphis Ry., at Altamont or St. Elmo, Ill. The incorporators are: Don R. Patterson, Henry J. Messing, J. P. Reeves, B. A. Smith and E. H. Seneff, of Chicago.

Southwest.

OMAHA, KANSAS CITY & EASTERN.—This company has been incorporated with a capital stock of $1,500,000, to build and operate a railway from Pattonsburg, in Daviess county, Mo., through the counties of Daviess and Harrison to Trenton, in Grundy county, a distance of 34 miles, and to buy and operate the Quincy, Omaha & St. Louis R. R., from Quincy, Ill., to Trenton, Mo., and the Omaha & St. Louis R. R., from Omaha, Neb., to Pattonsburg, Mo.; incorporators: John Lowber Welsh, Philadelphia, Pa.; Theodore Gilmer, Jr., Yonkers, N. Y., and A. E. Stillwell, E. L. Martin, J. J. Cairnes, J. T. Nolthenius and C. A. Braley, Kansas City, Mo.

SAND CREEK & SULPHUR SPRINGS.—This company has been incorporated with a capital stock of $20,000, by N. T. White, Pine Bluff, Ark.; Frank Kendall, M. F. Williams, George McLeod, of Kedron, Ark., and Ed. McGann, of Brooks, Ark. Proposed line will run from a point on the Mississippi & Malvern R. R., at its crossing of Sand Creek in Jefferson county, to Sulphur Springs in the same county. ,

SOUTHWESTERN ARKANSAS & INDIAN TERRITORY.—Geo. R. Brown, Little Rock, Ark., writes us that the projected length is 35 miles, to connect Smithton, Okalona, Antoine and Pike City, Ark. Track now finished 23 miles from Smithton; grade finished for the entire line. Track will all be laid by Sept. 1. H. T. Dodson, Wilton, Ark., is the contractor. Pres., J. H. Hutchinson, New York city; Ch. Engr., M. P. Jackson, Smithton, Ark.

Rocky Mountain and Pacific.

ASTORIA & COLUMBIA RIVER.—Work is in progress on this line, which is to afford railway communication between Astoria, Ore. (at the mouth of the Columbia River) and the city of Portland. The Southern Pacific Co. is said to be interested. Honeyman, de Hart & Co., of Portland, are the contractors. Engr., T. K. Jamieson, Astoria, Ore.

COLUMBIA & WESTERN.—Arthur P. Heinze, Secy., Butte, Mont., writes us that the projected length is 200 miles, connecting Sayward, Trail, Rossland, Robson, Boundary and Penticton. The road from Trail to Rossland is completed and in operation. The entire line has been surveyed; right of way can readily be secured as the country is unsettled. The contractors for the completed portion of the road were Bennett & King, Tacoma, Wash. Pres., F. Aug. Heinze, Butte, Mont.; Ch. Engr., F. P. Gutelins, Rossland, B. C.

OREGON CENTRAL & EASTERN.—This company has laid track for a few miles east of its eastern terminus, extending to a pass through the range, and there is talk of constructing the extension east to Boise City, Idaho, the right of way for which has already been secured.

VANCOUVER, VICTORIA & EASTERN.—This company has given notice that application will be made to the Parliament of Canada for a charter for a railway from Vancouver, B. C., thence in an easterly direction through Alberta, Assiniboia and Manitoba, all south of the line of the Canadian Pacific Ry., thence through Ontario to the Great Lakes, and through Quebec to some point on the Atlantic seaboard, with power to construct branch lines, also with power to acquire, own, maintain and navigate steamboats and other vessels between the cities of New Westminster, Vancouver, Nanaimo, Victoria and other points in the Province of British Columbia. Donald G. Macdonell, Vancouver, B. C.

Foreign.

OCCIDENTAL.—Press dispatches state that this railway, which runs from Champerico, on the Guatemala coast, to San Felipe, 41 miles inland, is to be extended 30 miles to Mazaltenango, and a feeder run from San Felipe to Mazaltenango, a distance of ten miles. The actual work of construction will commence within six weeks. It is thought the company's intention is to extend the road clear across the country.

NEW SOUTH WALES.—Bids are asked until Dec. 30 for a supply of 150,000 tons of steel rails, to be manufactured in the colony of New South Wales, as stated in our advertising columns. J .H. Young, Minister of Public Works, Sydney, N. S. W.

STREET AND ELECTRIC RAILWAYS.

DEERING, ME.—The Portland St. Ry. Co. has petitioned to extend its tracks. Pres., W. R. Wood; Secy. and Supt., E. A. Newman, 471 Congress St.

CAPE ELIZABETH, ME.—The Portland & Cape Elizabeth St. Ry. Co. has asked permission to make extensive additions to its tracks. Pres., J. S. Winslow; Gen. Mgr., H. R. MacLeod, 45 Exchange St.

MONTPELIER, VT.—The time for building the electric railway in this city and Barre has been extended for one year. J. J. Flynn and A. O. Humphrey, Burlington, Vt., are interested.

RUTLAND, VT.—The Rutland St. Ry. Co. informs us that no further extensions are projected for the present.

BROCKTON, MASS.—The Brockton, Bridgewater & Taunton St. Ry. Co. has received franchises for a railway to connect this city, Bridgewater and Taunton; franchise calls for the completion of the road within 18 months.

HUDSON, MASS.—The Hudson, Bolton & Lancaster Electric Ry. Co. may be formed with a capital of $100,000 to build a railway from Lancaster to Hudson, a distance of seven miles. The estimated cost is $200,000. Henry Tower, W. H. Moulton and Geo. A. Tripp are interested.

MIDDLEBORO, MASS.—A franchise has been granted to the incorporators of the Middleboro & Lakeville St. Ry.

SPRINGFIELD, MASS.—The Enfield & Longmeadow Electric Ry. Co. has been reorganized with a reported capital stock of $125,000 to build a line nine miles long, starting from connection with the Springfield St. Ry. at the state line, and proceeding through Thompsonville to Enfield, so that the southern terminus will be within three miles of the Windsor terminal of the Hartford, Conn., electric road. Contracts for its construction were to have been awarded this week. Work will be begun soon.——The Springfield Electric St. Ry. Co. is reported as making extensive additions. Pres., John Olmstead; Gen. Mgr., A. E. Smith, Main St.

WORCESTER, MASS.—Press reports state that a company has been organized to build an electric railway from Worcester to Clinton. The stock has been practically all taken. The route will be from Worcester from Adams square, through Lincoln to Old Boylston over the turnpike. From that village the line will follow one of the roads just east of the Metropolitan reservoir to Clinton, a total distance of 12 miles.

BRIDGEPORT, CONN.—It is reported that Frank E. Clark, Frank Miller, N. H. Heft and Geo. E. Somers are interested in obtaining a charter for a new electric railway.

BRISTOL, CONN.—The Bristol & Plainville Electric Ry. may be extended to Terryville.

HARTFORD, CONN.—It is stated that a survey is in progress for an extension of the Hartford, Manchester & Rockville Tramway from Talcottville to Rockville via Vernon Center.

MIDDLETOWN, CONN.—Press dispatches state that the Middletown St. Ry. Co. will extend its tracks to Portland, Conn., a distance of 2½ miles. Pres., I. A. Kelsey; Supt. E. W. Goss, 265 Main St.

ROCKVILLE, CONN.—The Rockville & Ellington St. Ry. Co. is reported as making surveys for a proposed electric railway from Rockville to Talcottville. Mr. Burritt is general manager.

STAMFORD, CONN.—It is stated that the New York. New Haven & Hartford R. R. Co. has awarded contracts for the construction of the electric road between Stamford and Norwalk. H. Gore & Sons, of Boston, will construct the extension, and the General Electric Co., Schenectady, N. Y., will furnish the equipment.

HAMBURG, N. Y.— The Buffalo, Orchard Heights & Hamburg Electric Ry. Co. has been organized to build an electric line from Buffalo to Hamburg; capital stock, $120,000; incorportors: M. W. Wheatley, New York city; A. W. Hickman, I. W. Allan, U. L. Upson, A. V. Brown, F. K. Wing, Buffalo; S. A. Abbott, E. E. Hepp, O. L. Aga, H. A. Pierce, Armour; C. G. Briggs, Orchard Park, N. Y.

BATAVIA, N. Y.—The Batavia St. Ry. Co. may build an electric railway to Horse-Shoe Lake. The line has already been surveyed. Ch. Engr., J. W. Holmes.

DUNKIRK, N. Y.—An electric railway may be built to connect Dunkirk and Chattanooga. H. L. Kent and W. L. Minton are interested.

NEW YORK, N. Y.—C. H. T. Collis, Comr. Pub. Wks., has notified the Metropolitan Traction Co. and all lines operating cars on First Ave., from 20th St. to 109th St., to raise their tracks in conformity with the new street levels, so that the paving of the avenue may be completed.

ELIZABETH, N. J.—The Elizabeth "Herald" states that the work of rebuilding the Elizabeth St. Ry. and changing its motive power from horse to electricity, will be begun at once, and pushed forward to completion. Pres., F. L. Heidritter; Supt., J. C. Husbands, foot of East Jersey St.

NEWARK, N. J.—The Passaic & Newark Electric Ry. Co. has been granted permission to extend its lines.

PLAINFIELD, N. J.—The Plainfield Electric St. Ry. Co. is reported as contemplating extensions to be completed by December, 1896. Supt., John H. Adelmann, 909 West 4th St.

STOCKTON, N. J.—The Camden & Suburban Ry. Co. has been granted permission to extend its lines.

NEW CASTLE, PA.—The New Castle & Mahoning St. Ry. Co. was incorporated Aug. 4 to build an electric railway. Pres., De Witt Dilworth.

DAYTON, O.—The county commissioners have granted a 30-year franchise to the Troy, Tippecanoe & Dayton Inter-Urban Electric Ry. Co. to operate an electric road over that portion of the Miami and Montgomery turnpike lying in Montgomery county and outside the corporate limits of Dayton. The company is to pay the county $20 per mile per year for the first five years, and thereafter $50 per mile per year. Construction is to commence on or before Dec. 1, 1896, and be completed on or before July 1, 1897.

MADISON, IND.—The Madison Light & St. Ry. Co. has been incorporated. The capital stock is $75,000, of which $72,800 is owned by John S. Ward, of Chicago. The directors of the new company are John S. Ward, John Sutherland, Lewis J. Highland, Charles Fifer and George Everrod.

HARVARD, ILL.—Charles T. Yerkes, of Chicago, is said to be interested in a proposed electric railway to connect this place with the Chicago, Milwaukee & St. Paul Ry. at Elkhorn, Wis.

JOLIET, ILL.—A press dispatch states that the Joliet Ry. Co. has been reincorporated, and the capital stock placed at $300,000. The following officers have been elected: Jacob A. Henry, Joliet, Ill., Pres.; George F. Duncan, Portland, Me., Vice-Pres.; Henry P. Cox, Portland, Me., Treas. The road will be extended and new cars put on several lines.

WAUKESHA, WIS.—The Milwaukee & Waukesha Electric Ry. Co. has received a franchise from Milwaukee and the officers are quoted as saying that the road will be built this summer.

EAST ST. LOUIS, ILL.—Surveys have been made by L. L. Harper, Engr. East St. Louis & Belleville Rapid Transit Co., for an electric railway from East St. Louis to Belleville, about 14 miles.——The Belleville Electric R. R. Co. has petitioned the East St. Louis city council for a franchise to lay tracks on Missouri Ave., from 3d St. to the eastern city limits. This company also proposes to construct a line from Belleville to East St. Louis.

TACOMA, WASH.—A franchise has been granted to Frank C. Ross for building and operating an electric street railway.

SALEM, ORE.—An electric railway is proposed to connect this city, Fruitland, Macleay, Annisville, Stayton and Mehama.

SAN DIEGO, CAL.—An ordinance has been passed granting a franchise to the San Diego Electric Ry. Co. to extend its lines.

SANTA BARBARA, CAL.—The Consolidated Electric Co. has been granted the privilege of extending its lines.

ELECTRIC LIGHT AND POWER.

FAIRFIELD, ME.—The Waterville & Fairfield Electric Light & Power Co. is planning to build an addition of 20 or 30 ft. to its power house and to install two or three Hercules water-wheels.

CLAREMONT, N. H.—The Claremont Electric Light Co. has increased its capital from $12,000 to $20,000 and applied it to improving its plant. Storage batteries to augment the incandescent system have been introduced and the arc light system will be increased.

HOPKINTON, N. H.—A public meeting will be held Aug. 13 to consider supplying the village with electric lights.

BROOKLYN, N. Y.—Bids are asked until Aug. 13 for furnishing and installing a complete electric incandescent light plant at the sewage purification works; security, $1,250. Theo. B. Willis, Comr. Cy. Wks.; R. M. Whiting, Secy.

KINGSTON, N. C.—This town will soon vote on the question of issuing bonds for an electric light plant. The proposition is reported to meet with general approval.

BRYAN, O.—At a special election Aug. 1, the citizens voted 408 to 56 to issue bonds for an electric light plant.

ST. CLAIRSVILLE, O.—At an election July 25 the question of issuing bonds for $5,000 to improve the electric light plant was voted on.

SAULT STE. MARIE, MICH.—The Lake Superior Power Co. has been granted a franchise and proposes to build a canal 250 ft. wide and 20 to 30 ft. deep, to cost $2,000,000, and to erect suitable machinery to develop 40,000 HP. Calcium carbide works will be built and run by power transmitted by cable from the Canadian power station.

KANKAKEE, ILL.—Bids are asked until Aug. 10 for supplying 100 2,000 c. p. arc lamps for five years. Henry Reuter, Chn. Com.

MINNEAPOLIS, MINN.—The county commissioners have decided to erect an electric lighting plant for the city hospital.

PINE CITY, WASH.—A press report states that it is probable that this village will soon be lighted by electricity.

TACOMA, WASH.—It is reported that bids will soon be asked for another 2,000 lamp incandescent dynamo.

SONORA, CAL.—T. H. Linn and Geo. Batten have petitioned for a 50-year franchise to construct and maintain an electric power system along the public highways of Tuolumne county.

GRAND FALLS, N. B.—C. Le B. Miles, of Andover, N. B., Rest. Engr. Grand Falls Water Power Co., writes us that he has made a survey and completed plans and profile for the proposed canal, noted in our issue of July 16; nothing definite yet decided.

TORONTO, ONT.—A permit has been granted to the Toronto Electric Light Co. to erect a large power house on the Esplanade, south of Scott St.; cost, $5,000.

BRIDGES.

RUTHERFORD, N. J.—The freeholders of Passaic and Bergen counties have awarded a contract for an iron bridge over the Passaic River at Union Ave., this city, to Dean & Westbrook, at $25,750.

CONNELLSVILLE, PA.—A storm July 27 destroyed seven bridges between this place and Uniontown on the Connellsville & Fairmont branch of the Baltimore & Ohio R. R.

PHILADELPHIA, PA.—Bids are asked until Aug. 12 for repairs to bridges and for painting one bridge. Thos. M. Thompson, Dir. Pub. Wks.

EASTON, PA.—Bids are asked until Aug. 14 for constructing a highway bridge, as stated in our advertising columns. A. J. Cooper, Engr.; H. F. Trumbore, Clk.

ROCKVILLE, MD.—The county commissioners have awarded the contract for a bridge 72 ft. long and 16 ft. wide over the Baltimore & Ohio tracks at Capitol View to the Charlestown Building Co., of Charlestown, W. Va., at $1,148, to be completed within 60 days.

LIMA, O.—Bids are asked until Aug. 19, according to reports, for constructing a stone arch and abutments for three bridges. Phillip Walther, County Audr.

CINCINNATI, O.—Bids are asked until Aug. 15 for the construction of a wrought-iron truss bridge over Taylor's Creek, on the Hines road, Green township, and until Aug. 19 for the superstructure of bridge over Little Miami River and Big Dey Run at Indian Hill, Anderson township.. Geo. C. Zimmermann, Clk. County Comrs.

MINNEAPOLIS, MINN.—Bids are asked until Aug. 18 for the construction and erection of the superstructure of the Seventh St. bridge over the tracks of the Minneapolis & St. Louis and Great Northern railways; also until Aug. 11 for furnishing the iron and steel for the superstructure of the Nicollet Ave. bridge over Minnehaha Creek. Specifications on file at the office of F. W. Cappelen, Cy. Engr.; Chas. F. Haney, Cy. Clk.

LITTLE ROCK, ARK.—The only bids considered at the opening of bids July 15 were those which provided for payments in county warrants at the rate of $25,000 a year, as stated in the advertisement in Engineering News, being as follows: Missouri Valley Bridge & Iron Works, of Leavenworth, Kan., and Pulaski Bridge Co., Little Rock, plan A, $350,000; B, $375,000; C, $390,000; Groton Bridge & Mfg. Co., Groton, N. Y., $353,022, $372,322, $393,400. Edwin Thacher, Ch. Engr., 33 Telephone Bldg., Detroit, Mich. There were 33 inquiries received in response to the advertisement.

GREEN BAY, WIS.—Bids will soon be asked for constructing a 180-ft. drawbridge; estimated cost, $10,000. E. L. Shaw, Engr., Marietta; Jos. F. Rothe, Chn. Com.

ELLENSBURG, WASH.—The county commissioners have awarded a contract to Geiger & Zabriskie, of Tacoma, for the construction of a 200-ft. single-span wood and steel bridge, with one 180-ft. approach, at this place.

DALLAS, ORE.—At a meeting of the county court the clerk was authorized to advertise for bids for the completion of the Rock Creek road, a distance of seven miles; and for the construction of a bridge across the Yamhill River on the Lee Rowell road

NEHALEM, ORE.—Bids are asked until Sept. 9 for constructing a yellow fir bridge, 220 ft. in length, with about 250 ft. of approaches. J. D. Edwards, County Clk.

MERCED, CAL.—Bids are asked by the clerk of the supervisors until Aug. 24 for a bridge across Deadman's Creek, about three miles southwest of Athlone.

SANTA MONICA, CAL.—Competitive plans are asked until Aug. 17 for the construction of a bridge across the canyon lying between Railroad Ave. and the grounds of the Arcadia Hotel, said bridge to be of concrete and iron, or iron or steel, the plans accepted by the board to be paid for at the price of $75, and shall become the property of the town of Santa Monica. Each plan must be accompanied by an estimte of the probable cost of the proposed bridge. C. S. Dales, Clk.

BUILDINGS

TAUNTON, MASS.—Bids are asked until August 27 for the interior finish, plumbing and gas piping for the U. S. post-office building in this city, as stated in our advertising columns. Wm. M. Aiken, Supervising Arch., Washington, D. C.

NEW YORK, N. Y.—Plans have been filed for three brick flats, on St. Nicholas Ave. ,near 117th St., to cost $72,000; Chas. H. Dahlanser, 849 First Ave., owner; Neville & Bagge, 217 West 125th St., architects.——Plans were filed July 28, for a 16-story brick and terra cotta office building, at Broadway and 26th St., cost, $1,500,000; Bruce Price, architect.——John B. Ireland, owner, 15 East 47th St., has filed plans for a brick building, to cost $125,000, at 570 and 572 West Broadway; Hill & Turner, 44 Broadway, architects.——Plans were filed July 30, for eight 5-story brick flats, to cost $180,000, on 7th Ave., between 146th and 147th Sts.; Burns & Regan, 292 Lenox Ave., owners.——Plans were filed July 31, for six 3-story brick dwellings, on 148th St., near Grand Boulevard; cost, $60,000; James T. Fitzpatrick, 630 East 138th St., owner.

BUFFALO, N. Y.—Bids are asked until Aug. 26, for the construction of a 17-room school building, on Seventh St., to cost about $50,000. R. G. Parsons, Secy. Bd. Pub. Wks. ——Lansing & Beierl have prepared plans for a 5-story brick, steel frame candy factory, to be built for Sibley & Holmwood, at 153 Swan St.; to cost about $40,000.——H. L. A. Jaeckel has prepared plans for a 4-story brick tenement house to be built for E. B. Shearer, at the southwest corner of Franklin and Edward Sts.; cost, $30,000.

MOHAWK, N. Y.—Bids are asked until Aug. 10, for furnishing material and labor and erecting an addition to the drill hall of the state armory building. I. G. Perry, Albany, State Arch.; Maj. Gen. Edw. A. McAlpin, Adj. Gen. S. N. Y.; Brig. Gen. Fredk. C. McLewee, Insp. Gen., S. N. Y.; Brig. Gen. Benj. Flagler, Ch. of Ordnance, S. N. Y., Comrs.

YONKERS, N. Y.—The Metropolitan Building Co. has engineers at work laying out lots near Waring Place, upon which it intends building at once 20 more new houses.

PHILADELPHIA, PA.—Bids are asked until Aug. 12, for the erection of a powder magazine, two shell houses, three dwellings, one stable and five cisterns, at the U. S. magazine, Fort Mifflin, near this city. W. T. Sampson, Ch. of Bureau of Ordnance, Navy Dept., Washington,

PITTSBURG, PA.—Henry Phipps, Jr., has been granted a permit for building a steel and iron store building, eight stories in height, at the corner of Penn Ave. and Cecil Alley. Estimated cost, $160,000.

READING, PA.—Plans for the Masonic Temple to be erected on North Fifth St., have been modified so as to reduce the cost from $150,000 to $125,000.

NORFOLK, VA.—Carpenter & Peebles, Archs., of Norfolk, have prepared plans for a $500,000 hotel to be built at this place; construction will probably be commenced within 60 days; no general contract will be let. Sylvanus Stokes, of Baltimore, is interested.

HALIFAX, N. C.—The county commissioners are building a fireproof jail in which will be placed steel and iron cages and cells.

ATLANTA, GA.—The Mutual Building Co. has petitioned the board of aldermen to be allowed to erect a 12-story building extending over the sidewalks at the junction of Peachtree and Broad Sts., which has been granted, and J. M. Holbrook and J. C. Peck have presented like petitions for buildings at the intersection of Forsyth and Whitehall and Peachtree and Pryor Sts., respectively.

COLUMBUS, O.—Bids are asked until Aug. 14 for furnishing the materials and labor necessary for the enlargement of the chapel of the Ohio State University. Yost & Packard, Archs.; Alexis Cope, Secy.

LANCASTER, O.—Bids are asked until Aug. 15 for tearing down the old city hall building, and for furnishing the materials and erecting a new city hall building in this city. H. T. Mechling, Cy. Clk.

TOLEDO, O.—Bacon & Huber, Archs., have prepared plans for a new car barn, 100 × 150 ft., to adjoin the present structure on Canton Avenue, and it is reported that the contract will soon be let.

INDIANAPOLIS, IND.—Work on the Stevenson building was to be commenced this week; it will be 12 stories in height and cost $750,000, according to local papers. Henry Ives Cobb, Arch., Chicago.

SOUTH BEND, IND.— Bids are asked until Sept. 7 for the construction of a county jail in this city. John D. Fulmer, Peter H. Reeves, John N. Lederer, Bd. County Comrs.

DETROIT, MICH.—Bids are asked until Aug. 10 for furnishing the materials and labor necessary for erecting a new 12-room school house on McGraw Ave., and a 4-room addition to the Johnston school on Waterloo St.: also for furnishing the materials, labor, machinery and appliances for a system of ventilating and steam heating apparatus for each. L. H. Chamberlin, Secy.

CLINTON, IA.—The supervisor of Clinton county let the contract July 31 for the completion of the new courthouse to C. A. Moses, of Chicago, at $57,000.

WICHITA, KAN.—Press reports from this city state that the St. Louis & San Francisco Ry. will build new freight and passenger stations in this city.

LIVINGSTON, MONT.—A press report states that all arrangements for the erection of a new city hall are complete and the work of construction will soon begin. Hancock Bros., Archs., Fargo, N. Dak.

ST. LOUIS, MO.—The following contracts have been awarded: For constructing a new building to replace engine house No. 7, Wm. Daman & Son, $8,996; painting pillars and other iron-work in new city hall, Flesh & Mook, $1,885; for structural iron-work in new city hall, Koken Iron Works Co., $27,990.

SAN JOSE, CAL.—An ordinance has been adopted by the common council calling an election for the immediate erection of a $75,000 high school building.

SAN FRANCISCO, CAL.—Bids are asked until Sept. 1 for the construction of a new roof on the new city hall. for wainscoting and paving in the rotunda and for furnishing 3,000 bbls. of Portland cement. A. Sutro, H. T. Creswell, W. Broderick, Bd. of Comrs., New City Hall; J. J. McCarthy, Secy.

VISALIA, CAL.—Bids are asked until Sept. 9 for the construction of four modern steel cages and the erection of them in the county jail. Address the city clerk.

GUAYMAS, MEX.—H. T. Richards has been awarded the contract for the erection of a new brick and stone custom house in this place. The plans include a substantial stone wharf. Cost will be about $80,000.——Dr. P. Figueroa, Acting Governor of the state of Sonora, is arranging to erect a state penitentiary here.

WATER-WORKS.

MADISON, ME.—At a special meeting, July 30, the village corporation voted to purchase all property and rights of the Madison Water Co., for $80,000.

BOSTON, MASS.—The contract for laying water-pipes, July 28, as advertised in Engineering News, has been awarded by the metropolitan water board, to Snyder & Williams, Dayton, O., at $42,582. The itemized bids will probably be published in our next issue.

BRAINTREE, MASS.—At a special town meeting, July 22, the subject of an additional water supply was discussed.

BILLERICA, MASS.—Percy M. Blake, of Hyde Park, has been engaged to investigate the subject of a water supply, noted last week. F. S. Clark, Chn. Comrs., North Billerica.

LANESBORO, MASS.—It is reported that a proposition to build works is being considered. J. K. Anthony, Adams, offers to construct a $20,000 hotel if a system is built. Estimated cost about $10,000.

MARIEVILLE, R. I.—The question of extending the Pawtucket water mains to this place is under discussion.

WESTERLY, R. I.—An injunction has been granted by the circuit court prohibiting this town from erecting water-works, for which the contracts were recently awarded.

WESTERLY, R. I.—The Westerly Water-Works Co. is reported to have contracted with the New York Filter Co. for three new gravity filters to be placed at the pumping station near White Rock.

NAUGATUCK ,CONN.—The water company has voted to build a new 12,000,000-gallon reservoir on Mulberry Hill; cost, from $20,000 to $22,000. Capital of company will be increased from $60,000 to $85,000, according to report.

ROWAYTON, CONN.—The new water-works system has been commenced. John Cotter is interested.

ALDEN, N. Y.—Bids are asked, according to report, for a new well or reservoir 10 ft. in diameter and sufficiently deep to insure water enough for fire protection. E. A. Millinan, Chas. Sanderson and Chas. Ellers are interested.

CLAYTON, N. Y.—It is reported that plans for water-works have been approved by the state board of health, and a special public meetnig to decide whether they shall be built will soon be held. H. W. Morse, Village Clk.

DANSVILLE, N. Y.—Bids are asked until Aug. 21 for constructing works, as described in our advertising columns. J. F. Witmer, Engr., Buffalo; Frank J. Blum, Secy. Comrs.

LOCKPORT, N. Y.—The water commissioners will lay about 2,000 ft. of 6-in. pipe; work will be done by the board. C. H. Cornes, Cy. Engr.

MIDDLETOWN, N. Y.—The taxpayers, by a vote of 286 to 153, have refused to authorize the issuing of bonds to extend the water-works.

MONTOUR FALLS, N. Y.—It is reported that a franchise for water-works and electric lights has been let to E. A. Dunham & Co., of this place. E. W. Hibbard, Clk.

SOUTH GLENS FALLS, N. Y.—The Franklin Iron Co., of Troy, has been awarded the contract for the boilers for the new water-works.

NEWARK, N. J.—The board of street and water commissioners has decided to introduce watermeters in all factories.

DUSHORE, PA.—A press report states that this borough is considering putting in a system of water-works. B. S. Collins, Borough Secy.

ELKLAND, PA.—A vote will be taken Aug. 18 on the issuing of bonds for $10,000 for the purpose of building works.

NEW CASTLE, PA.—The city council has voted to invite ten of the heaviest taxpayers to go over the figures and make a recommendation on the question of buying the water-works in this place now owned by a private company.

PITTSBURG, PA.—The Chester Valley Water Co. has been incorporated with capital stock of $3,000, to supply water to the district south and west of the Ohio and Allegheny rivers, outside the city of Pittsburg; Treas., Frank S. Brunt, Castle Shannon.

FREEDOM, PA.—It is reported that plans and specifications for complete sewerage and water-works systems have been accepted and that an election will be held next spring to vote on an issue of bonds for the construction.

J. P. Leaf, Engr., Rochester; E. J. Bischoffberger, Borough Secy.

HYATTSVILLE, MD.—W. S. Powell, of Annapolis Junction, is reported to have applied for a permit from the town commissioners to lay water pipes in the streets to supply the town with water.

SAVANNAH, GA.—The water supply is reported to be inadequate for fire protection.

STARKVILLE, MISS.—Water is said to have been struck at the depth of 1,080 ft., flowing at the rate of 30 gallons a minute.

CROWLEY, LA.—The city authorities are said to have decided to erect water-works at once. An electric light plant is also talked of.

CLEVELAND, O.—The lowest bids for the construction of the Lake tunnels received July 31, as advertised in Engineering News, were: East side tunnel—W. J. Gawrie, Cleveland, $524,190; tunnel extension and shafts—Chicago Star Construction & Dredging Co., Chicago, Ill., $306,062. Complete bids will probably be published next week.

COLUMBUS, O.—Bids are asked until Aug. 24 for the construction of a 14 × 100-ft. steel stand-pipe, enclosed in a tower of brick and stone, with the foundations for the same; and for pipes, castings, hydrants, valves, etc. Adress R. W. Bell, Steward, Ohio Institution for the Education of the Blind; H. P. Crouse, Pres.; Frank Snyder, Engr.

DELPHOS, O.—G. F. Almy, Secy., writes us that 56 bids were received in answer to the water-works advertisement published in Engineering News, the contract being awarded to the Shaw-Kendall Engineering Co., Toledo, at $62,600. R. H. Gamble, Engr., Lima, O.

QUINCY, O.—Work has been begun on the water-works in this place.

RIPLEY, O.—The following contracts have been awarded for constructing water-works: Addyston Pipe & Steel Co., Addyston, O., cast-iron pipe and specials, at $7,948; Wm. N. Air, Newport, Ky., pipe laying, $2,470; J. R. Poindexter, Cynthiana, Ky., building pump house, $1,066; Boyce & Heffron, Cincinnati, O., settling basins, $2,300; Ryan & Link, Reading, O., storage reservoir, $2,067; C. H. Barnes Co., Cincinnati, O., boiler and stack, $1,180; Hall Steam Pump Co., Allegheny, Pa., pump and air lift, $3,005. Hydrant and valve not decided on. Bonds were sold by council to Seasongood & Meyer, Cincinnati, O., for $23,828, being at a premium of $828. L. Vern Williams, Clk. Bd.

WAUSEON, O.—Bids are asked until Aug. 12 for furnishing labor and material to sink as many artesian wells as may be required to furnish 500,000 gallons per day. C. E. Guilford, Secy.

KENTLAND, IND.—This city expects to lay 4,000 or 5,000 ft. of additional mains next year. Chas Frankenberger, Pres. Bd.

PENDLETON, IND.—A system of water-works to cost $30,000 is proposed. Dr. L. E. Alexander is interested.

HOLLAND, MICH.—The following contracts were awarded July 25 for building the new water-works: For furnishing pipes—Lake Shore Foundry, Cleveland, O., $20.20 per ton delivered at Holland; for laying pipes—A. L. Holmes, Grand Rapids, 16 cts. per ft. Work will be commenced at once.

CERRO GORDO, ILL.—The date for the opening of bids for the construction of water-works as advertised in Engineering News has been postponed. Chas. F. Sturtevant, Consult. Engr., 320 South 3d St., St. Louis; E. A. Barnwell, Clk.

GILMAN, ILL.—Bids are asked until Aug. 22 for constructing works, as stated in our advertising columns. A. D. Thompson, Engr., Peoria.; Chas. Meyer, Chn. Com.

GREENUP, ILL.—The village board has decided to issue bonds for $4,000 for water-works. A plant to cost $10,000 will be erected and an assessment will be levied for the balance.

POLO, ILL.—A tax has been levied to raise money to lay more mains next summer. L. F. Thomas, Chn. Com.; J. H. More, Cy. Engr.

LINDEN, WIS.—It is reported that a system of water-works will be built.

NEENAH, WIS.—About two miles of extensions are projected. I. E. Johnson, Supt.

DUNLAP, IA.—Bids are asked until Aug. 20 for furnishing and laying about 2,000 ft. of 4-in. water main with fire hydrants and connections complete. H. Jennings, Mayor; I. L. Pease, Recdr.

FAIRFIELD, IA.—The contract for digging a trench for 2,700 ft. of new 12-in. water mains has been awarded to Jefferson Griffiths. The water committee of the city council has decided that the city can build the new dam cheaper than by contract. Estimated cost, $5,000.

SHELDON, IA.—A second boiler is now under construction and there is talk of another pump next year. J. O. Gates, Supt.

TOLEDO, IA.—The contract for building a 140,000-gallon reservoir has been awarded to Turbett & Vest at $1,200.

FOSSTON, MINN.—The water-works and electric light letting, advertised for Aug. 6, has been postponed until early next spring,owing to failure to sell bonds. Chas. F. Loweth, Engr., St. Paul.

WELLS, MINN.—Bids are asked until Aug. 13 for furnishing and laying 2,500 ft. of 4-in. cast-iron pipe, and for a 16-in. × 16-ft. steam boiler. C. F. Loweth, Engr., St. Paul; A. O. Oleson, Village Recdr.

PLATTSMOUTH, NEB.—The city council at its meeting, July 28, discussed the question of purchasing the gas and electric light plant and appointed a committee to investigate.

FORT BENTON, MONT.—At a meeting of the town council it was decided to construct a reservoir or filtering well at the pumping station.

ST. LOUIS, MO.—Contracts have been awarded as follows: Laying water pipe, R. J. McDonald & Co., $9,410, and P. O'Donnell, $8,210; for furnishing 2,700 tons of water pipe, Howard-Harrison Iron Co., $53,028; for furnishing 75 tons special castings, Howard-Harrison Iron Co., $2,505; for furnishing 127 stop-valves, George J. Fritz Foundry & Machine Co., $2,625; for furnishing 100 fire-plugs, George J. Fritz Foundry & Machine Co., $1,375.

GOLDFIELD, COLO.—A press report states that a proposition for a system of water-works has been received by the town council from J. E. Hurd, civil engineer, of that place, and will be acted upon at the next meeting of the board of trustees. C. E. Dersell, Town Cilk.

CASTLE ROCK, ORE.—According to a press report H. Orchard has been granted a 30-year franchise for the construction of water and sewer systems; source of water supply is a mountain stream about two miles distant; a reservoir will be built.

MYRTLE, ORE.—An electric light and water-works plant is proposed for this city; P. L. Nelson may be addressed.

SPOKANE, WASH.—It is reported that the council is again agitating the subject of a new reservoir.

ANAHEIM, CAL.—An election was held Aug. 1 to vote on an issue of $11,000 in bonds for extensions; the city expects to take up old riveted pipe and replace with cast-iron pipe, about 2½miles. Chas. S. Rogers, Cy. Engr.; M. Nebelung, Clk.

BOSTONIA, CAL.—J. Donald is reported to be building a 60,000-gallon reservoir near this place to supply the town with water.

NORTH ONTARIO, CAL.—The Mountain View Water Co. has been incorporated, with a capital stock of $13,875, for the purpose of supplying water for domestic and irrigation purposes. Geo. B. Ford, Ontario; J. N. Huehn, North Ontario; A. Thompson and D. R. Clay, Clermont; J. T. Brady, Pomona.

SANTA BARBARA, CAL.—All previous actions of the city council concerning water-works have been annulled and new plans and specifications have been prepared by J. K. Harrington, Cy. Engr. They contemplate a sea-water system with a pump with capacity of 300 gallons a minute; a 200,000-gallon reservoir and suitable connections for street sprinkling and fire protection. A pipe line costing $29,100, from the city tunnel, and a 1,000,000-gallon reservoir to cost $20,000 will be required for the city service.

OSBURN, IDAHO.—Money is in hand for one mile of extensions of the water mains. W. B. Heyburn owns the plant.

NORTH SYDNEY, N. S.—J. J. McInnis, of Port Morien, C. B., has the contract for constructing the works at this place; plant will cost about $50,000 and is to be completed in December. J. N. Armstrong, Town Clk.

DESESONTO, ONT.—The question of spending $58,000 for a water-works system will be submitted to a popular vote.

VANCOUVER, B. C.—The city engineer has advised the city council to construct another water main from the reservoir to Westminster Ave., in order to regulate the pressure. The matter has been referred to the water committee.

IRRIGATION.

WICHITA FALLS, TEX.—Press reports announce that a $600,000 irrigation project is being agitated by Chas. D. Keyes, J. A. Kemp, Maj. W. W. Ford and others of this city, and that the money for the enterprise is to be furnished by T. C. Pudry, of St. Louis, Gen. Mgr. Missouri, Kansas & Texas Ry., representing John D. Rockefeller and other eastern capitalists. A stone dam will be built in the Wichita River about 35 miles southwest of this city, and a reservoir covering 40,000 acres will be made, from which 200,000 acres of land will be irrigated. It is stated that several contracts have already been awarded and it is believed that active work will begin within 90 days.

PORTAGE LA PRAIRIE, MAN.—F. E. Simonds has work on hand which includes estimating the cost of building and irrigation flume.

NEW COMPANIES.—National Land & Irrigation Co., Omaha, Neb.; $350,000; Edgar C. Salisbury, H. G. Candee.

Polomas Canal Co., Polomas, Ariz.; $6,000; directors: E. F. Snider, J. B. Martin, S. H. Grumbles, H. E. Fairman and J. T. Snider.

SEWERAGE.

DEERING, ME.—At the meeting of the council Aug. 14 the question of sewage disposal into Back Bay will be considered; at present only one sewer from the city has its outlet into that bay. Elbridge Matthews, Chn. Com.

RUTLAND, VT.—Surveys have been made by Sidney Smith, Cy. Engr., for 13,000 ft. of 12 to 6-in. pipe sewers, to be built by day labor. The contract for the Moon Brook sewer, for which bids were received June 12, as advertised in Engineering News, has not yet been awarded, although the sewer may be built this season.

NEW BRITAIN, CONN.—The sewer commissioners have prepared plans and estimates for a trunk sewer to drain the southwestern section of the city; estimated cost,$300,000; average depth, 13 ft.; work will include considerable rock excavation.

ARVERNE, N. Y.—A meeting of the property owners was held last week to discuss the question of sewers and macadam roads and it was voted to issue $50,000 in bonds for this purpose. Wm. H. Amerman and Oscar Mussinan are interested.

BROOKLYN, N. Y.—Bids are asked until Aug. 13 for constructing sewers; sureties, $1,750 and $8,500. Theo. B. Willis, Comr. Cy. Wks.

BUFFALO, N. Y.—Bids are asked until Aug. 25 for constructing 15 to 10-in. tile sewers in three streets. R. G. Parsons, Secy. Dept. Pub. Wks.

SANDY HILL, N. Y.—The plans for a system of sewerage for this village (population about 4,000) has been prepared by John W. Burke, of New York city, and approved by the state board of health, and will soon be submitted to the taxpayers to vote upon. The plans contemplate over 20 miles of 24 to 6-in. sewers; estimated cost, $60,000. F. M. Van Wormer is a member of the committee.

TROY, N. Y.—The following bids were received July 31 for a sewer in Mill St.: Robert J. Gleason, $21,400; Frank Cavanaugh, $22,889; Casey & Kavanaugh, $25,510; Martin Murray, $30,414; James H. Morrissey, $33,500.

ELIZABETH, N. J.—Francis Collingwood has prepared plans for the purification of the Elizabeth River and has submitted estimates to the city council for an intercepting sewer three miles long to tide water; size, 2 ft. 6 ins. × 3 ft. 9 ins. to 66 ins.; pumping station half-mile from terminus; estimated cost, $112,000, and $5,000 a year for maintenance of pumping station.

MANOR STATION, PA.—The construction of sewers in the town of Manor will soon be commenced, according to reports.

PHILADELPHIA, PA.—Thos. M. Thompson, Dir. Pub. Wks., awarded contracts July 29 for constructing about 80 branch sewers, to cost about $75,000, the successful bidders being as follows:- William & J. B. McHugh, John Morrison, James J. Madden & Co., James H. Deehan, P. P. Stuart & Co., David McMahon, John McCann, L. A. Hubbs, Richard Bennis, Robert Higgins, David France, H. C. Eyre, R. B. McDaniels & Co., Joseph Perna & Co., Frank McCullough, Walter D. Stone, Michael O'Rourke, William Chambers, William Moss, Jones & Wallace, Richard P. Bennis, McCann & Wilkins, Patrick Monaghan, John D. Murphy, John Robinson, John Dotger, Delaplaine & West, John Kerrigan, Patrick Durkin, J. H, Loucheim and Donnelly & Scattergood.

SWARTHMORE, PA.—It is reported that $15,000 has been appropriated for sewers to tidewater, by a vote of 59 to 16.

HAGERSTOWN, MD.—The town council has voted to issue $7,000 in bonds for two drains in the west side, one of which will be 1,680 ft. in length.

DALTON, GA.—The city clerk writes us that the sewer proposition was defeated at the recent election.

CLEVELAND, O.—Bids are asked until Aug. 12 for constructing sewers in two streets; D. E. Wright, Dir. Pub. Wks.

CLYDE, O.—It is reported that this place will have a sewage disposal farm of ten acres.

NORWOOD, O.—Bids are asked until Aug. 10 for the purchase of $36,892 in village bonds to pay for sewers W. E. Wichgar, Clk., 317 Walnut St., Cincinnati.

WARREN, O.—Bids are asked until Aug. 20 for constructing about 1,700 ft. of 15 to 9-in. pipe sewer, average cut 8 to 11 ft. Homer C. White, Cy. Engr.; Albert E. Andrews, Cy. Clk.

FRANKFORT, IND.—Bids will not be received Aug. 11 for constructing lateral sewers, as noted July 23, the council having withdrawn the advertisement. James A. Price, Cy. Clk.

HOLLAND, MICH.—A mass meeting was held last week to consider the construction of a sewer system, for which Alvord & Shields, of Chicago, have prepared plans, estimated cost, about $20,000.

PANA, ILL.—The council has appropriated $8,000 for sewers.

MILWAUKEE, WIS.—Contracts for sewers were awarded July 28 as follows: To J. S. O'Neill, at 98 cts. a lin. ft.; J. P. Ryan, pipe, $1.03; H. Hohensee, pipe, $1.07, J. C. F. Brand, pipe, $1.13; J. O'Donnell, brick, $2.25; pipe, $1.45; James Markey, $2.69.

OAKLAND, CAL.—Two sewer contracts have been awarded to N. S. Douglass and one each to E. Cavanaugh and John Geary.

SAUSALITO, CAL.—The trustees are considering an ordinance providing for an issue of bonds for a sewer system.

TORONTO, ONT.—C. H. Rust, Deputy Cy. Engr., writes us that the matter of the construction of the proposed trunk sewer has been held over and it is quite probable that nothing will be done this year.

GARBAGE DISPOSAL—STREET CLEANING.

YORK, PA.—The city officials are reported to be inspecting the garbage crematories in other cities.

WILMINGTON, DEL.—The contract for garbage collection for two years is reported to have been awarded to James B. Stidham..

INDIANAPOLIS, IND.—Local papers state that the city officials have secured information from cities in all parts of the country in regard to garbage contracts and hope to have the matter in shape in a few weeks for action in this city.

STREETS AND ROADS

RUTLAND, VT.—Sidney Smith, Cy. Engr., informs us that probably 100 ft. of retaining wall, which was washed out by spring freshets, may be replaced this season at the intake of the water-works. About 1,000 ft. of street macadam and 2,600 ft. of macadam sidewalks in parts are projected; may be done by day work.

ARVERNE, N. Y.—There is talk of issuing $50,000 in bonds for macadamizing and sewering this village.

BROOKLYN, N. Y.—Bids were received by the shore road commission Aug. 5 for filling in portion of the wharf at the foot of 96th St. Edwin C. Swezey, Engr. in Charge, 3d Ave. and 39th St.; Elijah R. Kennedy, Pres.; Geo. Ingram, Secy. Comn. Plans for the shore drive have been in preparation for some time by Olmsted, Olmsted & Eliot, landscape architects and engineers, and it is stated that the construction will soon be in progress. The road will be about three miles in length, of easy grade, by gentle windings from 67th St., in Bay Ridge, to the concourse at Fort Hamilton.——It is probable that Leonard St. will soon be paved with asphalt between Greenpoint Ave. and Broadway, at a cost of about $70,000.

BUFFALO, N. Y.—Bids are asked until Aug. 25 for paving in Forest Ave. and John St. R. G. Parsons, Secy.

LOCKPORT, N. Y.—Bids are asked until Aug. 17 for 2,088 sq. yds. of brick paving in Locust St. Chas. H. Cornes, Cy. Engr.

NEW YORK, N. Y.—Bids are asked until Aug. 12 for paving with asphalt and stone; 19 contracts. Chas. H. T. Collis, Comr. Pub. Wks.——The park commissioners are reported to have awarded the contract for the construction and improvement of the third section of Riverside Park drive, from 120th St. to 129th St., to Bart Dunn, at $119,090.

NEW YORK, N. Y.—Bids are asked by the park department until Aug. 17 for about 24,000 sq. yds. of asphalt pavement with concrete base and about 30,000 sq. yds. without concrete base.

OSWEGO, N. Y.—Bids are asked until Aug. 17 for asphalt and brick paving, as stated in our advertising columns. E. A. Cooke, Clk. Dept. of Wks.

PATCHOGUE, N. Y.—A public meeting was held last week to consider the question of improving the roads; committee has been appointed.

BOUND BROOK, N. J.—Bids are asked until Aug. 11 for macadamizing 1,700 lin. ft. of Hamilton St. F. N. Voorhees, Clk.

JERSEY CITY, N. J.—The street commissioners have ordered the improving of eight streets, nearly all of which connect with the Hudson County boulevard.

PHILADELPHIA, PA.—Bids are asked until Aug. 12 for paving streets and other work. Thos. M. Thompson, Dir. Pub. Wks.

WASHINGTON, D. C.—Bids are asked by the district commissioners until Aug. 15 for furnishing red paving brick, as stated in our advertising columns.

CANTON, O.—A report from Youngstown, O., states that W. W. Young, Pres. Cy. Council; L. E. Chapin, Cy. Engr., and others have been inspecting the brick pavements in that city.

CLEVELAND, O.—Bids are asked until Aug. 26 for 8,084 sq. yds. of asphalt paving in Giddings Ave., and 9,200 sq. yds. in Murray Hill Ave. The bids recently received for this work ranged from $23,239 to $25,593 for the Giddings Ave. work, and $32,534 to $33,439 for the Murray Hill Ave. work. D. E. Wright, Dir. Pub. Wks.

TOLEDO, O.—Bids are asked until Aug. 31 for paving in two streets with brick. L. P. Harris, Cy. Clk.

EVANSVILLE, IND.—Bids are asked until Aug. 8 for 13,000 sq. yds. of brick paving, estimated to cost $10,000. Aug. Pfaefflin, Cy. Engr.

MARION, IND.—Contract for paving with brick Fourth St. and the Public Square was awarded to the Capitol Paving & Construction Co., of Indianapolis.

EAST ST. LOUIS, ILL.—Bids are asked until Aug. 15 for 23,600 sq. yds. of vitrified brick paving on 6 ins. concrete foundation. L. L. Harper, Cy. Engr.

THE DALLES, ORE.—A local paper states that County Surveyor Goit has returned from making a survey of the proposed free road leading from Dufur across Deschutes and on to the Cook county line. The heaviest expense will be the construction of a bridge across the river, but it is thought that the cost of the road and bridge will not be more than $3,500.

STOCKTON, CAL.—The council is reported to have passed a resolution in faver of macadamizing Main St. Geo. A. Bidwell, Supt. of Streets.

NELSON, B. C.—The Nelson "Tribune" states that John R. Patton, of Rossland, an experienced railway builder, has contracted to complete the first 10 miles of the Sanca-Shite Grouse wagon road in 30 days, at $950 per mile. Mr. Patton began work July 22. The remaining 8 miles will be let and work commenced as soon as the grade is established.

MANUFACTURING PLANTS.

BARTON LANDING, VT.—E. L. Chandler's box and sounding-board factory was destroyed by fire July 29. The mill, machinery and stock are a total loss. The loss on the mill and contents is from $18,000 to $20,000.

ATTLEBORO, MASS.—The Mossberg Mfg. Co. is asking the citizens to subscribe $50,000 for building a new factory.

ALBANY, N. Y.—P. J. McArdle, M. Freeman and Edward White are interested in the erection of an ice plant to cost about $50,000.

GLOVERSVILLE, N. Y.—It is stated that Jacob Adler & Co. will enlarge their glove factory by erecting a three-story addition, 32 × 24 ft. They will also erect a new brick boiler house.

COHOES, N. Y.—Work has been begun on the addition which is to be built to the American Hosiery mill on Mohawk St. Charles McCarthy, the proprietor, has awarded the contract for the mason work to Stanton & Neary, at $10,500. The addition will be 22 × 122 ft., four stories high with an attic. On the southwest corner will be built a tower six stories high in the top of which is to be placed a large water tank.

ROME, N. Y.—The Rome Mfg. Co. is erecting a factory 260 × 70 ft., with a boiler house 40 × 60 ft.; cooking utensils are to be made.——The Columbia Knitting Mill Co. is putting up a factory 124 × 54 ft., three stories high

SYRACUSE, N. Y.—The Tourist Cycle Co.'s works was burned Aug. 3. Loss, $35,000, fully insured.——The Barnes Cycle Co. has made arrangements for the building of a new factory in Water St., just east of its present building. It will be five stories high.

BEAVER FALLS, PA.—The McCool Tube Co., of Beaver Falls, is tearing down part of the old cutlery works buildings in order to make room for a building 100 × 200 ft., in which to manufacture seamless steel cycle tubing. Each bench will be run by a separate 20-HP. electric motor. This company was recently organized and has applied for a charter; capital stock, $300,000; Wm. A. McCool, Harry W. Reeves, of Beaver Falls; A. S. Reeves and J. M. Kreamer, of Philadelphia, and Hunter Eckert, of Reading, Pa.

BRADDOCK, PA.—On July 31, a recently erected boiler house at the Edgar Thomson Steel Works that cost $8,000 was demolished by the gale. It was a brick building and was blown completely over. Three large smoke stacks were also blown over, causing probably $3,500 damage.

LATROBE, PA.—Hamilton Bros., of Pittsburg, who have been looking for a site for their glass plant, which is now located at Pittsburg, are stated to have accepted the Piper farm, located ½ mile east of here. The works will consist of four large furnaces, each employing 100 men, and several structural steel buildings, costing $40,000. The cost of the entire plant will be about $75,000.

PHILADELPHIA, PA.—The main building of the extensive phosphate and fertilizer works of the Baugh & Sons Co. was destroyed by fire Aug. 4. Supt. Wells estimates the company's loss at $200,000, which is partly covered by insurance. A large vat of grease boiling over into a fire started the flames.

PHILADELPHIA, PA.—The plant of the Philadelphia Paving & Construction Co., manufacturers of asphaltum, was destroyed by fire Aug. 2; loss is about $12,000.——The paint shop in the yards of the Cramp Ship & Engine Building Co. was destroyed by fire Aug. 1, with most of its contents, entailing a loss of about $40,000. The burned structure was of frame, 200 × 90 ft.

WHEELING, W. VA.—The Principio Forge Co. is to double its capacity by the addition of more forge fires, and also a new 5,000 lb. steam hammer.

FLAT ROCK, N. C.—The Hart Knitting Mills Co. will double the capacity of its plant and put in Mayo automatic knitters.

MEBANE, N. C.—A large cotton mill to cost over $100,000 is to be built at this place at an early date.

ATLANTA, GA.—The Whittier cotton mills located near this city will double its capacity by installing 10,000 more spindles.

BARNESVILLE, GA.—An underwear factory to turn out 100 suits of underwear daily is to be built and equipped at this place; $10,000 was subscribed by the business men last week for that purpose.

CHATTAHOOCHE, GA.—It is stated that the Whittier Cotton Mills contemplates doubling its plant. It has 10,000 spindles in operation now.

CORDOVA, ALA.—It is stated that ground has been surveyed for a new cotton mill. The main building will be 328 × 128 ft., three stories high. In addition there will be an engine room, a boiler room, a ware room and a commissary—all of brick.

CHATTANOOGA, TENN.—It is stated that the Chattanooga Foundry & Pipe Co. is to build a blast furnace in connection with its plant, to make its own iron.

CENTRALIA, ILL.—The Centralia brewery and ice plant, two miles from the city, burned Aug. 1. Estimated value of plant, $20,000; insurance, $7,000. The plant was owned by St. Louis capitalists and under the management of J. Himple of that city.

FRIAR'S POINT, MISS.—The Delta Veneer & Box Co.'s plant burned July 31. Loss, $100,000, partially insured. The plant was owned by the Chicago National Bank.

ARGENTINE, KAN.—A press dispatch states that a party of Ohio capitalists has bought the plant of the Kansas

City Steel & Iron Works. The works will at once be enlarged and steel will be manufactured under a new process.

TELLURIDE, COLO.—The Telluride Foundry & Machine Co. expects to commence the construction of its main building within a few days; the molding room is now under construction. V. J. H. Schram, Mgr.

SALINAS, CAL.—It is stated that Claus Spreckles may build a large beet sugar factory here.

MINING.

SHAMOKIN, PA.—The Royal Oak Co., Ltd., will erect a new 600-ton coal breaker, according to report.

CISCO, CAL.—It is reported that Heath & Doolittle are developing their Lost Emigrant mine 16 miles southeast of this place.

GRANITEVILLE, CAL.—Bids were asked until Aug. 1 for driving a main tunnel, 5 × 6½ ft., on the Gaston Ridge or California mine, by power drills, 700 ft. Dana Harmon, Mgr. Shasta Mining Co.

JACKSON, CAL.—It is reported that a 30-stamp mill is to be put in at the Union Consolidated mine. Capt. W. S. Davis and W. T. Matson, of San Francisco, are interested.

SAN BERNARDINO, CAL.—A. G. Campbell will double the capacity of his stamp mill at the Boomerang mine and expects to spend $60,000 for machinery, according to reports.

SONORA, CAL.—Supt. Neville is reported as to put in new hoisting machinery at the Alabama mine.

TRAIL, B. C.—The Lillooet, Fraser River & Caribos Gold Fields, Ltd., has purchased the rights and title to the property of the Columbia & Western Ry. in this locality amounting to one square mile. The price paid was $50,000.

MISCELLANEOUS CONTRACTS.

STONE CRUSHER.—Folsom, Nev.—It is reported probable that a second stone crusher will be put in at the new state plant.

STEAM ROAD ROLLER.—Greenfield, Mass.—The selectmen are reported as considering the purchase of a steam road roller.

SUBWAY.—Boston, Mass.—Bids are asked until Aug. 20 for constructing Section 5 of the subway. A. Carson, Ch. Engr.; B. L. Beal, Secy.

DREDGING.—Portland, Me.—Bids are asked until Aug. 24 for dredging, as stated in our advertising columns. Lt.-Col. A. N. Damrell, U. S. Engrs.

ICE MACHINE.—Columbus, O.—Bids are asked until Aug. 20 for an ice-making and cold storage apparatus. A. B. Richardson, Secy. State Hospital.

SNAGBOAT.—Portland, Ore.—Bids are asked until Aug. 20 for constructing a snagboat, as stated in our advertising columns. Capt. W. L. Fisk, U. S. Engrs.

WHARF.—San Pedro, Cal.—The Kerckhoff-Cuzner Mill & Lumber Co. has been granted an extension of time in which to complete its wharf, until Dec. 24, 1897.

CEMENT AND SAND.—Portland, Me.—Bids are asked until Aug. 15 for cement and sand, as stated in our advertising columns. Lt.-Col. A. N. Damrell, U. S. Engrs.

DREDGING, ETC.—Chicago, Ill.—Bids are asked until Aug. 24, for dredging and pier extension, as stated in our advertising columns. Maj. W. L. Marshall, U. S. Engrs.

TELEPHONE FRANCHISE.—Wilmington, Del.—The Delaware & Atlantic Telegraph & Telephone Co. has been granted a franchise to lay underground conduits in all parts of the city.

WHARF.—Stockton, Cal.—An ordinance has been passed by the council providing for the construction of a wharf at least 100 ft. long on the south side of Stockton channel. J. M. McCall, Cy. Clk.

STREET SWEEPING MACHINE.—San Diego, Cal.—Bids are asked until Aug. 13 for furnishing a street sweeping machine, as stated in our advertising columns. F. H. Dixon, Secy. Bd. Pub. Wks.

LEVEE WORK.—Talluhah, La.—Bids are asked until Aug. 10 for the raising and enlargement of levees in Madison and Tensas parishes; 15 contracts. F. L. Maxwell, Pres. 5th Dist. Levee Bd.; A. L. Lane, Secy.

TUNNEL.—Beaver Meadow, Pa.—A tunnel through Spring Mountain to drain the Coxe collieries into the Quakaka Valley is reported as to be built; length, 1½ miles. Eckley B. Coxe is the originator of the plan.

RIVETED STEEL PIPE.—Redding, Cal.—Bids are asked until Aug. 27 for furnishing 4,800 ft. of 30-in. riveted steel pipe, as stated in our advertising columns. Geo. Kent Radford, Consult. Engr., 2312 Warring St., Berkeley.

STONE WALL.—San Francisco, Cal.—Bids are asked until Aug. 27 for the construction of a stone wall along the southern boundary of Military Reservation at Presidio. Lieut.-Col. J. C. G. Lee, Deputy Q. M. Genl., U. S. A., 36 New Montgomery St.

CANAL AND BASIN ENLARGEMENT.—Kings Park, N. Y.—Alonzo E. Smith, of Islip, has been awarded two contracts aggregating $20,000, for enlarging the basin and widening the canal leading from the Nissequogue River to the store house on the hospital grounds.

COAL CONVEYING PLANT.—Kings Park, N. Y.—C. W. Hunt & Co., of West New Brighton, Staten Island, have been awarded the contract at $12,041, for constructing a dock, trestle work, iron work bridge, steam engine and hoisting apparatus for handling coal at the state hospital.

READING SUBWAY.—Philadelphia, Pa.—The awarding of contracts for constructing a portion of the Reading subway is noted in another column under Contract Prices. It has been decided to have the tunnel the length planned originally, about 2,800 ft., and new bids will be asked in a few days for this work.

ROCK CRUSHER.—Vancouver, B. C.—The city engineer has been instructed by the board of works to ascertain terms for the purchase of a rock crusher and land for a site for the same. There is no money available to purchase the property this year, but it is desired to know on what terms owners will be willing to sell.

COAL CONVEYOR.—Schenectady, N. Y.—Bids are asked until Aug. 10 for furnishing a coal hoisting and conveying plant, as stated in our advertising columns. The Stanwix Engineering Co., Engrs.; Geo. T. Ingersoll, Supt. W. W.

CRIBS.—Detroit, Mich.—The following bids were received July 31 for furnishing the material and labor for constructing and placing 7 cribs in Hay Lake Channel, St. Mary's River, Mich., as advertised in Engineering News:

Eslow & Munroe, Charlevoix, Mich.	$5,622
Beauvais & Coulter, Charlevoix, Mich.	6,416
McCurdy Bros, Duluth, Minn.	6,432
C. E. Mitchell & Co., Ludington, Mich.	6,804
J. V. Gearing, Detroit, Mich.	9,178

CONTRACT PRICES.

READING SUBWAY.—Philadelphia, Pa.—The bids for the construction of temporary tracks in connection with the abolishment of grade-crossings on the line of Pennsylvania Ave. and Noble St. (Reading Subway), as advertised in Engineering News, were published July 30. The following ten contracts have since been awarded: E. D. Smith & Co., Philadelphia, contract No. 13, blocks T, R, I and K, at $79,744; No. 14, excavation of core, construction of bridges, etc., at $742,028; No. 23, retaining walls and reconstruction of buildings, blocks F and O, at $78,364; No. 28, block Q, at $15,547; P. H. Flynn & Co., 211 South 9th St., Philadelphia, contracts No. 12, blocks U, V and S, at $212,602; No. 17; retaining walls and buildings, blocks B and K, at $101,027; No. 19, blocks C and L, at $131,570; No. 21, blocks D and M. at $110,561; No. 22, retaining walls and reconstructing buildings, blocks E and N, at $84,730; No. 24, retaining walls, etc., in blocks P, G and H, at $142,852; time for completion of each of the ten contracts has been changed to 18 months. The detailed bids for contracts 13 and 14 were as follows:

Bids for Contract No. 13, Reading Subway, Philadelphia, Pa.

SEWERS.—Dayton, O.—The contract for a sewer in Wayne Ave. and Anderson St. has been awarded to W. N. Carlisle, Port Huron, Mich., at $8,200, the price being reported as follows: 36-in. brick, 2-ring, 1,810 ft., $1.85 per ft.; 30-in. brick, 2-ring, 2,434 ft., $1.57; 24-in. D. strength, 90 ft., $1; 12-in. pipe, 970 ft., 27 cts.; catch-basins, 44, $10; manholes, 12, $16; stone, 10 perch, $3.25; street railway drips, 2, $7. J. Connelly & Son, Cleveland, bid $9,299; P. E. Lehman, $10,732; Teigter & Gabler, $9,189; Munger & Co., $9,531; D. A. Onkst, $9,943; Bruno Ritta, $10,020.

BRICK PAVING.—Lowell, Mass.—The contract for 2,000 sq. yds. of brick paving on the Moody St. bridge has been awarded to the Boston Paving Co., at $2.10 a sq. yd. for metropolitan brick; Staple Bros., Lowell, bid $2.25, and the Davis Co., Philadelphia, $2.80.

BRICK PAVING.—Fort Dodge, Ia.—J. W. Campbell, of Des Moines, is reported to have been awarded a $40,000 brick paving contract in this city, at $1.22 a sq. yd. for Fort Dodge brick; said to be the first paving to be done in town.

ASPHALT PAVING.—New York, N. Y.—The following bids were opened July 29 for asphalting 126th St., from Second to Fourth Ave.: California Asphalt Co., $3.09 a sq. yd. and 70 cts. for the curb; Sicilian Asphalt Paving Co., $2.88 and 65 cts.; Barber Asphalt Paving Co., $2.95 and 80 cts.; Warren-Scharf Asphalt Paving Co., $2.53 and 65 cts. For two asphalt strips, 4 ft. wide, along various streets, for bicycles, the bids are reported as follows: Sicilian Asphalt Paving Co., $2.23 and $2.16; Barber Asphalt Paving Co., $2.25; California Asphalt Co., $2.15 and $2.31.

CURBING AND STREET WORK.—Milwaukee, Wis.—Local papers state that contracts for curbing (lowest bids ever received) have been awarded as follows: A. Kellner, 33 cts. per lin. ft.; Arthur Froemming, 32⅔ cts.; John

Wilce, 33½ cts.; C. Edson, 32.49 cts.; J. H. Donahue, 33 cts. Seven contracts were awarded for paving alleys with cobblestones in various wards, the prices ranging from 34½ cts. to 42 cts. a sq. yd.; J. H. Kearney will furnish $2,000 worth of crushed stone for repairs of First Ward streets, at $1.08 a cu. yd.; John Morgan, $1,000 worth of gravel for the Sixth Ward at 65 cts.; T. R. Wiesemann, slag for repairs in four south side wards at from 46 to 56 cts., and C. Beck, slag for the Fourteenth Ward at 54 cts. a cu. yd.

BRIDGE.—New Bedford, Mass.—Wm. F. Williams, Cy. Engr., has sent us the following statement of the bids received July 15 for building that portion of the New Bedford & Fairhaven Bridge way and approaches, between the harbor commissioners' line, near the west shore of Pope's Island, and the west line of Main St., Fairhaven, 2,825 lin. ft., as noted in Engineering News of July 9; Wm. Sanders, Chn. County Comrs.; cost of items for double-tracking electric railway are omitted in table and also all the totals except the lowest total of each bidder for completed structure on engineer's plans; where more than one method of doing work is given the estimated quantitites are repeated:

SEWER MATERIALS.—Watertown, Mass.—The committee on sewers for the east end of Watertown is reported to have received the following bids July 26: For 15,400 ft. of 16 to 18-in. sewer pipe, Berry & Ferguson Co., Boston, 62% discount; David W. Lewis, Hyde Park, 62½%; Fiske, Holmes & Co., Boston, 63%; Waldo Bros., Boston, 63½%; M. B. Page, Peabody, 64½%; Portland Stoneware Co., Boston, 65%; George B. Teele, Watertown, 65%; Kennedy, King & Co., 72%; 73% if inspected at the factory. For hard-burned sewer brick, 250,000, the bids were as follows: Perry Bros., Cambridge, $8.50 per 1,000; W. H. Peveer & Co., Watertown, $8 and $8.50 (awarded contract). For 700 bbls. Rosendale cement: H. A. George, $1.07 per bbl.; Berry & Ferguson, $1.09; Chester, Sprague & Co., $1.15; for 200 bbls. Portland cement: H. A. George, Watertown, $2.07; Berry & Ferguson, $2.28; Chester, Sprague & Co., Watertown, $2.30; both contracts awarded to H. A. George. For manhole sets, about 70: Waltham Iron Foundry Co., $7 per set (awarded contract); Mechanics' Iron Foundry, $7.22. The system of sewers for East Watertown will be built by the town, and no contract labor will be employed. Work was begun July 26.

ORDNANCE SUPPLIES.—Washington, D. C.—The following bids were opened at the war department Aug. 3, according to press reports:

For 10-in. disappearing gun carriages—American Hoist & Derrick Co., St. Paul, ten or more at $11,800 each; Weimar Machine Works, Lebanon, Pa., 30, more or less, $17,250 each; Bethlehem Iron Co., five, at $16,800 each, or ten or more at $16,400 each; Robert Poole's Son & Co., of Baltimore, 30, at $13,748 each; Cramp & Sons, Philadelphia, 30, at $17,000 each; John H. Dialogue, Camden, N. J., five, at $20,300 each; Kilby Mfg. Co., Cleveland, O., six, at $17,500 each; Morgan Engineering Co., Alliance, O., one for $18,500, or six for $17,180 each; Pond Machine Tool Co., Plainfield, N. J., one for $24,147, ten for $169,470, and 20 for $330,940, if over 20, at $16,500 per carriage; Southwark Foundry & Machine Co., of Philadelphia, one for $12,660, all above ten at $11,500 each; Niles Tool Works, Hamilton, O., six at $15,975 each; and each additional carriage at $15,175 each.

Motor carriages—American Hoist & Derrick Co., 20 or more, at $5,618 per carriage; Weimar Machine Works, all of the carriages, but not less than ten, at $8,500 per carriage; the Dixon Mfg. Co., Scranton, Pa., ten spring return carriages at $8,950 each; Robert Poole's Son & Co., 56 or more spring return carriages, at $5,396 each; West Point Foundry Co., Cold Spring, N. Y., 20 or less spring return carriages, at $7,300 each; Morgan Engineering Co., one carriage for $8,150, or 12 for $6,980 each; Walker Mfg. Co., Cleveland, O., 56, more or less, at $8,250 per carriage; Niles Tool Works, ten for $7,575 each, and additional carriages at $7,175 each; Kilby Mfg. Co., six 12-in. carriages at $7,850 each; Southwark Foundry & Machine Co., one for $6,450, and all above ten for $5,750 each; Pond Machine Tool Co., five for $41,244, or 20 for $151,780; Builders' Iron Foundry, Providence, R. I., 50 or more at $6,136 each, less than 20 at $6,819 each.

Forgings for 10, 12 and 16-in. guns—Bethlehem Iron Co., 18 sets for 10-in. guns, at 23.6 cts. per lb.; for 12-in., 23.9 cts. per lb., and for 16-in., 24 cts. per lb.; Midvale Steel Co., 18 sets, for 10-in., 23.85 cts. per lb.; 18 sets for 12-in., 23.65 cts. per lb., and one set for 16-in., at 30 cts. per lb.

Mortar forgings—Bethlehem Iron Co., 60, more or less, for 12-in., 23½ cts. per lb.; Midvale Steel Co., 60 sets, at 29.3 cts. per lb.

Finishing and assembling 12-in. mortars—Builders' Iron Foundry, Providence, R. I., 30 or more, $3,759 each; less than 20, at $3,875 each.

Completing mortars—Bethlehem Iron Co., 20 complete, $12,250 each; over 20, at $12,000 each.

Rapid-fire guns—American Ordnance Co., 6-pdr., Driggs-Schroeder type, $1,565 each; Thomas F. Lane, 6-pdr., with mounts, Maxim types, $1,795 each.

Bids for deck-piercing shell were submitted by the Carpenter Steel Co., the Sterling Steel Co., and the Midvale Steel Co., and ranged from $162 and $141 for the 800-lb. shell to $208, and $175 each for the 1,000-lb. projectile. The same firms submitted proposals for furnishing armor-piercing shot.

The bids for $1,000,000 worth of steel gun forgings, for use in manufacturing two 8-in., 50 6-in., 35 5-in., and 20 4-in. breech-loading rifles opened at the navy department Aug. 3 were as follows: Bethlehem Iron Co., 4, 5 and 6-in. forgings, 26½ cts.; 8-in. forgings, 23.7 cts.; Midvale Steel Co., 4 and 5-in. forgings, 27 cts.; 6-in. forgings, 26 cts., 8-in. forgings, 23.9 cts. Secretary Herbert has intimated that he would not pay over 24 cts. for naval guns, this being the price allowed the army in the fortification act.

LEVEE WORK.—New Orleans, La.—James Hingle, Jr., Home Place, has been awarded 13 contracts for levee work, at 11 and 11.3 cts. a cu. yd.

EXTENDING WATER TUNNEL.—Ontario, Cal.—Arthur S. Hobby, Jr., Engr., Rose Block, Ontario, writes us that the bids received July 13 for extending the Bodenhamer tunnel have been rejected and the work is being done under the direction of the engineer at a much less cost than the lowest bid, the 3½ × 2½ × 6 ft. tunnel costing only $3.65 under present management; bids were as follows; all lumber for timbering to be furnished by the water company: Hall & Anderson, Monrovia, Cal., main tunnel to be retimbered, 20 ft. $4 a lin. ft.; main tunnel, 4½ × 3½ ft., extended, 50 ft., $6.40 a lin. ft.; lateral drifts, 3½ × 2½ × 6 ft., 420 ft., $6.25 a lin. ft.; shaft, 4 × 4 ft., 60 ft., $7 a lin. ft.; total, $3,445. Carmichael & McGillard, Pasadena, $10, $8.50, $6.75, $6.25 and $3,735, respectively.

CHANNEL EXCAVATION.—Vicksburg, Miss. — Bids were opened July 25 by Maj. J. H. Willard, U. S. Engr., for 150,000 cu. yds. of excavation in the Yazoo River canal. A. P. Martin, of Louisiana, was the lowest bidder at 19⅜ cts. Work is to begin as soon as the contract is awarded and must be completed by Dec. 25.

BRICK PAVING AND GRADING.—Des Moines, Ia.—The following bids were received for the paving of West Eighth St. and the grading of 18th St., from University Ave. to Forest Ave. For paving: A. P. Herrick, $1.45 a sq. yd.; J. L. Black, $1.43.9; J. A. Bryan, $1.37; W. A. Youngerman, $1.40; H. V. King, $1.43; for the grading: Herrick, 15.9 cts. per yd.; John A. Jones, 22½ cts.; J. A. Black, 15.9 cts.; William Jubb, 18⅜ cts.; and H. V. King, 12⅛ cts.

INDUSTRIAL NOTES.

THE SYRACUSE BELTING CO., Syracuse, N. Y., has made an assignment; liabilities, $16,000.

THE MERRIMACK WHEEL & GEAR CO., Amesbury, Mass., has had its plant closed by order of the mortgagee; liabilities, about $60,000; assets, $30,000.

THE CARNEGIE STEEL CO., Pittsburg, Pa., is stated to have put in blast furnace D at Braddock, Pa. This will give employment to 150 men who have been unemployed several months.

THE PORTLAND DOOR, SASH & BLIND CO., Portland, Me., will soon begin the manufacture of fireproof elevator and partition doors to be made of asbestos. The concern will employ between 40 and 50 men.

MR. JAMES H. LANCASTER, 169 and 171 Broadway, New York city, informs us that he has received from Kern Bros. Packing Co., Portland, Ore., an order for three 1¼-yd. grapples for the excavation of 300,000 yds. of earth.

THE EAST CHICAGO IRON & STEEL CO., of Hammond, Ind., made an assignment in the county court July 29 to David L. Evans. Parkhurst & Wilkinson, whose failure was noted last week, were interested in the concern.

THE AMERICAN HOIST & DERRICK CO., of St. Paul, submitted the lowest bid Aug. 3 for 10-in. disappearing gun carriages, at $11,800 each for ten or more, and will probably be awarded the contract by the War Department. The company bid $5,618 each for 20 or more motor carriages and may receive this contract also.

THE STAR FILE WORKS, Buffalo, N. Y., has changed hands and is now a stock company of which the following are the officers: Pres., Thos. B. Cloyes; Vice-Pres., Victor Hill; Secy., Ulysses J. Rogers; Treas., F. Cloyes. The company will continue to manufacture files and will also build bicycles. The factory is located on Adams St.

THE CARBOLINEUM WOOD-PRESERVING CO., of Nashville, Tenn., has opened an office at 21 Cliff St., New York, to which customers from the eastern and middle states are invited to send their orders direct. The manager of the company, Mr. C. S. McKinney, is now in personal charge of the New York office. The company reports an increasing demand for its Carbolineum Avenarius.

THE LUX & TALBOTT STONE CO., Logansport, Ind., has just completed the building of side tracks into its quarries in Logansport, Cass county, Ind., and is about prepared to deliver a superior quality of steel blue magnesia lime stone for building purposes. The company has erected a crushing plant with a capacity of 200 cu. yds. per day, for furnishing crushed rock for concrete or paving.

THE AMERICAN AIR POWER CO., Rome, N. Y., has delivered three Hardie air-motors to the Third Ave. R. R. Co., of New York, and is building trial air-motor for the Manhattan Elevated Ry. The company was incorporated a few months ago with a capital stock of $1,250,000, and has offices at 160 Broadway, New York; Pres., E. A. Willard; Vice-Pres., Edward Comstock; Treas., Henry Marquand; Secy., Samuel Lee; Gen. Mgr., Henry D. Cook; Engr., E. E. Pettee. Allen C. Washington, Pres. Iron Steamboat Co., and Arthur W. Soper, Pres. Safety Car Heating & Lighting Co., are among the stockholders.

THE BROWN HOISTING & CONVEYING MACHINE CO., of Cleveland, Ohio, General Eastern office, Havemeyer Bldg., New York, has just received an order from Fried. Krupp at Essen, Germany, for a complete hoisting and conveying plant for his blast furnace at Rheinhausen This plant consists of three standard Brown overhead bridge tramways, to be operated by electricity, each machine having independent winding drums and electric motors. The Brown Hoisting & Conveying Machine Co. is to furnish all the working parts, including the sheaves, engines, motors, hoisting and conveying machines, etc.: in fact, everything put the bridges proper, which will be built in Germany, the Brown Co. sending a man abroad for that purpose. There will be three Elwell-Parker motors used of about 60 HP. each. The entire plant is to be in operation by the early part of 1897.

THE GENERAL ELECTRIC CO., Schenectady, N. Y., has the order for installing electricity in the coal mines of Ellsworth, Morris & Co., Hartford, O. The system to be employed is the three-phase system of the General Electric Co., and the plant will consist of one 135-HP. electric generator and eight coal cutters of the new induction motor chain type. These will be placed in two mines at Trail Run and Hartford, O., distant from each other 2½ miles. The power house will be located centrally and the current will be carried for nearly two miles, over aerial wires, which will be run through drill holes into the entries of the mines and be carried to the various points where the cutters are employed. Induction motor cutters were adopted in place of direct current motor cutters for the reason that compared with the latter the former is lighter in make, possesses many characteristics rendering the method of applying power to the cutter superior, decreases the amount of copper required to equip the mine, has no commutator or brushes, has no starting rheostat and does not spark. The Hutson Coal Co., owning and operating coal mines at Deerfield, Portage Co., O., has also adopted electrical apparatus for cutting its coal. The plant consists of one 100-HP. three-phase generator and one 6-ft. coal cutter. The particular mine in which the cutter is working has just been opened. The entry is driven in only a few hundred feet and there is only room at present for one cutting machine.

NEW COMPANIES.—Reliance Engineering Co., Aurora, Ill.; to manufacture engines and ice machines; $250,000; John Alexander, Willis Hoyt, J. J. McLallen, and Henry Slaker.

American Clay Mfg. Co., Pittsburg, Pa., $1,000; Treas., Charles P. Hill.

Cicero Telephone Co., Austin, Ill.; $10,000; R. H. Trail, W. O. Cline, Louis Nissen.

Globe Chuck Co., Alexandria, Va.; $100,000; Albert Stephans, John A. Schneider.

Buhl Steel Co., Sharon, Pa.; $300,000; J. H. Buhl, K. S. Fruit, T. J. Foraker, John Carley.

Portland Elevator Co., Portland, Me.; $50,000; John W. Loud, Geo. P. Westcott, Chas. Percy.

Inter-State Equipment Co., New York, N. Y.; $5,000; John H. Sprall, F. W. Spier, H. L. Sprague.

Electrical Tool Co., New York city; $100,000; Stanley Cunningham, Abraham M. Johnston, L. A. Smith.

Patton Mfg. Co., Columbus, O.; to manufacture castings, $50,000; A. G. Patton, W. E. Joseph, N. B. Abbott.

Buhl Steel Co., Sharon, Mercer county, Pa.; $30,000; F. H. Buhl, T. D. Buhl, J. S. Fruit, T. J. Farker and John Carley.

Moffatt Bearing Co., Council Bluffs, Ia.; to manufacture and sell a ball roller bearing; $3,000,000; A. B. Hunt, B. Silloway, and Goerge F. Wright.

La Campania Aceite Mascotta de Los Estados Unidos de Norte America, Los Angeles, Cal.; to develop oil territory; $200,000; commencing with $500; H. L. Williams, L. A. Grant, K. H. Wade, E. L. Doheney, all of Los Angeles.

Philipsburg & Clearfield Telephone & Telegraph Co., Philipsburg, Pa.; $1,000, all paid in; Treas., Thomas J. Lee, Philipsburg, Pa.

Globe Electric Heating Co., Camden, N. J.; $100,000, commencing with $1,200; J. C. Haywood, Geo. B. Fraley, Amos B. Paulson.

Coronet Steel Co., Hoboken, N. J.; $500,000, commencing with $5,000; H. Richard Payne, New York city; Wm. R. Hinsdale, Orange, N. J.; Edward C. Sicardi, Brooklyn, N. Y.

Reading Schale Brick Co., Reading, Pa.; $75,000; commencing with $7,500; Treas., Wm. W. Seitzinger, 711 North 5th St., Reading, Pa.

M. Kollman & Co., San Francisco, Cal.; to manufacture electrical devices; $100,000; A. Iverson, M. Greenblatt, R. Capelli.

Carr Trolley Head Co., Bath, Me., to purchase, own and control patents, and patent rights useful in operating electric railways; $10,000, commencing with $200; W. H. Carr, C. R. Donnell.

New Hammondsport Wire Co., Hammondsport, N. Y.; $50,000; Edwin C. Cook, Bath; Benj. W. Wallington, Corning, N. Y.; Wm. H. Doty, of Yonkers, N. Y.

Knight Asbestos Mfg. Co., Newark, N. J.; $15,000, all paid in; Edward M. Knight, New York city; Thomas J. Regan, Wm. M. Clarke, Newark, N. J.

Acetylene Gas Apparatus Co., New York city; $100,000; commencing with $100; Ernest Hopkinson, D. N. Maxon, Brooklyn, N. Y.; David A. Davis, New York city.

Anti-Chill Core Compound Co., Peoria, Ill.; to manufacture castings; $2,500; Geo. M. Spangler, Charles E. Anderson, and Wm. P. Roberts.

The Durbrow & Hearne Mfg. Co., New York city; to manufacture machines and machinery; $25,000; Victor H. Schneider, of New York city; and W. E. Eatkins and John W. Leech, of Brooklyn.

Sussex Bicycle Co., Poughkeepsie, N. Y.; to manufacture bicycles; $5,000; Albert H. Gleason, C. H. Broas and Charles A. Stewart, of New York city.

American Falls Water Power Co., Milwaukee, Wis.; $200,000; to purchase and sell land, develop water power for navigation, manufacturing, mining, etc.; E. D. Rigby, J. E. Clayton and James M. Dunn.

Carbon Rheostat & Electrical Mfg. Co., Chicago, Ill.; $10,000; Sidney Stein, Henry R. Platt, Frank Crowe.

United Traction Co., Pittsburg, Pa.; $15,000; to commence with $1,500; Treas., John W. Taylor, Pittsburg.

Plunger Elevator Co., Towell, Mass.; $28,000; M. P. Higgins, G. I. Alden, J. W. Higgins and W. F. Cole.

Stevenson Wrench Co., Elkton, Md.; $10,000; George W. Cosden, James Mallen, Charles H. Squier, John S. Simcoe.

Alcade Oil & Mineral Association, Los Angeles, Cal.; J. F. Hall, W. H. Gilbert, G. W. Hack, all of Los Angeles.

Abbott & Hoyle Railway Supply Co., Atlanta, Ga.; $10,000; Frank J. Hoyle, Chas. A. Abbott, E. M. Roberts.

Adams County Telephone Co., Gettysburg, Pa.; $10,000; commencing with $1,000; Treas., George E. Stock, Gettysburg.

Poplar River Improvement Co., Duluth, Minn.; $50,000; to improve Poplar River, in Cook county, from its head waters to Lake Superior, especially with a view of improving navigation and logging; J. H. Younker, J. F. Dufur, A. W. Sanborn, A. Brace and A. H. Dufur, all of Ashland, Wis.

Warsaw Drainage & Sewer Co., Warsaw, Ind.; $10,000; J. D. Kutz, J. A. Frank, L. E. Harter, J. F. Beyer, R. I. Long.

Atlantic Mining & Smelting Co., New York, N. Y.; $10,000; Charles F. Phillips, Charles Roblee, Daniel R. Hendricks, of Brooklyn, N. Y.

British Columbia Smelting & Refining Co., Jersey City, N. J.; $2,500,000; to commence with $1,000; Geo. W. Mark, Stanley Gifford, New York; Edwin S. Maturin, Jersey City.

Columbia Motor Mfg. Co., Trenton, N. J.; $10,000; to commence with $1,000; John B. Powell, Philadelphia: Wm. Wallace, Henry J. Ingram, Trenton.

California Power & Exploration Co., San Francisco, Cal.; $500,000; to commence with $25; Chas. W. Willard, P. J. Muller, R. T. Harding, H. L. Atkinson, A. H. Winn, all of San Francisco.

West Melville Telephone Co., New Bethlehem, Pa.; $3,000; to commence with $300; Treas., J. F. Sloan, Hawthorn, Pa.

Pittsburg Fire Protection Co., Pittsburg, Pa.; $250,000, commencing with $25,000; Geo. B. Hill, Treas., 333 4th Ave., Pittsburg, Pa.

American Engineering Works, New York city; to manufacture and deal in machinery and gas and electric apparatus; $5,000; Frank M. Ashley, of Brooklyn, N. Y., and John J. Hankenhof, New York city.

Cisco Oil Mills Co., Cisco, Tex.; to manufacture cotton seed oil; $75,000; J. T. Reynolds, W. D. Reynolds, P. W. Reynolds, D. C. Campbell.

Palmetto Oil Co., Los Angeles, Cal.; $100,000, commencing with $50; J. F. Holbrook, J. L. Boyle, H. D. Thompson, all of Los Angeles.

Chas. F. Parker & Co., Jersey City, N. J.; to carry on general construction business; $125,000, commencing with $1,000; Chas. F. Parker, Frank Lazarus, J. Rockfield Furman, all of New York city.

Rarig Engineering Co., Columbus, O.; to manufacture engines, boilers, build blast furnaces, elevators, or hoists, foundations, make castings, and repair machinery; $200,000; A. K. Rarig, Theodore Leonard, E. N. Huggins, C. E. Morris and F. J. Sager.

Franklin Machine & Steam Boiler Works, Brooklyn, N. Y.; $14,000; Abella McNeil, Archibald McLean, and Jos. S. Montgomery, of Brooklyn.

Schlight Combustion Co. of Long Island; to manufacture and deal in machinery; $300,000; Thomas H. Harris, New York city; L. H. McKinney and Arthur H. Spear, of Brooklyn, N. Y.

Standard Radiator Mfg. Co., Buffalo, N. Y.; $750,000; Nelson Holland, Nelson C. Holland, and William H. Harris, all of Buffalo.

Interstate Equipment Co., New York city; to manufacture, sell and lease locomotives, cars and railway equipment; $5,000; John H. Pratt, F. W. Speir and H. L. Sprague.

BOSTON TRANSIT COMMISSION.

BOSTON SUBWAY, SECTION 5.

SEALED BIDS FOR BUILDING SECTION 5, open incline and subway, will be received at the office of the Boston Transit Commission, 20 Beacon Street, Boston, Mass., until 12 o'clock m. of Thursday, August 20, 1896. Each bid must be accompanied by a certified check for the sum of $1,000. Section 5 extends from the southerly end of Section 4, in Tremont Street, near Warrenton Street, to Pleasant Street. Some of the items are estimated to be as follows: 5,000 cubic yards earth excavation; 90 tons iron and steel, furnished by the Commission, to be set in place; 2,000 cu. yds. concrete, brick and cut stone masonry. Plans can be seen and specifications and forms of contract can be obtained at 20 Beacon Street, fifth floor. A bond will be required for the faithful performance of the contract in the sum of 20 per cent. of the amount. The commission reserves the right to reject any and all bids.

GEORGE C. CROCKER, Chairman.
CHARLES H. DALTON,
THOMAS J. GARGAN,
GEORGE F. SWAIN,
ALBERT C. BURRAGE,
Boston Transit Commission.
HOWARD A. CARSON, Chief Engineer.
D. LEIGHTON BEAL, Secretary.
32-2t

TREASURY DEPARTMENT, Office Supervising Architect, Washington, D. C., July 30, 1896.—Sealed proposals will be received at this office until 2 o'clock p. m., on the 27th day of August 1896 ,and opened immediately thereafter, for all the labor and materials required for the INTERIOR FINISH, PLUMBING AND GAS PIPING for the U. S. Post-office building at TAUNTON, MASS., in accordance with the drawings and specifications, copies of which may be had at this office or at the office of the Superintendent, at Taunton, Mass. Each bid must be accompanied by a certified check for a sum not less than 2% of the amount of the proposal. The right is reserved to reject any and all bids or to waive any defect or informality in any bid should it be deemed in the interest of the Government to do so. All proposals received after the time stated will be returned to the bidders. Proposals must be enclosed in envelopes, sealed and marked, "Proposals for interior finish, etc., for the U. S. Post-office, Taunton, Mass.," and addressed to WM. MARTIN AIKEN, Supervising Architect. 32-2t

COAL CONVEYOR.

Water Commissioner's Office,
Schenectady, New York,
July 28, 1896.

Sealed proposals will be received at this office until 10 o'clock a. m., of August 10th, 1896, for furnishing and erecting a complete plant for hoisting coal from boat and conveying same to coal shed. All information regarding the apparatus can be obtained from the Stanwix Engineering Company, at their office in the city of Schenectady. The commissioners reserve the right to reject any or all bids.

E. NOTT SCHERMERHORN,
WALLACE E. VAN DEUSEN,
DE WITT C. SMITH,
32-1t Water Commisioners.

PAVEMENTS.

Oswego, N. Y., August 1, 1896.

Sealed proposals will be received until 2 o'clock p. m., August 17, 1896, by the Department of Works of this city, for the construction of the following pavements:

ASPHALT PAVEMENT.

In West First, from Bridge Street to Utica Street, with vitrified brick in the center of street between street railway tracks and two feet on either side of tracks.

BRICK PAVEMENT.

In East Utica Street, from the east end of the bridge to Second Street, of vitrified brick.

All the above according to plans and specifications on file in the city engineer's office, copies of which will be furnished on application.

The right is reserved to reject any and all bids.

By order of the Department of Works.
32-2t E. A. COOKE, Clerk.

U. S. ENGINEER OFFICE, 1637 Indiana Avenue, Chicago, Ill., Aug. 3, 2896.—Sealed proposals for the following River and Harbor works will be received here until 12 m. Aug. 24, 1896, and then publicly opened: DREDGING in Calumet River, Ill.; DREDGING in Calumet Harbor, Ill.; PIER EXTENSION, Calumet Harbor, Ill. Information furnished on application. W. L. MARSHALL, Maj. Engrs. 32-2t

---

U. S. ENGINEER OFFICE, 537 Congress St., Portland, Me., July 23, 1896.—Sealed proposals for DREDGING at Lubec Channel, Camden Harbor, and Belfast Harbor, Me., will be received here until 3 p. m., August 24, 1896, and then publicly opened. Information furnished on application. A. N. DAMRELL, Lieut. Col. Engrs. 32-3t

---

U. S. ENGINEER OFFICE, 39 Whitehall St., New York, Aug. 3, 1896.—Sealed proposals for DREDGING in Port Chester Harbor and in Mamaroneck Harbor, N. Y., will be received here until 12 o'clock noon, Sept. 3, 1896, and then publicly opened. Information furnished on application. H. M. ADAMS, Major Engrs. 32-4t

PERSONALS.

Mr. N. M. Brandon, City Engineer, of Meridian, Miss., died Sept. 14.

Mr. Thomas Sharp, iron manufacturer, of Salem, O., died Sept. 10.

Mr. Chas. E. Putnam has been appointed Superintendent of Parks of Boston, Mass.

Mr. William F. Hunt, ex-County Surveyor, of Crawfordsville, Ind., died Sept. 12.

Mr. Hudson Ansley, President of the Salamanca (N. Y.) Water-Works Co., has resigned.

Mr. Arthur D. Seavy, ex-Water Commissioner and Auditor of Saratoga, N. Y., died Sept. 21.

Mr. F. P. Graf has been appointed Receiver for the Ohio Southern R. R., in place of Mr. J. R. Megrue, resigned.

Mr. Robert B. Lloyd, of the firm of Lloyd & Asson, contractors and builders, of New York city, died Sept. 9.

Mr. Harvey N. Loomis has been appointed General Manager of the Trojan Car Coupler Co., of New York city.

Mr. Jacob D. Valentine, of the firm of Valentine & Co., iron manufacturers, died at Bellefonte, Pa., Sept. 16, aged 75.

Mr. W. H. Hudson, Master Mechanic of the Southern Ry., at Atlanta, Ga., has been promoted to be Master Mechanic of the new shops at Salisbury, N. C.

Mr. Thomas Somerville, Superintendent of the Fairland, Franklin & Martinsville Branch of the Cleveland, Cincinnati, Chicago & St. Louis Ry., died Sept. 9.

Mr. W. A Stone, Master Mechanic of the Southern Ry., at Selma, Ala., has been transferred to Birmingham, in the same capacity, to succeed Mr. W. L. Tracy.

Prof. John J. Parson, of the School of Civil Engineering of Cornell University, Ithaca, N. Y., was married Sept. 15, to Miss Bertha Champlin, of Washington, D. C.

Mr. H. C. Stanley, an officer of the Department of Railways of Queensland, Australia, is making an examination of the railway systems of the United States and Canada.

Mr. Vernon H. Gridley, Assistant Engineer in the Bureau of Construction and Maintenance of the Department of City Works of Brooklyn, N. Y., died of typhoid fever, Sept. 17.

Mr. William B. Caton, an engineer on the Kansas City R. R., was killed in a railway accident near that city recently. He was formerly connected with various South American railways. He was 62 years of age.

Dr. Edward Coe Seymour, Principal of the Academic Department of the Polytechnic Institute of Brooklyn, N. Y., died Sept. 17. He had held this position for 37 years and was prominent as a mathematician.

Maj. M. B. Millen, railway contractor and builder, of Atlanta, Ga., died Sept. 13, aged 75. He built the Central of Georgia Ry. from Savannah to Macon, and was one of the best known contractors in the South.

Majors R. L. Hoxie, W. H. Hein and J. H. Gregory, of the Engineer Corps, U. S. Army, have been appointed as the Board of Engineers on the new bridge which it is proposed to erect across the Ohio River at Ironton, O.

Mr. George M. Lehman, late Assistant Engineer on the Lake Erie and Ohio River ship canal, has accepted the position of Assistant Engineer in charge of the government survey of the Allegheny River under Maj. R. L. Hoxie.

The following officers have been elected by the Board of Directors of the Oregon Improvement Co.: Mr. Elijah Smith, President; Mr. C. A. Dolph, Vice-President; Mr. Prosper W. Smith, Treasurer, and Mr. N. Poston, Secretary.

Mr. Benjamin Thackara, founder of the Thackara Manufacturing Co., of Philadelphia, Pa., died Sept. 15. He was born at Haddonfield, N. J., June 4, 1820, and was one of the largest gas fixture manufacturers in the country.

Mr. Edward H. Kendall has been appointed Consulting Architect of the Department of Docks of New York city. He is an ex-President of the American Institute of Architects and was Consulting Architect for the Washington Bridge over the Harlem River.

Mr. James M. Ashley, founder and ex-President of the Ann Arbor R. R., and father of Mr. H. W. Ashley, General Manager of the same, died in Alma, Mich., Sept. 16. He commenced the road in 1878, without capital, and was the chief executive for many years.

Mr. George F. Elms, mechanical engineer, of Chicago, Ill., has been appointed as an expert to investigate the various water meters in the market with a view to ascertaining which is the best for use in that city. He will be associated with two others and they will make their report to Commissioner Downey.

Mr. W. H. Newman, Third Vice-President of the Chicago & Northwestern Ry., has resigned to accept the position of Second Vice-President of the Great Northern Ry., to succeed Mr. Wm. W. Finley, whose election to the office of Second Vice-President and General Manager of the Southern Ry. was announced in our issue of Sept. 10.

Mr. Arthur J. Hubbard, Local Manager of the Standard Oil Co., at Toledo, O., fell from a train on the Lake Shore & Michigan Southern Ry., near Blissfield, Mich., Sept. 17, and died soon after of his injuries. He was 57 years of age and had been in the employ of the company all his life looking after their leases and wells in the western territory.

Mr. Edwin P. Dawley, M. Am. Soc. C. E., Division Engineer of the New York, New Haven & Hartford R. R., with office at Providence, R. I., has been appointed Resident Engineer of the new union station at Boston, Mass., to succeed Mr. George Blinn Francis, whose appointment to this position was announced in our issue of July 9.

Prof. Henry Moissan, of the University of Paris, arrived in New York, Sept. 21, by the "La Gascogne," from Havre. He comes as a representative of the University of Paris to the Princeton sesqui-centennial, which will be celebrated on Oct. 20, 21 and 22. He is President of the French Chemical Society and while in this country will be the guest of Prof. Marquand, of Princeton.

Mr. R. B. Gemmell, Superintendent of Telegraph of the Atchison, Topeka & Santa Fe Ry., died at Topeka, Kan., Sept. 14. He was born in Greensburg, Pa., April 27, 1839, and entered railway service in 1854 as a telegraph operator on the Pennsylvania R. R., remaining there until 1866. In 1866 he was appointed Chief Clerk to the General Superintendent of the eastern division of the Union Pacific Ry. In 1874 and 1875 he was Superintendent of the Lawrence & Southwestern R. R., and in 1875 he became Chief Clerk to the General Freight agent of the Atchison, Topeka & Santa Fe. He was appointed Superintendent of Telegraph in 1878 and held this position until his death.

◆

ENGINEERING SOCIETIES.

COMING TECHNICAL MEETINGS.

INDIANAPOLIS ENGINEERING CLUB.
Sept. 26. Secy., C. C. Brown, Indianapolis, Ind.

ENGINEERS CLUB OF PHILADELPHIA.
Oct. 3. "The Cement Laboratory of the City of Philadelphia," by R. L. Humphrey. Secy., L. F. Rondinella, 1122 Girard St.

TECHNICAL SOCIETY OF THE PACIFIC COAST.
Oct. 4. Secy., O. Von Geldern, 819 Market St., San Francisco, Cal.

WESTERN SOCIETY OF ENGINEERS.
Oct. 4. Secy., Nelson L. Litton, Monadnock Block, Chicago

CIVIL ENGINEERS' SOCIETY OF ST. PAUL.
Oct. 5. Secy., C. L. Annan, City Engineer's Office.

ENGINEERS' SOCIETY OF WESTERN NEW YORK.
Oct. 5. Secy., Carleton Greene, Library Bldg., Buffalo.

COLUMBIAN ENGINEERING SOCIETY.
Oct. 6. Secy., F. W. Hart, 15th and H Sts., N. W., Washington, D. C.

AMERICAN RAILWAY ASSOCIATION.
Oct. 7. Annual meeting in New York city. Secy., W. F. Allen, 24 Park Place, New York city.

ENGINEERS' CLUB OF ST. LOUIS.
Oct. 7. "Some Notes on the Operation of the St. Louis Water-Works Conduit," by S. Bent Russell. Secy., Wm. J. Bryan, Turner Bldg.

AMERICAN SOCIETY OF CIVIL ENGINEERS.
Oct. 7. "The Reconstruction of Grand River Bridge," by W. A. Rogers. Secy., C. W. Hunt, 127 E. 23d St., New York.

CANADIAN SOCIETY OF CIVIL ENGINEERS.
Oct. 8. Secy., C. H. McLeod, Montreal, Can.

ENGINEERS' AND ARCHITECTS' CLUB OF LOUISVILLE.
Oct. 8. Secy., James K. Zollinger, Norton Bldg., Louisville, Ky.

ENGINEERING ASSOCIATION OF THE SOUTH.
Oct. 8. Secy., L. P. Brown, Nashville, Tenn.

MONTANA SOCIETY OF ENGINEERS.
Oct. 10. Secy., Forrest J. Smith, Denver Block, Helena.

ENGINEERS' CLUB OF KANSAS CITY.
Oct. 12. Secy., F. W. Tuttle, Baird Bldg.

DENVER SOCIETY OF CIVIL ENGINEERS.
Oct. 13. Secy., Walter Pearl, 36 Jacobson Bldg.

NORTHWEST RAILWAY CLUB.
Oct. 13. Secy., T. A. Foque, Soo Line, Minneapolis, Minn.

NORTHWESTERN SOCIETY OF ENGINEERS.
Oct. 13. Secy. D. W. McMorris, 635 Burke Block, Seattle, Wash.

WISCONSIN POLYTECHNIC SOCIETY.
Oct. 13. Secy., W. K. Means, Loan and Trust Bldg., Milwaukee, Wis.

NEW ENGLAND RAILROAD CLUB.
Oct. 14. Secy., Edw. L. Jones, P. O. box 1158, Boston.

AMERICAN SOCIETY FOR MUNICIPAL IMPROVEMENTS.
Oct. 14-16. Secy., D. L. Fulton, Allegheny, Pa.

ENGINEERS' CLUB OF CINCINNATI.
Oct. 15. Secy., J. F. Wilson, P. O. box 333.

NEW YORK RAILROAD CLUB.
Oct. 15. Secy., W. W. Wheatley, Brooklyn Heights R. R., Brooklyn, N. Y.

TACOMA SOCIETY OF CIVIL ENGINEERS AND ARCHITECTS.
Oct. 16. Secy., 201 Washington Bldg.

ENGINEERS' CLUB OF COLUMBUS.
Oct. 17. Secy., M. S. Hopkins, Columbus, O.

ENGINEERS' CLUB OF MINNEAPOLIS.
Oct. 19. Secy., Elbert Nexsen, 1620 S. E. 4th St., Minneapolis, Minn.

ASSOCIATION OF RAILWAY SUPERINTENDENTS OF BRIDGES AND BUILDINGS.
Oct. 20. Annual meeting at **Chicago. Secy., S. F. Patterson, Concord, N. H.**

ENGINEERS' SOC. OF WESTERN PENNSYLVANIA.
Oct. 20. Secy., Daniel Carhart, 410 Penn Ave., Pittsburg.

WESTERN RAILWAY CLUB.
Oct. 20. Secy., W. D. Crossman, The Rookery, Chicago.

AMERICAN STREET RAILWAY ASSOCIATION.
Oct. 20-23. Annual convention at St. Louis. Secy., T. C. Penington, 2020 State St., Chicago.

ENGINEERS' AND ARCHITECTS' ASSOCIATION OF SOUTHERN CALIFORNIA.
Oct. 21. Secy., **F. Van Vleck, Los Angeles.**

ASSOCIATION OF ENGINEERS OF VIRGINIA.
Oct. 21. Secy., J. A. Pilcher, Roanoke, Va.

BOSTON SOCIETY OF CIVIL ENGINEERS.
Oct. 21. Secy., S. E. Tinkham, City Hall.

AMERICAN INSTITUTE OF ELECTRICAL ENGINEERS.
Oct. 21. Secy., R. W. Pope, 26 Cortlandt St., New York city.

WESTERN FOUNDRYMEN'S ASSOCIATION.
Oct. 21. Secy., A. Sorge, Marquette Bldg., Chicago.

CIVIL ENGINEERS' CLUB OF CLEVELAND.
Oct. 27. "Gas Producers and the Mechanical Handling of Fuel for Same," C. L. Saunders. Secy., F. A. Colburn, Case Library Bldg.

RAILWAY SIGNALLING CLUB.
Nov. 10. Secy., Geo. M. Bashford, The Rookery Bldg., Chicago.

CENTRAL RAILWAY CLUB.
Nov. 13. Secy., H. D. Vought, Buffalo "Courier," Buffalo, N. Y.

SOUTHERN AND SOUTHWESTERN RAILWAY CLUB.
Nov. 19. Kimball House, Atlanta, Ga. Secy., F. A. Charpiot, Macon, Ga.

NORTHWESTERN TRACK AND BRIDGE ASSOC.
Dec. 11. Secy., D. W. Meeker, St. Paul, Minn.

AMERICAN SOCIETY OF IRRIGATION ENGINEERS.
Dec. 11 and 12. Annual meeting to be held in Denver, Colo. Secy., John S. Titcomb, Room 36, Jacobson Bldg., Denver, Colo.

NATIONAL IRRIGATION CONGRESS.
Dec. 15, 16 and 17. Annual meeting to be held in Phoenix, Ariz. Secy., C. M. Heintz, Los Angeles, Cal.

MICHIGAN STATE ENGINEERING SOCIETY.—The following officers have been elected: Pres., Geo. Wells, Bay City; Secy. and Treas., Francis Hodgman, Climax; Directors, D. Skeels, Grand Rapids; Wm. B. Sears, Saginaw; C. E. Greene, Ann Arbor, Mich.

AMERICAN SOCIETY OF RAILROAD SUPERINTENDENTS.—At the recent meeting at Niagara Falls, N. Y., noted in our issue of Sept. 17, some new officers were elected, the President, Mr. Price, however, holding office for another year, and the Secretary, Mr. C. A. Hammond, also holding his office. The new officers are as follows: First Vice-President, W. F. Potter (Flint & P. Mar. R. R.), Saginaw, Mich.; Second Vice-President, G. R. Brown, Fall Brook Ry., Corning, N. Y.; Members of the Executive Committee, C. A. Brunn, Erie R. R., Buffalo, N. Y., and Ralph Peters, Pittsburg, Cincinnati, Chicago & St. Louis Ry., Cincinnati, O.

ENGINEERS' CLUB OF PHILADELPHIA.—At the regular meeting on Sept. 19, Mr. E. F. Smith presented a paper on "The Water Supply of Philadelphia—Considered with Reference to the Minimum Flow of the Schuylkill River." He presented tabulated statistics, comparing the Philadelphia water supply with that of other eastern cities. Mr. Smith referred to the great area and population of this city, and said there was need of several impounding reservoirs to insure a full supply during seasons of drought. The great need of Philadelphia is a larger storage capacity, and this might be secured by constructing several large reservoirs, with a capacity of about 20,000,000 gallons, with which to feed the other reservoirs.

WESTERN SOCIETY OF ENGINEERS.—At the meeting held Sept. 16, two papers on "Parks and Roads" were read by Mr. H. C. Alexander and Mr. J. F. Foster. The following are the papers to be read at the coming meetings of 1896: Oct. 7, "Railway Yards and Terminals," by H. G. Hetzler; Oct. 21, "Steel for Boilers and Fire Boxes," by T. L. Condron, and "Steel Forgings," by H. F. J. Porter; Nov. 4, "Medical Treatment of Men on Engineering Work," by Dr. S. W. Maphis; Nov. 18, "Cableways," by Frank B. Knight; Dec. 2, "The Equipment of Manufacturing Establishments with Electric Motors and Electric Power Distribution," by D. C. Jackson, and "Electric Traction," by Edward Barrington; Dec. 16, "Modern Pumping Machinery," by E. E. Johnson.

WESTERN FOUNDRYMEN'S ASSOCIATION. — The regular meeting of the association was held at the Great Northern Hotel, Chicago, Sept. 16, and two papers were read, by Mr. Curtis W. Shields, on "Compressed Air and Its Economies in the Foundry," and by Mr. Geo. A. True, on "Compressed Air as a Hoisting Power in the Foundry." The committee appointed to report upon an apprenticeship system presented its final report. The report divided foundry work into three classes, viz.: (1) General machinery work; (2) Agricultural and stove molders; (3) Bench and brass molders; and gave a form of indenture for each class. The meeting was followed by a banquet in the evening. A. Sorge, Marquette Building, Chicago, is the secretary of the association.

WESTERN RAILWAY CLUB.—The first of the regular monthly meetings of the club for the year 1896-7 was held at the Auditorium Hotel, Chicago, Ill., Sept. 15. The paper of Mr. David L. Barnes on "The Relation of Speed to the Power and Efficiency of Direct Current Series Electric Motors for Railways," was discussed and also the paper by Prof. W. F. M. Goss on "Notes Concerning the Performance of the Purdue Locomotive, 'Schenectady.'" For topical discussion the subject was "Metal Underframing for Tenders and Cars," In the evening a banquet was held at the hotel. The club begins its new year's work with a membership of 888 railway men, and its prospects are bright for an active and valuable year's work. Among the pleasing announcements made is the one that a complete subject index of the proceedings of the club since its organization, twelve years ago, is now in the hands of the printer and nearly ready for distribution. Mr. A. M. Waitt, General Master Car Builder, Lake Shore and Michigan Southern Ry., is president of the club, and Mr. Walter D. Crossman, The Rookery, Chicago, is the secretary.

MASTER CAR BUILDERS' ASSOCIATION.—The following is the list of subjects for committee reports to be presented at the meeting in June, 1897:

1. "Automatic Couplers" (Continued). To advise what changes may be desirable in the standard size of M. C. B. automatic coupler shank, and to recommend a standard yoke or pocket strap for rear attachment to car.

2. "Uncoupling Arrangements for M. C. B. Automatic Couplers" (Continued). To consider whether a standard uncoupling device is practicable and the details thereof, and to recommend a device which would be applicable to the greatest number of couplers possible.

3. "Loading Logs, Poles, Bark and Long Structural Material on Cars." To suggest modifications of or additions to recommended practice, if found desirable.

4. "Trains Parting." To consider the extent and causes of break-in-twos with automatic couplers, and to suggest remedies.

5. "Passenger Car Pedestal and Journal Box for Journal 4¼ × 8 ins." To suggest designs.

6. "Specifications and Guarantee for Cast-Iron Wheels." To propose a revision of the recommended practice of the Association, and to consider therewith the form of wheel.

7. "Air-Brake and Signal Instructions." To confer with a committee from the American Railway Master Mechanics' Association and to propose a revision of the code adopted in 1892.

8. "Freight Car Buffers." To follow up and report upon experiments about to be made with improved buffers.

9. "Box-Car Side and End Doors." To submit designs for side and end doors, including fixtures, for adoption.

10. "Arch Bars and Column Bolts for Diamond Trucks." To recommend forms in detail, for cars of 60,000 lbs. capacity, and to submit designs for same for cars of 80,000 lbs. capacity.

11. Independent Committee of Five to present individual report on Designs for Steel Car Frames.

12. Subjects for 1898. Jno. W. Cloud, Secy.

MASTER CAR AND LOCOMOTIVE PAINTERS' ASSOCIATION.—The twenty-seventh annual convention was held at the Park Avenue Hotel, New York city, Sept. 9 to 11, over 100 members being present. The convention discussed: "The Application of Compressed Air in Burning Paint Off Cars," "The Cause and Prevention of the Flatting of Varnish on Coaches and Engines," "Is it Advisable to Paint Locomotive Jackets, either Planished Iron or Black Steel? If so, Which is the Best and Most Economical Method," "Painting Galvanized Iron," "The Practical Painting of a Locomotive." In the last discussion it was brought out that the cost of painting locomotives on different railways varies widely. Mr. D. M. Little presented a table showing the cost on eleven different roads to vary from $113.59 for passenger and $90.97 for freight engines to $46.55 for passenger and $23.87 for freight; the average cost on the eleven roads being respectively $68.68 and $59.88. The discussion on this topic dealt more with the artistic than the practical.

For painting jackets and superheated parts, Mr. W. J. Josenhaus recommended the following: 13 lbs. keg lead, ⅛ gallon coach japan, ½ gallon rubbing varnish, ¼ gallon turpentine, 1 lb. lamp-black and ¼ lb. Prussian blue. The convention advised the painting of jackets of rusted planished iron or steel for the purpose of preservation; the surface to be carefully cleaned before the application of the paint. It was stated that paint in imitation of planished iron could be made but no formulas were given.

On the question of housing passenger equipment, the majority of the members expressed themselves as favoring car sheds not only for idle cars but for those remaining standing only from one train to another. This housing must, however, be done in well lighted and well ventilated buildings, or else the varnish and paint will be spoiled.

It was the opinion of the convention that the one great cause of trouble with railway painted work is that the paint is not allowed sufficient time to dry.

Other questions discussed were as follows: "Which is the Most Economical and Durable, a Sandpaper or a Pumice Stone Surfacer?" "Spontaneous Combustion in the Railway Paint Shop," "Is it Advisable for the Association to Employ a Practical Chemist for the Accommodation of Members?"

The old officers were elected for the ensuing year: Pres., C. E. Copp, Boston & Maine R. R.; first Vice-Pres., C. W. Mason, Pennsylvania R. R.; second Vice-Pres., D. B. Vail, New York, Lake Erie & Western R. R.; Secy., Robt. McKeon, Kent, O. The next meeting will be held at Old Point Comfort, Va.

AMERICAN SOCIETY OF CIVIL ENGINEERS.—At the meeting on Sept. 16, Mr. E. Sherman Gould read an abstract of his paper on "The Water-Works of Havana, Cuba," giving a very interesting account of the methods of work and the peculiar conditions controlling contract work under Spanish rule, which latter part of the paper was commented upon in our issue of Sept. 3. The specifications called for wrought iron service pipes, but these were corroded by the soil in about three months and the contractors had to keep on making renewals, as they were not allowed to follow their wishes and use the ¾-in. and 1-in. cast-iron pipe which can be obtained from English makers (though not manufactured in the United States). Eventually, however, the authorities permitted the use of a patent pipe which resisted corrosion and thus avoided further trouble. The cast-iron mains were not allowed to be coated, the specifications having been prepared many years ago, before the present coatings were in use, and it was the idea of the engineer who framed these specifications that a coating was merely a method of concealing defects. The pipes were therefore laid bare and rusty, but there was not so much trouble from discoloration of the water as Mr. Gould had expected.

In the discussion, Mr. Tratman referred to the author's remarks on the handling of large blocks of stone by merely manual power, and said that in clearing the site for the new Dalhousie Square station of the Canadian Pacific Ry. at Montreal, boulders and large stones were moved and rolled up planks into the carts by gangs of five or six men, or as many as could get a hand on the stone to hoist or push it along, no derricks being used. He also asked whether the concrete was laid wet, as the author described the methods by which the finished work was kept constantly wetted down for some months. In answer to this Mr. Gould said that it was laid fairly wet, though it was difficult to exactly describe the consistency. While he did not approve of very wet concrete (as favored by the Spanish engineers) he considered that very dry concrete was even worse. Mr. Chibas described the red tape and the "metallic influence" required to get permission from the local and home authorities to carry out the simplest engineering works in Cuba, even the construction of a plantation tramway, the time occupied being often from four to six years; in the Spanish-American countries the system is entirely different, based more on American practice. Mr. Wegmann referred to the use of asphalt pipes, described in a German paper, but no members seemed to know anything about said pipes. The secretary read a discussion from Mr. Emile Low describing a brine reservoir with four basins, built at Saltsville, Va. Two of the basins were 120 × 75 ft., 12 ft. deep, and two were 72 × 57 ft., 7 ft. deep. The floor was of concrete (laid very wet), and the walls of brick. The brickwork was laid in mortar instead of cement for reasons of cheapness, but parts failed and fell down, the mortar never having hardened and being so soft that it could be washed off the fallen bricks with water from a hose. The work was rebuilt with brick laid in cement.

◆

NEW PUBLICATIONS.

RULES FOR LOADING LONG MATERIALS.—Rules Governing the Loading of Lumber and Timber on Open Cars and Loading and Carrying Structural Materials, Plates, Rails, Girders, Etc. Adopted by the Master Car Builders' Association as Recommended Practice. 1896. Published by the Association; Secretary, John W. Cloud, 974 Rookery Building, Chicago. Paper; 8vo.; pp 20; illustrated. 5 cts.

These rules were given practically in full in our issue of July 23, 1896.

THE WISCONSIN ENGINEER.—University of Wisconsin Engineering Journal, Quarterly, Madison, Wis., June, 1896. Pamph.; 8vo.; pp. 160. $1.50 per year.

This is the first number of a new engineering periodical published quarterly by the students of the College of Engineering of the University of Wisconsin. It is a very creditable publication, and contains a number of interesting articles on engineering subjects written by the professors and instructors in the college. A special feature is an alphabetically arranged classified index of current engineering literature, covering the leading American, English, French and German periodicals. The index in the first number covers the dates Dec., 1895, to April, 1896, inclusive.

TRADE PUBLICATIONS.

WESTINGHOUSE ENGINES.—The Westinghouse Machine Co., Pittsburg, Pa. Pamph.; 6 × 9 ins.; pp. 43.

This pamphlet contains a number of half-tone cuts of important installations of Westinghouse engines, with lists of sizes, with some account of their material, workmanship, testing, steam economy, etc. It informs us that in the 14 years that these engines have been on the market there have been 7,000 of them put into operation in all parts of the world.

TABLES OF DIMENSIONS OF GATE VALVES AND FITTINGS.—The Walworth Mfg. Co., Boston, Mass. Pamph.; 10 × 13 ins.; pp. 32.

We believe these tables which this enterprising firm has just published will be found a great convenience in every water-works office and by every engineer and contractor engaged in water-works construction. The tables show clearly every important dimension of each size and weight of the gate valves, flanges, elbows, tees and crossings, and screwed fittings which the firm manufactures. The trouble and delay caused when a fitting is ordered for some especially contracted situation and has to be returned because it proves too large, can all be obviated by the use of these handy tables; and the enterprise of the manufacturers in publishing them will doubtless be appreciated by their customers.

CONSTRUCTION NEWS.

CONDENSED LIST OF CONTRACTS PENDING WITH DATE OF OPENING BIDS.

Bids to be opened.	Work. Place.	See Eng. News.
Sept. 24.	Canal work (3 contracts), Albany, N. Y.	Sept. 17
Sept. 24.	Levees, masonry, etc., Albany, Ill.	Sept. 17

RAILWAYS.

East of Chicago.

BROOKLYN WHARF AND WAREHOUSE.—This company is making rapid progress in the work of providing railway facilities along the water front in connection with its system of warehouses in Brooklyn, N. Y.

BROOKVILLE.—The Brookville, Pa., "Republican" states that the work of construction is being pushed, 140 men being now employed. The tracks have been laid for a distance of about six miles, nearly one-half of the entire length of the road.

CHICAGO, INDIANA & EASTERN.—A press report states that this railway, extending from Fairmount to Matthews, Ind., ten miles, has suspended operations, the receiver, George B. Sweetser, Marion, Ind., finding it unprofitable to operate the line. Receiver Sweetser has petitioned for an order of sale for the rolling stock to pay the labor claims.

CARP & ALMONTE.—The Almonte, Ont.; "Gazette" states that Bell & Wilkie, surveyors, have their staff at work making a preliminary survey of the proposed new line of railway from Carp to Almonte. Almonte and Carp business men subscribed between $200 and $300 to pay for the survey.

CAMBRIA COUNTY.—Geo. S. Good & Co., Lock Haven, Pa., have the contract for building this branch of the Beech Creek R. R., and will commence work at once. It is reported that it will extend from Wigton colliery to Spangler, Pa., a distance of seven miles; the company is capitalized at $100,000. When the road is completed a large quantity of coal mined at Spangler and Barnesboro will be shipped over it to the Beech Creek. Pres., Marlin E. Olmstead, Harrisburg, Pa.; directors, W. M. Ogelsby, A. C. Stamm, H. C. Houtz, of Harrisburg, and F. E. Herriman and William T. Grier, both of Philadelphia.

FALL BROOK.—Geo. S. Good & Co., Lock Haven, Pa., have also been awarded several arches and other masonry, as well as trestle filling in the Cowanesque Valley for the Fall Brook R. R. Co. Pres., Geo. J. Magee, Corning, N. Y.

JOHNSTOWN & ARMAGH.—The Johnstown, Pa., "Democrat" states that T. C. Du Pont, John Fulton, M. B. Stevens, W. H. Matthews and N. F. Thompson were appointed a committee by the Johnstown board of trade to negotiate the building of this railway. It is stated that the Pennsylvania Ry. Co. will build the line if aid can be secured along the route.

LIMA NORTHERN.—A press report from Adrian, Mich., states that a party of Lima Northern officials and promoters visited that city Sept. 13, and consulted local citizens in regard to arrangements for building the road directly into the city. It now connects with the Wabash, 10 miles south, and will run its trains to Adrian over the latter company's tracks. Asst. Ch. Engr., N. M. De Bruin, Lima, O.

NORTH SHORE.—A press dispatch from New Brighton, Pa., states that this railway, noted in our issue of Sept. 17, is capitalized at $200,000; incorporators, Theo. Oatman, John Reed, Charles J. Coats, W. J. Barr, W. J. Smith, D. D. Mills, J. B. Campbell, J. J. Lovinger and E. S. Kennedy.

SENECA COUNTY.—The Buffalo, N. Y., "Enquirer" announces that work will begin the latter part of this month. The foreman is at Geneva, and considerable material has been accumulated in the way of ties and railroad iron.

SHELBYVILLE SOUTHERN.—W. S. Dawley, C. E., Chicago, writes us that this is a branch of the Chicago & Eastern Illinois from Shelbyville to Altamont, Ill., a distance of 24½ miles; the line is located and the right of way is nearly all purchased. Contract is let to M. S. Cartter & Co., Oriel Bldg., St. Louis, Mo., who have 200 teams at work. Two pile drivers and masons are at work on the foundations for a viaduct over the Kaskaskia River, 1,400 ft. long and 100 ft. above the bed of the stream. Ch. Engr., N. R. Olcott, Altamont, Ill. Baxter L. Brown, Resident Engr., Shelbyville, Ill., also writes us as above, and states that sub-contractors are Johnson Bros. & Fought, St. Elmo, Ill.; Myers Construction Co., St. Louis, Mo.; Detroit Bridge Co., Detroit, Mich.

Southern.

BALTIMORE & OHIO.—The Martinsburg, W. Va., "Independent" states that the branch from Green Spring to Romney may be extended to Moorefield. Surveyors are now at work laying out the route. Ch. Engr., N. T. Manning, Baltimore, Md.

CAROLINA, TENNESSEE & OHIO.—Gillis & Black, contractors, Wilmington, N. C., write us that the projected length is 30 miles from Navassa, via El Paso and Town Creek, to Southport, N. C. The work is now half completed. Gillis & Black and Frank H. Blodgett, Willston, O., are the contractors. Pres., J. C. Challenger, Philadelphia, Pa.; Ch. Engr., Walter G. MacRae, Wilmington, N. C.

LOUISVILLE & NASHVILLE.—This company proposes to renew its main track in Newport, Ky., during October, with 80-lb rails.

SISTERSVILLE.—E. J. Miller, Ch. Engr., Wheeling, W. Va., writes us that the preliminary survey has been completed as far as Middlebourne, W. Va., a distance of 12 miles. This is the most difficult part of the route. The road is projected to extend from Sistersville to some point in Tyler county.

Northwest.

GREAT NORTHERN.—A press dispatch from Aneta, N. Dak., states that this company is extending its Hope branch to Aneta, in the southeastern part of Nelson county, N. Dak. It will be completed about the middle of October. The terminus will be Aneta, N. Dak. Ch. Engr., J. F. Stevens, St. Paul, Minn.

KANSAS CITY & OMAHA.—This company has been incorporated to build a railway 170 miles long, beginning at Fairfield, Clay county, Neb.; capital stock, $3,000,000; incorporators, W. R. Kelly, Frank W. Hills, W. J. Carroll, Erastus Young and Frank D. Brown. It is reported that the Union Pacific is interested.

LUMBER.—A press dispatch from Dickerson, Minn., states that D. F. Brooks and M. J. Scanlon, of Scanlon, Gibson Lumber Co., Minneapolis, Minn., and Engineer Cox have been looking over the proposed route for a new logging railroad, on which they expect to commence work immediately. The line will run north into Carleton county, through a large tract of timber which this company recently purchased.

PEORIA, LACON & NORTHERN.—E. C. Howlett, Secy., Peoria, Ill., writes us that the projected length is 51 miles from Spring Bay, via Holton and Lacon, to Spring Valley, Ill., The surveys are made, right of way well in hand; capital not all secured; contracts will be let as soon as money is subscribed. Pres., Jno. M. McNabb, Mount Palatine, Ill.; Ch. Engr., Geo. F. Wigton, Lacon, Ill.

Southwest.

BATON ROUGE & CENTRAL LOUISIANA.—The Alexandria, La., "Town Talk" states that F. M. Welch is promoting the building of this railway. The capital stock is said to be fixed at $3,000,000; he is trying to secure a 5-mill 10-year tax from the parishes through which the road will be built. It is proposed to have the line in operation by Jan. 1, 1898.

Rocky Mountain and Pacific.

ALVISO.—The San Jose, Cal., "News," dated Sept. 9, states that all impediments to the project of the Alviso Ry. are now removed and that it is now ready for construction; contractors were on the ground last week making estimates, which will be submitted to the railway people next week. It is expected that actual work on the construction of the road will commence in two or three weeks, and it will be pushed rapidly to completion.

BRITISH COLUMBIA SOUTHERN.—A press report states that this company has given notice of an application to Parliament for power to extend its line of railway from its present authorized terminus in Crow's Nest Pass, easterly to MacLeod and Lethbridge, in the Province of Alberta, British Columbia. The line has been subsidized with a land grant of 4,000,000 acres.

COLUMBIA & RED MOUNTAIN.—A press dispatch, dated Sept. 12, stated that tracklaying from Spokane, Wash., will begin next week, and the road will be hauling ore in 80 days. It has a grade from Northport, where connection is made with the Spokane line, of 3%, The altitude of Rossland at the terminal is 2,100 ft. above Northport, and the line is 22 miles long.

SONORA.—This company has advertised for bids for furnishing 15,000 ties, 6 × 8 ins. and 8 ft. long; to be delivered not later than Dec. 31, 1896. Address, the office of the company, at Guaymas, Mex.

WILCOX.—A press dispatch states that a railway will be built from Wilcox, Ariz., on the Southern Pacific, southward to Nacosari, to open a copper camp. A company, with a capital of $6,000,000 has been formed for the purpose of building and the plans and specifications are being made. Work will begin inside of four months and the surveyors will begin as soon as the plans are completed. Prof. Ricketts will have charge of the engineering corps.

STREET AND ELECTRIC RAILWAYS.

SOUTH PORTLAND, ME.—The Portland "Express" states that the Portland & Cape Elizabeth Ry. Co. has petitioned the selectmen of South Portland to allow it to build a single track electric railway with the necessary turnouts and switches from the junction of the shore road and Angell St., to the town line between South Portland and Cape Elizabeth. A hearing will be held at the town hall, Sept. 28.

BARRE, VT.—The Barre Electric Ry. Co. is said to have filed a bond to the amount of $3,000 with the city clerk to the effect that it will have the proposed electric railway in operation by Sept. 1, 1897. F. C. Kennedy, Burlington, Vt., is interested.

BOSTON, MASS.—The "Transcript" states that the New York, New Haven & Hartford Ry. may equip its suburban lines with the third rail electric system, such as is now in use on the Nantasket Beach route.

NEWTON, MASS.—The Wellesley & Boston St. Ry. Co. has been granted permission to build an electric railway.

WORCESTER, MASS.—The "Telegram" states that A. L. Kneeland has succeeded in organizing the Westminster St. Ry. Co., to build an electric street railway to Mount Wachusett, a distance of about 10 miles; capital stock, $100,000. Among those interested are: D. C. Miles, Wm. Mayo, F. A. Merriam, Artemus Merriam, P. P. Ellis, and S. F. Lamb, of Westminster; W. B. Ferguson, of Malden; W. E. Putney, of Fitchburg, and Geo. H. Mellen, of Worcester.

WEYMOUTH, MASS.—The Weymouth & Braintree St. Ry. Co. has been granted permission to extend its tracks.

WEST HAVEN, CONN.—The Winchester Ave. St. Ry. Co. has been granted permission to extend its lines.

COHOES, N. Y.—It is stated that an electric railway 1¾ miles long will be built to connect, through Watervliet and Green Island, the lines of the Cohoes City and the Albany City Ry. companies, and thus connect Cohoes and Albany. Houlihan & Larkin are the contractors. Work will begin at once.

TOTTENVILLE, N. Y.—The Edgewater trustees have granted permission to the Midland Electric R. R. Co. to construct a double track on Richmond road from Broad St. to Osgood Ave.

CARLISLE, PA.—M. B. Cumbler, Ch. Engr., Carlisle, Pa., writes us that it is the Cumberland Valley Traction Co. and not the Lamb Valley that is building the electric railway from Carlisle to Boiling Spring, as stated in our issue of Sept. 10. Pres., Geo. W. Cumbler, Steelton, Pa.

DOYLESTOWN, PA.—The stockholders of the Doylestown & Willow Grove Turnpike have leased the road to the Bucks County Ry. Co. for building an electric railway. It is stated that work on the extension from Willow Grove to Doylestown will begin by Oct. 15. The distance is 12 miles. Henry J. Harris, Doylestown, is interested.

CONNELLSVILLE, PA.—A charter has been issued to the Connellsville Suburban St. Ry. Co. to build a line to connect Connellsville and South Connellsville, by way of the village of Gibson; capital stock, $25,000; directors, S. R. Slaymaker, John F. Barrey, Lancaster; Joseph Soisson, John D. Frisbee, H. S. Newmyer, John Soisson, R. W. Soisson, Connellsville.

BALTIMORE, MD.—Rights of way through private property have been secured by the City & Suburban Ry. for the proposed extension of its Walbrook line from Mount Holly to Electric Park. Grading will probably be finished this winter and tracks laid early next spring. The road will be double-tracked and 2½ miles long.

FREDERICK CITY, MD.—It is stated that the Frederick & Middletown Electric Ry. Co. has obtained the right of way over the Baltimore & Frederick turnpike and will soon begin work on an extension to the Frederick fair grounds. It is expected to have the road completed by Oct. 12.

GOSHEN, IND.—A press report states that the Commercial exchange is advocating a proposition to secure the completion of the electric line between Goshen and Elkhart. It is proposed to levy a ½% tax for the purpose and a special election is soon to be called to vote on the question.

PEORIA, ILL.—The "Herald" states that the village trustees of North Peoria granted a franchise to the Glen Oak & Prospect Heights Electric Ry. Co.

SOUTH MILWAUKEE, WIS.—The Milwaukee Electric Ry. Co. has been granted permission to extend its lines into South Milwaukee. An agreement with the Racine Electric Ry. Co. has been prepared and awaited only the granting of the franchise to be signed by the officers of the two lines. It arranges for an interchange of cars and a continuous passage between the two cities without change, a distance of about 25 miles. It is stated that the grading has been completed to a point within four miles of the corporate limits of the village and within six miles of the terminus. Ties have been distributed along the line and large quantities of steel are awaiting distribution. All the work has been completed for several miles out of Racine.

KANSAS CITY, MO.—A proposition to give a franchise to the West Side St. Ry. is being considered.

EMPORIA, KAN.—The Emporia Electric Light, Ry. & Gas Co. has been incorporated; directors: F. R. Beidler and A. M. Coffman, Baltimore, Md.; J. A. Bendure, Atchison, Kan.; William Addis, H. Parkman, D. W. Hainer and J. O. Patterson, Emporia.

CANON CITY, COLO.—Jos. B. Crosby, London, Eng., is said to be the promoter of an electric railway to connect Canon City with the Cripple Creek district. It would be used for hauling ore. The plan includes the erection of two mills and the building of a power plant to illuminate Cripple Creek. The estimated cost of all is $1,250,000.

TACOMA, WASH.—The "Ledger" says that the King county commissioners have ordered recorded the acceptance of a franchise to Frank C. Ross for a street railway across the East Tacoma tide flats.

LOS ANGELES, CAL.—The city council will receive bids until Oct. 5 for a franchise for an electric street railway. C. A. Luckenbach, Cy. Clk.

SAN JOSE, CAL.—It is reported that the supervisors have granted the petition of L. M. Hale for six months' extension of time in which to commence the work of constructing an electric railway from the western boundary line of San Jose to Saratoga.

LIVERPOOL, N. S.—It is reported that an electric railway is to be built at once from Liverpool, five or six miles to the pulp mill at Milton, to carry its products, as well as passengers, to the seaport.

QUEBEC, QUE.—A company of Quebec capitalists is said to be in the process of formation to take over the franchise of Mr. Beemer and construct the electric railway. The capital necessary for this purpose is estimated to be $400,000. Among those interested are: E. E. Webb, T. H. Dunn, A. Breakey, F. W. Ross, A. Thompson, E. M. Methot, E. Sharples, G. T. Davie. It is said to be the intention of the promoters to put between 400 and 500 men at work at once to equip and put in operation the Lower Town section as far as the St. Valier tollgate this fall.

ELECTRIC LIGHT AND POWER.

NEAZIE, ME.—It is reported that the Public Works Co., of this place, is soon to put in a new 750-HP. engine at its power plant.

COLLINS, N. Y.—An electric light plant will be placed in the state farm hospital at Collins. About 1,000 incandescent lights and sufficient wiring and a dynamo will be required; also a 400-HP. boiler, etc., for the new pumping plant. Arch., A. C. Essenwein, 316 Pearl St. Buffalo, N. Y.

SYRACUSE, N. Y.—The council has granted franchises for electric light and power and telephone systems to Eugene Hughes & Co. R. R. Stuart, Cy. Engr.

DOVER, N. J.—It is stated that the site for the proposed new plant of the Dover Electric Light Co. has been selected; it is probable that contracts for the erection of the plant will soon be awarded.

DUNMORE, PA.—Bids are asked until Oct. 6 for lighting this place with 55 arc lights for five years, commencing Feb. 1, 1897. Address H. B. Gilligan.

AUGUSTA, GA.—Local papers state that a company is being organized to build a new electric light plant in this city. E. A. Swete, Arlington Hotel, is reported as interested.

BRUNSWICK, GA.—It is proposed to build an electric light plant in this city. J. B. Abrams, Chn. Com.

JACKSONVILLE, FLA.—It is stated that the Jacksonville Textile Mill Co. is securing estimates for a 60-light dynamo.

SHREVEPORT, LA.—The mayor is reported as interested in a projected light plant.

ROSEVILLE, GA.—J. W. Stevenson has been granted a franchise for an electric light and power plant.

BRYAN, O.—Bids are asked until Oct. 9 for constructing an electric light plant. Engr., Frank B. Rae, 134 Monroe St., Chicago, Ill.; John W. Nelson, Mayor; A. E. Snyder, Chn. Com.

JASPER, IND.—The Jasper Electric Light Co. is reported to have been granted a franchise for lighting this city, a plant for which will be built at once.

MANISTEE, MICH.—Bids are asked until Oct. 15 for lighting the streets with 100 arc lights. James L. Sibben, Cy. Clk.

GILLESPIE, ILL.—It is stated that Smith & Querback, of Staunton, Ill., have been granted a franchise for lighting this place with electricity for ten years.

STAUNTON, ILL.—Bids are asked by the city clerk until Sept. 29 for constructing an electric light plant. Consult. Engrs., Bryan & Humphrey, Turner Bldg., St. Louis, Mo.

OCONTO, WIS.—It is reported that estimates are wanted for constructing a 100-arc light-plant. C. A. Bridger, Cy. Clk.

BRITT, IA.—The Britt Light & Power Co. is reported to have been granted a franchise. The company wants bids for two 25 K-W. machines, engines, boilers, lamps, wire.

CARTHAGE, MO.—The council is reported as considering the question of putting in a municipal electric light plant.

FERGUSON, MO.—It is reported that the Olive Branch Electric Light & Supply Co. proposes to build a duplicate plant.

ST. LOUIS, MO.—The board of public improvements will soon ask for bids for lighting the streets of this city with electricity for 23 years. Robt. E. McMath, Pres.

BALLINGER, TEX.—An electric light plant is to be constructed by the Ballinger Mfg. Co., according to reports.

TACOMA, WASH.—The fire and water committee has decided to recommend to the council the granting of the request of the board of public works for $6,000 worth of improvements in the light department. T. E. Doherty, Comr. Pub. Wks.

MARIPOSA, CAL.—The Mariposa Electrical Co. was incorporated last week. It proposes to dam the Merced River and thus secure about 6,000 HP. The works will be 7½ miles from the dam and the plant will be in the center of the mother lode. It is said that nine-tenths of the mines are now idle because steam power is too dear.

SAN JOSE, CAL.—A resolution has been adopted by the council granting the Peninsular Lighting Co. permission to erect poles, string wires and make all preparations for equipping an electric light line from San Francisco Creek to Mayfield and Mountain View. H. A. Pfister, Clk.

GRANBY, QUE.—It is reported that an electric plant is projected to light this place, Adamsville, Farnham Centre and East Farnham.

WINCHESTER, ONT.—An electric light plant for this place is proposed, according to reports.

LIMA, PERU.—It is stated that the corporation of the city of Lima has approved a contract with an American electric lighting and tramway company to which is accorded concessions to the amount of 70,000 ($34,000) sols per annum. Feberico Bergmann, Consul Gen., 25 Whitehall St., New York, N. Y.

NEW COMPANIES.—Amherstburg Electric Light, Heat & Power Co., Limited, Amherstburg, Ont.; $20,000; W. H. McEvoy, Amherstburg; F. C. Armstrong, Toronto, Ont.; J. J. Ashworth, Toronto; Mary A. McEvoy, Amherstburg; Mary A. Kane, Amherstburg.

Marquette Electric Co., Chicago, Ill.; $2,500; Edwin O. Lamphere, Henry J. Brubaker, Ripley N. Baylis.

Bradley Electric Light, Heating & Power Co., Cleveland, O.; $100,000; George Lillis, John C. Burgess, S. H. Holding, M. W. Neal, Frank S. Masten.

San Luis Potosi Electrical Co., Charleston, W. Va., $100,000, with $500 paid in; Chas. H. White, Fred. J. Curnick, Geo. A. Waddell, New York, N. Y.; Justin D. White, Newark, N. J.; P. Du Pratt White, Nyack, N. Y.

BRIDGES.

PORTLAND, ME.—Bids are asked until Oct. 9 for building five masonry bridge piers, as stated in our advertising columns. Geo. N. Fernald, Comr. Pub. Wks.

FALL RIVER, MASS.—The construction of an $18,000 bridge in the park is being considered. Phillip D. Borden, Cy. Engr.

BEVERLY, MASS.—The question of building a temporary drawbridge at a cost of $2,500 is being discussed by the council. The draw of the permanent bridge is to be widened at once.

WOONSOCKET, R. I.—An appropriation of $21,500 has been made for new bridge abutments, etc. Plans will be ready in about ten days. Frank H. Mills, Cy. Engr.

HARTFORD, CONN.—The committee has awarded J. J. Goodwin the contract at about $2,000 for building an ornamental stone bridge over Park River at Asylum Ave.

TORRINGTON, CONN.—The Berlin Iron Bridge Co., of East Berlin, Conn., has been awarded the contract at $6,895 for constructing a new bridge over the Naugatuck River at Main St.

BINGHAMTON, N. Y.—The Owego Bridge Co., Owego, N. Y., has been awarded the contract for building two new bridges over the Seneca River at a cost of $19,400.

BUFFALO, N. Y.—The New York Central & Hudson River R. R. Co. has signed a contract with the grade crossing commissioners to abolish the grade crossing at Chicago St. A large viaduct will be built.——The council has asked the board of public works to prepare plans and specifications for rebuilding the unsteady piers of the Elmwood Ave. bridge.

NEW YORK, N. Y.—Plans have been prepared by M. A. Kellogg, Ch. Engr. Park Dept., for an approach for the southern end of the Central bridge. The improvement will widen 153d St. 40 ft., giving it a total width of 70 ft

HACKENSACK, N. J.—Bids are asked until Oct. 3 for building a bridge with steel beams and flagging at Wortendyke. John H. Post, Chn. Com., Hackensack.

BEAVER FALLS, PA.—The viewers have recommended the purchase by the county of the bridge over the Beaver River at Bridgewater, which has recently been condemned; its value is reported at $37,000.

ELLWOOD CITY, PA.—The county commissioners have awarded to Nelson & Buchanan, Chambersburg, Pa., the contract for the cantilever bridge over the Connequenssing River. It will be 468 ft. long with a 24-ft. roadway, and two 5-ft. sidewalks.

PHILADELPHIA, PA.—The board of surveys has recommended the construction of a bridge over the railway tracks at Butler St. at a cost of about $100,000. T. M. Thompson, Dir. Pub. Wks.

PHILADELPHIA, PA.—It is stated that the engineer of bridges of the Pennsylvania R. R. Co. is preparing plans for a 10-span steel viaduct bridge on the Phoenixville branch, near Chickering Valley station.——H. P. Nichols, of the Philadelphia & Reading R. R., is preparing plans for an iron and stone bridge at the Falls Road, Falls of Schuylkill.

BOYDS, MD.—Press reports state that the contract for erecting a steel bridge for the Baltimore & Ohio R. R. Co., over Little Seneca Creek, near Boyd's, has been let to the Pennsylvania Steel Co., Steelton, Pa. Work has commenced on the bridge, which is expected to be finished by Dec. 15, 1896. The new bridge will replace a wooden structure. It will be over 400 ft. long and about 100 ft. high. The construction will be under the management of John W. Carroll, of Harrisburg, Pa. The masonry, which was awarded to Bennett & Talbott, of Greensburg, Pa., is rapidly nearing completion under the supervision of C. A. Grannell, of Smithfield, Pa. The engineers in charge of the work are P. H. Irwin, C. M. James and Webb. M. Kefauver, of Baltimore, Md.

HASTINGS, FLA.—The citizens have petitioned the county commissioners at St. Augustine for a new bridge over Deep Creek.

CLEVELAND, O.—The Erie R. R. Co. is considering plans for a bridge over its tracks at Martin St.

INDIANAPOLIS, IND.—Bids will be received Sept. 30 for five girders under bridge over canal at West St.

DETROIT, MICH.—Chas. F. Payne, Engr. Michigan Central R. R. Co., has prepared plans for an iron bridge to carry the railway tracks over Woodward Ave.; estimated cost, $53,000.

CHICAGO, ILL.—L. B. Jackson, Cy. Engr., has ordered the rebuilding of the bridge over the river at Northwestern Ave.——It is stated that the Milwaukee Bridge Co., of Milwaukee, Wis., was the lowest bidder Sept. 2 for the construction of the bridge for the Elgin, Joliet & Eastern R. R. Co., over the Chicago drainage canal, as advertised in Engineering News, at $33,477, and also for the Southwest Boulevard bridge at $15,200: Benzette Williams, Chicago, was the lowest bidder at $34,444, for the masonry for the latter bridge. James Reddick, Clk. Sanitary District.

FOSTER, ILL.—The township committee has voted to build a 65-ft. and a 50-ft. bridge in Drury township. Joseph Fitzpatrick, Chn. Com.; F. P. Gillitt, Town Clk.

DULUTH, MINN.—Bids are asked until Oct. 6 for constructing four bridges of 150 to 52 ft. span. O. Halden, County Audr.; F. Davis, County Surv., Trust Co. Bldg.——The council has voted to request the St. Paul & Duluth R. R. Co., the Northern Pacific R. R. Co., and the Duluth Transfer Ry. Co. to build a viaduct over their tracks at Garfield Ave. Henry Truelsen, Mayor.——The Duluth-Superior Bridge Co. has filed a second general mortgage covering an issue of $300,000 of general second mortgage bonds subject to the first mortgage of $650,000. The mortgage is given to the Central Trust Company, of New York, and runs 30 years at 5%. The piles for the pivot pier for the bridge have been driven and work on the masonry has been begun. Ch. Engr., A. P. Boller, 71 Broadway, New York, N. Y.

ST. PAUL, MINN.—The city engineer has been directed to prepare plans for an iron bridge at Summit Ave., over the railway tracks. L. W. Rundlett, Cy. Engr.

HILLSBORO, N. DAK.—The following bids were received Sept 8 for constructing nine county bridges; Geo. O. Stomner, County Audr., Hillsboro:

Gillette-Herzog Mfg. Co., Minneapolis, Minn.	$9,939
L. H. Johnson, Minneapolis	10,000
S. M. Hewett & Co., Minneapolis	10,050
Milwaukee (Wis.) Bridge & Iron Works	9,592
Wrought Iron Bridge Co., Canton, O. (accepted)	9,395

ELK POINT, S. DAK.—Bids are asked until Oct. 15 for constructing a 220-ft. wooden and iron pile bridge at the mouth of the Broken Kettle, and also a 161-ft. pile bridge over the Big Sioux River. A. P. Asbjeld, County Audr.

BIG TIMBER, MONT.—Bids are asked until Oct. 8 for constructing an iron and steel bridge over the Yellowstone River, near Big Timber. J. W. Bailey, Chn. Bd. County Comrs.

BILLINGS, MONT.—The construction of a 150-ft. bridge over the Musselshell River, at a cost of $5,000, is being considered. J. C. Bond and P. O. Grennell are the commissioners. A. A. Morris, County Surv., Billings.

HOUSTON, TEX.—Bids are asked until Oct. 12 for erecting a bridge over Green's Bayou on the Houston and Crosby Road; bond, $2,000. John G. Todd, County Judge, Houston.

WICHITA, KAN.—We are informed that the county commissioners received the following bids Sept. 15 for constructing a 225-ft. steel bridge, each company submitting its own plan:

Oregonia Bridge Co., Oregonia, O.	$4,718 and $4,899
St. Louis Br. & Ir. Co., St. Louis, Mo.	4,050 and 4,375
Mo. Valley Br. & Ir. Co., Leavenworth, Kan.	4,195
Farnsworth & Blodgett, Kansas City, Mo.	4,100
Massillon Bridge Co., Massillon, O.	5,200
Geo. E. King Bridge Co., Des Moines, Ia.	4,000
Groton Bridge & Mfg. Co., Groton, N. Y.	4,985
Canton Bridge Co., Canton, O.	3,960
Wrought Iron Bridge Co., Canton, O.	$3,600 to 4,300
Kansas City Bridge Co., Kansas City	4,300 and 4,406
Youngstown Bridge Co., Youngstown, O.	3,550 to 4,700

DENVER, COLO.—The city engineer has been directed to prepare plans and specifications for completing the 14th Street viaduct. W. W. Booth, Pres. pro tem. Bd. Pub. Wks. T. J. Milner, Ch. Engr.

KANSAS CITY, MO.—Daniel O'Flaherty, Kansas City, has prepared plans for a new viaduct from Main to Wall St., on 8th St.; estimated cost, $20,000. H. A. Wise, Cy. Engr.

SIDNEY, WASH.—Bids are asked until Oct. 5 for constructing a 600-ft. trestle in Section 15. Joseph Pitt, County Audr.

CORVALLIS, ORE.—Bids are asked until Oct. 7 for constructing a wooden bridge over the Luckiamute River. V. E. Watters, County Clk.

OAKLAND, CAL.—The council is considering the question of filling in the space at the 8th St. bridge and of rebuilding the bridge at a cost of about $19,000.

RED BLUFF, CAL.—Bids are asked by the city clerk until Sept. 28 for constructing a 100-ft. steel bridge.

SACRAMENTO, CAL.—Bids are asked until Sept. 28 for constructing a steel or combination bridge over the Cosumnes River on the Stockton road, near McConnell's Station. The structure is to be 225 ft. long with a roadway 20 ft. wide; and until the same date for an 80-ft. trestle. J. C. Boyd, County Surv.; Wm. B. Hamilton, Clk.

SAN RAFAEL, CAL.—The city trustees have accepted plans and specifications for a concrete bridge.

SONOMA, CAL.—The street committee has authorized the city clerk to advertise for bids for building a new bridge at Fourth St.

BUILDINGS.

BURLINGTON, VT.—Bids are asked until Oct 12 for the construction, plumbing, heating, etc., of one double set of officers' quarters at Fort Ethan Allen. Capt. Guy Howard, Asst. Q. M., Burlington.

BURLINGTON, VT.—It is reported that the Central Vermont R. R. Co. will soon build a new round house in this city. F. W. Baldwin, Gen. Supt., St. Albans, Vt.

BOSTON, MASS.—Estimates are being secured for erecting a 5-story brick office building on Fulton St., near Barrett St., for the estate of Thos. E. Proctor. Archs., Winslow & Wetherell, 3 Hamilton Place.——Bids are asked until Oct. 1 for constructing, heating and ventilating a brick school building at Chambers and Poplar Sts. Arch., John L. Faxon, 7 Exchange Place; Edward H. Dunn, Chn. Com.

BOSTON, MASS.—The American Congregational Association has appointed a committee to secure plans, etc., for a new building on Beacon St. adjoining the Boston Atheneum. The building will be a 10-story steel frame structure. Rev. Joshua Coit, Wm. H. Emerson, Jonathan A. Lane, Rev. Dr. A. H. Quint and Samuel B. Capen compose the committee.

MELROSE, MASS.—Tristram Griffin, 172 Washington St., Boston, and Malden, Mass., has prepared plans for a new high school building to cost $100,000. The building will be 154 × 76 ft. Royal P. Barry, Chn. Com.; Oliver A. Roberts, Chn. School Bd.

NORTHAMPTON, MASS.—It is reported that bids will soon be asked by Joseph Heckert for erecting a Masonic temple to cost $65,000. Archs., Putnam & Bayley, Northampton.

BROOKLYN, N. Y.—We are informed that the following bids were received by the bureau of docks and yards, Washington, Sept. 21, for repairs to the hospital at the Brooklyn Navy Yard, as advertised in Engineering News:

Thomas Dwyer, 106 E. 116th St., New York	$47,000
M. Gibbons & Son, 318 Columbia St., Brooklyn	29,975
Isaac A. Walker & Son, 1213 Filbert St., Phila.	26,491
D. S. Hess & Co., 876 Broadway, New York	38,900
Arthur H. Weeks, 2150 Fulton St., Brooklyn	32,000

BUFFALO, N. Y.—Eckel & Ackerman, 46 Niagara St., have prepared plans for an addition to engine house No. 2. It will be of brick and stone, 20 × 116 ft., and is to cost $20,000. Bids will probably soon be asked.——I. G. Perry, State Arch., Albany, has prepared plans for the $400,000 armory of the 74th Regiment of the National Guard. There is an appropriation of $25,000 to begin the work.

COLLINS, N. Y.—The trustees of the state farm at Collins have instructed A. C. Essenwein, 316 Pearl St., Buffalo, to add to the original plans a hospital wing for 120 patients, costing $60,000, a dining room for 800, to cost, $20,000, a kitchen and servants' wing to cost $30,000, and a laundry.

MOUNT VERNON, N. Y.—The committee has reported the cost of a new city hall at $150,000. Edwin W. Fiske, Mayor.

NEW YORK, N. Y.—Bids are asked until Oct. 7 for makiing repairs, etc., to the fire department building at 160 Chambers St.; bond, $7,000. O. H. La Grange, Pres. Comrs. Fire Dept, 189 East 67th St.——Hoppen & Koen are preparing plans for an office building at Broadway and 37th St. for Mrs. Wm. J. FitzGerald. Col. S. V. R. Cruger and H. W. McVickar can be addressed.——It is stated that R. T. Wilson, a New York banker, proposes to erect an office building at 32 and 34 Broadway.——Local papers state that there is some talk of constructing two hotels at Broadway and 36th St., and at 37th St. E. A. Cruikshank & Co. are the representatives.——Plans have been filed by Phillip Kloeberg for a 4-story brick dwelling on Riverside Drive, near 73d St., to cost $55,000, and by G. L. Lawrence for a 5-story brick store on Amsterdam Ave., near 106th St., to cost $45,000.

NEW YORK, N. Y.—Plans have been filed by the New York Building & Improvement Co., 156 Broadway, for a 12-story brick store building at 625 Broadway, to cost $318,000.

SYRACUSE, N. Y.—Benson & Brockway, 225 Bastable, Syracuse, and 55 Broadway, New York, have prepared plans for a building for the Bank of Syracuse. The structure will be 70 × 27 ft. and is estimated to cost $50,000.

HOBOKEN, N. J.—Bids are asked until Oct. 14 for constructing a new school building at Park Ave. and Newark St. Archs., Fall & Maxson, 1214 Washington St.; M. V. McDermott, Cy. Clk.

MONTCLAIR, N. J.—Bids are asked until Sept. 26 for erecting a school building on Maple Ave. John J. H. Love, Clk. Bd. Education.

NEWARK, N. J.—Plans are being considered by the board of health for a hospital to cost $200,000.

ALLEGHENY, PA.—Geo. J. Holler, 151 Washington Ave., Allegheny, has been awarded the contract for erecting a new school building in Ward No. 6, at $96,400. The total cost will be about $125,000.

APOLLO, PA.—Edward Stotz, 347 Fifth Ave., Pittsburg, has prepared plans for a brick school building. Address S. S. Jack, Apollo.

ANNAPOLIS, MD.—Morrow & Bro., of Baltimore, have been awarded the contract at $15,794 for constructing a new school building in this city.

BALTIMORE, MD.—An appropriation of $20,000 has been made for two new elevators in the city hall. B. B. Owens, Inspector of Bldgs.

NORFOLK, VA.—It is reported that work will soon be begun on a new hotel for the Monticello Realty Co. The building will be six stories high, 217 × 150 ft., and will contain 230 guest rooms. Pres., D. Lowenberg; Archs., Carpenter & Peebles, 104 Main St., Norfolk.

MARTINSBURG, W. VA.—Bids are asked until Oct. 9 for constructing approaches to the post office building in this city, as stated in our advertising columns. Wm. Martin Aiken, Supervising Arch., Washnigton, D. C.

TALLADEGA, ALA.—The executive committee of the Alabama Industrial School for White Girls at Montevallo has asked for new bids for constructing the first of the three proposed wings for the school. The bids received Sept. 14 ranged from $16,500 to $21,000.

NEW ORLEANS, LA.—Harrod & Audry, Masonic Bldg., are preparing plans for a $50,000 office building.

LEITCHFIELD, KY.—W. H. Bailey, of Henderson, Ky., has been awarded the contract at $13,759 for erecting a county court house. O. F. Hughes, Geo. Fletcher and J. A. Bishop are the commissioners.

LOUISVILLE, KY.—Plans are wanted for a two-room addition to the court house, which addition is reported as estimated to cost about $250,000. Alderman De Garno, Chn. Com.——Joseph McWilliams & Co. have been awarded the contract for a new heating apparatus for the county court house, at $8,900.

RUSHVILLE, IND.—Plans are asked by the committee of the members of the Immaculate Conception Church for a new edifice to cost $25,000.

DETROIT, MICH.—Bids are asked until Oct. 7 for constructing a county building in this city. Archs., John Scott & Co., 85 Moffat Block, Detroit; Wm. Rickert, Chn. Com., County Audrs.

CHICAGO, ILL.—The residents of Irving Park have selected a committee to make arrangements for erecting a new school building.

CHICAGO, ILL.—The construction of a printing building to cost about $200,000 is proposed for the University of Chicago. C. W. Chase is the director of the University Press.

MINNEAPOLIS, MINN.—It is stated that J. J. Hill, Pres. Great Northern Ry., has been granted a permit to erect a 1,500,000-bushel elevator in this city.

HELENA, MONT.—The capitol building commission on Sept. 5 let the first contract for the excavation for the foundation and basement for the new state capitol to Gebhardt & Wegner, of Helena, at 18 cts. a cu. ft. for earth work and 50 cts. cu. ft. for rock work. Arch., Geo. R. Mann, City Hall, St. Louis, Mo.; J. E. Rickards, Chn. Com., Helena.

GALVESTON, TEX.—Plans and specifications are asked by the Galveston Wharf Co. until Nov. 14 for constructing a 500,000-bushel elevator, and also for a 250,000-bushel clearing house. John E. Baily, Secy., Galveston.

SPOKANE, WASH.—Chase & Daniels, proprietors of the Arcadia Theatre at Riverside, are receiving bids for constructing a $50,000 theatre, according to reports.

FRESNO, CAL.—The board of supervisors has examined plans and specifications for the new county orphanage,

LAWRENCE, MASS.—The contract for a new pumping engine has been awarded to the Barr Pumping Engine Co., at $9,500. A. D. Marble, Cy. Engr.

MILLER'S FALLS, MASS.—The commissioners of the water supply district are reported to have voted to receive bids this week for the construction of the works from Lake Pleasant to Miller's Falls.

NEW BEDFORD, MASS.—Bids are asked until Oct. 1 for building foundations at pumping station and constructing conduit connections, etc., as stated in our advertising columns. Geo. S. Rice and Geo. E. Evans, Engrs., Boston; R. C. P. Coggeshall, Supt.

BALLSTON SPA, N. Y.—An election was called for Sept. 24 to vote on the question of a new water supply.

BRIDGEWATER, N. Y.—E. F. Musson, of Norwich, is making preliminary surveys for works at this place. If his report is favorable the question will soon be submitted to a vote of the people. This item, by mistake, was published under Norwich, N. Y., last week.

BROOKLYN, N. Y.—The board of aldermen has appropriated $311,000 for the usual maintenance of the water system; $150,000 for diverting Horsebrook stream from Hempstead reservoir; $75,000 for the purchase of ponds near Springfield and for the cleaning of the ponds and streams now in use as water supply. Theodore B. Willis, Comr. Cy. Wks.

DELHI, N. Y.—The company has submitted a proposition to sell the works to the village for $35,000.

LITTLE VALLEY, N. Y.—Efforts are being made to secure a new reservoir for better fire protection.

WATERVLIET, N. Y.—Bids are asked until Oct. 17 for furnishing labor and material for increasing the water supply for fire protection at Watervliet arsenal. Maj. Isaac Arnold, Jr., Ord. Dept.

DOVER, N. J.—Councilmen Mulligan, Young and Baker have been appointed a committee to employ an engineer and investigate the question of municipal works; present contract expires in November, 1897.

PASSAIC, N. J.—The Passaic Water Co. is said to have awarded a contract for trenching for a 30-in. water main from the Grand St. reservoir, at Paterson, to the two others, to William Whitmore, County Engr.

ALTOONA, PA.—S. C. Corson, of this city, is preparing plans for works for the borough of Juniata; new election will be held Nov. 3; at a previous election $24,000 in bonds was voted for works, but proposed source of supply voted on then has been changed.

BEAVER FALLS, PA.—The People's Water Co. has been organized by William Sloan, Mark Wisener, Sr., J. D. Perrott and others to construct works.

DAWSON, PA.—Bids are asked until Sept. 30 for laying about 4,000 ft. of 10 to 4-in. pipe, building a 100,000-gallon brick reservoir, etc. Taylor, Romine & Scott, Engrs., McKeesport; D. J. Redding, Chn. Com.

DELTA, PA.—The board of trade is reported as considering the question of constructing a reservoir and putting in water-works.

HARRISBURG, PA.—An ordinance appropriating $10,000 to extend the intake pipe further into the river has passed first reading in select council.

LEBANON, PA.—It is reported that one or more artesian wells will be sunk at South Mountain to secure at least 2,000,000 gallons of water a day, work to be commenced at once.

McKEESPORT, PA.—The water commissioners have contracted with Jacob Hocker, of Hocker & Shaw, to sink an 8-in. test well in the river near the pumping station.

PITTSBURG, PA.—Bids are asked until Sept. 25 for laying water pipe in about 30 streets, for furnishing and erecting a steel water tank, with foundations, for building new pumping station, for furnishing and erecting boilers and for one 12-in. reducing valve. E. M. Bigelow, Dir. Pub. Wks.

ARLINGTON, MD.—Local papers state that the water board has decided to abandon the scheme to furnish West Arlington with water from an artesian well.

NORFOLK, VA.—The water board is reported to have decided to send the superintendent to Massachusetts to investigate the question of filtration.

RICHMOND, VA.—Improvements to cost $1,400 are to be made at the pumping station.

PIEDMONT, W. VA.—Pownall & Minshall, of St. Louis, Mo., have been engaged to design a system of water-works for this city. R. W. Cannon, Secy. Comrs.

LINCOLNTON, N. C.—It is reported that the North State Hotel Co. and the county have united in contracting for works at this place.

LAURENS, S. C.—Bids are asked until Oct. 1 for the purchase of $30,000 in 20-year 6% water and light bonds. L. G. Balle, Clk.

EATONTON, GA.—An election will be held Oct. 12 to vote on an issue of $25,000 in bonds for water-works.

OXFORD, ALA.—Surveys are being made for a new water supply from a spring.

CHARLESTON, MISS.—A press report states that the county supervisors have advertised in local papers for bids for sinking an artesian well, probably 500 ft. deep, but received no bids.

TUNICA, MISS.—It is reported that this town has voted to issue bonds for artesian wells.

NASHVILLE, TENN.—The board of public works is considering the question of a water supply for the Centennial; about two miles of new mains will probably be required.

LANCASTER, KY.—There is talk of sinking an artesian well. Address, J. E. Stormes.

MARION, KY.—R. E. Bigham is reported as interested in projected works at this place.

BLANCHESTER, O.—Bids are asked by the city clerk until Oct. 3, according to reports, for the purchase of $20,000 in bonds for water-works. G. L. McKibben, Engr., Van Wert, O.

CINCINNATI, O.—The superintendent has been directed to report the best means for supplying Winton Place and Chester Park with water.

DAYTON, O.—Plans are being considered for a new water supply for the insane asylum at this place; estimated cost about $16,000. J. M. Ratliff, Supt.

HIRAM, O.—B. S. Dean, Clk. Bd., writes us that the bids received Sept. 15, as advertised in Engineering News, exceeded the appropriation, and new plans are now being made, after which new bids will be opened. E. C. Cooke, Engr., Cleveland.

ZANESVILLE, O.—Bids are asked until Sept. 28 for furnishing and erecting a 6,000,000 or 8,000,000-gallon pumping engine T. D. McCaddon, Secy.

EVANSVILLE, IND.—Bids are asked until Oct. 15 for furnishing 1,215 tons of 30-in. water pipe and special castings, as stated in our advertising columns. L. Weinheimer, Clk. Water Trustees.

JACKSON, MICH.—Bids are asked until Oct. 5 for the purchase of $10,000 in 5% refunding water bonds maturing Sept. 1, 1904. W. J. Caldwell, Cy. Recdr.

VICKSBURG, MICH.—It is reported that $15,000 in water and light bonds have been sold to Grand Rapids parties.

WYANDOTTE, MICH.—The water board is reported about to purchase two new boilers, 66 × 14, and also to introduce the meter system.

ALTON, ILL.—It is stated that the water company has refused to put in a filter at the pumping station; the matter has been referred by the council to a committee with power to act.

CHICAGO, ILL.—Bids are asked until Nov. 14 for furnishing and erecting six 20,000,000-gallon pumping engines, as stated in our advertising columns. Joseph Downey, Comr. Pub. Wks.

EDWARDSVILLE, ILL.—Bids are being asked, according to reports, for sinking test wells. Joseph Edmonds and G. W. Belk are interested.

MINONK, ILL.—Bids are asked until Oct. 5 for furnishing and erecting complete a 3,000-bbl. steel tank on a 60-ft. brick tower. M. H. Pfaffle, Cy. Clk.

STOCKTON, ILL.—The contract for constructing works has been awarded to the U. S. Wind Engine & Pump Co., of Batavia, Ill., at $7,950. An issue of $4,000 in 6% gold bonds has been authorized.

BALDWIN, WIS.—Press reports state that the city council has decided to construct works; bids will be received as soon as the plans are completed.

GREEN BAY, WIS.—The council is reported as refusing to pay more hydrant rental until the water company takes steps to increase the fire pressure.

MARINETTE, WIS.—The water company has completed an artesian well and it is said that a test will soon be made to see if a sufficient supply can be obtained from wells.

MILWAUKEE, WIS.—The health commissioner has recommended that filters be put in all the schools.

PORTAGE, WIS.—The council has passed a resolution declaring that unless the water company furnishes pure water within 60 days the city will refuse to pay for its supply.

DOWS, IA.—I. C. Fenninger, Cy. Clk., writes us that the contract for constructing works, as advertised in Engineering News, has been awarded to Jackson & Moss, of Des Moines, at $4,749.

PEPIN, WIS.—A petition has been circulated and a committee appointed to construct works; cost will probably not exceed $2,000.

FORT SCOTT, KAN.—The contract for a new stand-pipe 150 ft. high, as advertised in Engineering News, has been awarded to the Springfield Iron & Boiler Mfg. Co., of Springfield, Ill.

WELLINGTON, KAN.—As a result of litigation, it is reported probable that the works will pass into new hands and improvements be made.

WAMEGO, KAN.—A press report states that the construction of water-works and an electric light plant has been postponed until after the November election.

PARKVILLE, MO.—A water-works system is being built for Park College and a proposition has been made to extend the mains through the village; a steel tank will be erected.

ST. LOUIS, MO.—The work for which bids are asked until Oct. 6, as noted last week, includes the furnishing and laying of 7,800 ft. of 36-in. and 15,100 ft. of 30-in. pipe, etc. Local papers state that George P. Prendergast, contractor for laying about 54,000 ft. of water pipe, has the work only about one-half completed and has been notified to show why his contract should not be annulled. Robert E. McMath, Pres. Bd. Pub. Improvements.

HOUSTON, TEX.—The water company will probably put in additional steel tanks.

CASTLE ROCK, WASH.—The Castle Rock Water Co. has been incorporated with a capital stock of $15,000, by H. Orchard, G. A. Doty and J. P. Atkins. A franchise was recently granted to H. Orchard, of Kalama, Wash.

GRANITE, ORE.—A water company is said to have been organized to construct works in this town.

HEALDSBURG, CAL.—The trustees are considering different sources for a proposed water supply.

LOS ANGELES, CAL.—Bids are asked until Oct. 5 for erecting a boiler house and stack to cost about $9,000, according to reports. F. K. Upham, Treas., Pacific Branch National Home for D. V. S.

SONOMA, CAL.—The trustees have voted in favor of a municipal water-works system. F. Breitenbach, Cy. Clk.

WASHINGTON, CAL.—J. H. Richardson, H. Wilson, and Hugo Frommelt have been appointed commissioners, and will take steps to construct works, according to reports; proposed supply from the Sacramento River.

HUNTSVILLE, ONT.—Bids are asked until Sept. 28 for the purchase of $20,000 in water bonds.

WINNIPEG, MAN.—The present contract expires in three years, and there is talk of municipal works after that date.

PARRSBORO, N. S.—It is reported that Prof. Butler will prepare plans for works in this town.

IRRIGATION.

CHEYENNE, WYO.—Press reports state that the officers of the Wyoming Development Co. have received notice from the secretary of the interior that their application for a reservoir site reservation has been approved by the department. The company contemplates building a storage reservoir to impound the spring waters of the Laramie River as a reserve water supply for the Wheatland colony, where a tract of 60,000 acres of land is under irrigation. Pres., J. M. Carey, Cheyenne.

SANTA BARBARA, CAL.—The land owners on the Romero Creek, in Montecito, are reported as planning to combine their interests and construct a dam and reservoir at the head of the canyon. Mr. Blayter is the manager.

BOISE CITY, IDAHO.—H. E. Miller, of Albion, Idaho, has filed plans for an extensive reservoir on Goose Creek, Cassia county, according to reports.

MEXICO, MEX.—A press report states that Sr. Telesforo Garcia has undertaken the work of utilizing the water of the River Charcon for irrigation purposes, and will proceed at once with the construction of canals and ditches to conduct the water to the plain of Tecozautla, for the inhabitants of that district and also those of Huichapan.

NEW COMPANIES.—Smith Lake Irrigating & Mfg. Co., La Salle, Colo.; $2,500; Neil McMillan, A. Walker, R. W. Devinny, James Conlin.

Black Rock Reservoir & Canal Co., Eden, Ariz.; $3,000; J. D. Holladay, J. Busby, Elijah Hancock.

SEWERAGE.

PORTSMOUTH, N. H.—The council has voted to appropriate $10,000 for sewers.

WAKEFIELD, MASS.—The construction of a better sewer system is again being discussed.

CENTRAL FALLS, R. I.—The construction of sewers in two streets, estimated to cost $6,200, is proposed.

BROOKLYN, N. Y.—The aldermen have appropriated $25,000 for a relief sewer to be constructed on the extension of Clinton Ave. to the Wallabout. T. B. Willis, Comr. Cy. Wks.

BUFFALO, N. Y.—The board of public works received the following bids Sept. 11 for constructing sewers in (1) Lang Ave. and (2) Colfax Ave.: Louis W. Miller, 1, $43,000; J. H. Franklin, 1, $34,700; John Harrer, 1, $31,900; 2, $2,590; C.A.Smith. 1, $33,700; 2, $3,460; George & Thomas Dark, Jr., 1, $39,750; Jacob Ritzmann, 1, $33,300; 2, $2,260; G. W. Moore 1, $44,943; 2, $2.994; Hy. Harter, 1, $36,890; 2, $3,351; John Mumm, 1, $31,749; 2, $2,400; F. J. Martin, 2, $3,129; Andrew Beaser, 2, $2,224; W. A. Rappich, 2, $2,394; A. Kratzmann, 2, $2,929. R. G. Parsons, Secy.

BUFFALO, N. Y.—Bids are asked until Oct. 7 for constructing 30 to 12-in. pipe sewers in ten streets. R. G. Parsons, Secy. Dept. Pub. Wks.——E. B. Guthrie, Cy. Engr., has requested that the city remedy the Hamburgh canal nuisance by making it a covered channel at an estimated cost of $500,000.

HAMBURG, N. Y.—This village will build a new system of sewers. J. W. Salisbury, Chn. Com.

MOUNT VERNON, N. Y.—Bids are asked until Oct. 6 for constructing a lateral sewer in Bridge St. Geo. M. Jenkins, Cy. Clk.

JAMESTOWN, N. Y.—An election is reported for Sept. 26 to vote on the question of extending the sewers at a cost of about $46,000. John E. Conway, Chn. Bd. Pub. Wks.

TROY, N. Y.—The council has decided to build 12 and 10-in. pipe sewers in a number of streets. E. O. Ross, Secy. Bd. Contract.

WALDEN, N. Y.—The board of trustees have been petitioned to construct a sewer in Montgomery St. J. S. Taylor, G. Robinson, S. Andrews and Wm. Van Amburgh are interested.

HOBOKEN, N. J.—Bids are asked until Sept. 30 for constructing an 18-in. pipe sewer in two streets in West Hoboken; check, $2,000. John P. McMahon, Town Clk.; Chas. J. Chandless, Chn. Com., West Hoboken.

NEW BRUNSWICK, N. J.—Bids are asked until Oct. 5 for constructing 4,200 ft. of pipe sewers in Ward 6, as stated in our advertising columns. Asher Atkinson, Cy. Surv.

OCEAN GROVE, N. J.—Niart Rogers has presented a report on sewers for this city. John A. Githeus, Washington White and Maxwell Crosbie compose the sewer committee.

ROSELLE, N. J.—Bids are asked until Oct. 2 for constructing 8,500 ft. of 12 to 8-in. pipe sewers, as stated in our advertising columns. G. A. Rawlins, Borough Clk.; H. M. Herbert, Engr., Bound Brook, N. J.

SOUTH ORANGE, N. J.—Committees have been appointed at this place and West Orange looking toward a joint sewerage system for the two townships.

ALLEGHENY, PA.—Bids are asked until Sept. 28 for constructing lateral and main sewers in 10 streets. Robt. McAfee, Dir. Pub. Wks.

BALTIMORE, MD.—The Southwest Baltimore Improvement Association has petitioned the mayor for the construction of a sewer in Stockholm St. Frank C. Wachter, Pres.

TAMPA, FLA.—Geo. E. Waring, 874 Broadway, New York, N. Y., and Newport, R. I., has prepared plans for a sewer system, 54 miles long, for this city. It is probable that bids will soon be asked.

LOUISVILLE, KY.—The board of public works has ordered the construction of a sewer in 22d St. J. H. Pearson, Cy. Engr.

NEWPORT, KY.—No work is projected in this city for this year. In 1897 the trunk sewer in District E will be constructed, in addition to the usual amount of lateral work. It is the intention to improve Columbia St. with brick or asphalt. W. L. Glazier, Cy. Engr.

AKRON, O.—McGowan & Hunt have been awarded the contract at $4,389 for constructing a main trunk sewer in South Akron. The other bidders were Hallinan & Derrig, $5,747; McGarry & McGowan, $7,360; O. N. Gardner, $6,080; Wilhelm & McCourt, $6,752. S. W. Parshall, Cy. Engr.

CLEVELAND, O.—Bids are asked until Sept. 30 for constructing a sewer in Kinkel St. D. E. Wright, Dir. Pub. Wks.——The board of control has approved plans for the Walworth Run sewer, which will be over 14,000 ft. in length. The sewer will extend along Walworth St. in the valley, having an outlet into the river near the lower end of Scranton Ave. The sewer will be 18 ft. 9 ins. in diameter at its outlet and 8 ft. at Gordon St. The contract will probably soon be let. Des. Engr., C. G. Force, The Livingston, Cleveland.——The council has voted to issue $23,000 in bonds for constructing a sewer in Willson Ave. Frank A. Emerson, Pres. Council; Howard H. Burgess, Cy. Clk.

MARIETTA, O.—The council has voted to construct additional sewers in Franklin St., from Lancaster St. to the Ohio River. S. J. Hathaway, Pres. Council; Carl Becker, Cy. Clk.

WATERLOO, IA.—Bids are asked by the city clerk until Sept. 28 for constructing 30 to 24-in. pipe sewers in two streets. M. L. Newton, Cy. Engr.

MILWAUKEE, WIS.—The board of public works has awarded nine contracts aggregating 9,422 ft. of 18 to 12-in. pipe sewers to Mathias Chybowski, at 94 cts. to $1.22 a ft. G. H. Benzenberg, Cy. Engr.

WEBSTER CITY, IA.—E. E. Fox, of Chicago, Ill., is reported as preparing estimates, etc., for a sewer system. Geo. S. Jacks, Cy. Clk.

COFFEYVILLE, KAN.—Bids are asked until Sept. 30 for constructing about 34,000 ft. of 15 to 8-in. pipe sewers, etc. John M. Walker, Cy. Engr.

PORTLAND, ORE.—The council has voted to issue $25,000 in bonds for sewers. T. M. Hurlburt, Cy. Surv.

CHINO, CAL.—It is reported that the question of constructing sewers for this place is being discussed.

SACRAMENTO, CAL.—The following bids were received Sept. 8 by the trustees for a sewage pumping plant. Des. Engr., M. H. Veach, Sacramento; Wm. Mullenny, Cy. Surv.:

Risdon Iron Wks., San Francisco, Cal.	$20,162 to $21,862
Krogh Mfg. Co.	16,805 to 19,950
San Francisco Iron Works, San Francisco	17,333
Sacramento Boiler Works, Sacramento.	14,283 to 15,124

SACRAMENTO, CAL.—The trustees have awarded to J. W. McDonald, of the City Street Improvement Co., the contract for the sewage pumping plant at S St., at $41,586.

SAN JOSE, CAL.—The council has adopted an ordinance calling an election Oct. 31 to vote on the proposition of issuing $115,000 in bonds, $40,000 of which is to be used to complete the main sewer a distance of 5,000 ft., to drain into a slough near Alviso.

ST. JOHN, N. B.—The council has voted to appropriate $11,000 for extending sewers and water mains.

WINNIPEG. MAN.—It is proposed to construct an outlet sewer in Colony St. to cost $6,000. C. J. Brown, Cy. Clk.

GARBAGE DISPOSAL—STREET CLEANING.

BROOKLYN, N. Y.—Bids are asked until Oct. 5 for the removal, collection and disposition of garbage in this city from Jan. 1, 1897, to Dec. 31, 1901; deposit, $15,000; surety, $100,000. Specifications require the construction of a plant to cremate or dispose of at least 500 tons of garbage each 24 hours. Z. Taylor Emery, Comr. of Health; T. B. Willis, Comr. Cy. Wks.

TROY, N. Y.—The garbage crematory of Zeph F. Magill, on Centre Island, was injured by fire Sept, 11 to the extent of about $1,500. Efforts are being made to have a new building ready for use this week.

READING, PA.—The following bids were received Sept. 21 for constructing a garbage disposal plant, as advertised in Engineering News:

	Building of	
Bidder.	Brick.	Cor. iron.
Columbia Mfg. Co., N. Y. City	$16,000	$16,000
M. L. Davies, Lancaster, Pa.	13,900	......
Rider Garbage Furnace Co., Pittsburg.	18,000	18,000
Wm. H. H. Acbruff, Philadelphia.	27,000	27,500
Dixon Sanitary Crematory Co., Findlay, O.	10,000	9,000

WILKESBARRE, PA.—The city council has adopted the report recommending the purchase of a 60-ton Dixon crematory to cost $10,000, as advertised in Engineering News. Bids were received from seven concerns.

BALTIMORE, MD.—The special committee appointed by the council last winter to investigate the garbage question, is said to favor the construction of a crematory, at a probable cost of $100,000. Councilman Hennighausen is chairman of the committee.

MEMPHIS, TENN.—The question of garbage removal is receiving considerable attention in this city and there is talk of a crematory or other improved method of garbage disposal.

CLEVELAND, O.—The "Leader" reports the bids opened Sept. 17 for a garbage disposal plant, as noted in Engineering News, Aug. 27, as follows: Columbian Mfg. Co., of New York city, was informal. Geo. A. Rose, of Cleveland, bid $2.55 a ton for disposing of the refuse only; $94,000 a year for the disposition of the same material for five years, or $85,000 for ten years; also $145,000 for building a crematory, including the site, the plant to be of the Textor make. The Ohio Reduction Co., of Cleveland, bid on the same material at $2.40 a ton, or $90,000 a year for five years, or $79,500 for ten years; also offered to build an Arnold crematory for $129,000, including the cost of land. M. F. Bramley, of Cleveland, offered to dispose of both refuse and garbage for $2.50 a ton, or $108,000 a year for five years, or $120,000 for ten years; would erect a Dixon crematory for $54,000, the land to be supplied by the city. Ed. Butler, of St. Louis, bid only on disposing of garbage and refuse for ten years at $143,000 a year until March 8, 1898, and thereafter $150,500 a year. The River Machine & Boiler Co., of Cleveland, offered to erect a Holthaus crematory for $147,980, the land to be supplied by the city. The Dixon Crematory Co. bid $54,000 for a crematory of its own make, the city to supply the land.

MILWAUKEE, WIS.—Aldermen Oldenberg, Stevens, Stark, Corcoran, and Stollenwork and the health commissioner have been appointed a committee to consider the advisability of the city owning and conducting its own garbage disposal plant; present contract expires next year.

HELENA, MONT.—The contract for building a garbage crematory with a stack 80 ft. high, is reported to have been awarded to H. E. Jamison, at $2,700; Gebhardt & Wegner bid $2,845.

SAN FRANCISCO, CAL.—By a decision of Judge Hebbard, Sept. 8, the disputed garbage franchise is to be awarded to the heirs of Wm. Sharon; in a previous decision in the suit of L. V. Merle against the board of supervisors, the court decided that neither Mr. Merle nor the Sharons were entitled to the franchise.

STREETS AND ROADS.

BOSTON, MASS.—Bids are asked by B. W. Wells, Supt. of Streets, until Sept. 26 for 1,000 sq. yds. of granite block paving, 470 sq. yds. of brick sidewalks, etc., and until Sept. 28 for grading in Mystic Valley Parkway. The work to include 1,300 cu. yds. of earth excavation, 10,000 cu. yds. of filling in, etc. Wm. T. Pierce, Engr. Metropolitan Park Comn., 114 Ames Bldg., Boston.

SPRINGFIELD, MASS.—The council has voted to pave South Main St., work on which will be begun at once. Chas. M. Slocum, Cy. Engr.; W. C. Dickinson, Supt. of Streets.

OLD SAYBROOK, CONN.—Samuel H. Pratt, First Selectman, informs us that the following bids were received Sept. 19 for constructing macadam road:

	Per lin. ft.
The Stone Road Construction Co., Bridgeport	$1.01
B. D. Pierce, Jr., & Co., Bridgeport	.93
John A. Doolittle & Co., New Haven	.89
C. W. Blakeslee & Sons, New Haven	.79¾
Robert Furton, Willimantic	.87
A. Brazos & Sons, Middletown	.69¾

SUFFIELD, CONN.—Bids are asked until Sept. 30 for grading and macadamizing about 3,100 ft. Edmund Halladay, Selectman, Suffield.

WATERBURY, CONN.—It is stated that the Milford Land & Cottage Co., which is to construct a new street through the centre of this city from Bank to Leavenworth Sts., has recorded deeds for property acquired for a large real estate scheme. A mortgage for $140,000 has also been recorded in favor of J. H. Wittemore, of Naugatuck, Conn., who put most of the money into the project. The company contemplates spending nearly $1,000,000 in this scheme.

ALBANY, N. Y.—It is reported that the state canal board has set aside $3,000 additional, making $10,000 in all, for repairing the 13 miles of state road leading from White Lake to South Lake, through Woodhall and North Lake, in Herkimer and Oneida counties. South Lake is situated on the direct road to Honnedaga Lake, the headquarters of the Adirondack League Club. G. W. Aldridge, Supt. Pub. Wks.

BROOKLYN, N. Y.—Timothy L. Woodruff, Park Comr., on Sept. 22, awarded contracts for the extension of the Eastern Parkway from Ralph Ave. to Ridgewood Park, as follows: The first section, from Ralph Ave. to Rockaway Ave., to Thomas F. Byrnes, $58,118. The distance is 3,000 ft. The second section, from Bushwick Ave. to Ridgewood Park, to Michael J. Dady, at $170,725. The distance is 3,500 ft., including a viaduct 200 ft. long, and considerable grading. The section between Rockaway and Bushwick Aves. will be let later, when specifications are completed.

BUFFALO, N. Y.—Bids are asked until Oct. 7 for repaving in two streets and grading, etc., in one other. R. G. Parsons, Secy.

OSWEGO, N. Y.—The council has directed that several streets be paved with brick or asphalt. H. D. McCaffrey, Pres. Bd. Pub. Wks.

JAMAICA, N. Y.—The trustees of the village have decided to call a special election to decide the question of appropriating $150,000 for macadamizing and general road improvements. John J. McLaughlin, Village Engr.

MOUNT VERNON, N. Y.—Bids are asked until Oct. 6 for macadamizing in Cottage Ave. G. M. Jenkins, Cy. Clk.

ROCHESTER, N. Y.—The West End Improvement Association is discussing the question of making West Ave. a boulevard. Another meeting to consider the subject will be held Oct. 7. D. M. Anthony and Wm. Cox, of the association are interested.——Whitmore, Rauber & Vicinus, of Rochester, were the lowest bidders, at $5,000, for paving in two streets. Edwin A. Fisher, Cy. Engr.

ROCHESTER, N Y.—Bids are asked until Oct. 2 for asphalt paving in Exchange Place and cement sidewalks in three streets. Thos. J. Neville, Clk. Executive Bd.——It is proposed to pave Mill St. with asphalt, at a cost of $21,000.

STAPLETON (S. I.), N. Y.—Bids are asked until Oct. 22 for improving certain roads, according to reports. Henry P. Morrison, Engr. County Roads.

JERSEY CITY, N. J.—Bids are asked until Sept. 29 for improving Highland Ave. The work will include 310 cu. yds. of earth and rock excavation, 675 sq. yds of paving, about 9,500 sq. ft. of flagging, etc. John C. Kaiser, Chn. Com.——It is proposed to pave Mercer St. with asphalt, at a cost of $60,000.

WILDWOOD, N. J.—At an election held Sept. 8 the question of issuing $50,000 in bonds for general improvements was voted upon.

WOODBURY, N. J.—It is stated that the Gloucester county board of freeholders, on Sept. 17, adopted a resolution to build a stone road between Paulsboro and Swedesboro, a distance of about six miles. John S. Jessup, County Solicitor.

ALLEGHENY, PA.—Bids are asked until Sept. 28 for grading, paving, etc., in four streets. Robt. McAfee, Dir. Pub. Wks.

NEWCASTLE, PA.—It is reported that $50,000 of 4% street and sewer bonds will be sold in November. Frank Tidball, Cy. Clk.; J. H. Miller, Cy. Engr.

PITTSBURG, PA.—Bids are asked until Sept. 26 for grading and asphalt paving in ten streets. Edward M. Bigelow, Dir. Pub. Wks.

MACON, GA.—Bids are asked until Oct. 13 for the purchase of $130,000 of 4½% paving bonds. Bridges Smith, Clk. Council; S. B. Price, Mayor.

TAMPA, FLA.—The question of paving West Fayette St. is being considered.

OWENSBORO, KY.—An election will be held Nov. 2 to vote on the question of issuing $25,000 in bonds for paving, and $25.000 for erecting an electric light plant. H. M. Talbott, Cy. Engr.

CINCINNATI, O.—Bids are asked by the board of administration until Oct. 8 for asphalt paving in two streets, and granite block paving in one street. Aug. Herrmann, Pres.; A. P. Butterfield, Clk.

CINCINNATI, O.—Bids are asked until Oct. 5 for brick paving in three streets and until Oct. 19 for brick paving in Carll St. Aug. Herrmann, Pres.——The council of St. Bernard has voted to construct cement sidewalks in Mitchell Ave.

CLEVELAND, O.—Bids are asked until Oct. 14 for grading about nine miles of the Brecksville road. Julius C. Dorn, Clk. County Comrs., Old Court House, Cleveland. ——The council has voted to pave two streets with brick. Frank A. Emerson, Pres. Council.

COLUMBUS, O.—The board of public works has directed the city clerk to advertise for bids for improving two streets. N. B. Abbott has been awarded the contract at $24,577 for improving Broad St. from High St. to the river. Josiah Kinnear, Cy. Engr.

NILES, O.—Bids are asked until Oct. 15 for about 5,000 sq. yds. of paving with asphalt blocks or brick, and until Oct. 17 for the purchase of $11,000 in 6% paving bonds, as stated in our advertising columns. Wm. Wilson, Engr.; John L. McDermott, Cy. Clk.

RICHMOND, IND.—Bids are asked until Oct. 12 for improving North D St., according to reports. J. H. Winder, Clk. Bd. Pub. Improvements; H. L. Weber, Cy. Engr.

BAY CITY, MICH.—The council is discussing the question of repaving Centre Ave., which was paved about four years ago with cedar blocks, at a cost of $40,000, but has proved a failure. Geo. Turner, Cy. Engr.

PORT HURON, MICH.—The council has directed the city engineer to advertise for bids for cedar block paving, on a sand foundation, in Pine Grove Ave.; estimated cost, $17,000. F. F. Rogers, Cy. Engr.

SAGINAW, MICH.—The street committee has recommended to the council the paving of four streets with asphalt and brick. H. E. Terry, Cy. Engr.

CHICAGO, ILL.—Bids are asked until Sept. 30 for laying cement sidewalks in about 30 streets. The sidewalks are to be from 14 to 6 ft. in width, and in many cases to be on both sides of the streets. Joseph Downey, Comr. Pub. Wks.

MILWAUKEE, WIS.—It has been decided to pave a portion of East Water St. with asphalt. L. L. Caufy, Alderman from the 7th Ward, can be addressed.

WAUKESHA, WIS.—The council is reported as again considering the question of issuing $16,000 in bonds for streets and sewers.

OMAHA, NEB.—The county commissioners have agreed to the proposed macadamizing of Centre St. for several miles beyond the city line. The city engineer has been instructed to draw plans and specifications for about 1½ miles of macadam road which will be built this fall. It is not known when the bids will be opened. Also for one mile of asphalt on South 16th St., which may be completed this fall. R. B. Howell, Cy. Engr.

BUTTE, MONT.—The county commissioners have decided to extend Park St. at a cost of about $4,000. Other improvements are also proposed.

DENVER, COLO.—The Colorado Paving Co., Pres., C. B. Rhodes, has been awarded the contract by the board of public works for grading and curbing district No. 1, on East Capitol Hill, at $120,000. T. J. Milner, Engr. Bd. Pub. Wks.

PORTLAND, ORE.—The committee has recommended that the contract be awarded to Hamilton & Sweeney at $5,347 for brick paving on a concrete foundation in Burnside St. T. M. Hurlburt, Cy. Engr.

MARTINEZ, CAL.—Bids are asked until Oct. 5 for building a road over a mile long. Elam C. Brown, County Surv., Martinez; F. L. Glass, County Clk.

SACRAMENTO, CAL.—The county surveyor has submitted estimates for constructing a road on the levee around the island. The work will include 200,000 cu. yds. of excavation.

SAN DIEGO, CAL.—The street committee has recommended to the council the paving of 5th St., at a cost of about $18,000. E. M. Capps, Cy. Engr.; F. W. Osburn, Supt. of Streets.

WINNIPEG, MAN.—The council has voted to improve the sidewalks in a number of streets at a cost of about $2,000. C. J. Brown, Cy. Clk.——The city engineer has been directed to make a number of improvements to the streets.

MANUFACTURING PLANTS.

HAZARDVILLE, CONN.—Four buildings of the Hazardville Powder Co. were recently destroyed; reported loss, $10,000.

OSWEGO, N. Y.—Fire destroyed the plants of the Silver Metal Co., and the Seliger-Toothill Novelty Co., on Sept. 20; reported loss, $100,000.

CLIFTON, N. J.—The Paterson "Guardian" announces that John W. Ferguson, of Paterson, has the contract for the construction of a three-story brick mill for Pitkin, Houldsworth & Co., woollen manufacturers, of Passaic, to be built at this place. The factory will be 275 × 60 ft., and the contract price is $36,500.

GARWOOD, N. J.—It is reported that A. J. Beckley, of Meriden, Conn., Pres. A. J. Beckley Steel & Iron Perforating Co., is arranging to erect a factory at this place. It is expected to have the building completed by Dec. 1.

ALIQUIPPA, PA.—The Victor Mfg. Co. will build a plant at this place. Chas. Bickel, of Pittsburg, is preparing plans.

BRADFORD, PA.—The Bradford Glass Works were destroyed by fire Sept. 18. The loss is estimated at $18,000; insurance, $10,000.

NORRISTOWN, PA.—The Norristown Wire Co. is building a plant at this place, and has already completed the foundation for the main building. Fred. M. Jaquith and J. H. Ruige, Jr., of Philadelphia, are interested.

NORRISTOWN, PA.—The Peerless Pipe Covering Co.'s buildings were destroyed by fire Sept. 22. The loss will reach about $15,000, with $5,000 insurance.

PHILADELPHIA, PA.—The "Record" states that the George W. Blabon Co. is going to put an additional story to its three-story oil cloth works, at Schuyler St. and the Philadelphia & Reading R. R. The additional story will be 10 ft. high, 50 × 153 ft.

PITTSBURG, PA.—The Iron City Brewery will build a new cooper shop, to cost $50,000. V. Wyss Thalman, Arch.

SHARON, PA.—It is stated that the Buhl Steel Co. has decided to increase its capital, for the erection of a steel mill, from $300,000 to $600,000. The company has already been chartered. with a capital stock of $300,000.

READING, PA.—It is understood that the Chantrell Tool Co. is to increase its plant to double its present capacity.

TROY, N. C.—The buildings for the Smitherman Cotton Mills are about completed, consisting of a main building 78 × 320 ft., engine and boiler room 35 × 60 ft. Space is provided for 5,000 spindles and 200 looms, but only about half of the amount will be put in at the present time.

PIQUA, O.—The plants of the Piqua Fabric Co. and the Piqua Hosiery Co. were burned Sept. 19. Reported loss, $60,000; insurance, $45,000.

MUSKEGON, MICH.—Wm. F. Wiselogels planing mill and furniture factory burned recently. Loss, $25,000; insurance, $10,000.

KANSAS CITY, MO.—The plant of the Marsh Oil Co. was recently totally destroyed by fire. Reported loss, $70,000; insurance, $60,000. It is stated that the company will rebuild.

ARDMORE, IND. TER.—The plant of the Chickasaw Asphalt Co., located at Woodford, Ind. Ter., was totally destroyed by fire Sept. 14. Loss, several thousand dollars.

MONCTON, N. B.—On Sept. 20 fire destroyed the Moncton sugar refinery, owned by the Acadia sugar combine; reported loss, $200,000.

LONDON, ONT.—It is stated that J. Mills, of Hamilton, has the contract to erect car shops for the Grand Trunk Ry. and work will soon commence.

MISCELLANEOUS CONTRACTS.

STONE CRUSHER.—Shawano, Wis.—It is reported that the council has voted to purchase a stone crusher.

STEAM ROAD ROLLER.—Franklin, N. H.—It is stated that this place has voted to purchase a steam road roller.

STREET SWEEPER.—Santa Ana, Cal.—It is stated that the city clerk has been directed to advertise for bids for a street sweeper.

NATURAL GAS PLANT.—Wheeling, W. Va.—The Wheeling Natural Gas Co. is reported as about to lay mains in this city.

DREDGING.—Philadelphia, Pa.—Bids are asked until Oct. 17 for dredging in the Schuylkill River, Pa. Maj. C. W. Raymond, U. S. Engr., 1428 Arch St.

JETTY WORK. —San Diego, Cal.—It is stated that bids will soon be asked for constructing another section of the jetty in the harbor, for which $50,000 is now available.

DREDGING.—Wilmington, Del.—Bids are asked until Oct. 8 for dredging in Christiana River, Del., as stated in our advertising columns. Maj. Wm. F. Smith, U. S. Agt.

REMOVAL OF WRECKS.—Wilmington, Del.—Bids are asked until Sept. 28 for removing the wrecks of two barges in Upper Christiana River, Del. Wm. F. Smith, U. S. Agent.

DIKES.—Portland, Ore.—Bids are asked until Oct. 8 for constructing dikes, etc., in Tillamook Bay, Ore., as stated in our advertising columns. Capt. W. L. Fisk, U. S. Engrs.

LEVEE WORK.—Arkansas City, Ark.—Bids are asked until Oct. 12 for enlarging the railway levee south of this city, according to reports. C. P. Balfour, Pres. Bd. Levee Comrs., Bayville, La.

ENGINE.—Grant's Pass, Ore.—A local paper states that Major C. Newell proposes to put in a 120-HP. engine at his hydraulic mines on the river above town, for the purpose of hoisting water.

DITCH EXCAVATION.—Winnipeg, Man.—Bids are asked until Sept. 26 for the excavation of a ditch five miles long, about 30,000 cu. yds. of earthwork. Robt. Watson, Minister Pub. Wks.

RIPRAP EMBANKMENTS.—Duluth, Minn.—Bids are asked until Oct. 20 for riprap embankments at Agate Bay, Minn., as stated in our advertising columns. Maj. Clinton B. Sears, U. S. Engrs.

QUARRY MACHINERY.—Rockland, Me.—A cave-in at the lime quarry of the Cobb Lime Co. last week resulted in the destruction of derricks, pump house, engines, etc.; reported loss, 5,000 to $15,000

PIERS.—Brooklyn, N. Y.—The commissioner of city works is considering the question of constructing two piers and bulkheads at Wallabout Market. W. E. Belknap, Asst. Engr. Dept. Cy. Wks.

FEED PUMPS.—Chicago, Ill.—Bids are asked until Sept. 28 for three duplex feed pumps for the Chicago public library building. Shepley, Rutan & Coolidge, Archs., Venetian Bldg.; W. B. Wickersham, Secy., City Hall.

DREDGING.—New York, N. Y.—Bids are asked until Oct. 17 for dredging in Lemon Creek, Staten Island, N. Y., and until Oct. 19 for dredging in South River, N. J., as stated in our advertising columns. Maj. H. M. Adams, U. S. Engrs., 39 Whitehall St.

COAL CONVEYOR.—Chicago, Ill.—Bids are asked until Sept. 28 for the apparatus and machinery for receiving, conveying and storing the daily coal supply for the public library building on Dearborn Park. W. B. Wickersham, Secy., City Hall.

REPAIRING DAMS.—Albany, N. Y.—Bids are asked until Sept. 28 for repairing steel dam over the Mohawk River at Cohoes, on the Champlain Canal, and the dam across the Mohawk River at Rexford Flats. Thos. Wheeler, Asst. Supt. Pub. Wks., Syracuse; R. G. Lay, Asst. Supt., Rochester; Geo. W. Aldridge, Supt., Albany.

OIL WELLS.—Indianapolis, Ind.—It is stated that the Keystone Oil Co. has had plans prepared for sinking a well on the Wm. Bradley farm; also that in a few weeks about 20 more wells will be started on this farm and on the Hessong farm, in which R. C. Fry is interested. Wm. Murphy and Alex. McKnight are interested in the Keystone Oil Co.

PIERS.—Baltimore, Md.—It is stated that Benjamin Glen has contracted to build for Wolf Bros., at Rose Bank fishing shore, Back River, a promenade and boat pier 120 ft. long and 12 ft. wide. At the end will be a walk 20 × 30 ft. Mr. Glen will also build on his own fishing shore, opposite Rose Bank, a platform pier 120 ft. long and 8 ft. wide.

BRICK CONDUIT.—Boston, Mass.—Bids are asked until Sept. 25 for building Section 5, Columbus Ave., Roxbury, of the brick conduit for Stony Brook. The conduit is to be 15½ × 17 ft. The work will include 20,540 cu. yds. of earth excavation, 7,150 cu. yds. of rock excavation, 1,240 cu. yds. of concrete, 2,877 cu. yds. of brick masonry and 10,500 ft. B. M. of spruce lumber. Benj. W. Wells, Supt. of Streets.

PARK WORK.—Boston, Mass.—The park commissioners have awarded to Perkins & White, at $23,000, the contract for the construction of the North End Pleasure Ground, at Copp's Hill. The park will be 235 × 188 × 158 × 117 ft. The other bidders were: Metropolitan Construction Co., $25,500; Trumbull & Ryan, $35,498; H. P. Nawn, $29,648; L. D. Wullen & Co., $38,750; John Shay, W. P. Chapman and S. L. McCallam, $23,740.

BONDS.—Cleveland, O.—No bids were received for $250,000 of 4% Cleveland park bonds which were offered for sale on Sept. 16, and the bids opened on the same day for $300,000 of 4% water bonds were rejected. The park bonds will draw interest from July 1, 1896, and will mature April 1, 1927, and the water bonds will draw interest from Oct. 1, 1896, and will mature Oct. 1, 1926. Principal and interest of both loans will be payable at the American Exchange National Bank of New York.

GRAIN ELEVATORS.—St. Paul, Minn.—It is stated that the Chicago Great Western Ry. Co. has secured about $5,000,000 from European investors for improvements to the road, which include the erection of grain elevators in Kansas City (now under construction at a cost of $200,000); St. Joseph, Mo.; Omaha, Neb.; Leavenworth, Kan.; Topeka, Kan.; Minneapolis and St. Paul, Minn.; Buffalo, N. Y.; and probably one in Liverpool, Eng. Pres., A. B. Stickney; Vice-Pres., Ansel Oppenheim, Metropolitan Opera House Block, St. Paul.

CANAL WORK.—Albany, N. Y.—It is stated that the state canal board has approved additional plans and specifications for canal work under the $9,000,000 improvement scheme to cost $252,154. This work is divided as follows: Eastern Division, Erie Canal, $126,600, to include $86,000 for deepening the canal from Rexford Flats, Aqueduct, to Schenectady; Middle Division, $115,266, to include an item for lengthening and improving lock 18 on the Oswego Canal, the last lock before entering Lake Ontario, and Western Division, $10,287. This work will be advertised soon by Geo. W. Aldridge, Supt. Pub. Wks., Albany.

SEA WALL.—Boston, Mass.—Application has been made by the city engineering department for a permit from the Harbor and Land Commissioners to erect the sea-wall which is to mark the outer edge of the new Dorchester Ave. in the vicinity of the new Union Station. When this is granted, as it will undoubtedly be in a few days, another application will be made and drawings submitted for the construction of 200 ft. of wall on Fort Point Channel, adjoining the yards of the New York & New England. This will be the beginning of work on the part of the city. The work on Summer St. extension will come later, as the Boston Terminal Co. is not yet ready to turn over to the city the land needed.

HARBOR IMPROVEMENT.—Aransas Pass, Tex.—Press reports state as follows: At a meeting in Baltimore, Sept. 12, the bondholders of the Aransas Pass Harbor Co. accepted a proposition, made by Col. Goodyear, a New York contractor, to secure and maintain 20 ft. of water over Aransas bar. Charles Clarke & Co., the contractors who built the breakwater, offered to secure and maintain for five years a depth of 20 ft. for $650,000 and a bonus of $40,000 for each additional foot up to 25 ft. Col. Goodyear will secure 20 ft. for $500,000 and the engineers are confident that when the current is guided through a channel 20 ft. deep it will soon scour to the clay bottom at a depth of over 30 ft. At present the distance across the bar between 20-ft. contours is only about 3,700 ft. It is not expected that the work of dredging a 20-ft. channel for that distance will occupy many weeks, especially as the ebb tide has a velocity of over two miles an hour.

GAS WORKS.—Indianapolis, Ind.—Local papers state that the two natural gas companies which supply this city with fuel are making preparations for more gas this winter. The Indianapolis Gas Co.'s pumping station is almost ready for operation. About 35 new wells will be completed by the time the pumping station is in action and the supply of gas that reaches the city is promised to be larger and of stronger pressure than ever before. The Consumers' Gas Trust Co. will expend $300,000 in extending and bettering its plant. A pumping station will be constructed at the edge of Hamilton county, and the company will draw from a largely increased territory and at least 30 more wells. A new main will be built from the field connecting with the 16-in. main which extends into the city from a point about 12 miles out. About 45 miles of small pipe will be laid in the field connecting with the new main. The company expects to almost double the amount of gas which reaches the city.

PIER.—Philadelphia, Pa.—Armstrong & Prentzenhoff have been awarded the contract for extending pier No. 18, South Wharves, to the new Port Warden's line. Work was begun Sept. 21. The extension of this pier means practically the construction of an entire new wharf. The contract was awarded by the Charles P. Beck estate, the owners of the present small pier at that point. This is to be entirely removed, and in its place will be erected a substantial covered wharf. Its dimensions will be: Length, 593 ft.; width, 65 ft. The shed which will cover it will be 587 ft. long and 63 ft. wide. This shed will have a wooden frame with corrugated iron sides, the whole to be covered with a slag roof. At the Delaware Avenue end of the pier, offices will be constructed. All the latest appliances for the expeditious handling of freight will be introduced, and eight wharf drops will be built. The contract calls for the pier's completion by Jan. 1, 1897. When finished the Ocean Steamship Co., which now occupies piers Nos. 35 and 39, South Wharves, will take possession of it.

CONTRACT PRICES.

CEDAR BLOCK PAVING.—Milwaukee, Wis.—Three contracts for paving with cedar blocks were awarded Sept. 10 to E. E. Naugle, of Chicago, at 85 cts., 93 cts. and $1.02 a sq. yd. for paving, and 30 cts. and 33 cts. a lin. ft. for curbing; Wm. Forrestal received one contract at 97 cts. for paving and 45 cts. for curbing.

SEWERS.—Latrobe, Pa.—L. W. Fogg, Engr., informs us that the contracts for constructing sewers, as advertised in Engineering News, has been awarded to Thos. Pottinger, the bids being as follows:

Quantities.		T. Pottinger, Latrobe, Pa.	Jno. Herrmann, Latrobe, Pa.	Caleb & Conture, Bridgeport, O.	Wm. Chisholm, E. Liverpool, O
12-in. pipe........	1,970 ft......	$0.41½	$0.51	$0.42	$0.81
24-in. "	2,000 "	.88¾	.99	1.08	1.64

Iron castings.......	5 tons...	29.00	37.00	45.00	35.00

ROCK EXCAVATION.—Fostoria, O.—The contract for excavating rock for reservoir, screen chamber and sewage well for the sewage disposal plant has been awarded to Fred. Kleinman, of Findlay, O., at 70 cts. a cu. yd.; bond, $5,000.

SEWERS.—Bluffton, Ind.—Phillips & Goss, Consult. Engrs., Martinsville, Ind., inform us that the contract for constructing a sanitary sewer system 16 miles in length, bids received Sept. 5, has been awarded to Derheimer & Shanklin, and that for a system of storm sewers, bids received Sept. 14, to J. W. Wilding & Co., the bids being as follows:

Bids for Constructing Storm Sewers:

Quantities.		Derheimer & Shanklin, Fort Wayne, Ind.	J. W. Wilding & Co., Fort Wayne, Ind.	Weicking & Mason, Bluffton. Ind.
15-in. pipe sewer	374 ft.	$0.65	$0.42	$0.70

[1] Rhodes-Williams flushtanks, $58.25; Van Vranken, $59.75. [2] All kinds at same price.

BRICK PAVING.—Milwaukee, Wis.—The contract for paving the hill in Biddle St., from Market St. to Broadway, was awarded Sept. 18 to Wm. Forrestal at $1.89 a sq. yd.; Geo. J. Markey bid $1.98; Jas. O'Donnell, $2; Vogt Fuel & Construction Co., $2.03.

DREDGNIG.—Milwaukee, Wis.—The following bids were received by Capt. Geo. A. Zinn, U. S. Engrs., Sept. 16, for 122,000 cu. yds. of dredging in Waukegan Harbor, Ill.:

	Per cu. yd.	
Green's Dredging Co., Chicago, Ill............	9	cts.
Charles Berner, Green Bay, Wis......	10.5	"
William A. Starke, Milwaukee, Wis....	9	"
Racine Dredge Co., Racine, Wis.............	9.5	"
Illinois Dredging Co., Chicago, Ill......	8	"
Arthur H. Vogel, Milwaukee, Wis.....	8.6	"

JETTY WORK.—Newport, R. I.—Maj. D. W. Lockwood, U. S. Engrs., has recommended that the contract for furnishing and placing stone in jetty at entrance to Great Salt Pond. Block Island, as advertised in Engineering News, be awarded to S. & E. S. Belden, Hartford, Conn., at $1.33 a ton; bids opened Sept. 21; appropriation available, $35,000.

CHANNEL EXCAVATION.—Boston, Mass.—The Metropolitan water board has awarded the contract for section No. 11 Nashua aqueduct to Moulton & O'Mahoney, the bids being as follows:

Bids for Section No. 11, Nashua Aqueduct (Open Channel), Boston, Mass., Sept. 15, 1896.

Bidder.	Excavation, Earth, 290,000 cu. yds.	Rock, 300 cu. yds.	Rip-rap, small stone, 1,000 cu. yds.	Rip-rap, large stones, 1,300 cu. yds.	Masonry: Cement concrete, 1,070 cu. yds.	Rubble-stone, in mortar, 660 cu. yds.	Split-stone, in mortar, 920 cu. yds.	Dim. stone, in mortar, 150 cu. yds.	Face dress'g, point'd wrk, 2,600 sq. ft.	Face dress'g, six-cut wrk, 350 sq. ft.	Lumber, in foundation, 5 M. ft.	Total.

QUAY WALLS.—Brooklyn, N. Y.—The following bids were received at Washington, Sept. 16, for constructing quay walls at the Brooklyn Navy Yard, as advertised in Engineering News; price is per lin. ft.:

	At coal wharf.	Inside Whitney Basin.
T. A. Walsh, 96 Water St., N. Y......	———	$123.00
Benner & Opdyke, Philadelphia........	$111.80	96.80
Thos. Dwyer, New York....	119.00	109.00
*P. Sanford Ross, Jersey City....	84.50	107.00

*Telegram requested that each of the two sealed bids be reduced $6 a lin. ft.

RETAINING WALL, ETC.—Rutland, Vt.—Sidney Smith, Cy. Engr., writes us that the contract for building concrete retaining wall and making excavations for channel for East Creek, at the water-works, as advertised in Engineering News, was awarded Sept. 16, to Willis, Young & Creed, of Rutland, at $2,544, as follows: Trench for wall, 150 ft., $1.33 a lin. ft.; channel excavation, 410 cu. yds., 95 cts. a cu. yd.; American concrete masonry, 40 cu. yds., $4.87; Portland concrete masonry, 270 cu. yds., $6.33.

ASPHALT PAVING.—Milwaukee, Wis.—The contract for paving Third St., from the Union depot to the Second Ward bank, 11,385 sq. yds. with asphalt on a concrete foundation, has been awarded to the Western Paving & Supply Co., at $2.29½ a sq. yd.; the Warren-Scharf Asphalt Paving Co. bid $2.33.

STEEL.—Boston, Mass.—The Boston Transit Commission has awarded the contract for furnishing steel for Section 8 of the subway to A. & P. Roberts Co., of Philadelphia, at $41.98 a ton; New Jersey Steel & Iron Co., bid $49.80; Boston Bridge Works, $59.90; Carnegie Steel Co., $44.80; Pennsylvania Steel Co., $44.80.

BRICK PAVING.—Marion, O.—The contract for paving North Main St. with brick has been awarded to P. Kelly & Co. ,of Marion, prices being given in a local paper as follows: Bolen brown granite blocks, 91½ cts. a sq. yd.; grading, 25 cts. a cu. yd.; circular curbing, 37½ cts. a lin. ft.; curbing, 37½ cts.; corner blocks, $3; redressing and resetting old curbing, 7 cts. a lin. ft.; redressing and resetting old corner blocks, $1.07; catch basins, $15; rebuilding and resetting old catch basins, $5; iron platforms 6 cts. a lb.; coal tar filler No. 6, 12 cts.; retarring stone, 15 cts. a ft.; concrete, $3.50 a cu. yd. James Williams, Cy. Clk.

TORPEDO BOATS.—Washington, D. C.—Bids were opened Sept. 18 for 13 torpedo boats to cost not more than $1,300,000, authorized by the last session of Congress; 3 to have a speed of 30 knots, the cost being limited to $800,000, and for the remaining 10 a total of $500,000 is allowed. It is stipulated that not more than three of the boats are to be constructed in one yard or by one party. If possible, at least one boat is to be built on the Mississippi, one on the Gulf of Mexico and one on the Missouri River. For the 10 smaller vessels the department asked for bids for two separate types, involving approximately 105 ft. length, 12½ ft. beam, 4½ ft. mean draft, 68 tons displacement. 850 HP. and 20 knots speed, armed with two single deck torpedo guns and one one-pounder rapid-fire rifle; no premium to be paid, but a deduction at the rate of $10,000 per knot to be exacted below 20 knots. On plans of their own builders were invited to propose 22½-knot boats, about 140 ft. long, 150 tons displacement and 1,700 HP. The bids are reported as follows: For the 30-knot boats the Union Iron Works, San Francisco, bid for one at $227,500; Bath Iron Works, Bath, Me., for two at $194,000 each, and for three at $189,000 each, and submitted another proposition for two at $235,000 each; Herreshoff Co., for one at $218,000 and for three at $206,000 each, and John H. Dialogue & Son, of Camden, N. J., for one at $260,000 or two at $255,000 each; the Columbian Iron Works, of Baltimore, offered one, two or three 20-knot boats for $49,000 each on the department plans, and on its own design for the same speed at $45,000 each; the same company asked $79,100 for 22½-knot vessels; Moran Bros. & Co., of Seattle, Wash., bid $59,840 for one 20-knot boat and $56,928 each for three of them; also three of the 22½-raters at $94,255 each; Bath company bid $80,000 each for three of the 22½ boats and $123,580 each for three special 25-knot vessels; all the Bath bids were accompanied by a proposition to use bronze in the construction of the vessels for a slight increase; Herreshoff company offered three of the 20-knot boats for $37,000 each, or one for $40,000, and also bids for the 22½-knot vessels as low as $80,000 each; the 22½-knot design, the exact duplicate of the "Cushing" was offered for $92,500 each, and with certain modifications for $78,500 each; Wolff & Zwicker, of Portland, Ore., offered to build 20-knot boats at $45,000 each for three, and 22½-knot boats for $75,100 each; Providence Steam Engine Co., of Rhode Island, bid $51,000 each for two of the department's 20-knot plans and $48,650 each for three of them; Lewis Nixon, of Elizabeth, N. J., has his own design for the little boats, and asked $69,000 for one, or $68,000 each for two; Charles Hillman Ship & Engine Co., of Philadelphia, asked $48,000 each for two on the department's plans, and John Dialogue asked $68,500 each for the same; George Lawley & Son, of South Boston, submitted their own designs for the 20-knot boats, asking $56,835 for each, if three were awarded them, or $61,500 for one. They offered 22½ knots as low as $78,800 each for three, or $83,500 for one. There was an irregular bid from Alexandria, Va., for an electric boat to run 35 knots, for which $530,000 was asked. Many of the companies made combination bids for two of one class and one of another, and some bidders furnished various designs, which will have to be carefully examined by the bureau of engineers before any award is made.

◆

INDUSTRIAL NOTES.

THE ELLIOT CAR WORKS, Gadsen, Ala., has received an order from the Florida East Coast Ry. for 50 flat and 300 ventilated box cars.

THE MICHIGAN PENINSULAR CAR CO., Detroit, Mich., is at work on an order for 400 coal cars for the Chicago, Rock Island & Pacific R. R.

THE NEW CASTLE STREET CAR MFG. CO., New Castle, Pa., has received the contract to furnish the New Castle Electric Co. with ten cars.

THE KENSINGTON ENGINE WORKS, Philadelphia, Pa., has the contract for a disinfecting plant for the Municipal Hospital, Pittsburg, to cost $3,099.

THE UNION CAR CO., Depew, N. Y., is building 1,000 gondola cars for the Philadelphia & Reading R. R. Co., and 250 of various kinds for the West Shore R. R. Co.

THE TERRE HAUTE CAR WORKS, Terre Haute, Ind., has the contract for 200 tank cars for the Indiana Pipe Line & Repairing Co., and for 150 refrigerator cars for the Vandalia Ry.

THE FORT PITT BRIDGE WORKS, Canonsburg, Pa., has been awarded the contract by the United States government for the iron for the movable dams on the Monongahela River.

THE ST. CHARLES CAR CO., St. Charles, Mo., has finished several new passenger cars for the Union Pacific, Denver & Gulf Ry. The company is also building 30 furniture cars for the same railway.

MR. W. W. CURTIS, 1108 Monadnock Block, Chicago, has the contract for the erection of two steel buildings and 855 ft. of steel viaduct for the Homestake Mining Co., Lead, S. Dak.; the buildings will be a boiler house, 50 × 50 ft., and a shaft house, 90 × 150 ft.

STANLEY G. FLAGG & CO., Philadelphia, Pa., writes us that they have for some time been making steel fittings for ice machines. The company supplies the fittings, flanged or screwed, and tested in sizes from ¼-in. to 4 ins. and larger by special order.

THE MARIETTA BOILER WORKS, Marietta, O., has finished its new plant and has begun operations. The plant has a capacity for the employment of 300 men. The company is capitalized at $100,000. Among its officers are J. J. Leidecker and Hughes Bros., of Butler, Pa.

THE PULLMAN CAR CO., Chicago, Ill., it is said, will shut down the freight car department indefinitely. This will throw 300 men out of work. The cause is lack of orders. The company is just finishing the last 1,000 of an order for 5,000 freight cars for the Baltimore & Ohio.

THE BIRMINGHAM CAR WHEEL WORKS, Birmingham, Ala., has added new machinery for the manufacture of tram car wheels. Heretofore the plant has only made large wheels. The company employs about 100 men and has been constantly at work since it started in the spring.

THE WESTINGHOUSE AIR BRAKE CO., Pittsburg, Pa., is reported to have been awarded the contract for furnishing the Pennsylvania R. R. with 30,000 sets of air brakes. The order will keep the company's plant in steady operation until March 1, 1897, and give employment to 1,500 men.

THE RAND DRILL CO., of New York city, has recently received an order from the Michigan Central R. R. for three air compressors for its shops in Detroit, Mich., Jackson, Mich., and St. Thomas, Canada. It has also an order from the Missouri Car & Foundry Co., of St. Louis, Mo., for two air compressors.

THE BROWN & SHARPE MFG. CO., Providence, R. I., announces that owing to the increased demand upon its hardening and annealing department, it has recently erected a building which will be entirely devoted to this branch of its business. The building is fitted with all modern improvements as well as many tools and appliances which are the outgrowth of twenty years' experience in this line of work.

THE BAGNALL & LOUD BLOCK CO., Boston, Mass., writes us that it is in receipt of a diploma, accompanied by a bronze medal, which were awarded for its exhibit at the Columbian Exposition. The award reads: "For a complete collection of wooden and steel frame blocks, embodying improvements of importance for better service in manila and wire rope systems for hoisting and transferring; also, for development in design of special sheaves of wood and metal, and adjustable bushings for same."

THE PENNSYLVANIA ASPHALT CO., Pittsburg, Pa., is building a plant in East Liberty, Pa. The company lately completed a like plant on South Ave., Allegheny. A. W. Sewall, Secy., is quoted as saying that the East Liberty plant would be ready to start in a couple of weeks. It will be used exclusively for mixing Trinidad Lake asphalt. The one in Allegheny will prepare for use the Bermudez asphalt. The company has recently been awarded street paving contracts in both cities.

THE BOSTON & LOCKPORT BLOCK CO., Lockport, N. Y., at a recent meeting of the directors elected Hon. Albert D. Bosson, of Boston, president to fill the vacancy caused by the death of the late President Beverly. Mr. Bosson is president of the Winnisimmet Savings Bank and formerly vice-president of the company. Mr. Frank Gebbie, Mgr. of the Mohawk Condensed Milk Co., St. Johnsville, was elected vice-president and A. C. Beverly, director. The treasurer reported the factories both at Lockport and Boston as running as usual, but with a lager assorted stock of goods on hand than ever carried before; he also reported a good number of orders received but usually small in amount, indicating that the trade is buying from "hand to mouth," which necessitates carrying a much larger stock in the factories than formerly.

THE ST. LOUIS IRON & MACHINE WORKS, St. Louis, Mo., has just completed the steam plant for the Maryville Electric Light & Power Co., Maryville, Mo., and the new plant is now in operation furnishing the entire city with lights, the equipment consisting of a boiler plant of 250 HP., a St. Louis Corliss engine of 250 HP., a Thomson-Houston arc dynamo of 40 lights capacity, a 50 K-W. General Electric alternator, and a 75 K-W. Fort Wayne alternator. This company is also furnishing the new power plant for the Trenton Thomson-Houston Electric Light & Power Co., Trenton, Mo., and will install a St. Louis Corliss engine of 125 HP. capacity, with line shafting, belting, etc. When the new machinery is installed and in operation the old plant will be abandoned. New dynamos will be purchased. It is also furnishing the entire steam plant for the new lighting station of the Bement Electric Light & Power Co., Bement, Ill.; this plant will have two horizontal steel boilers and one St. Louis Corliss engine of 125 HP.

Contract Work Should Always be Advertised in a Paper Read by Contractors.

Nearly Every Prominent Contractor and Manufacturer of Contractors' Supplies in North America Reads Engineering News

PERSONALS.

Mr. James Duncan, contractor, of New Castle, Pa., died Oct. 2, aged 77.

Mr. Homer A. Collar, City Engineer, of Grand Rapids, Mich., has resigned.

Mr. George F. Crandall, marine architect, of Newport, R. I., died Oct. 1, aged 65.

Mr. William L. Bull, President of the Minneapolis & St. Louis R. R., has resigned.

Mr. Frederick J. Starin, railway contractor, of Whitewater, Wis., died Oct. 3, aged 76.

Mr. W. H. Ferguson, Superintendent of the Dayton Coal & Iron Co., Dayton, Tenn., has resigned.

Mr. Charles S. Barintz has been appointed Receiver for the Middletown Gas Co., of Middletown, O.

Mr. F. C. Cleaver has been appointed Master Mechanic of the Louisville, Evansville & St. Louis R. R.

Mr. Charles E. Levy, President of the New Orleans & Western R. R., has resigned on account of ill health.

Mr. William L. Bull, President of the Minneapolis & St. Louis R. R., with headquarters in New York city, has resigned.

Mr. Henry Fink, Receiver for the Norfolk & Western R. R. Co., has been made President of the reorganized company.

Mr. W. H. Stark, Master Car Builder of the Wheeling & Lake Erie Ry., with headquarters at East Toledo, O., has resigned.

Mr. Sylvanus D. Locke, civil engineer, of Hoosick Falls, N. Y., died Sept. 27. He was at one time City Engineer of Janesville, Wis.

Mr. W. H. McDoel, Vice-President and General Manager of the Louisville, New Albany & Chicago Ry., has been appointed Receiver.

Mr. G. O. Viebahn, City Engineer, of Watertown, Wis., has resigned and will begin the study of law this fall, according to report.

Mr. O. E. Weller, of Boston, Mass., has been appointed Receiver for the Citizens Gaslight Co., of Reading, South Reading and Stoneham.

Mr. A. H. Kimball, Superintendent of the Fitchburg (Mass.) Gas & Electric Light Co., was married to Miss Carrie J. Bordwin, Oct. 1.

Mr. Frank J. Sarnan, Master Mechanic of the Manitou Beach R. R., has been appointed Superintendent, to succeed Mr. George C. Mills.

Mr. Charles D. Marvin, architect, of Brooklyn, N. Y., died Oct. 2, aged 38. He was a graduate of Cornell University in the class of 1878.

Mr. J. F. Sechler, Master Mechanic of the Louisville, Evansville & St. Louis R. R., with headquarters at Princeton, Ind., has resigned.

Mr. D. R. Murphy has been appointed Superintendent of the Duluth, Mississippi River & Northern Ry., to succeed Mr. H. O. Halsted, resigned.

Mr. W. Mason Smith, Vice-President of the New Orleans & Western R. R., has been elected President, to succeed Mr. Chas. E. Levy, resigned.

Mr. Edward C. Coggeshall, builder, of New York city, died Oct. 4, aged 67. He was born in Providence, R. I., and came to New York 29 years ago.

Mr. J. H. McGill has been appointed Master Mechanic of the New Orleans & Northwestern Ry., in charge of the locomotive and car departments and the water supply.

Mr. William C. Hoge, civil engineer, committed suicide at Santiago, Chili, Aug. 19. He was 65 years of age, a native of Kentucky and lived for several years in Monterey, Cal.

Mr. H. U. Wallace has been appointed Roadmaster of the First Division of the Illinois Central R. R., with headquarters at Chicago, Ill., to succeed Mr. A. Philbrick, transferred.

Mr. F. G. Patterson, President and General Manager of the Altoona, Clearfield & Northern R. R., with offices at Altoona, Pa., has been appointed Receiver on petition of its officers.

Mr. James Gaston has been appointed Master Car Builder of the Louisville, Evansville & St. Louis R. R., with headquarters at Princeton, Ind., to succeed Mr. W. E. Looney, resigned.

Mr. R. P. C. Sanderson, Division Superintendent of Motive Power of the Norfolk & Western R. R., with headquarters at Roanoke, Va., has resigned and the office has been abolished.

Mr. H. H. Havill has been appointed Engineer of Sewage Purification in the Twenty-sixth Ward Purification Works of Brooklyn, N. Y., by Commissioner Willis, of the Department of City Works.

Mr. John H. Winder, of Raliegh, N. C., until recently General Manager of the Seaboard Air Line, has formed a business connection with the banking firm of Sharp & Bryan, of New York city.

Mr. Francis Stokes, one of the two Receivers for the Susquehanna Water Power & Paper Co., of Harford county, Md., has resigned, and Mr. D. C. W. Smith has been appointed sole Receiver.

Mr. Jacob Bushong, of the firm of Bushong Bros., of Reading, Pa., died Sept. 24, aged 72. He was for a time engaged in metallurgical work, and built a large part of the present Schuylkill & Lehigh R. R.

Mr. J. A. Atwood, Principal Assistant Engineer of the Pittsburg & Lake Erie R. R., has been appointed Chief Engineer, to succeed Mr. F. E. House, now holding a similar position with the Butler & Pittsburg Ry.

Prof. C. M. Strahan and Mr. O. H. Sheffield, Assistant, of the Engineering Department of the University of Georgia, Athens, Ga., have formed a partnership as architects under the firm name of Strahan & Sheffield.

Mr. Frederic Harrison, Vice-President of the London & Northwestern Ry., of England, and Mr. Robert Turnbull, Superintendent of the same, are in Chicago, Ill., inspecting the operations of the roads centering at that city.

Mr. A. G. Wright, Roadmaster of the Louisville, New Albany & Chicago Ry., at Monon, Ind., has been appointed Division Master Mechanic of the Chicago, St. Paul, Minneapolis & Omaha Ry., with headquarters at Altoona, Wis.

Mr. Charles Worthington has resigned his position in the Department of Maintenance of Way of the Pennsylvania R. R., and is now engaged as estimating and designing engineer with the Pennsylvania Steel Co., Steelton, Pa.

Mr. John M. Perham, C. E., with the E. & T. Fairbanks Scale Co., St. Johnsbury, Vt., was married on Oct. 7 to Miss Mary A. Sheldon, of Burlington, Vt. Mr. Perham graduated from the University of Vermont in the class of 1890.

Mr. C. G. Sholes, Assistant Superintendent of Telegraph of the Atchison, Topeka & Santa Fe Ry., has been appointed Superintendent of Telegraph to succeed Mr. R. B. Gemmel, whose death was announced in our issue of Sept. 24.

Mr. William S. Wright, contractor and builder, of Brooklyn, N. Y., was run over in that city by a runaway horse attached to an express wagon, Oct. 5, and died two hours later in the Homeopathic Hospital, of which he was the builder.

Mr. Alexander Galloway, Superintendent of the Cincinnati, Hamilton & Indianapolis Division of the Cincinnati, Hamilton & Dayton R. R., has been appointed Superintendent of the Cincinnati Division to succeed Mr. F. A. Husted, resigned.

Mr. Thomas A. Lawson, Assistant Superintendent of the Wisconsin Division of the Chicago & Northwestern Ry., has been appointed Superintendent of the same division, to succeed Mr. W. A. Gardner, promoted, with headquarters at Chicago, Ill.

Mr. Henry S. Douglas, Assistant U. S. Engineer at Natchez, Miss., in charge of the levees from Warrenton to the mouth of the Red River, has been transferred to New Orleans, La., and will have charge of the harbor work near that city.

Mr. W. A. Scott, General Superintendent of the Chicago, St. Paul, Minneapolis & Omaha Ry., with headquarters at St. Paul, Minn., has been appointed General Manager, to succeed Mr. Horace G. Burt, promoted, and the former office will be abolished.

Mr. C. Kadono, who was formerly on the engineering staff of the Pennsylvania R. R., and who recently returned to Japan, has been appointed Assistant to the Chief Engineer and Engineer of Construction of the Sanyo Ry., with headquarters at Hiroshima.

Mr. Thomas J. English, Trainmaster of the Cleveland, Cincinnati, Chicago & St. Louis Ry., has been appointed Superintendent of the Sandusky Division, with headquarters at Springfield, O., to succeed Mr. William Gibson, whose resignation was noted last week.

Mr. Palmer H. Baermann, formerly City Engineer of Troy, N. Y., has been declared insane, and will be removed to an asylum. He is a graduate of the Rensselaer Polytechnic Institute and was for a time engineer of the Public Improvement Commission.

Mr. A. Sterle, Assistant Engineer in the office of Maj. William F. Smith, Corps of Engineers, U. S. Army, in charge of river and harbor work with headquarters at Wilmington, Del., has resigned to accept a position with the Light House Board at Tompkinsville, Staten Island.

Mr. Horace G. Burt, whose appointment to the office of General Manager of the Chicago, St. Paul, Minneapolis & Omaha Ry. we announced in our issue of July 2, has been appointed Third Vice-President of the Chicago & Northwestern Ry., to succeed Mr. W. H. Newman, whose resignation was noted in our issue of Sept. 24. Mr. Burt has also been promoted to be Assistant to the President of the former road.

Mr. Loewenherz, mechanical engineer, formerly of the Engineering Department of the Metropolitan Telephone & Telegraph Co, of New York city, is engaged upon the work now under execution by the recently incorporated New York Telephone & Telegraph Construction Co., for the Newark & Hudson Telephone Co., operating in Newark and Jersey City.

Capt. Harry Pollitt, of Gorton, England, Chief Locomotive and Marine Engineer of the Manchester, Sheffield & Lincolnshire Ry., and Mr. W. G. Percy Maclure, Assistant Engineer of the same, are visiting this country on a tour of inspection of some of the leading railways with a view of gaining practical knowledge of the best American methods in the mechanical departments.

Mr. Yen Nien, special commissioner of the Emperor of China, is in New York city on a tour of inspection of American manufactories, transportation methods and systems of municipal government. He is said to be an experienced mechanic, and one of the principal objects of his visit is to report on the latest improvements in machinery, particularly in weaving, shoemaking and similar industries. He will return to China by way of London, France and the Suez Canal.

Dr. T. M. Downe, President of Lehigh University, Bethlehem, Pa., and formerly Professor of Chemistry in the Massachusetts Institute of Technology, Boston, Mass., has been retained by City Engineer McClure, of Worcester, Mass., as an expert to study the sewage disposal problem in that city and decide upon the best means of meeting the present difficulty. Mr. Samuel M. Gray, engineer, of Providence, R. I., will be associated with him in his investigations.

Messrs. R. Ulrich and Chas. W. Leavitt, Jr., have opened an office at 15 Cortlandt St., New York city, for the practice of landscape architecture and engineering. Mr. Leavitt was formerly assistant engineer of the East Jersey Water Co., and Mr. Ulrich was at one time superintendent of the Hotel del Monte Park, Monterey, Cal., and for two years superintendent of Public Parks of Brooklyn, N. Y. He also had charge of landscape work at the World's Columbian Exposition, at Chicago, for Messrs. Olmstead & Elliott, consulting engineers.

Mr. Ernest S. Cronise, consulting mechanical engineer, of 37 Broad St., New York city, died at Ridgewood, N. J., Sept. 14, aged 35. He graduated from Stevens Institute, Hoboken, N. J., in June, 1881, and entered the employ of the Pennsylvania R. R. Co. the following spring. Later he became Assistant Superintendent of Car Construction of the West Shore R. R., at Pullman, Ill., and in 1885 entered the employ of Mr. Henry R. Worthington. He superintended the erection of various pumping engines, among them those of the Cincinnati (O.) Water-Works of 25,000,000 gallons capacity. In 1894 he opened an office in New York city as a consulting engineer, and made a commendable reputation as a railway expert.

Mr. Rokuro Oshima, Chief Mining Engineer of the Hokkaido Colliery & Ry. Co., of Sapporo, Japan, and Mr. M. Suzuki, General Manager of the Sumitomo Co., of Osaka, Japan, arrived in Tacoma, Wash., Sept. 28. The former is here on a tour of examination of the largest mining localities in this country, and will visit the mines of Washington, California, Colorado, Pennsylvania, Virginia and Alabama. He is interested in the mines in Hokkaido Island, about 800 miles from Tokio, the largest of which four, produces 300,000 tons of coal annually. It is his purpose to especially study the working of mines with electrical power and will probably have it introduced in his mines in Japan upon his return. Mr. Suzuki will accompany him on his trip eastward.

Mr. Robert Lewis Harris, M. Am. Soc. C. E., M. Inst. C. E., died of apoplexy, on Sept. 29, at Kearsarge Village, N. H., where he had been spending the summer. Mr. Harris was born about 62 years ago, and commenced his engineering career as a student with Ezra Lincoln, C. E., of Boston, Mass. After spending three years in Mr. Lincoln's office, he was, in 1852, made leveler and chief draughtsman on the Cleveland & St. Louis Air-Line Ry., under Chief Engineer E. G. Goddard. In 1854-55 he was assistant engineer on the Delaware Ry., under E. Q. Sewall, Jr.; in 1856 he was engaged on the Racine & Mississippi Ry., and in 1857 was resident engineer on the Milwaukee & Beloit Ry. He went to Honduras in the latter part of 1857, with the late John C. Trautwine, and spent a year there as resident engineer on the Inter-Oceanic Ry.; but he returned in 1858 and became a resident engineer on the Minnesota & Pacific Ry., the first railway west from St. Paul. In 1859-1860 he opened an office in Boston for general work, and then made an accurate survey of Portsmouth, N. H. From 1860 to 1871 Mr. Harris had an office in San Francisco, Cal., and was chief engineer of the Napa Valley, San Francisco & Oakland, Alameda, Valley, California Pacific and a number of other railways projected or built. In 1865 he located about 45 miles of the Central Pacific Ry., east of the summit of the Sierra Nevada Mountains. In 1871-1872 he was chief engineer of the Northwestern Construction Co., which built 225 miles of the Northern Pacific Ry. across Minnesota; from 1872 to 1874 Mr. Harris was chief engineer of the Chicago & Canada Southern Ry., and in 1875-1876 he held the same position on the Canada Central Extension, now a part of the Canadian Pacific Ry. From this time to 1883 he was engaged in various railway enterprises, chiefly in the Southern states, and from 1883 to 1891 he practiced as a consulting engineer in New York city. In 1893 he was chief engineer of the Wilkes Barre & Hudson River Improvement Co. Mr. Harris was made a Member of the American Society of Civil Engineers May 3, 1876, and a Member of the Institution of Civil Engineers, of Great Britain, on March 3, 1891. He contributed several papers to both the American and English societies. Mr. Harris has of late made his home at Portsmouth, N. H., and a widow and two daughters survive him.

AMERICAN INSTITUTE OF ARCHITECTS.
Oct. 20, 21, 22. Annual meeting to be held at Nashville, Tenn. Secy., Alfred Stone, Providence, R. I.

AMERICAN STREET RAILWAY ASSOCIATION.
Oct. 20-23. Annual convention, at St. Louis. Secy., T. C. Penington, 2020 State St., Chicago.

ENGINEERS' AND ARCHITECTS' ASSOCIATION OF SOUTHERN CALIFORNIA.
Oct. 21. Secy., F. Van Vleck, Los Angeles.

ASSOCIATION OF ENGINEERS OF VIRGINIA.
Oct. 21. Secy., J. A. Pilcher, Roanoke, Va.

BOSTON SOCIETY OF CIVIL ENGINEERS.
Oct. 21. Secy., S. E. Tinkham, City Hall.

AMERICAN INSTITUTE OF ELECTRICAL ENGINEERS.
Oct. 21. Secy., R. W. Pope, 26 Cortlandt St., New York city.

WESTERN FOUNDRYMEN'S ASSOCIATION.
Oct. 21. Secy., A. Sorge, Marquette Bldg., Chicago.

ENGINEERS' CLUB OF ST. LOUIS.
Oct. 21. "Boiler Efficiency with Low Grade Fuels," by Wm. H. Bryan. Secy., Wm. J. Bryan, Turner Bldg.

AMERICAN SOCIETY OF CIVIL ENGINEERS.
Oct. 21. "Suspension Bridges—A Study," by Geo. S. Morison. Secy., C. W. Hunt, 127 E. 23d St., New York.

CANADIAN SOCIETY OF CIVIL ENGINEERS.
Oct. 22. Secy., C. H. McLeod, Montreal, Can.

ENGINEERING ASSOCIATION OF THE SOUTH.
Oct. 23. Secy., L. P. Brown, Nashville, Tenn.

INDIANAPOLIS ENGINEERING CLUB.
Oct. 24. Secy., C. C. Brown, Indianapolis, Ind.

CIVIL ENGINEERS' CLUB OF CLEVELAND.
Oct. 27. "Gas Producers and the Mechanical Handling of Fuel for Same," C. L. Saunders. Secy., F. A. Colburn, Case Library Bldg.

CIVIL ENGINEERS' SOCIETY OF ST. PAUL.
Nov. 2. Secy., C. L. Annan, City Engineer's Office.

ENGINEERS' SOCIETY OF WESTERN NEW YORK.
Nov. 2. Secy., Carleton Greene, Library Bldg., Buffalo.

WESTERN SOCIETY OF ENGINEERS.
Nov. 4. Secy., N. L. Litton, Monadnock Block, Chicago.

TECHNICAL SOCIETY OF THE PACIFIC COAST.
Nov. 6. Secy., O. Von Geldern, 819 Market St., San Francisco, Cal.

RAILWAY SIGNALLING CLUB.
Nov. 10. Secy., Geo. M. Bashford, The Rookery Bldg., Chicago.

ENGINEERS' AND ARCHITECTS' CLUB OF LOUISVILLE.
Nov. 12. Secy., James K. Zollinger, Norton Bldg., Louisville, Ky.

CENTRAL RAILWAY CLUB.
Nov. 13. Secy., H. D. Vought, Buffalo "Courier," Buffalo, N. Y.

MONTANA SOCIETY OF ENGINEERS.
Nov. 14. Secy., Forrest J. Smith, Denver Block, Helena.

SOUTHERN AND SOUTHWESTERN RAILWAY CLUB.
Nov. 19. Kimball House, Atlanta, Ga. Secy., F. A. Charpiot, Macon, Ga.

AMERICAN SOCIETY OF MECHANICAL ENGINEERS.
Dec. 1, 2, 3, 4. Meeting to be held at the Society House, New York city. Secy., F. R. Hutton, 12 W. 31st St., New York city.

NORTHWESTERN TRACK AND BRIDGE ASSOC.
Dec. 11. Secy., D. W. Meeker, St. Paul, Minn.

AMERICAN SOCIETY OF IRRIGATION ENGINEERS.
Dec. 11 and 12. Annual meeting to be held in Denver, Colo. Secy., John S. Titcomb, Room 36, Jacobson Bldg., Denver, Colo.

NATIONAL IRRIGATION CONGRESS.
Dec. 15, 16 and 17. Annual meeting to be held in Phoenix, Ariz. Secy., C. M. Heintz, Los Angeles, Cal.

NEW PUBLICATIONS.

AMERICAN RAILWAY MASTER MECHANICS' ASSOCIATION.—Report of the Proceedings of the Twenty-ninth Annual Convention, Held at Saratoga, N. Y., June 22, 23 and 24, 1896. Published by the Association; John W. Cloud, Secretary, Chicago, Ill. Cloth; 8vo.; pp. 365; plates 16.

This contains the constitution, list of members, reports of committees and full discussions of the subjects presented at the convention, the proceedings of which were reported in our issues of June 25 and July 2, 1896. It is well printed on good paper, and is well illustrated, most of the cuts being inserted in the text, but some of the illustrations on the folding plates might have been reduced to a smaller scale and put on the pages. This is the first year that the report has been issued in cloth binding.

MASTER CAR BUILDERS' ASSOCIATION.—Report of the Thirtieth Annual Convention, held at Saratoga, N. Y., June 17, 18 and 19, 1896. Published by the Association; John W. Cloud, Secretary, Rookery Building, Chicago, Ill. Cloth; 8vo.; pp. 531; plates, 33.

This volume contains the full reports, discussions and illustrations of the various subjects under discussion at the convention, the proceedings of which were reported in our issue of June 25. It is the best style of volume of the M. C. B. reports which has yet appeared, and it is well printed on good paper. The arrangement of the plates is defective in that they are all folding plates, folded so closely that the loose edge is close against the binding, making it very liable to crease and bend the plate in closing the volume. This is the more objectionable in that the lack of visible title on the folded plates makes it necessary to partly unfold each plate in looking for any particular one. The illustrations on single pages are much more convenient.

STANDARD TABLES.—The Carnegie Steel Co., Limited, 1896. Pittsburg, Pa. 8 sheets; 7¾ × 11¾ ins.

Mr. F. H. Kindl, Structural Engineer of the Carnegie Steel Co, sends us a set of these tables which have been compiled by him for use in preparing shop details for structural work. By their use it is hoped to avoid the complications which arise from different individual practice. They include tables of lengths of shop-driven rivets for punched work, clearance for driving, draftsman's signs for countersinking, distance from center of beams and from back of channels to end of framed beams, channels and angles, center distance of holes for connecting angles, sizes of wall anchors, size and weight of connection angles, details of connections of I-beams to Z-bar columns and to cast-iron columns, etc. The tables will undoubtedly be of value to structural engineers, but it is to be regretted that they have not been printed in a better form. The sheets are very poor photo-reproductions from the draftsman's originals. It would have been much better if the tables had been set up in type, and if the illustrations had been engraved from well-executed drawings, and then the whole printed either in such shape that it could have been inserted into the Carnegie Pocketbook, or else in the standard circular size of 6 × 9 ins.

LITERARY MAGAZINES.—In the "Nineteenth Century," for September, we find a paper by Mrs. Percy Frankland with the prosaic title "Boiling Milk," Our readers will recall Mrs. Frankland's contributions to the columns of Engineering News on sanitary subjects. Her present paper is an excellent summary of the reasons why milk which has been sterilized by boiling should be used not only for infants and children but for all purposes. In "The Contemporary Review," Mr. W. R. Lawson writes on "American Currency Cranks," and pokes fun at the efforts of political speakers to make out that English monetary institutions are the enemies of the United States. We venture to quote the following:

> In the rabid fancy of the Silverite and the Populist, Lombard Street is a golden-clawed vampire sucking the life blood of American industry.
>
> But our base designs have been seen through at last, and, in the proud language of Mr. Shackelford, of the Eleventh Ward, Cook County, Illinois, "the Democrats mean, and the American people mean, to throw defiance in the face of England." Alas, England has hitherto remained in happy ignorance of the danger that threatens her. Reuter's telegrams, too fully occupied with less important affairs, have not furnished her with a single sample of the thunder-bolts which, during the Convention, Chicago hurled at her devoted head. She little recks the fate that hangs over Lombard Street; little dreams that her gold standard and her "monetary despotism" are marked out for a common doom. Perhaps not a dozen persons in England have read these Chicago speeches at length, or bestowed a thought on the mischief they may do to Americans themselves should they pass unchallenged. The present writer has studied them professionally as well as theoretically, and, knowing something of the real Lombard Street, he believes that impartial, unbiased Americans will be glad to know how widely it differs from its Chicago caricature.
>
> The Lombard Street of stump oratory is the headquarters of the gold monopolists, the temple of dear money and low prices, the happy hunting-ground of creditors, mortgagees, landlords, financiers, and the whole of the "predatory and piratical element" which, in the elegant language of a Kansas delegate, "loots the Treasury, stifles commerce, paralyzes industry and plunders the world." Lombard Street is the universal enemy against which a holy war is to be proclaimed by all the bona fide producers, with the tramps and demagogues at their head. Possibly not a single orator who helped to draw this fancy picture and to pile lurid colors on it has ever seen Lombard Street or read a plain account of its actual business. If they had to spend a day in it they might be surprised to find that it is not paved with gold, and that there is less show of metallic money in it than in Chicago itself. It might astonish them further to discover that its fabled monopoly is the very freest of free trade; that its alleged tyranny over silver-using countries is in the nature of things an utter impossibility; and that its blood-sucking propensities are restrained by a glut of money which makes lenders there thankful to earn as much interest in a year as they would get in a month or even in a week in the Western States.
>
> The real Lombard Street deals in money of all kinds and qualities; not gold money alone, or silver money, or paper, but any form of monetary material. It deals honestly all round, and, by so doing, it has become the monetary center of the world. It undertakes to convert at sight the currency of any country into that of any other country. In the process it uses very little gold, and can turn over millions sterling with less handling of coin than takes place every day in a second-rate California city. Gold as such has had little to do with the prosperity or the power of Lombard Street. Silver might have served equally well if it had been adhered to with equal persistence and had its market value been as jealously safeguarded. It was not the yellow metal, but the standard and its strict maintenance that possessed the magical virtue. * * * * * *
>
> If there be a class of producers who above all others have benefited by the facilities that Lombard Street has provided for turning their produce into sound money it is the Grangers and Populists, who at Chicago screeched about "the monetary despotism of the same old stepmother." Fifty-cent wheat, twenty-cent corn, and seven-cent cotton are calamities without doubt, and for the sake of the British as well as the American farmer a remedy for them would be highly desirable. But what has Lombard Street had to do with them? Without Lombard Street they might have been very considerably worse; nay, it is certain they would have been. Suppose that British ports had been barred against American produce, as French and German ports have been, how much less would the Western farmer be getting for his crop than the slender pittance which, in order to complete his ruin, he now seems anxious to receive in silver instead of gold?
>
> The South and West are both under deep obligations to the much-abused Lombard Street for throwing open to them the best and most profitable foreign markets they possess. If, as we believe, they get better returns for their exports to England than to any other country, they have Lombard Street and its unrivaled exchange facilities to thank for it. But they have got it into their heads that Lombard Street is the Juggernaut that has crushed silver. It is on a gold basis certainly, but it has never raised a finger to hurt silver or to discourage the use of it by countries that prefer it. Lombard Street has always said in such cases, "Have a silver standard by all means, and make the best you can of it, so long as you let those who prefer a gold standard also do the best they can with theirs."

Along with this discussion, Mr. Lawson explains in detail just what business is done in Lombard St., and just what its relations are to the financial and mercantile world. He also frankly confesses the weaknesses and limitations of the gold standard and expresses the opinion that it may yet become necessary to suspend the free coinage of gold. The paper is one which will interest every student of the currency question. The editorial review on "Money and Investments" in the same magazine discusses American financial affairs in considerable detail, and is of especial interest as showing how the British investor is coming to regard the American securities which he is asked to purchase.

The leading article in the "Popular Science Monthly" is a paper on "The Metric System," by Dr. T. C. Mendenhall, which is written as an answer (and a very excellent and pointed one it is) to the attack on the metric system by Mr. Herbert Spencer, which was published in a recent number of the same magazine. We advise any who are interested in the question to read the two articles. Even those not interested in the subject will relish immensely the keen wit with which the American demolishes the ponderous logic of the distinguished Englishman. In the same magazine Mr. Chas. Howard Shinn tells in an interesting manner the history of Nevada silver mining, a romantic story and one with much of especial interest to engineers. There is a short article on "Acetylene," which would have been timely once but is an old story now.

"The North American Review" is chiefly devoted to politics this month. Under the title "A Hindrance to Our Foreign Trade," the Consul-General of the United States in China explains how impossible it is for our consuls to do efficient work when their tenure of office is interrupted by changes in the Administration. We have nowhere seen a better description of the difficulties which lie in the way of making our consular service the aid to the extension of our commerce that it should be than is given in this article. The writer also explains what an enormous market for American manufactures China is destined to become, if only we are successful in securing our share of its trade. Another paper in the same magazine deserving mention here is "Our Neglected Shipping," by Mr. Alex. R. Smith, Secretary of the American Merchant Marine Association.

"Harper's" this month has a long paper with the rather broad title "Electricity," by Mr. R. R. Bowker, the managing Vice-President of the Edison Electric Illuminating Co., of New York city. The paper is an excellent summary in a brief space of what has been accomplished to the present time in the various fields in which electricity has been applied, and its non-technical description of many matters may clear up clouds in the minds of some engineers as well as laymen. In the "Editor's Study," Mr. Charles Dudley Warner has an interesting discussion of the forestry question and of the steps now being taken looking to the preservation of the forests on the public lands.

"The Review of Reviews" is political in its contents entirely this month, but is none the less of interest for that. Both in its editorial and in its contributed articles it gives a broader and more enlightened view of the campaign and of the questions which are being fought over than we have found in any other periodical.

In "Scribner's," Mr. Francis V. Greene writes on "The Government of the Greater New York," and discusses principles of municipal government so ably that his paper will interest many who do not reside in the future metropcIis. There is also an entertaining account of the cruise of the "Almeria," the United States supply vessel which makes an annual visit to every lighthouse and beacon on the Atlantic and Gulf coasts.

TRADE PUBLICATIONS.

RAILWAY EQUIPMENT.—M. Mitshkun & Co., Detroit, Mich. Pamph.; 4 × 6 ins.; pp. 32; illustrated.

This is a catalogue of second-hand locomotives, cars, relaying rails, track supplies, logging railway equipment, etc., on hand and for sale by the above named company.

THE TAYLOR GAS PRODUCER.—R. D. Wood & Co., 400 Chestnut St., Philadelphia, sole makers. Pamph.; 6 × 9 ins; pp. 56.

This pamphlet describes the well-known Taylor gas producer in its different forms, and contains a brief treatise on gas fuel and its application to manufacturing purposes.

WATER-TUBE MARINE BOILERS.—J. I. Thornycroft & Co., London. John Platt & Co., 97 Cedar St., New York, agents for the United States. Pamph.; 7½ × 9¾ ins.; pp. 8.

This pamphlet briefly describes three forms of the Thornycroft marine boiler which is now extensively used in Great Britain on yachts, torpedo boats, etc. It is claimed that 200,000 HP. are already in use.

MECHANICAL STOKERS.—The Playford Stoker Co., Cleveland, O. Pamph.; 6 × 9 ins.; pp. 11.

This pamphlet illustrates the Playford mechanical stoker and smokeless furnace, used especially for bituminous coal. The stoker is of the chain grate type, with a fire brick arch over a portion of the grate in front of the coal hopper.

LONG BURNING ARC LAMPS.—General Electric Co., Schenectady, N. Y. Paper; 4¼ × 6⅝ ins.; pp. 12; illustrated.

These are 100-hour and 150-hour arc lamps for use on direct current incandescent circuits. They require trimming and new carbons only about eight times in a year. The arc is entirely enclosed by an inner globe, and the latter is surrounded by an outer globe.

BELT CONVEYORS.—Robins' Conveying Belt Co., 64 Cortlandt St., New York. Pamph.; 6 × 9 ins.; pp. 12.

This circular contains photographs and descriptions of the operation of the Robins' system of belt conveyors. One of the cuts shows a belt conveying 100 tons of coarsely-broken iron ore per hour up an incline of 25½°, elevating it about 40 ft. This system of conveying and elevating seems likely to come extensively into use.

THE ARTIFICIAL PRESERVATION OF TIMBER.—Otis Allen & Son, Lowell, Mass. Pamph.; 7 × 11 ins.; pp. 27.

This pamphlet contains an interesting account of the "kyanizing" of timber, by impregnation with bichloride of mercury or corrosive sublimate. The process has been in use more or less since 1832. Numerous photographs of sticks of timber which have been kyanized and buried underground used as railway ties, or exposed in fences, bridges, etc., for long periods, in some cases over 40 years, without decaying, are shown. The kyanizing works of Otis Allen & Son contain tanks having a capacity of 150,000 ft. of lumber. The present price of kyanizing is $8 per 1,000 ft., board measure, and $1 per 1,000 for shingles.

CONSTRUCTION NEWS.

CONDENSED LIST OF CONTRACTS PENDING WITH DATE OF OPENING BIDS.

Bids to be opened.	Work. Place.	See Eng. News.
Oct. 8.	Bridge, San Jose, Cal.	Oct. 1
Oct. 8.	Repairs to hospital building, New York.	Oct. 1
Oct. 8.	Grading, Scranton, Pa.	Oct. 1
Oct. 8.	Railway repairs, etc., San Francisco, Cal.	Oct. 1
Oct. 8.	Steam fire engine, Cleveland, O.	Oct. 1
Oct. 8.	Dredging in Christiana River, Del. Advertised, Eng. News, Sept. 24 and Oct. 1.	Sept. 24
Oct. 8.	Plumbing, heating, etc., Toronto, Ont.	Sept. 24
Oct. 8.	Iron and steel bridge, Big Timber, Mont.	Sept. 24

RAILWAYS.

East of Chicago.

BUTLER & PITTSBURG.—Press dispatches state that the work is over half finished. Over 3,000 men are at work. As stated in our issue of July 16, C. I. McDonald, Penn Building, Pittsburg, Pa., is the principal contractor. Of the sub-contractors, Peyton & Reynold, of Charleston, W. Va., are at work in a deep cut through almost solid rock. They have 1½ miles of the contract and the grading is finished in many parts. A. M. Winsper has 115,000 cu. yds. of excavation through rock 60 ft. deep, which is difficult work. F. A. Masselli, of Columbus, O., has two miles of work, and has opened every cut with his force of 150 men. Admirable progress has been made, and work has just begun on a heavy cut, having in it over 40,000 cu. yds. of excavation. C. B. Donaghy has two miles of heavy work and has it nearly completed. The Ferguson Contracting Co. is also nearly through. Two miles of heavy cutting have been brought into good shape by Dell & Diulus Bros. The only tunnel on the road is 350 ft. long, which is being driven by Contractor Simon Harrold. This tunnel is one of the most important contracts on the line. It is almost two miles long, with its approaches, and 75,000 ft. of earth and rock will be taken out of the approaches alone. The most important contract on the entire road is that at the Summit cut, which Contractor McDonald is doing. Over 162,000 cu. yds. of earth will have to be taken out, and 200 laborers are employed. The general contractor has also a cut 30 ft. deep and 500 ft. long at Brimstone Corners over half done, and the digging is being pushed with great speed. Spellacy & Ellwier, of Columbus, who have almost two miles of digging, have 150 men at work, and D. A. Sanders has 140 men and 40 horses on his half-mile contract. The cuts in these portions are heavy, deep and rocky, and the advance made is necessarily tedious. Ch. Engr., F. E. House; Pres., Jas. T. Odell.

BENTON HARBOR & EASTERN TRANSIT.—This railway, it is said, is to be built from Benton Harbor, Mich., to connect with the Grand Trunk early next year. The Arnold Transportation Co. is said to have the deal in hand and will run its boats in connection with the line.

CINCINNATI, UNION CITY & CHICAGO.—It is announced that this railway, projected from Union City to Huntington, Ind., will soon be built. The panic of 1893 caught the promoters of the enterprise, work was suspended, and the company has been involved since in litigation over claims for labor and material. John H. Bliss and F. W. Short, of Chicago, have acquired nearly all of these claims and secured control of the property. It is stated that enough funds will be at hand to assure the resumpton of work on the road, which is partially graded.

CARP & ALMONTE.—It is stated that this railway is to be built between Carp and Almonte, Ont.; Surveyors Bell & Wilkie are making a preliminary survey of the proposed line to be paid for by subscriptions from citizens of the two towns.

DEPEW & TONAWANDA.—This railway, about 12 miles long, near Buffalo, is completed, and will soon be formally opened for travel. It is a branch of the Lehigh Valley, and extends from the new town of Depew to North Tonawanda.

DEAD RIVER LOGGING.—A press dispatch from Skowhegan, Me., states that E. C. Greenwood has completed the survey for this proposed logging railway. The work will not be commenced this fall but will be built next spring and summer. There has been no contract for the work yet. This road will start from Dead River, in Crocker township, and extend ten miles, ending in the valley of the Carrabassett.

ERIE.—Mayor P. F. Wanser has announced that the contract for the elevation of the Erie R. R. tracks will be ready by the end of next week, and that the work will probably begin as soon as the contract is signed.

GOSHEN & WABASH.—This company has been formed to build a railway from Goshen, via Ligonier, to Elkhart, Ind. Directors: J. J. Burns, W. L. Stone, K. E. Ripley, F. G. Hubbell and Alfred Lowry.

MONTREAL & OTTAWA.—It is stated that construction work is going forward rapidly. This line is being built by the Canadian Pacific to accommodate a section of farming country. Track has been laid for ten miles beyond Rigaud, through which place the line will run, to St. Eugene; and it is expected that before winter the line will be completed to Alfred, 45 miles further on. Stations will be erected at St. Eugene, Vankleek Hill, Caledonia Springs and Plantagenet. Next year this railway will be completed to Ottawa. Ch. Eng., P. A. Peterson, Montreal, Que.

MANITOULIN & NORTH SHORE.—A charter for a single or double track railway was granted this company by the Ontario Government in 1888 which charter was amended in 1891 and 1894. The route on which the charter was granted was from the town of Little Current, Manitoulin Island, Ontario, northward across the islands in Georgian Bay to some point on the Soo branch of the Canadian Pacific Ry. at or near Stanley, a distance of about 42 miles. The amendment of 1891 authorizes the company to issue bonds to the amount of $20,000 per mile. The date for commencement of the work of construction is fixed as March 23, 1897, and completion three years later. The Ontario Government has granted a subsidy of $3,000 per mile and the Dominion Government has granted a subsidy of $3,200 per mile. Directors: Peter Ryan, Toronto; W. P. Chapman, Hamilton; E. S. Townsend, Toronto; David Isaacs, Niagara Falls; R. H. Bowes, Toronto; David Phillips, Niagara Falls; John Ryan, Toronto. The company is now advertising for bids for the construction and equipment of the road, which will be received by Mr. MacIntire, Niagara Falls, Ont., until Oct. 12. The road will be built in six months from the time work is commenced. It will be in operation not later than May 1, 1897.

PITTSBURG, SHENANGO & LAKE ERIE.—The Pittsburg press states that the Carnegie Steel Co. is making extensive preparations for the completion of an ore line to Lake Erie. Large freight yards are being constructed at the company's various mills and the capacity of the big docks of the Pittsburg, Shenango & Lake Erie road, at Conneaut harbor, is being doubled. The grades of the Shenango road are being reduced and sharp curves are being taken out. Over $400,000 is being expended on this work alone. Laborers have been started on a curve north of Greenville. This will be straightened, as will the old sharp curves near it. The heavy grades north of Greenville will also be cut down at once. Some of these grades now exceed 52 ft. to the mile. They will be reduced to 28 ft. Ch. Engr., Geo. W. Sykes, Greenville, Pa.

PHILADELPHIA & READING.—The Philadelphia "Record" states that improvements are being made at West Falls. The roadway is being widened about 40 ft. on the river side, abutments for a new 50-ft. bridge at the West Falls road are being constructed, the old archway will be removed, and the approach leading from the bridge across the Schuylkill will be extended about 12 ft. Two additional tracks will be laid, and double tracks run into the southern portion of the Pencoyd Iron Works for freight purposes. Nolan & Co. are the contractors. They expect to have the roadbed and arch ready for use by Dec. 1. The grading from Pencoyd to the Falls road is finished and only about 75 ft. of grading below the road is yet to be done. Ch. Engr., H. K. Nichols, Philadelphia, Pa.

STONE VALLEY.—An effort is being made to build a railway through Stone Valley in Huntingdon county, Pa., from Pine Grove Mills, Pa., connecting with Beech Creek R. R. to Huntingdon, Pa., connecting with Broad Top R. R. Meetings are being held in the valley and R. C. Patterson, at present at Petersburg, Pa., a western capitalist, agrees to take all the bonds provided the construction does not cost more than $6,000 per mile.

Southern.

ATLANTA & SELMA.—It is stated that A. R. Littlejohn, of New Orleans, is interested in the project to build a railway from Atlanta, Ga., to Selma, Ala., and which may be extended to New Orleans. R. M. Mitchell, of Atlanta, is also interested.

BALTIMORE & OHIO.—It is reported that contracts for improvements have recently been awarded as follows: At Locust Point yards, work to begin at once on enlarging and improving the facilities for handling freight, to cost about $50,000. A contract has been awarded to Burns & Wade for grading an extension of the yards, which will necessitate the removal of from 60,000 to 70,000 cu. yds. of earth and rock. W. H. Thorne has the contract for masonry and piers for the extension of the Fort Ave. bridge, Baltimore, a distance of about 400 ft. Lane Bros. & Co., Esmont, Va., have the contract for grading yard E at Cumberland; estimated cost, from $30,000 to $40,000.

LINVILLE LUMBER.—It is stated that a line eleven miles long is now being surveyed to develop lumber lands near Linville, N. C. A company has been organized with a capital stock of $200,000. Among those interested are: A. B. Camp, E. H. Camp, S. T. Kelso, all of Linville.

NORFOLK & WESTERN.—Press dispatches state that with the completion of the reorganization of the Norfolk & Western system, the extension of this railway to a connection with the Marietta & North Georgia will again be considered. At present the Norfolk & Western terminates at Bristol, Tenn. By building through Cocke and Sevier counties, in Tennessee, the connection with the Marietta & North Georgia road could be made, and the Norfolk & Western thus have an entrance into Atlanta. It is stated that engineers have been making surveys from Bristol.

SPARTANBURG & WHITNEY.—It is stated that surveys are being made for a railway from Spartanburg to Whitney, S. C., a distance of 1½ miles. Ch. Engr., Henry Wells. The line would be a branch of the Southern system.

TREDEGAR MINERAL.—The Gadsen, Ala., "Times" states that work is in progress on this line which runs from Jacksonville to Centre and near the latter place will connect with the Chattanooga Southern. This road traverses a mineral region of Alabama and through forests of pine, oak and hickory. Gen. Burke, Jacksonville, Ala., is interested.

Northwest.

GREAT NORTHERN.—J. F. Stevens, Ch. Engr., St. Paul, Minn., writes us that the extension from Hope to Aneta, N. Dak., is 28¼ miles long. All contracts let to Foley Bros. & Guthrie, St. Paul, Minn.——A press dispatch states that Foley Bros. & Guthrie are building a 33-mile branch of the Great Northern from Halstad to Crookston, Minn. One-half the track is reported laid, work progressing at the rate of two miles a day. Within the next two weeks the entire branch will be completed and in operation.

N. C. FOSTER LUMBER.—It is stated that this company of Fairchild, Wis., will immediately commence the construction of an extension of their private line from Fairchild through to the town of Greenwood, giving 25 miles of private road in all. At Greenwood the Foster road will connect with the Wisconsin Central.

CHICAGO, MILWAUKEE & ST. PAUL.—The Milwaukee "Journal" says that work will be commenced in a few days on a branch which will leave the Wisconsin Valley line at Casanovia, Wis., and extend to Rhinelander, a distance of about 20 miles. It will pass through a rich timber and agricultural section.

SHEBOYGAN, ST. PAUL & WESTERN.—This company has been incorporated with a capital stock of $350,000, by Frank Geele, Frank L. Roenitz, Arthur F. Winter, James Mallman and Paul Krez. The road is to be constructed from the city of Sheboygan, Wis., to a point on the Milwaukee and Northern division of the Chicago, Milwaukee & St. Paul, at or near Random Lake, in Sheboygan county, and will be 18 miles in length.

SAGINAW & GRAND RAPIDS.—It is reported that a special meeting of the board of directors will be held at Alma, Mich., Oct. 17, for the purpose of considering propositions for an extension and the construction and acquisition of other lines and branches. Address, James E. Howard, Secy.

WINONA & WESTERN.—It is stated that this company may build from Simpson to Rochester, Minn., a distance of seven miles. The work, if done, will be undertaken next season.

Southwest.

CENTRAL LOUISIANA.—It is stated that a new company has been formed to build this railway from Abbeville to Palmetto, La., passing through Crowley and Washington, a distance of 75 miles. It is also proposed to extend the line south from Abbeville to a port on Vermillion Bay, 25 miles. Pres., Hampden Storey; Ch. Engr., William Bradford.

GULF & INTERSTATE.—The Dallas, Tex., "News" says that this company has notified the railroad commission of Texas that it has completed 70 miles of its road to Bolivar Point, and asks that the commission send its engineer to Galveston to inspect the road and report on the application for the registration of additional bonds. The commission has ordered Engineer Charles Comer to make the inspection.

GULF.—This company has been incorporated at Guthrie, Okla. Ter., to build a railway through the counties of Grant, Garfield, Kingfisher, Logan, Oklahoma, Payne, Kay, Noble, Lincoln, Pawnee, Pottawatomie, and also through the Choctaw and Chicasaw nations, Cherokee, Creek and Graham counties, Tex., to Denison. Incorporators: G. S. Dill, John Grattan, R. L. Hall and L. B. Haven, of Medford, and John A. Blair, of Caldwell, Kan. Headquarters, Wakita, Okla.

GULF & BRAZOS.—It is intended to run this line from Henrietta to Velasco, on the Gulf of Mexico, passing through Waco, Mineral Wells and Jacksboro, Texas. It will connect with the St. Louis, Oklahoma & Texas Air Line, now under construction from Sapulpa, I. T., to Henrietta. Pres., W. A. Squires, Henrietta, Tex.

KANSAS CITY, FORT SCOTT & MEMPHIS.—The Indian Territory extension of this line has been completed and opened for business from Baxter Springs, Kan., to Miami, Ind. Ter., a distance of 14 miles.

ST. LOUIS & SAN FRANCISCO.—It is stated that the survey for the extension of the St. Paul branch from Elkins towards Huntsville, Ark., commenced Sept. 24, as a preliminary to the beginning of work which will be pushed until finished.

ST. LOUIS, POMONA & SOUTHERN.—Work, it is said, will begin soon on this railway. A Mr. Merriweather, of Pomona, Kan., is the chief promoter.

TEXARKANA & FORT SMITH.—Reports say that track laying on that part of the line in Texas, between the Neches and Sabine Rivers, was to have been commenced on Oct. 1. The grading is now about finished, and will be completed in about six weeks.

Rocky Mountain and Pacific.

COLORADO SPRINGS, PIKE'S PEAK & CRIPPLE CREEK.—This company has been incorporated to build a railway 30 miles long from Colorado Springs to Cripple Creek, Colo.; capital stock, $500,000; incorporators: Leslie Harris, N. M. Keith, Manitou Springs, Colo.; C. B. Weeks, W. A. Moore and H. E. Headley, of Colorado Springs.

RIO GRANDE WESTERN.—It is stated that track-laying has been completed to Eagle Rock Tunnel, three miles up Sevier Canon, and 20 miles below Richfield, Utah. Ch. Engr., E. J. Yard, Salt Lake City, Utah.

CORRALITOS.—Press reports state that the firms at present holding construction contracts with the Corralitos road are Gilbert Webb, Juarez, Mex.; Richard Caples, El Paso, Tex.; W. C. Bradbury & Co., Denver, Colo.; Farnsworth, Beck and others, of the Mormon colonies in Mexico, State of Chihuahua. J. Fewson Smith, of the railroad is chief engineer, with headquarters at Juarez. The road is being built by the Sierra Madre Construction Co., whose officers are, Pres., A. Foster Higgins; Treas., Solon Humphreys; and Secy., George Rowland, all of New York.

VENTURA & OJAI VALLEY.—This company has been incorporated to construct and operate a railway from Ventura to Nordhoff, Cal., a distance of 25 miles. Capital stock, $200,000, commencing with $50,000. A. P. Cross, S. R. Thorpe, J. E. Loomis, S. H. Garrett, all of Los Angeles, Cal.

Foreign.

CENTRAL AMERICAN.—Four out of the five Central American States are pushing the construction of railways through their territory, several new concessions or grants having been made lately. The "Iron Age" states that a new contract has just been signed with New York, California and Colorado capitalists to finish the western terminus of the Costa Rica Interoceanic Ry., thus connecting the two oceans and passing through San Jose, the capitol. The company has a capital of $1,500,000, and work will commence at once. Nicaragua is improving the port of Corinto with a view to extending the Managua R. R. in a northerly direction. The American contractors on the Rama R. R., which will ultimately connect Lake Nicaragua and the Atlantic, are pushing the surveys.

The Republic of Salvador has lately finished its Pacific line to Santa Ana, the contractors and principal engineers being American. Several bankers and contractors have now obtained a grant to run a line from Santa Ana to the town of Ahuachabam, on the Guatamala frontier. The concession is to run for 99 years, all preliminary work to be done within a year from date, otherwise a forfeit of $25,000 to be paid by the contractors. During the last four weeks eight vessels have arrived with iron for the Northern Interoceanic of Guatemala. Rails have been laid to Zacapa, on the central plateau, the most difficult work having been completed when the line crossed the swampy district of Amates and Tenedores. Grading has been carried to within 60 miles of the capital. Other lines now constructing in this country are the Cuban R. R., which opens up the extensive coffee districts of the North to the New York markets; the line from Quezaltenango to the Pacific and the extensions of the Central Ry. to Patulul. Bridge-work is now the most important part of the contracts with the Government. A new bridge is to span the Gualan River and an American bridge company gets the contracts at and near the port of Iztapa, which is to be the western terminus of the Interoceanic.

STREET AND ELECTRIC RAILWAYS.

BOSTON, MASS.—It is stated that the West End St. Ry. Co. is soon to give out a contract which aggregates about $365,000, for a new system of brakes.

EAST BRIDGEWATER, MASS.—Attempts are being made to organize a local company to construct an electric railway about seven miles long, to Campello. H. J. Nutter, Frank N. Fisher, Robt. O. Harris and Samuel Shaw are interested.

EVERETT MASS.—Citizens are attempting to get an extension of the West End Ry. tracks.

MEDWAY, MASS.—It is reported that the selectmen are to grant two franchises for electric railways—one to the Ray Co. and one to the Milford Co.

HUDSON, MASS.—Efforts are being made to secure subscriptions for an electric railway from Hudson, via Bolton, to Lancaster, a distance of about eight miles. The capital stock is $100,000. Water power is to be used in operating and dynamos. Among those interested are: Henry Tower, Geo. A. Tripp and Caleb L. Bringham, of Hudson; and W. N. Felton and H. N. Otterson, of Bolton, Mass.

SOUTH FRAMINGHAM, MASS.—The Framingham St. Ry. Co. has been granted permission to change its motive power from horse to electric on the Union Ave. line to Framingham. Pres. James R. Entwistle is quoted as saying that the company is ready to proceed with the work as soon as permission is granted. It is stated that several extensions may be built.

SPRINGFIELD, MASS.—A press dispatch states that the Springfield & Southwestern St. Ry. Co. is at work on a survey through Feeding Hills to Southwick Ponds. This route would be a branch of the main line from Springfield through Suffield to Hartford. It is intimated that the street railway company intends to develop Southwick Ponds into a pleasure resort.

WARREN, MASS.—Meetings of citizens are being held to promote the building of a proposed extension of the Southbridge & Fiskdale Electric Ry. to touch Brifield, Palmer and Warren. F. D. Lincoln and N. S. Hubbard, of Warren, are interested.

PLAINVILLE, CONN.—It is stated that a party of capitalists has been looking over the route between Plainville and Farmington, with a view to connecting these two villages by an electric railway.

BUFFALO, N. Y.—The Buffalo Ry. Co. has been granted permission to lay tracks on several additional streets.

EAST CHESTER, N. Y.—A committee of citizens, composed of William Allen, J. B. Holler, William Johnson, Thomas Egan, Dr. Webb and Dave D. Russell have asked the Union Trolley Co. to extend the 5th Ave. trolley line to East Chester. President Maher said that he would present the request to the company, with the recommendation that it be granted.

NEW YORK, N. Y.—The State Railroad Commission has granted permission to the Third Ave. R. R. Co. to use the overhead trolley system for ten years on its Kingsbridge extension above 162d St.

ROCHESTER, N. Y.—The "Herald" states that a project is on foot to establish a trolley line between Rochester and Fairport. Plans for the new road has been submitted and the right of way has been obtained along the route deemed most suitable.

SAVONA, N. Y.—A press dispatch states that an electric railway from Savona to Keuka will be built.

SYRACUSE, N. Y.—On Sept. 27, at Albany, a hearing was given by the railroad commission on the Onondaga Lake R. R. Co. for permission to build a railway from Syracuse around Onondaga Lake. An adjournment was taken until Oct. 19, and before that time the commission will inspect the proposed route.

SYRACUSE, N. Y.—The Syracuse St. Ry. Co. has secured permits for erecting a power-house to cost $20,000, and a car barn to cost $30,000.

BOUND BROOK, N. J.—The building of an electric railway is being considered between Philadelphia and Trenton, via Bound Brook. It is stated that L. E. Miller has the contract to build the road from Raritan to New Brunswick and is to have it completed by May 1, 1897.

PATERSON, N. J.—Work was to begin on the construction of the Union Traction Co.'s lines Oct. 5. W. A. Cullen, of Paterson, is the contractor. The line will connect Rutherford with Lyndhurst and Arlington, N. J.

PLAINFIELD, N. J.—It is said that the extension of the electric railway from Plainfield to Scotch Plains is assured, as surveys have already been made and the route is being staked out. The track will be laid up East 2d St. to Netherwood Ave., and from there a new street will be utilized.

CONNELLSVILLE, PA.—The United States Ry. Equipment & Construction Co., Cleveland, O., has been awarded the contract for constructing the Connellsville St. Ry.Co.'s new line, as advertised in Engineering News. It will be a single track overhead trolley system, 2½ miles in length, laid with 56-lb. steel rails.

IRWIN, PA.—An electric railway may be built to this place this fall. The line was completed to Manor last week. The Irwin "Republican" is pushing the project.

PITTSBURG, PA.—The "Commercial Gazette," Sept 28, says that the Consolidation Traction Co. is working to complete one track on Fifth Ave., so as to run into the city the latter part of next week. All the small jobs on side streets have been reconstructed. The casing of the cable system is being lifted on South Highland Ave. by a steam crane. When the Fifth Ave. road is opened for travel new cars with trailers will be used.

WASHINGTON, D. C.—The Montgomery Construction Co. was incorporated Sept. 28, by Geo. E. Teeple, Austin McLanahan, Chas. H. Bryne, Henry W. Williams and N. Winslow Williams, with a capital stock of $100,000. The company proposes to build a line of electric railway between Washington and the suburban town of Tacoma, in Montgomery county, Md., for which a charter has been granted by Congress.

BALTIMORE, MD.—The City & Suburban Ry. Co., on Sept. 28, began surveys for the extension of its Catonsville branch to Ellicott City, a distance of three miles. Work, it is said, will begin in a few weeks. A double track will be laid, and a heavy T-rail will be used. The road will probably continue through Ellicott City to its western outskirts, if permission can be obtained from the town council.

NORFOLK, VA.—It is stated that Berkley, Portsmouth and Norfolk may be connected by an electric line. Preliminary surveys have been made. The line may be built as an extension of the Norfolk St. Ry.

RICHMOND, VA.—The Richmond Traction Co. has been granted permission to extend its lines.

CHESTER, W. VA.—The East Liverpool & Rock Spring St. Ry. Co. was incorporated Oct. 5, capital stock, $100,000, commencing with $30,000, to construct a street railway to connect Chester, W. Va., and East Liverpool, O. Incorporators: Jas. E. McDonald, Wm. L. Smith, Geo. H. Owen, J. S. Hilbert, East Liverpool, O.; and E. D. Marshall, Chester, W. Va.

ATLANTA, GA.—The "Journal" states that plans for the building of a rock ballasted electric railway from Atlanta to Marietta are matured. A line has been surveyed and land terminal has been secured. New York capitalists are interested and it is probable that a road costing $350,000 will be built. It is not improbable that electric engines will be used instead of the overhead wire.

TAMPA, FLA.—It is reported that the Consumers' St. Ry. Co. may extend its lines to Tarpon Springs.

BUCYRUS, O.—On Sept. 28 the county commissioners granted the franchise to the right of way between the Galion line and the Bucyrus corporation line for an electric railway. The franchise is granted to Wm. E. Haycox, of Mansfield, and Fred. B. Perkins, of Toledo, and a bond of $3,000 is required to be placed in the hands of the commissioners on or before May 1, 1897, for the commencement of the work; the work must begin on or before June 1, 1897, and be completed by Aug. 1, 1898.

CINCINNATI, O.—The commissioners have granted a franchise to Charles Kilgour to construct and maintain a street railway to be operated by electricity or other motive power.——The Mount Auburn Electric Ry. Co. has received an offer of a bonus of $1,000 to extend its lines to the village of Hartwell and it is stated, will soon begin work.

CLEVELAND, O.—James Ritchie, Ch. Engr., Hickox Bldg., writes us that the Cleveland & Chagrin Falls Electric R. R. was organized in 1896 to build an electric railway from the eastern limits of Cleveland to Chagrin Falls, a distance of 14 miles. The officers are: Pres., V. A. Taylor; Secy., J. E. Latimer; Supt., R. L. Palmer; Treas., C. G. Barkwill; Ch. Engr., James Ritchie. The grading and masonry of 12 miles is completed, 1.6 miles of track laid and 2½ miles of material for track is distributed in addition. The power-house will be located at Orange, about midway of the line. Entrance to the business center of Cleveland will be had over the lines of the Cleveland City Ry. It is intended to complete the line this year. About four miles is over private right of way, the balance being on the county roads. The curvature is light and the maximum gradient is 4%. The road crosses the Chagrin River on the new high level bridge, 365 ft. long. The other bridges are small, excepting one trestle 250 ft. long. The contractor for construction and equipment complete is the Albion Construction Co. of Chicago.

COLUMBUS, O.—An electric railway is projected from Columbus to Lancaster via Carroll and Groveport. W. H. Lane, Canal Winchester, O., is interested.

LORAIN, O.—Jas. B. Hoge, Secy., writes us that the projected length is 20 miles from Lorain, via Avon Point and Rocky River, to Cleveland; contracts are closed for grading and most of the material; about five miles of grading is already done; capital fully subscribed: J. W. McReynolds is the principal contractor. It is stated that the bids for preparing the roadbed between Rocky River and Lorain were as follows:

J. N. LeDuke & Co., Cleveland	$30,485
Barnett & Carr, Cleveland	30,925
D. L. Miller & Co., Lock Haven, Pa.	31,240
H. Leach, Cleveland	31,410
M. F. Condon, Cleveland	33,200
M. Spellacy & Co., Columbus, O.	34,780
Currie & McKay, Detroit	34,900
Neal Norton, Cleveland	36,275
McCracken & Connell, Cleveland	38,940
Jacob Meyer, Lorain, O.	42,110
Northern Ohio Paving & Construc. Co., Cleveland	54,450
Wm. McReynolds, Cleveland	30,150

RAVENNA, O.—The county commissioners have granted a franchise to the Akron & Cuyahoga Falls Rapid Transit Co., to erect a street railway over the stone bridge at Kent, and from the east corporation line of Kent to the west corporation line of Ravenna. Within 90 days the company must secure a franchise through Kent, or this franchise is forfeited. All work is to be completed before July 11, 1897.

WASHINGTON COURT HOUSE, O.—It is stated that a number of capitalists intend building an electric railway to Hillsboro, via Greenfield. The board of trade is interested.

YOUNGSTOWN, O.—The Youngstown Park & Falls St. Ry. Co. will apply for a franchise to extend its lines.

CHICAGO, ILL.—The General Electric Ry. Co., it is stated, will build a system of underground conduit electric railway on the south side.——The trolley lines owned by Chas. T. Yerkes will probably be extended on several streets soon.——Work on the Van Buren St. side of the Union Loop will begin immediately after a favorable decision from the Supreme Court which was to meet Oct. 6. The officials of the Loop company are counting upon a favorable decision, and are putting in all the foundations for the superstructure on Van Buren St. and ordering all the iron for the line.

WAUKEGAN, ILL.—The Bluff City Electric Ry. Co. has been granted a franchise by the county supervisors.

MADISON, WIS.—It is proposed to extend the lines of the Madison St. Ry. to Wingra Park.

MILWAUKEE, WIS.—Work is in progress on an extension of the Milwaukee Electric Ry. to the city limits, from which place it will be built to Wauwatosa after a franchise is secured.

OSKALOOSA, IA.—An ordinance has been granted whereby electricity will be substituted for mules on the street railway. The company agrees to put in and operate 4½ miles of road, and have same in operation by Dec. 1, 1897.

ST. LOUIS, MO.—The Lindell Ry. Co. is said to be endeavoring to extend its lines northeast to O'Fallon Park and to the cemeteries. It has made several inquiries recently for the purpose of purchasing tracts of land in that vicinity.

WELLSTON, MO.—The Wellston, Creve Coeur & St. Charles Ry. Co. is asking for a franchise to construct an electric railway from Wellston to St. Charles.

HOUSTON, TEX.—An effort is being made to extend the Houston Electric Ry., a distance of 26 blocks. Citizens propose to give the company a bonus of $4,000.

CRIPPLE CREEK, COLO.—The Colorado Springs, Pike's Peak & Cripple Creek Ry. Co. was incorporated, Sept. 22, by Manitou and Victor parties, with a capital stock of $500,000, to construct and operate a railway and telephone and telegraph lines between Colorado Springs, Pike's Peak and the Cripple Creek district. The incorporators are Lisle Harris, N. M. Keith, C. B. Weeks, W. A. Moore and H. E. Headley.

LA CANYADA, CAL.—Dr. J. D. Hineman is said to be representing eastern capitalists who may build an electric railway to Los Angeles, a distance of 12 miles.

LOS ANGELES, CAL.—The Mateo St. & Santa Fe Ave. Ry. Co. now operating a horse car line from the Santa Fe depot to the new garbage crematory on Santa Fe Ave., has applied to the city council for an extension of its franchise to take in the heart of the city.

SANTA ROSA, CAL.—Bids will be received until Nov. 5, for a franchise for a street railway. S. B. Fulton, Cy. Clk.——The franchise for the building of an electric railway from this city to Sonoma was granted Sept. 21. The new lines will run via Melitta, Agua Caliente, Kenwood and Glen Ellen, thus opening up the entire valley. It will then run to the Napa county line and on to the Embarcadaro landing. Another line will be constructed from here to Healdsburg and other places, and by this means the whole county will be intersected. The Santa Rosa-Sonoma line will be constructed in two years.

HAMILTON, ONT.—Notice is given that application will be made at the next session of the Parliament of Canada for an act to incorporate the Canadian Electric Ry. & Power Co., to build and operate an electric railway from Cobourg, via Port Hope, Bowmanville, Oshawa, Whitby, Toronto, Oakville and Hamilton, to Suspension Bridge and Niagara Falls.

ELECTRIC LIGHT AND POWER.

OXFORD, MASS.—Horace Fay, of Worcester, Mass., is reported to have purchased the Gates Farm of about 200 acres, on which he will make a number of improvements, including the construction of an electric light and power plant. Edward M. Southwick, Worcester, is to be in charge of the work.

NORWALK, CONN.—It is stated that the Norwalk & South Norwalk Electric Light Co. passed Oct. 1 into the hands of the General Electric Co., its largest creditor. Under the agreement former stockholders will receive an interest of 40% of their holdings.

BUFFALO, N. Y.—The council has voted to ask for bids for an electric light plant for police headquarters at Seneca and Franklin Sts. R. G. Parsons, Secy. Bd. Pub. Wks.

ELMIRA, N. Y.—It is reported that the residents of Elmira Heights will soon vote on the question of building a municipal electric light plant.

JAMAICA (L. I.), N. Y.—Francis Luce and Eugene F. Vacheron, of Woodhaven, have petitioned the town board for electric lights in Woodhaven.

LE ROY, N. Y.—The Le Roy Gas Light Co. has been awarded the lighting contract by the village board for street lighting. This company has had the contract for the past five years. The former price paid was $3,350 per year, but now it will be $1,995. This is for 50 arc lights to burn 22 nights in each month and from twilight until 1 a. m. The Le Roy Hydraulic Electric Co. offered to light the village for $2,000.

NEW YORK, N. Y.—Bids are asked until Oct. 14 for furnishing electric light and gas fixtures, wiring, iron railings, etc., for the armory building on 14th St., near 6th Ave. Archs., Calele & Sargent, 18 Broadway; Wm. L. Strong, Mayor and Chn. Armory Bd., City Hall.

NORTH TONAWANDA, N. Y.—L. Van Dervoort, B. F. Felton and Wm. Gillie, who were appointed a committee to negotiate with the Niagara Falls Power Co. for furnishing this city with light and power, have submitted a report. The company agrees to furnish city with 2,500 HP.

OGDENSBURG, N. Y.—Bids are asked until Oct. 9 for erecting an electric light plant at the state hospital at Point Airy, near this city. I. G. Perry. State Arch., Albany; Wm. J. Akin, Asst. Bldg. Supt.; Geo. Hall, Pres.

CAMDEN, N. J.—The Camden Lighting & Heating Co. has been granted a franchise for constructing conduits in the streets for its wires. Chas. H. Ellis, Pres. Council; T. P. Varney, Clk.

EAST McKEESPORT, PA.—Specifications and plans are being prepared by the East McKeesport Light & Power Co. for lighting this place with electricity, for which the company was recently incorporated.

MIDDLETOWN, PA.—Press reports state that the storm last week destroyed a portion of the electric light plant, together with the machinery. L. V. Nelson, Supt.

PHILADELPHIA, PA.—Chas. Roberts has introduced an ordinance in the council authorizing an appropriation of $25,000 for erecting an electric light plant in Fairmount Park.

WASHINGTON, D. C.—Local papers state that the United States Electric Lighting Co. has decided to spend about $1,000,000 in improving its plant in the District of Columbia. All the machinery in the main plant will be changed for new and additional machinery, the wires are all to be put under ground, and two new plants will also be erected. Pres., A. A. Thomas, Washington.

BRUNSWICK, GA.—Col. J. E. du Bignon is reported to have petitioned the council for a franchise to put in a new electric light plant.——It is stated that the council is also asking for bids for a 100-arc light plant. J. B. Abrams, Chn. Com.

COCHRAN, GA.—It is reported that this place is discussing the question of electric lights and water-works.

CUTHBERT, GA.—This place is reported to have voted to issue bonds for an electric light plant.

FERNANDINA, FLA.—Mr. Fields, of New York, is reported to have been engaged to make estimates for an electric light plant for this city, to be operated in connection with the water-works.

NICHOLASVILLE, KY.—It is reported that M. A. Anderson and others are organizing an electric light company.

CLEVELAND, O.—The Century Lighting Co. has been granted a franchise for an electric light plant. The wires will be laid in a conduit to be constructed by the company. Ex-Councilman Albert Strauss is interested.

FOSTORIA, O.—It is stated that the Fostoria Light & Power Co. awarded contracts Sept. 26 for the machinery necessary to make its plant conform with the specifications of the contract recently awarded it by the city. The Arbuckle & Ryan Co., of Toledo, O., secured the contract for the complete steam plant, and the Fort Wayne Electric Corporation, Fort Wayne, Ind., for the incandescent plant. Estimated cost, $20,000 or $25,000.

GRAND HAVEN, MICH.—Bids are asked until Oct. 14 for furnishing an engine and apparatus for an electric light plant for this city, and also for the purchase of $10,000 of 5% electric light coupon bonds. Engr., H. H. Humphrey, 22 Bennett Bldg., Detroit, Mich.; R. R. Stallings, Mayor; W. N. Angel, Cy. Clk.

GRIGGSVILLE, ILL.—The electric light plant at this place is reported to have been destroyed Sept. 25 by fire. The plant was owned by a private company.

ALAMEDA, CAL.—The court has decided that this city can improve and add to its electric light plant. Theodore Leydecker, Trustee.

BLUE LAKE, CAL.—The Little River Placer Mining Co. intends to put in an electric light plant soon. The owners of the mine are S. F. Pine, G. H. Close, R. S. Morse and Chas. Hill.

LOS ANGELES, CAL.—The Los Angeles Electric Light Co. has been awarded the contract for lighting this city for one year, beginning Jan. 1, 1897, at $9.75 per arc light per month.

MODESTO, CAL.—J. D. Harper is circulating a petition to the city trustees asking that they take means as soon as possible to install an electric light plant in this city.

REDDING, CAL.—The Holt & Gregg Co. has begun the construction of the power house at this place for Dr. Wm. H. Garlick, a Ohio pottery manufacturer. Almarine B. Paul, of San Francisco, Cal., is the agent.

SANTA CRUZ, CAL.—The Big Creek Power Co. has submitted a proposition to the council to furnish power to operate the lighting and pumping system.

THREE RIVERS, QUE.—The North Shore Power Co. has been organized to build an electric light and power plant at this place.

NEW COMPANIES.—Newton Electric Light, Heat & Power Co., Newton, N. J.; $25,000, with full amount paid in; Julius A. Skilton, Henry I. Skilton, Brooklyn, N. Y.; Andrew J. Van Blarcom, Wm. H. Earl, John Huston, all of Newton, N. J.

Fleischhauer Electric Light & Power Co., New York, N. Y.; $10,000; John Keenan, Jacob Fleischhauer, Julius Fleischhauer, New York.

Clinton Mills Power Co., Cooperstown, N. Y.; $10,000; to furnish electricity for light, heat or power in Milford, Hartwick, Middlefield, Otsego and Cooperstown; George Brooks, George M. Jarvis, E. V. Adams, Cooperstown.

Electric Light, Power & Conduit Co., St. Louis, Mo.; $50,000; S. M. Dodd, J. C. Van Blarcom, Richard C. Kerens and others.

Salinas City Light & Water Co., Salinas, Cal.; $200,000, with $500 paid in; H. S. Ball, Luther Rodgers, E. P. Iverson, M. Hughes, F. B. Day, all of Salinas.

Electric Nursery Plant Co., Niagara Falls, N. Y.; $10,000; James S. Simmons, E. H. Stewart, Roanoke, Va.; Col. W. H. Barclay.

People's Electric Light & Mfg. Co., Speers, Pa.; $50,000, with $5,000 paid in; Frank Wentz, Treas., Pittsburg, Pa.

BRIDGES.

FALL RIVER, MASS.—The aldermen are talking of building a new bridge at Bradford Ave. P. D. Borden, Cy. Engr.

LOWELL, MASS.—Geo. Bowers, Cy. Engr., writes us as follows: The Wilder St. bridge is a small wooden bridge 40 ft. long and 30 ft. wide at present; it is proposed to widen this bridge 5 ft. on each side, making it 40 ft. in width. It is a small piece of work. There is no Water St. bridge to be repaired in this city, as mentioned in some newspaper reports. The $20,000 asked for by the street committee is for earth filling on Pawtucket St. to abolish a grade crossing over the Boston & Maine R. R. All the bridge work has been done by the railway company.

MILLERS FALLS, MASS.—E. C. Davis, of Northampton, Mass., is reported to have prepared plans for a new bridge at this place.

OLYNEYVILLE, R. I.—We are informed that no steps have been taken as yet in regard to the proposed Manton Ave. bridge, but steps will be taken this winter.

HARTFORD, CONN.—The bridge commissioners have awarded to O. W. Weand & Co., of Hartford, and also of Reading, Pa., the contract for removing six stone piers of the old East Hartford bridge down to low water level. Morgan G. Bulkley, Chn. Comrs.——C. E. Gross, Pres. Park Bd., informs us that no bridge has yet been authorized or ordered over Park River at Park St. to cost $15,000. The street board has the matter in charge, the park board having no authority in the matter.

BINGHAMTON, N. Y.—An election will be held Oct. 20 to vote again on the question of constructing a new bridge over the Chenango River at Ferry St.; estimated cost, $50,000. An election was held July 14 to vote on the question of issuing $65,000 in bonds for this bridge, but it was defeated. S. E. Monroe, Cy. Engr.

BROOKLYN, N. Y.—John J. McLaughlin, County Engr., Jamaica, N. Y., has recommended to the joint committee on bridges of the aldermen and the Queens county supervisors the plan prepared by Thomas E. Brown, Jr., 38 Park Row, New York, for bascule bridge over Newtown Creek, between Vernon Ave., Long Island City, and Manhattan Ave., Brooklyn. The structure is estimated to cost $105,000, without the substructure or the operating machinery. Plans for this bridge were received July 23, as advertised in Engineering News. The plans submitted were noted in our issue of July 30.

BUFFALO, N. Y.—Bids are asked by the grade crossing commission, 4 Municipal Bldg., until Oct. 15, for masonry, paving, and other work necessary for constructing piers, abutments of, and approaches to a viaduct over the West Shore R. R., the N. Y. C. & H. R. R. R., and N. Y., L. E. & W. R. R. tracks on Chicago St., between Seneca St. and a point at or near the L. V. R. R. crossing. Engr., Geo. E. Mann, Municipal Bldg.; E. B. Guthrie, Ch. Engr., Bureau of Engineering; R. B. Adams, Chn. Grade Crossing Comrs.

NEW YORK, N. Y.—The East River Bridge Commission, 49 Chambers St. New York, has awarded to E. W. Miller the contract for borings for the anchorage on the New York side at 40 cts. a lin. ft. L. L. Buck, Ch. Engr., 46 East 21st St., New York.

STAPLETON (S. I.), N. Y.—The supervisors have directed H. P. Morrison, Engr. County Roads, to prepare plans and specifications and to advertise for bids for the enlargement of the masonry, brick and iron highway bridge over Harbor Brook in Castleton.

BLOOMSBURG, PA.—It is stated that the recent storm destroyed the bridge over the river at Catawissa, Columbia county. This structure was purchased by the county commissioners about two years ago for $30,000.

COLUMBIA, PA.—The Pennsylvania R. R. bridge over the Susquehanna River, which was nearly a mile long, was destroyed by the storm, according to reports. Only two iron spans of the bridge remain. Wm. Pritchard, Constructing Engr., P. R. R. Co., is making surveys for a new steel structure.

HOLLIDAYSBURG, PA.—Several bridges in and around this place were destroyed by the recent storm.

McKEESPORT, PA.—The Schultz Bridge & Iron Co., McKee's Rock, Pa., has the contract for the rebuilding of the 3d Ave bridge, the old suspension span will be replaced by a truss span.

NEW BRIGHTON, PA.—It is proposed to build a new bridge over Black Horse Run and viewers have been appointed. No work is likely to be done until next year, according to reports.

PITTSBURG, PA.—The Ben Avon Bridge Co. has been incorporated to erect a bridge over Spruce Run at Ben Avon; capital stock, $1,000; J. N. Davidson, Treas., care Second National Bank, Allegheny, Pa.

BALTIMORE, MD.—The Lake Roland Elevated R. R. Co. has been granted permission to build an iron bridge over the Windsor Mill road.

HANCOCK, MD.—Reports state that the recent storms washed away 13 bridges between this place and Berkeley Springs.

RIVERTON, VA.—It is stated that the iron bridge belonging to the Norfolk & Western R. R. Co., over the Shenandoah River at this place, was destroyed Sept. 29, at a loss of $5,000. W. W. Coe, Ch. Engr., Roanoke, Va.

CIRCLEVILLE, O.—Bids were asked until Oct. 5 for the purchase of $10,000 of bridge bonds, according to reports.

CLEVELAND, O.—Bids are asked until Oct. 29 for building an iron and steel superstructure for the bridge at Willow St. over the Old River bed. D. E. Wright, Dir.

COLUMBUS, O.—The city engineer and the county surveyor are considering plans for lowering the Broad St. bridge, as the grade of the street is to be lowered. Henry Maetzel, County Surv.

INDIANAPOLIS, IND.—Bids are asked until Oct. 12 for constructing the substructure of the proposed bridge over White River at Judge Harding St., West Indianapolis. J. F. Reineke, Chn. County Comrs.; H. B. Smith, Audr.——The commissioners state that eventually there will be a bridge built at Raymond St.

INDIANAPOLIS, IND.—Bids are asked by the board of public works until Oct. 14 for girders for a bridge over the canal, and until Oct. 16 for a bridge over pleasant Run at Beecher St. B. J. T. Jeup, Cy. Engr.

LAINGSBURG, MICH.—The voters have decided to rebuild the bridge east of this place, at a cost of $1,250.

OREGON, ILL.—The county supervisors on Sept. 26 appropriated $12,000 for constructing a new 160-ft. steel and iron bridge over the Rock River at this town, provided Oregon also appropriates $8,000. W. A. Hunt, County Comr.; J. C. Foster, County Clk., Oregon.

SHELBYVILLE, ILL.—It is stated that a new steel bridge about 1,400 ft. long will be built over the Kaskaskia River at this place.

WATERLOO, IA.—The Rapid Transit Co. is reported as about to let contracts for constructing four bridges on the Cedarfalls line. The largest one will be about 400 ft. long. It is to be of steel, and is estimated to cost $15,000. The other three structures will be wood.

DULUTH, MINN.—The commissioners have condemned property for the right of way for an approach for the bridge to be constructed over the St. Louis River, at Fond du Lac. C. E. Richardson, Cy. Clk.

ATCHISON, KAN.—We are informed that nothing has been done yet towards rebuilding the Fifth St. bridge Fred. Giddings, Cy. Engr.

HOUSTON, TEX.—Bids are asked by the Indiana Bridge Co., 411 Binz Bldg., Houston, for erecting a 300-ft. steel draw span.

WACO, TEX.—The question of making improvements to the superstructure of the suspension bridge is being considered. Stephen Turner, Cy. Engr.

DENVER, COLO.—P. O'Brien, Cy. Engr., writes us that no plans have yet been prepared for the 14th St. viaduct, but are simply in contemplation.

COLORADO.—Press reports state that the storm and high water Sept. 23 destroyed a large bridge at Salt Wash, seven miles from Grand Junction; also a number of bridges over the Pine and Florida Rivers, near Durango, and the new iron and steel bridge over the Dolores River, near Montrose, just completed by the county, was washed away. H. A. Sumner, State Engr., Denver, Colo.

PENDLETON, ORE.—Bids are asked by the county clerk for constructing a 119-ft. Howe truss bridge over McCoy crossing; estimated cost, $2,000.

TILLAMOOK, ORE.—Bids are asked until Jan. 8 for constructing a 220-ft. wooden bridge over the Big Nestacca River, also an approach the same length. J. D. Edwards, County Clk.

AUBURN, CAL.—Bids are asked until Oct. 10 for repairing the Rattlesnake bridge over American River by adding 1,200 ft. of 2-in. steel cable to be laid in concrete Wm. I. May, County Clk.

FRESNO, CAL.—Bids are asked until Oct. 12 for constructing a combination iron and wooden bridge on the Fresno Slough. T. G. Hart, Clk.

LOS ANGELES, CAL.—Bids are asked until Oct. 12 for building a bridge over the Los Angeles River on the Los Fells road. C. A. Luckenbach, Cy. Clk.——It is also proposed to build a bridge over the Los Angeles River, north of the city limits. Chas. Compton, Cy. Engr.

MODESTO, CAL.—The supervisors have voted to rebuild several of the river bridges in Stanislaus county; estimated cost, $15,000.

REDLANDS, CAL.—Bids are asked by the city engineer until Oct. 14 for abutments for a steel bridge at Church St., plans for which have been prepared by the city engineer. L. W. Clark, Clk.

SACRAMENTO, CAL.—The supervisors received the following bids Sept. 28, for constructing a 225-ft. steel bridge over the Consumner River: J. C. Boyd, County Surv.; San Francisco Bridge Co., San Francisco, $4,444; California Bridge Co., $4,950; Thompson Bridge Co., $4,650; J. A. McMahon, $6,495; Healy, Tibbits & Co., $7,493; Darby, Laydon & Co., $7,757; Johnson & Peterson, $6,440; Cotton Bros., $5,590; G. B. Dean, $7,700. The Thompson Bridge Co., McMahon, Laydon & Co., Johnson & Peterson and Dean also submitted bids for a combination bridge.

SAN FRANCISCO, CAL.—Bids are asked until Oct. 15 for repairing the railway bridges and trestles, the railway track, etc., at Point Sur Light Station, Cal. Maj. Chas. E. L. B. Davis, U. S. Engr., San Francisco.

QUEBEC, QUE.—Press reports state that the civic deputation to Ottawa on the bridge question claims to have the positive assurance of Premier Laurier and his colleagues that at the proper time the government will financially assist the project. It is said that the aid promised will be in the shape of a grant of 15%. of the total cost of the bridge, that is to say, if the latter reaches $5,000,000 the government will give $750,000 of the amount. It is expected that the city corporation will take stock in the company to the extent of $250,000 and guarantee the interest on an issue of bonds to the extent of $1,000,000.

HAZELMERE, B. C.—The large bridge south of the North Bluff Road, on the Hall's Prairie Road, was completly destroyed by forest fires last Sept. 20. A new bridge will be built immediately, according to reports.

BUILDINGS.

BEVERLY, MASS.—J. A. McGinty, 53 State St., Boston, has prepared plans for a 2-story brick church at Cabot and Essex Sts., to cost $60,000; pastor, Rev. F. J. Curran.

BOSTON, MASS.—Bids are asked until Nov. 5 for erecting a light-house at Spectacle Island, Boston Harbor. Maj. W. R. Livermore, U. S. Engr., Boston.——At the convention of the Y. M. C. A's. of Massachusetts and Rhode Island to be held at North Adams, Mass., Oct. 22, the question of constructing association buildings at each of the union railway stations in Boston, to cost $40,000 each, will be considered.——Plans have been prepared for adding four stories to the historical buildings on Tremont St. Mayor Quincy is interested.——Winslow & Wetherell, 3 Hamilton Place, have prepared plans for a 5-story brick block on Fulton St. for Thos. E. Proctor. It is stated that the contract has been awarded to Gooch & Pray, 166 Devonshire St., at about $65,000.——Gerry & Northrup, 51 Bristol St., have been awarded the contract for constructing a $50,000 residence on Fisher Ave., for T. L. Gay, 150 Fisher Ave.; Arch., W. Y. Peters, 6 Beacon St.——The council has passed ordinances appropriating $145,000 for improvements to the city hall and to four other municipal structures. Alderman W. J. Donovan can probably give information.

NEW BEDFORD, MASS.—Bids are asked until Nov. 9 for erecting and delivering the Butler Flats light tower, New Bedford Harbor, Mass. Maj. W. R. Livermore, U. S. Engr., Boston.

SOMERVILLE, MASS.—Edward F. Staples has been awarded the contract by the aldermen for erecting a new school building to cost $23,000, with heating and ventilating apparatus. Arch., E. M. Sargent, Somerville.
